## 1. Introduction

The IPS2550 is a high-speed inductive position sensor with analog sine and cosine voltage output, which can be differential or single-ended. The analog high-speed sensor is optimized for lowest propagation delay.

The IPS2550 high-speed inductive position sensor is used in automotive, industrial, medical, and consumer applications. The sensor configuration can be changed to address a wide range of applications. This document describes digital communication with the IPS2550 and the available configuration options.

The digital communication interface of the IPS2550 uses I2C Standard-mode to program, configure and to read the diagnostic status. In addition to using the dedicated SDA and SCL pins, it is also possible to communicate via I2C protocol over the analog output pins to reduce the number of wires to a sensor module. The Slave Address is programmable in the register and can be modified by applying the correct voltage at ADR\_IRQN pin1, for details see section 2.3.

**Note:** It is highly recommended to read the *IPS2550 Datasheet* for electrical characteristics, product details, such as features, pin descriptions, functionality, and circuit descriptions before reading this manual.

### 1.1 Quick-Start / Default Configuration

The IPS2550 comes with a default configuration for the transmitter bias current, automatic gain control and output pins in differential sine and cosine voltage mode. Diagnostic alarm at the output pins is not active. The sensor outputs sine and cosine voltages relative to the target position after power-up without the need for programming in case the sensor coils are designed appropriately to work with the default configuration.

**Default Configuration:** (refer to section 3.1 for details)

|                      |                                           |
|----------------------|-------------------------------------------|
| Supply Mode:         | 5V                                        |
| Output Mode:         | SIN/COS differential                      |
| AGC Mode:            | ON (gain booster off)                     |
| Interrupt Signaling: | Off                                       |
| I2C ADR/IRQN Pin:    | I2C address pin                           |
| I2C Address:         | 24dec (ADR pin high), 17dec (ADR pin low) |
| I2C Integrity check: | ON                                        |
| RX configuration:    | INTERLEAVED - IPS2550                     |
| TX bias current:     | 496μA                                     |

### 1.2 Programming Procedure

The programming parameters depend on the application requirements. Most parameters do not change for production parts. Some parameters can be programmed individually to compensate production tolerances. A programming procedure usually includes following steps:

1. **General Configuration** (Select the correct supply voltage, Interface mode, etc. mainly in system configuration registers Adr 0x00, 0x01, ...)
2. **Transmitter Configuration** (TX Bias Current Setting, Adr 0x07)
3. **Receiver Configuration** (can be programmed individually if needed)
  - a. Static Gain Adjustment if AGC is switched off (Adr 0x02)
  - b. Signal Offset Compensation (Adr 0x04, 0x06)
  - c. Amplitude Mismatch Compensation (Adr 0x03, 0x05)

#### 4. Diagnostics Configuration (Diagnostic Mask, Alarm Levels, Adr 0x0B, 0x0C, 0x0D, 0x0F, 0x08, 0x09, 0x0A)

##### Notes:

- To avoid possible error signalling during a configuration procedure, it is recommended to enable the backend interrupt signalling (by System Configuration 1: Address 0x00 FTP; 0x40 SRB, back\_end\_irqn\_ena) and the interrupt mask (in Interrupt Enable 1: Address 0x0B FTP; 0x4B SRB, Interrupt Enable 2: Address 0x0C FTP; 0x4C SRB and Interrupt Enable 3: Address 0x0D FTP; 0x4D SRB) at the end of the programming procedure.
- It is recommended to disable the AGC and configure a fixed gain during configuration of offset compensation and gain mismatch registers to avoid distortion of measurements during a compensation procedure (R1 Fine Gain Compensation: Address 0x03 FTP; 0x43 SRB, R1 Offset Compensation: Address 0x04 FTP; 0x44 SRB, R2 Fine Gain Compensation: Address 0x05 FTP; 0x45 SRB, R2 Offset Compensation: Address 0x06 FTP; 0x46 SRB).

### 1.3 IPS2550 Block Diagram

Figure 1 shows the main components of the IPS2550.

Figure 1. Block Diagram

### 1.4 Programming Modes

There are two different programming modes available:

- Programming over I2C pins: used for embedded applications with I2C pins permanently connected to the sensor IC.
- Programming over output pins (slower): used for remote applications like a sensor module where only supply and output pins are available.

#### 1.4.1. Programming Over I2C Pins

The IPS2550 can be programmed with a clock frequency of up to 100kHz over the I2C interface pins SDA (pin16) and SCL (pin15). The I2C pins must be tied to VDD using two pull-ups as shown below. Communication over the I2C pins is available during operation and allows reading the diagnostic status while the differential sine cosine output is active.

Figure 2. Programming the IPS2550 Over the I2C Interface

#### 1.4.2. Programming Over Output Pins

The IPS2550 can be programmed with a clock frequency of up to 25kHz over the output pins COS\_SDA (pin12) and SIN\_SCL (pin14). The I2C pins must be tied to VDD using two pull-ups as shown in Figure 3.

Figure 3. Programming the IPS2550 Over the Output Pins

Programming over the output pins can be enabled only by sending an unlock command within a defined timeframe during the start-up procedure. In operation mode SinP/CosP are solely analog outputs used for either mission mode data, or diagnostics. The procedure to enter and exit the Programming mode is shown below.

**Figure 4. Enter Programming Mode Over Output Pins**

To enter the Programming mode, the programming request must be sent: the master must send the Slave Address byte with R/W bit set to '0' in the 1ms to 3ms time frame after the power-on-reset. If NACK is received, first step of the programming entry is not successful.

Once the programming request is received, the IPS2550 does not start in Normal Operation mode, but a programming window is enabled for 75ms.

During the programming window, a password command must be sent consisting of Slave Address, Memory Address and password code as shown in Figure 5. If the valid password command is received, the programming window counter is stopped and the IPS2550 enters the Programming mode. If no valid password command is received, the IPS2550 enters the Normal Operation mode after the programming window counter is finished after 75ms.

**Figure 5. Enter Programming Commands**

After successful configuration and programming, exit the Programming mode by sending the exit command.

#### Notes:

- During programming mode via the analog output pins, the analog output voltage can be read from SIN\_N and COS\_N pins only for sensor configuration.
- When entering the programming mode via the analog output pins, the i2c\_protocol\_fail flag in register Interrupt State 1: Address 0x6B SFR is set. Reset the error flag during the programming procedure if needed.

If IPS2550 is programmed via the analog output pins, the outbuf\_vcm\_fail flag in register Interrupt State 2: Address 0x6C SFR is set.

#### 1.4.3. Programming Over Output Pins Using the IPS-Comboard

When using the IPS-comboard to program an IPS2550 over the analog output pins, consider the following:

- Select 4kHz I2C clock (automatically selected by GUI)
- Filtering capacitors must be max 47nF or lower
- For further details please refer to the User Manual of the IPS2550 Starter Kit

## 1.5 Automatic Gain Control (AGC)

As default, the automatic gain control is active. The AGC uses the signal of an internal magnitude detector to control the signal amplitudes into a control window as defined in the *IPS2550 Datasheet* document.

The AGC uses all available gain steps per default. If `agc_plause_chk_en` is activated (0x02, bit10), the AGC uses only gain steps inside the plausibility range defined in the AGC Plausibility register (Address 0x0F FTP; 0x4F SRB). If the AGC plausibility check is enabled, the `agc_err` bit is set when the plausibility boundary code configured in the AGC Plausibility Configuration register (`agc_plause_uthresh`, `agc_plause_lthresh`) is reached.

**Note:** The upper plausibility threshold must be higher than the lower plausibility threshold.

It is possible to double the overall gain by using `d2a_afe_boost_sel` (0x02, bit07).

Some applications may require a static gain setting. In this case, the AGC must be disabled (0x00, bit9 `afe_agc_dis`) and the R1/R2 gain register must be configured for the desired gain.

To see if the AGC is in range, check the `agc_err` bit (0x6C, bit 1).

By using bits `agc_wait_tmr_sel` (0x02, bits [9:8]), the wait time after a direction change of the magnitude can be configured as shown in Figure 6. The default is 10μs.

After power-up, the AGC starts to work from the gain value that is configured for R1/R2.

**Note:** The `agc_err` bit is set during start-up if an AGC start value is programmed and the magnitude exceeds the AGC target range until the correct gain value is reached. To avoid such situation during start-up, set the R1/R2 gain to a low value or '0' when using the AGC.

**Figure 6. AGC Effect on Change in Magnitude**

For lab evaluation purpose the actual AGC value can be read from the `agc_gain_stage` (0x78, bits[6:0]) register.

The target amplitude is  $0.9V \pm 0.2V$  (default).

**Note:** The default typical peak amplitude on an output pin is 0.9V, and 1.8V peak-peak if the sensor is operated within AGC range. The differential typical output voltage between positive and negative output pin is 3.6V.

## 2. I2C Interface

To communicate with a microcontroller, the IPS2550 uses a two-wire Inter-Integrated Circuit (I2C) interface based on the specification rev. 6. The Slave Address is programmable and pin 1 can be configured as an address or interrupt pin.

### 2.1 Supported Features

- Standard-mode (Sm) up to 100 kbit/s
  - Start condition
  - Stop condition
  - Acknowledge
  - 7-bit Slave Address
- Single Write Operation
- Single Read Operation

### 2.2 Not Supported Optional Features

The following features are not supported:

- Clock stretching
- 10-bit Slave Address
- General Call Address
- Software Reset
- Device ID

Two wires connected to the serial data pin (SIO\_SDA, pin 16) and serial clock pin (SCK\_SCL, pin 15) carry information between the devices connected to the bus. Both SDA and SCL pins are connected to VDD via external pull-up resistors. When the bus is free, both lines are high. An external master (host controller) initiates a transfer, generates clock signals, and terminates a transfer.

The data on the SDA line must be stable during the high period of the clock. The high or low state of the data line can only change when the clock signal on the SCL line is low.

Figure 7. I2C Bit Transfer Signal State

A data transfer is initiated by a START condition (S) and is defined as a high to low transition on the SDA line while SCL is high. A STOP condition (P) is defined as a low to high transition on the SDA line while SCL is high as shown in Figure 8.

The master always generates START and STOP conditions. The bus is considered busy after the START condition. The bus is considered to be free again after the STOP condition.

Figure 8. I2C START and STOP Conditions

If a repeated START (Sr) is generated instead of a STOP condition, the bus stays busy. In this respect, the START and repeated START conditions are functionally identical.

Every transfer block on the SDA line must have a length of 1 byte (8 bits). The number of bytes that can be transmitted per transfer is unrestricted. Each byte must be followed by an acknowledge bit from the I2C master (see Figure 9). Data is transferred with the most significant bit (MSB) first. Data transfer with acknowledgement is mandatory.

Figure 9. I2C Acknowledge Signal State

## 2.3 Slave Address

The IPS2550 supports a 7-bit I2C Slave Address. The Slave Address format is shown in Figure 10.

The Slave Address can be configured by four programmable bits (A6, A5, A4, A3). These bits can be modified in System Configuration 1 register (0x00, bits [7:4] i2c\_slave\_sub\_addr). Slave address bits A2, A1, A0 are reserved bits and are set to '0' if pin1 is configured as interrupt pin.

If pin1 is configured as address pin (default, System Configuration 1 (0x00, bit [0]=0b1 system\_protocol)), A3 has the state of the address pin and A0 has the inverse state of the address pin.

Figure 10. I2C Device Address

Up to 21 devices can be connected to the same bus when using the address pin, and up to 14 devices when using different address pins. Two groups of reserved addresses (0000XXX and 1111XXX) are excluded. A list of configurable slave addresses is shown in Table 1.

**Table 1. Programmable I2C Slave Addresses with ADR\_IRQN PIN 1 configured for Interrupt Output (0x00, system\_protocol='0')**

| i2c_slave_sub_addr dec | 1       | 2       | 3       | 4       | 5       | 6       | 7       |

## 2.4 Operation and Frame Format

The IPS2550 supports both read and write operation. By default, the protocol integrity check is enabled for all I2C frames and can be deactivated in System Configuration 2 register (0x01, bit [2] prot\_integ\_check\_dis).

## 2.5 Memory Address

The first data byte after the Slave Address is defined as memory address <MemAddr> and consists of:

- D7 Slave Address Parity Bit
- D6....D0 6-bit memory address

**Figure 11. Memory Address Byte**

## 2.6 Content Data Bytes

The following consecutive pairs of data bytes (<CmdData> field) contain the 11-bit information for the memory. The remaining 5-bits are reserved and fixed to '1'. The sequence is MSB first.

Data Byte N:

- D7 ....D0 <ContentData[10:3]>

Data Byte N+1:

- D7 ....D5 <ContentData[2:0]>
- D4 ....D3 <Reserved, always 2'b11>
- D2 ....D0 <Reserved>:

- Integrity check 'On': CRC[2:0] over Memory Address and Content Data

- Integrity check 'Off': <Reserved> (Always all 1's)

The <Reserved> field is checked for all 1's and if the check fails the <ContentData> field is not written to the addressed memory space (no write action) and the slave receiver does not produce an acknowledge.

Figure 12. Content Data Bytes

## 2.7 SINGLE WRITE Operation

For a single write operation, the Slave Address byte has the R/W bit set to '0' and is followed by the memory address byte and two content data bytes as shown below in Figure 13. The master sends the address bytes and content data, which are acknowledged by the slave.

Figure 13. Single Write Frame

### Notes:

- If I2C master continue to provide clocks and data after the second write data byte, the IC will NACK the next byte.
- Consider the programming time when writing to a FTP register. Refer to Table 5 for details.

## 2.8 SINGLE READ Operation

For a single read operation, the Slave Address byte has the R/W bit set to '0', followed by the memory address byte. After a stop (P) or repeated start (Sr) condition, the Slave Address byte follows with the R/W bit set to '1' and two content data bytes. The master sends the address bytes, which are acknowledged by the slave. The slave sends the content data, which are acknowledged by the master.

Figure 14. Single Read Frame

**Note:** If the I2C master continues to provide clocks after the second read data byte, the IC continues to provide the same read data.

## 2.9 Protocol Integrity Check

The Data Integrity Check is an extension of the I2C protocol for fail safe communication between I2C master and slave devices. This check is activated by default, and can be disabled in System Configuration 2 register (0x01, bit [2] prot\_integ\_check\_dis).

### 2.9.1. Slave Address Parity Check

The IPS2550 supports an even parity check of I2C device address. If the check fails, the subsequent command is discarded and the diagnostic status “protocol\_integrity\_fail” is asserted.

PAR: Even parity calculated and checked for preceding received SlaveAddress address byte:

$$PAR = XOR (\{SlaveAddr, RnW\})$$

Table 3 shows the Slave Address field handling for verified “read/write action”.

Table 3. I2C Slave Address Byte and Memory Address Field Integrity Check

| Protocol Integrity Check Disable | D7                  | D6.....D0 | Diagnostic | Description                                         |
|----------------------------------|---------------------|-----------|------------|-----------------------------------------------------|
| 0b1                              | 0b1                 | 0bxxxxxxx | Asserted   | No action, no slave acknowledge                     |
| 0b1                              | 0b0                 | 0bxxxxxxx | Idle       | Read/write action                                   |
| 0b0                              | PAR <sub>fail</sub> | 0bxxxxxxx | Asserted   | Parity check fails, no action, no slave acknowledge |
| 0b0                              | PAR <sub>pass</sub> | 0bxxxxxxx | Idle       | Parity check passes, read/write action              |

### 2.9.2. Content Data CRC check

A 16-bit word is defined and transported by two consecutive data bytes (data byte n, data byte n+1).

A 3-bit CRC field is defined to detect the presence of errors in the transmission of each 16-bit data word. If the data transferred does not pass CRC verification, no write action is taken, the slave receiver does not produce an acknowledge, and the diagnostic status “protocol\_integrity\_fail” is asserted.

The polynomial used to calculate the 3-bit CRC is:

$$\text{CRC}(x) = x^3 + x^1 + x^0$$

Table 4 shows the data word handling for verified “write action”.

**Table 4. I2C <ContentData> Integrity Check**

| Protocol Integrity Check Disable | <ContentData>   | <Reserved>                  |       | Diagnostic | Description                                |
|----------------------------------|-----------------|-----------------------------|-------|------------|--------------------------------------------|
| 0b1                              | 0bxxx_xxxx_xxxx | 0b1_1111                    |       | Idle       | Write action executed                      |

| 0b0                              | 0bxxx_xxxx_xxxx | 0b00<br>...<br>0b10         | Fail  | Asserted   | Write action suspend, no slave acknowledge |
| 0b0                              | 0bxxx_xxxx_xxxx | 0b00<br>...<br>0b10         | Pass  | Asserted   | Write action suspend, no slave acknowledge |

### 3. Memory Architecture

The memory architecture of the IPS2550 consists of three different storage blocks with a total address range of 7 bits as follows:

- Few Times Programmable (FTP)      00<sub>HEX</sub> through 1F<sub>HEX</sub>
- Internal Configuration (RFU)      20<sub>HEX</sub> through 3F<sub>HEX</sub>
- Shadow Register Bank (SRB)      40<sub>HEX</sub> through 67<sub>HEX</sub>
- Special Function Register (SFR)      68<sub>HEX</sub> through 7F<sub>HEX</sub>

**Figure 15. Memory Architecture**

Notes:

- Some registers are be modified by internal processes.
- After power-on-reset (POR), most of the FTP content is mirrored into the corresponding SRB address range within the start-up time window.
- Do not change registers and bits that are marked as “Internal Configuration (RFU)” with note “Read as X”.

### 3.1 Memory Map and Default FTP Values

After writing to a FTP register, a programming time of minimum 3ms is required before a new command can be sent.

**Table 5. FTP (Non-Volatile)**

| Address (hex) | Description                       | Bit position |                            |            |         | Default Value<br>hex |
|---------------|-----------------------------------|--------------|----------------------------|------------|---------|----------------------|
|               |                                   | 15...12      | 11...8                     | 7...4      | 3...0   |                      |

If enabled, AGC stops gain code update when out of plausibility range. If the plausibility check is enabled, the threshold limits in register “AGC Plausibility Configuration: Address 0x0F FTP; 0x4F SRB” must be configured correctly. The upper threshold must be configured above the lower threshold. <ul style="list-style-type: none"> <li>• 0b1: enabled</li> <li>• 0b0: disabled</li> </ul> | RW             | RW | 0         | 0           |

The output signals can have amplitude mismatch resulting from production tolerances or a non-ideal coil structure. Such amplitude mismatch leads to increased angle non-linearity that is calculated from sine and cosine signals. Therefore, the application microcontroller usually calculates and eliminate the amplitude mismatch before angle calculation. IPS2550 is able to eliminate such amplitude mismatch already within the sensor IC as shown in Figure 16. The left picture shows amplitude mismatch on the cosine channel causing angle error, the right picture shows the error and the improved signal after compensation.

Figure 16. Compensated and Uncompensated Amplitude Mismatch

The output signals can have offset resulting from production tolerances or a non-ideal coil structure. Such offset leads to increased angle non-linearity that is calculated from the sine and cosine signals. Therefore, the application microcontroller usually calculates and eliminate signal offset before angle calculation. IPS2550 is able to eliminate such offset already within the sensor IC as shown in Figure 17. The left picture shows signal offset on the cosine channel causing angle error, the right picture shows the error and the improved signal after compensation.

Calculate the bias current based on LC tank parameters and bias current equation as follows:<br>• 0b00_0000 = 0.0μA<br>• 0b00_0001 = 0.5μA<br>• 0b00_0010 = 1.0μA<br>• 0b11_1111 = 31.5μA |                   |    |              |                |

The transmitter current for the LC Tank as shown in Figure 18 must be configured based on the application requirements. Reducing the transmitter bias current decreases the transmitter amplitude and lowers the total current consumption. The behavior is not linear and depends on the configuration of the LC oscillator.

Note that the oscillator requires sufficient bias current to ensure stable oscillation. Refer to following equation to estimate the bias current setting. The estimated value might be adjusted to meet application requirements.

Figure 18. Transmitter current configuration for LC Tank

$$I_{BIAS} = VDD / (35 \times L_{TX} \times Q \times F)$$

Where:

VDD = Supply voltage in Volt

L\_TX = Inductance of transmitter coil in Henry

F = Transmitter oscillator frequency in Hz

Q = Quality factor of the Transmitter coil, it is calculated according to the following formula:

$$Q = \frac{1}{R_{L\_TX}} \sqrt{\frac{L_{TX}}{C}}$$

Where:

R\_L\_TX = Resistance of the Transmitter Coil

C = Capacitance of the Transmitter resonator (C = C\_Tx1/2)

For Example:

If L = 6μH, R = 1Ω, C = 345pF (such that the transmitter oscillates at F = 3.5MHz) and VDD = 5V

According to the formula above:

$$Q = 132$$

$$I_{BIAS} = 51.5\mu A$$

The bit configuration for the bias current base value and multiplication factor can be selected from Table 15. An example is highlighted by blue, where 26 dec for the base value and 1 dec for the multiplication factor is shown.

Table 15. Transmitter Bias Current in μA

|                 |      | [10:0]  | <b>exc_freq_ll</b> : Lower limit for the TX frequency alarm.<br><ul style="list-style-type: none"> <li>• 0x000: 0 osc_dig cycle</li> <li>• 0x001: 1 osc_dig cycle</li> <li>• 0x002: 2 osc_dig cycles</li> <li>• ...</li> <li>• 0x7FF: 2047 osc_dig cycles</li> </ul> | RW             | RW | 0x00      | 0x00        |

The programmed time base must be AF hex (default) in FTP 0x08 and SRB 0x48. For this time base, the lower limit is calculated as:

$$exc\_freq\_ll = \frac{F_{TXlow}}{20000}$$

Where

$F_{TXlow}$  = lower frequency limit in Hz

Example: Lower limit is 2.8 Mhz

$$exc\_freq\_ll = \frac{2800000}{20000} = 140 \text{ dec}$$

|                    | [10:0]  | <b>transmitter_cntr</b> : Excitation frequency counter <ul style="list-style-type: none"> <li>0x000: 0 excitation cycle</li> <li>0x001: 1 excitation cycle</li> <li>0x002: 2 excitation cycles</li> <li>...</li> <li>0x7FF: 2047 excitation cycles</li> </ul> | RO                | 0x000        |

The transmitter frequency can be calculated from the transmitter\_cntr value.

For a time base value of AF hex (default) in register 0x48, the frequency is calculated as:

$$F_{TX} = \text{transmitter\_cntr} * 20000$$

Example for a timebase of 50μs (0x08 = AF<sub>hex</sub>):

$$F_{TX} = 200 * 20000 = 4 \text{ MHz}$$

## 5. Revision History

| Revision Date | Description of Change                                                           |
|---------------|---------------------------------------------------------------------------------|
| Apr.26.24     | Pin numbering updated for system_protocol.<br>Some typos corrected              |
| Mar.20.24     | Values for 7E and 7F are updated in registers 4, 44, 6, and 46.                 |
| Jul.7.21      | Updated Descriptions for AGC, Register 0x7A and corrections in formatting       |
| May.5.21      | Updated descriptions for sensor programming, I2C addresses, FTP/SRB, and flags. |
| Jan.19.21     | Initial release                                                                 |

## Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
6. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.

"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.

"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.

7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION ("Vulnerability Issues"). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
8. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
