

To our customers,

Old Company Name in Catalogs and Other Documents

On April 1st, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Renesas Electronics website: <http://www.renesas.com>

April 1st, 2010
Renesas Electronics Corporation

Issued by: Renesas Electronics Corporation (<http://www.renesas.com>)

Send any inquiries to <http://www.renesas.com/inquiry>.

Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7. Renesas Electronics products are classified according to the following three quality grades: “Standard”, “High Quality”, and “Specific”. The recommended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as “Specific” without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as “Specific” or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is “Standard” unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.
 - “Standard”: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.
 - “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.
 - “Specific”: Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

Application Note

V850ES/Jx3-L

Sample Program

(16-bit Timer/Event Counters (TMP, TMQ))

PWM Output Mode

This document describes an operation overview of the sample program and how to use it, as well as how to set up and use the PWM output function of 16-bit timer/event counters (TMP, TMQ). In the sample program, the brightness of LED2 is changed every 500 ms by using the PWM output function of the 16-bit timer/event counter (TMP) to control the pulse output duty. When the duty is changed, LED1 turns on or off.

- **The information in this document is current as of June, 2009. The information is subject to change without notice. For actual design-in, refer to the latest publications of NEC Electronics data sheets, etc., for the most up-to-date specifications of NEC Electronics products. Not all products and/or types are available in every country. Please check with an NEC Electronics sales representative for availability and additional information.**

- No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Electronics. NEC Electronics assumes no responsibility for any errors that may appear in this document.

- NEC Electronics does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from the use of NEC Electronics products listed in this document or any other liability arising from the use of such products. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Electronics or others.

- Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of a customer's equipment shall be done under the full responsibility of the customer. NEC Electronics assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.

- While NEC Electronics endeavors to enhance the quality and safety of NEC Electronics products, customers agree and acknowledge that the possibility of defects thereof cannot be eliminated entirely. In addition, NEC Electronics products are not taken measures to prevent radioactive rays in the product design. When customers use NEC Electronics products with their products, customers shall, on their own responsibility, incorporate sufficient safety measures such as redundancy, fire-containment and anti-failure features to their products in order to avoid risks of the damages to property (including public or social property) or injury (including death) to persons, as the result of defects of NEC Electronics products.

- NEC Electronics products are classified into the following three quality grades: "Standard", "Special" and "Specific".

The "Specific" quality grade applies only to NEC Electronics products developed based on a customer-designated "quality assurance program" for a specific application. The recommended applications of an NEC Electronics product depend on its quality grade, as indicated below. Customers must check the quality grade of each NEC Electronics product before using it in a particular application.

"Standard": Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots.

"Special": Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support).

"Specific": Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems and medical equipment for life support, etc.

The quality grade of NEC Electronics products is "Standard" unless otherwise expressly specified in NEC Electronics data sheets or data books, etc. If customers wish to use NEC Electronics products in applications not intended by NEC Electronics, they must contact an NEC Electronics sales representative in advance to determine NEC Electronics' willingness to support a given application.

(Note)

(1) "NEC Electronics" as used in this statement means NEC Electronics Corporation and also includes its majority-owned subsidiaries.

(2) "NEC Electronics products" means any product developed or manufactured by or for NEC Electronics (as defined above).

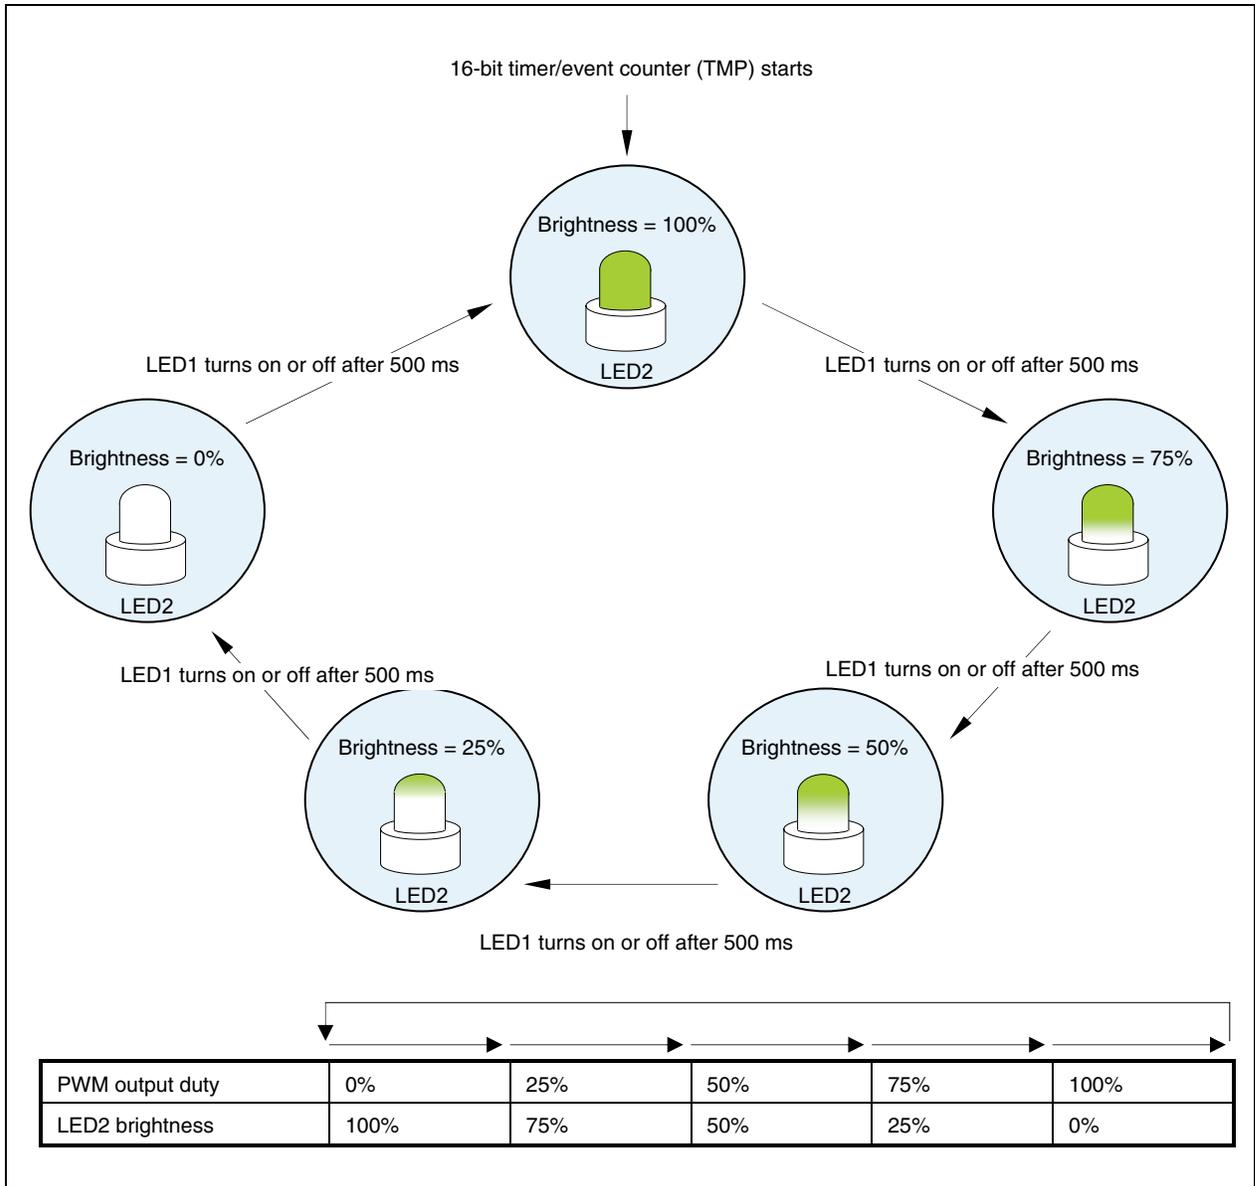

M8E0904E

CHAPTER 1 OVERVIEW

In this sample program, an example of using the PWM output function of the 16-bit timer/event counter (TMP) is presented. The brightness of LED2 is changed every 500 ms by controlling the PWM output duty. LED1 turns on or off each time the duty is changed.

Peripherals that stop immediately after a reset and are not used in the sample program are not set up.

Figure 1-1. Operation Overview

In this sample program, “LED2 brightness (%) = 100 – PWM output duty” because the PWM output active level is high and LED2 turns on when it is at low level.

1.1 Initial Settings

The main initial settings are as follows:

<Referencing option byte>

- Referencing the oscillation stabilization time immediately after a reset

<Setting up on-chip peripherals>

- Setting the number of wait cycles to 1 for bus access to on-chip peripheral I/O registers
- Specifying normal operation mode by using the on-chip debug mode register (OCDM)
- Stopping the internal oscillator and watchdog timer 2
- Specifying that the CPU clock frequency not be divided
- Specifying PLL mode and 20 MHz operation (5 MHz × 4)

<Pin settings>

- Setting up unused pins
- Selecting the LED1 output pin (PCM3 pin)
- Selecting the LED2 output pin (TOP01 pin)

<Timer P0 (TMP0) settings>

- Specifying the undivided f_{xx} (20 MHz) as the count clock frequency by using the TP0CTL0 register
- Specifying PWM output as the timer operation mode by using the TP0CTL1 register
- Enabling timer output from the TOP01 pin and specifying the active level as high by using the TP0IOC0 register
- Setting the PWM cycle to 2 ms by using the TP0CCR0 register
- Setting the duty to 0% by using the TP0CCR1 register
- Enabling TMP0 by using the TP0CTL0 register
- Setting the priority of the INTTP0CC0 interrupt to level 7 and unmasking it

1.2 Servicing Interrupts by Using 16-bit Timer/Event Counter (TMP0) Per Specified PWM Cycle

After the initial settings are specified, LED1 turns on or off and the duty of PWM output to LED2 is changed every 500 ms based on the INTTP0CC0 interrupt, which is generated by the 16-bit timer/event counter (TMP0).

Because the PWM cycle is initially set to 2 ms, the TMP0 interrupt (INTTP0CC0) occurs every 2 ms. During interrupt servicing, the number of interrupts that has occurred is counted and, every 250 counts, LED1 turns on or off and the duty of PWM output to LED2 is changed.

Caution For cautions on using a device, see the user's manual for that device (V850ES/JF3-L or V850ES/JG3-L).

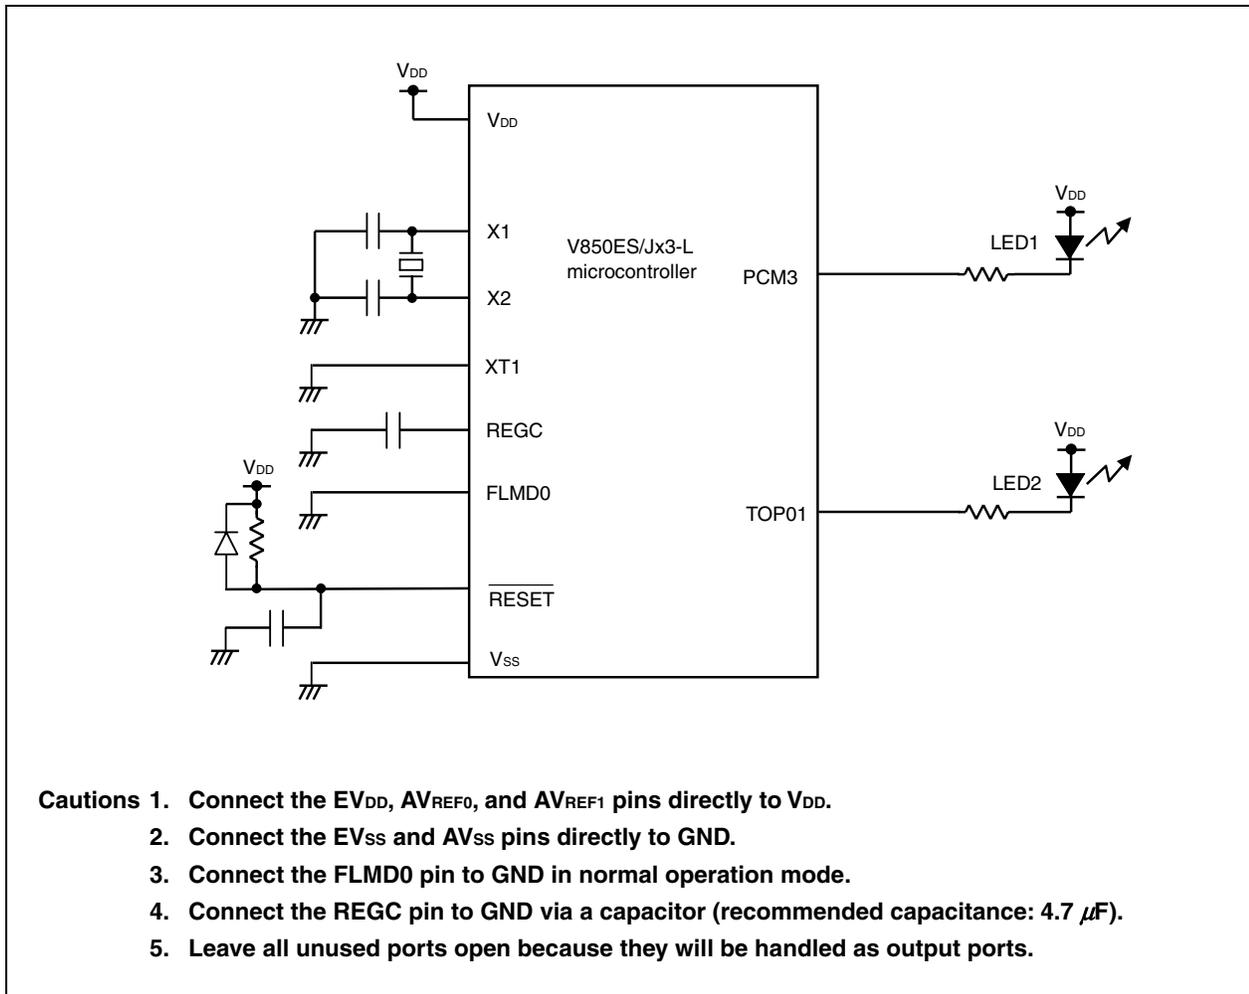

CHAPTER 2 CIRCUIT DIAGRAM

This chapter provides a circuit diagram and describes the peripheral hardware used in the sample program.

2.1 Circuit Diagram

The circuit diagram is shown below.

Figure 2-1. Circuit Diagram

2.2 Peripheral Hardware

The peripheral hardware to be used is shown below.

- LED1: LED1 is switched between on and off each time the brightness of LED2 is changed.
- LED2: The brightness is changed in five levels.

CHAPTER 3 SOFTWARE

This chapter describes the files included in the compressed files that are downloaded, on-chip peripherals of the microcontroller, and the initial settings, and provides an operational overview of the sample program. Flowcharts are also shown.

3.1 Included Files

The following table shows the files included in the compressed files that are downloaded.

File Name (Tree)	Description	Compressed (*.zip) Files Included	
			
<ul style="list-style-type: none"> • conf <ul style="list-style-type: none"> — crtE.s — AppNote_PWM.dir — AppNote_PWM.prj — AppNote_PWM.prw 	Startup routine file ^{Note 1}	–	●
	Link directive file ^{Note 2}	●	●
	Project file for integrated development environment PM+	–	●
	Workspace file for integrated development environment PM+	–	●
<ul style="list-style-type: none"> • src <ul style="list-style-type: none"> — main.c — minicube2.s — opt_b.s 	C source file including code for hardware initialization processing and the main microcontroller processing	●	●
	Source file for reserving the area for MINICUBE [®] 2	●	●
	Source file for specifying values for the option byte	●	●

- Notes**
- This is the startup file copied when “Copy and Use the Sample file” is selected in the Startup File dialog box in the New WorkSpace wizard. (If the default installation path is used, the startup file will be a copy of C:\Program Files\NEC Electronics Tools\CA850\version\lib850\r32\crtE.s.)
 - This is the link directive file automatically generated if “Create and Use the Sample file” is selected and “Use Internal memory only” is selected for “Memory Usage” in the LinkDirective File dialog box in the New WorkSpace wizard, and to which a segment for MINICUBE2 is added. (If the default installation path is used, C:\Program Files\NEC Electronics Tools\PM+\version\bin\w_data\V850_i.dat is used as the reference file.)

Remark  : Only the source file is included.

 : The files used with the integrated development environment PM+ are included.

3.2 On-Chip Peripherals Used

The following on-chip peripherals of the microcontroller are used in this sample program:

- PWM output function: 16-bit timer/event counter (TMP0)
- PWM output port (LED2): TOP01^{Note}
- Output port (LED1): PCM3

Note For the V850ES/JG3-L and V850ES/JF3-L microcontrollers, this pin also functions as TIP01 or P33.

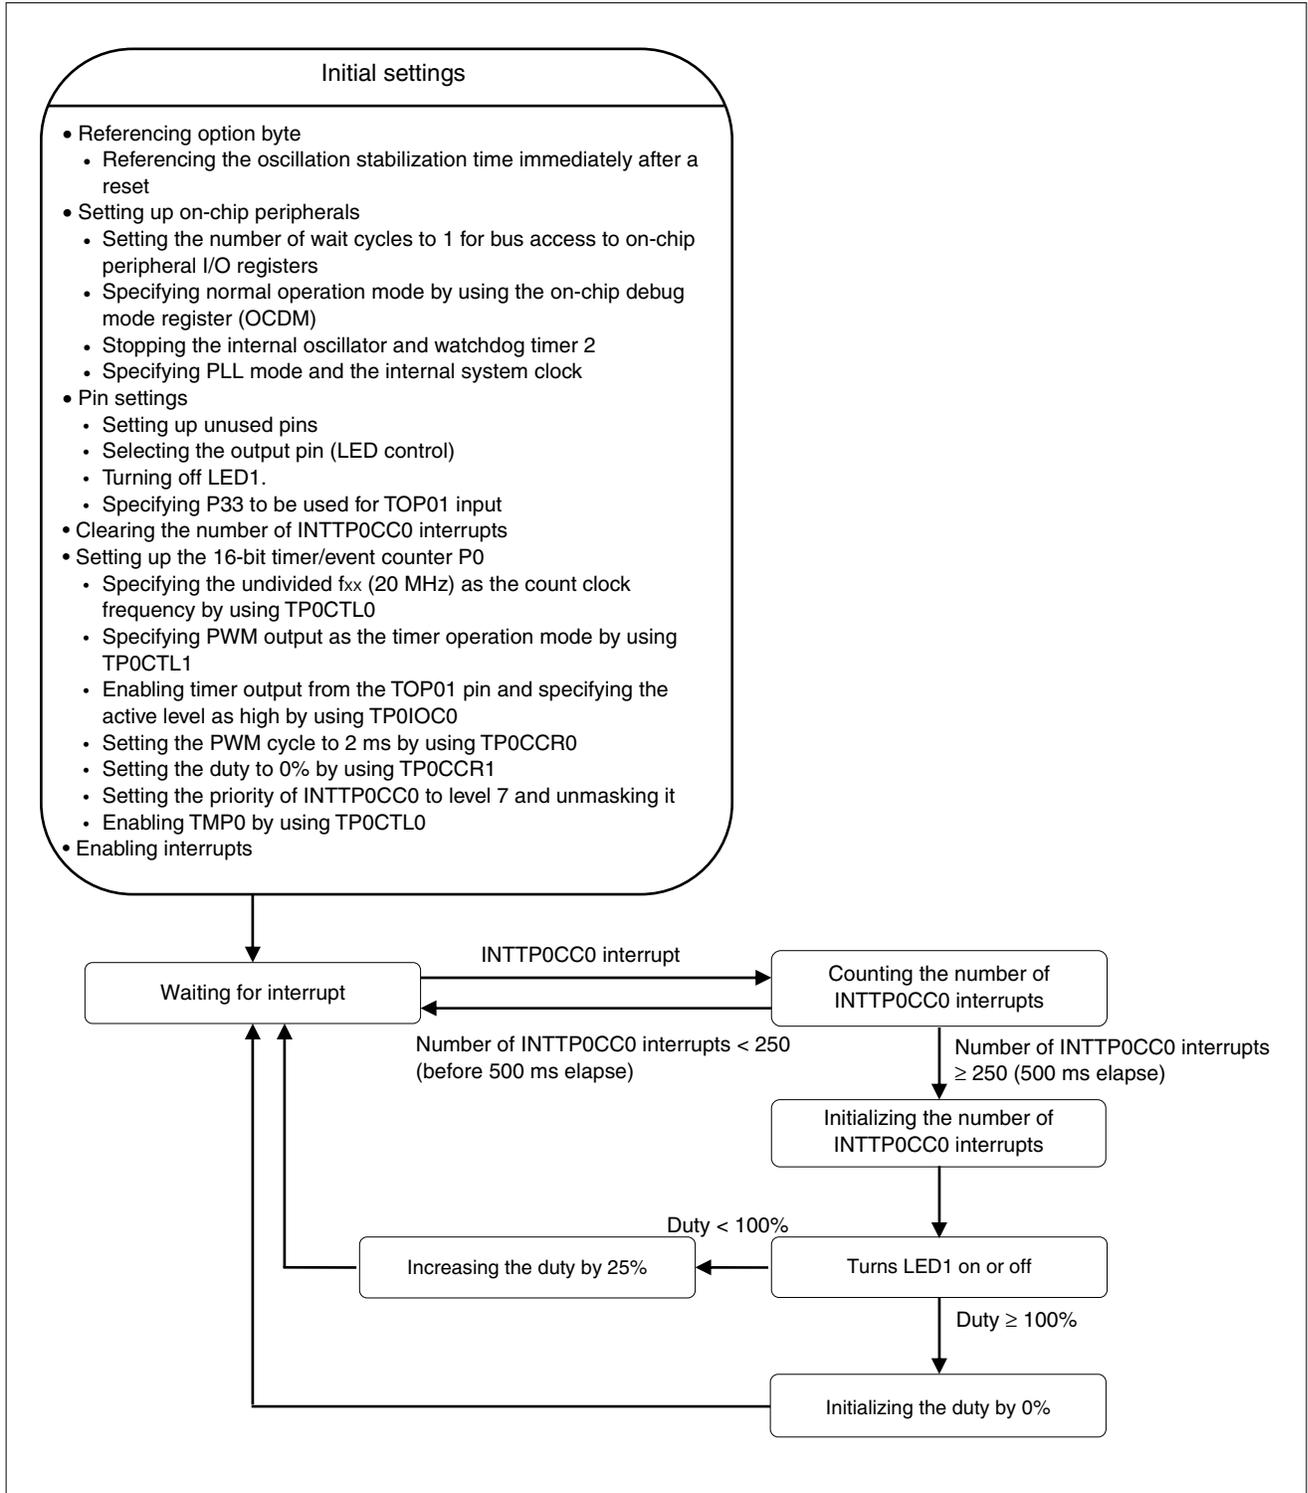

3.3 Initial Settings and Operational Overview

As the initial settings in the sample program, the clock frequency is selected, watchdog timer 2 is stopped, and settings for the I/O ports, PWM output from the 16-bit timer/event counter (TMP0), and interrupts are specified.

After the initial settings are specified, the brightness of LED2 is changed by controlling the duty of PWM output from the 16-bit timer/event counter (TMP0). The duty is changed every 500 ms by using the TMP0 interrupt (INTTP0CC0). LED1 turns on or off each time the duty is changed.

The details are described in the status transition diagram shown below.

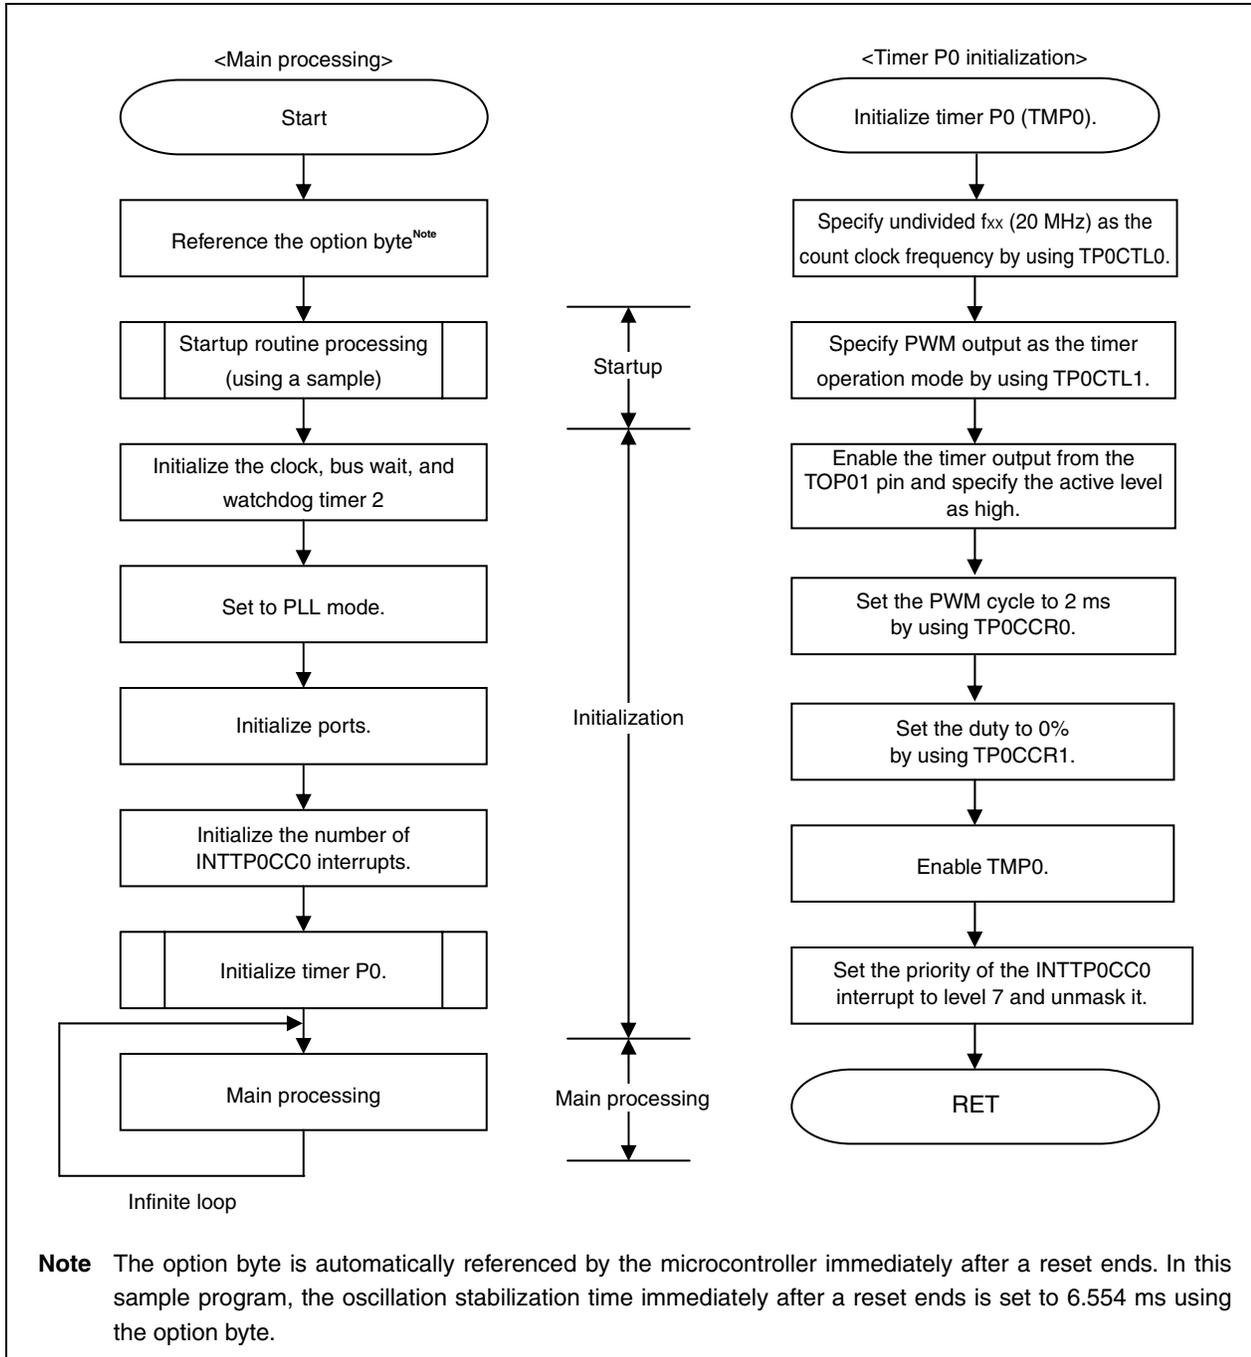

Figure 3-1. Status Transition

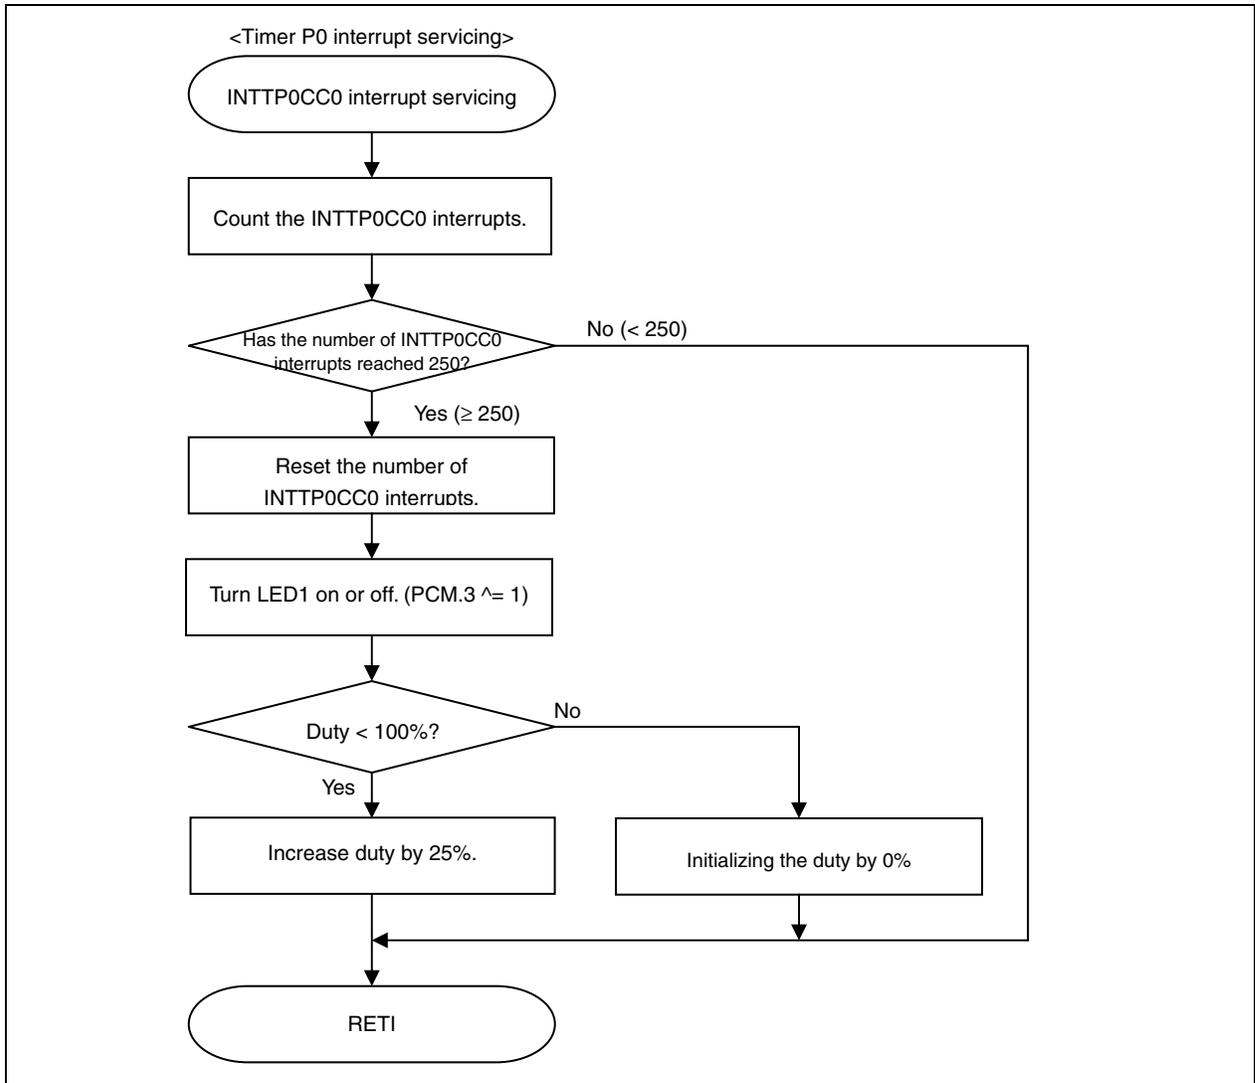

3.4 Flowcharts

Flowcharts for the sample program are shown below.

Figure 3-2. Status Transition

[Column] Contents of the startup routine

The startup routine is executed before executing the main function immediately after resetting the V850 ends. Basically, the startup routine executes initialization so that the C program can start. Specifically, the following are performed:

- Allocating the argument space for the main function
- Allocating the stack
- Setting up the reset handler when a reset is input
- Setting up the text pointer (tp)
- Setting up the global pointer (gp)
- Setting up the stack pointer (sp)
- Setting up the element pointer (ep)
- Specifying mask values for the mask registers (r20 and r21)
- Clearing the sbss and bss areas to 0
- Specifying the CTBP value for the prologue/epilogue runtime library
- Specifying r6 and r7 as the arguments for the main function
- Branching to the main function

3.5 Differences Between V850ES/JG3-L and V850ES/JF3-L

The V850ES/JG3-L is the V850ES/JF3-L with its functions, such as I/Os, timer/counters, and serial interfaces, expanded.

In this sample program, the initialization range of P1, P3, P7, P9, and PDH during I/O initialization differs.

See **APPENDIX A PROGRAM LIST** for details about the sample program.

3.6 Difference Between TMP and TMQ

16-bit timer/event counter P (TMP) and 16-bit timer/event counter Q (TMQ) differ in the number of capture trigger pins, timer output pins, and capture/compare registers.

In the sample program, 16-bit timer/event counter P (TMP) is used. When using 16-bit timer/event counter Q (TMQ), see **CHAPTER 4 SETTING UP REGISTERS** and **APPENDIX A PROGRAM LIST** for the settings.

3.7 Security ID

The flash memory can be protected from unauthorized reading by using a 10-byte ID code for authentication when executing on-chip debugging using an on-chip debug emulator.

For details about the security ID, see the **V850ES/Jx3-L Sample Program (Interrupt) External Interrupt Generated by Switch Input Application Note**.

CHAPTER 4 SETTING UP REGISTERS

This chapter describes the settings of 16-bit timer/event counter P (TMP) and 16-bit timer/event counter Q (TMQ).

For details about other initial settings, see the **V850ES/Jx3-L Sample Program (Initial Settings) LED Lighting Switch Control Application Note**. For details about interrupts, see the **V850ES/Jx3-L Sample Program (Interrupt) External Interrupt Generated by Switch Input Application Note**.

Peripherals that are stopped immediately after a reset and are not used in this sample program are not set up.

For details about how to set up registers, see the user's manual for the device used.

- V850ES/JG3-L 32-bit Single-Chip Microcontroller Hardware User's Manual
- V850ES/JF3-L 32-bit Single-Chip Microcontroller Hardware User's Manual

For details about extended C code, see the **CA850 C Compiler Package C Language User's Manual**.

4.1 Setting Up 16-bit Timer/Event Counter P (TMP)

The following nine registers are used to set up 16-bit timer/event counter P (TMP):

- TMPn control register 0 (TPnCTL0)
- TMPn control register 1 (TPnCTL1)
- TMPn I/O control register 0 (TPnIOC0)
- TMPn I/O control register 1 (TPnIOC1)
- TMPn I/O control register 2 (TPnIOC2)
- TMPn option register 0 (TPnOPT0)
- TMPn capture/compare register 0 (TPnCCR0)
- TMPn capture/compare register 1 (TPnCCR1)
- TMPn counter read buffer register (TPnCNT)

Remarks 1. n = 0 to 5 (V850ES/JG3-L), n = 0 to 2, or 5 (V850ES/JF3-L)

2. n = 0 in the sample program

3. The eleven registers below are used to set up 16-bit timer/event counter Q (TMQ).

The description on the following pages is of TMP. Therefore, when using TMQ, read the above registers as those below, and read TP in the bit names as TQ.

- TMQ0 control register 0 (TQ0CTL0)
- TMQ0 control register 1 (TQ0CTL1)
- TMQ0 I/O control register 0 (TQ0IOC0)
- TMQ0 I/O control register 1 (TQ0IOC1)
- TMQ0 I/O control register 2 (TQ0IOC2)
- TMQ0 option register 0 (TQ0OPT0)
- TMQ0 capture/compare register 0 (TQ0CCR0)
- TMQ0 capture/compare register 1 (TQ0CCR1)
- TMQ0 capture/compare register 2 (TQ0CCR2)
- TMQ0 capture/compare register 3 (TQ0CCR3)
- TMQ0 counter read buffer register (TQ0CNT)

4.1.1 Setting up 16-bit timer/event counter P (TMP) operation clock

TMPn control register 0 (TPnCTL0) selects the count clock for 16-bit timer/event counter P (TMP) and controls the counter.

Values must be specified for the TPnCKS2 to TPnCKS0 bits when the TPnCE bit is 0.

In this sample program, f_{xx} (20 MHz) is selected by clearing the TPnCKS2 to TPnCKS0 bits at initialization. After specifying the settings for the 16-bit timer/event counter P (TMP) registers, set the TPnCE bit to 1.

Figure 4-1. TPnCTL0 Register Format

TMPn control register 0 (TPnCTL0)
 Address: TP0CTL0 0xFFFFF590, TP1CTL0 0xFFFFF5A0,
 TP2CTL0 0xFFFFF5B0, TP3CTL0 0xFFFFF5C0,
 TP4CTL0 0xFFFFF5D0, TP5CTL0 0xFFFFF5E0

	7	6	5	4	3	2	1	0
	TPnCE	0	0	0	0	TPnCKS2	TPnCKS1	TPnCKS0

TPnCE	TMPn operation control
0	TMPn disabled (TMPn reset asynchronously).
1	TMPn enabled. TMPn starts.

TPnCKS2	TPnCKS1	TPnCKS0	Internal count clock selection	
			n = 0, 2, 4	n = 1, 3, 5
0	0	0	f _{xx}	
0	0	1	f _{xx} /2	
0	1	0	f _{xx} /4	
0	1	1	f _{xx} /8	
1	0	0	f _{xx} /16	
1	0	1	f _{xx} /32	
1	1	0	f _{xx} /64	f _{xx} /256
1	1	1	f _{xx} /128	f _{xx} /512

Remark The red values are specified in this sample program.

4.1.2 Setting up 16-bit timer/event counter P (TMP) operation mode

TMPn control register 1 (TPnCTL1) specifies the operation mode of 16-bit timer/event counter P (TMP). In this sample program, the PWM output mode is specified by specifying 100b for the TPnMD2 to TPnMD0 bits.

Figure 4-2. TPnCTL1 Register Format

TMPn control register 1 (TPnCTL1)

Address: TP0CTL1 0xFFFFF591, TP1CTL1 0xFFFFF5A1,
 TP2CTL1 0xFFFFF5B1, TP3CTL1 0xFFFFF5C1,
 TP4CTL1 0xFFFFF5D1, TP5CTL1 0xFFFFF5E1

7	6	5	4	3	2	1	0
0	TPnEST	TPnEEE	0	0	TPnMD2	TPnMD1	TPnMD0

TPnEST	Software trigger control
0	-
1	Generate a valid signal for external trigger input.

TPnEEE	Count clock selection
0	Disable operation with external event count input ^{Note} .
1	Enable operation with external event count input.

TPnMD2	TPnMD1	TPnMD0	Timer mode selection
0	0	0	Interval timer mode
0	0	1	External event count mode
0	1	0	External trigger pulse output mode
0	1	1	One-shot pulse output mode
1	0	0	PWM output mode
1	0	1	Free-running timer mode
1	1	0	Pulse width measurement mode
1	1	1	Setting prohibited

Note Clock selected using the TPnCK0 to TPnCK2 bits of the TPnCTL0 register

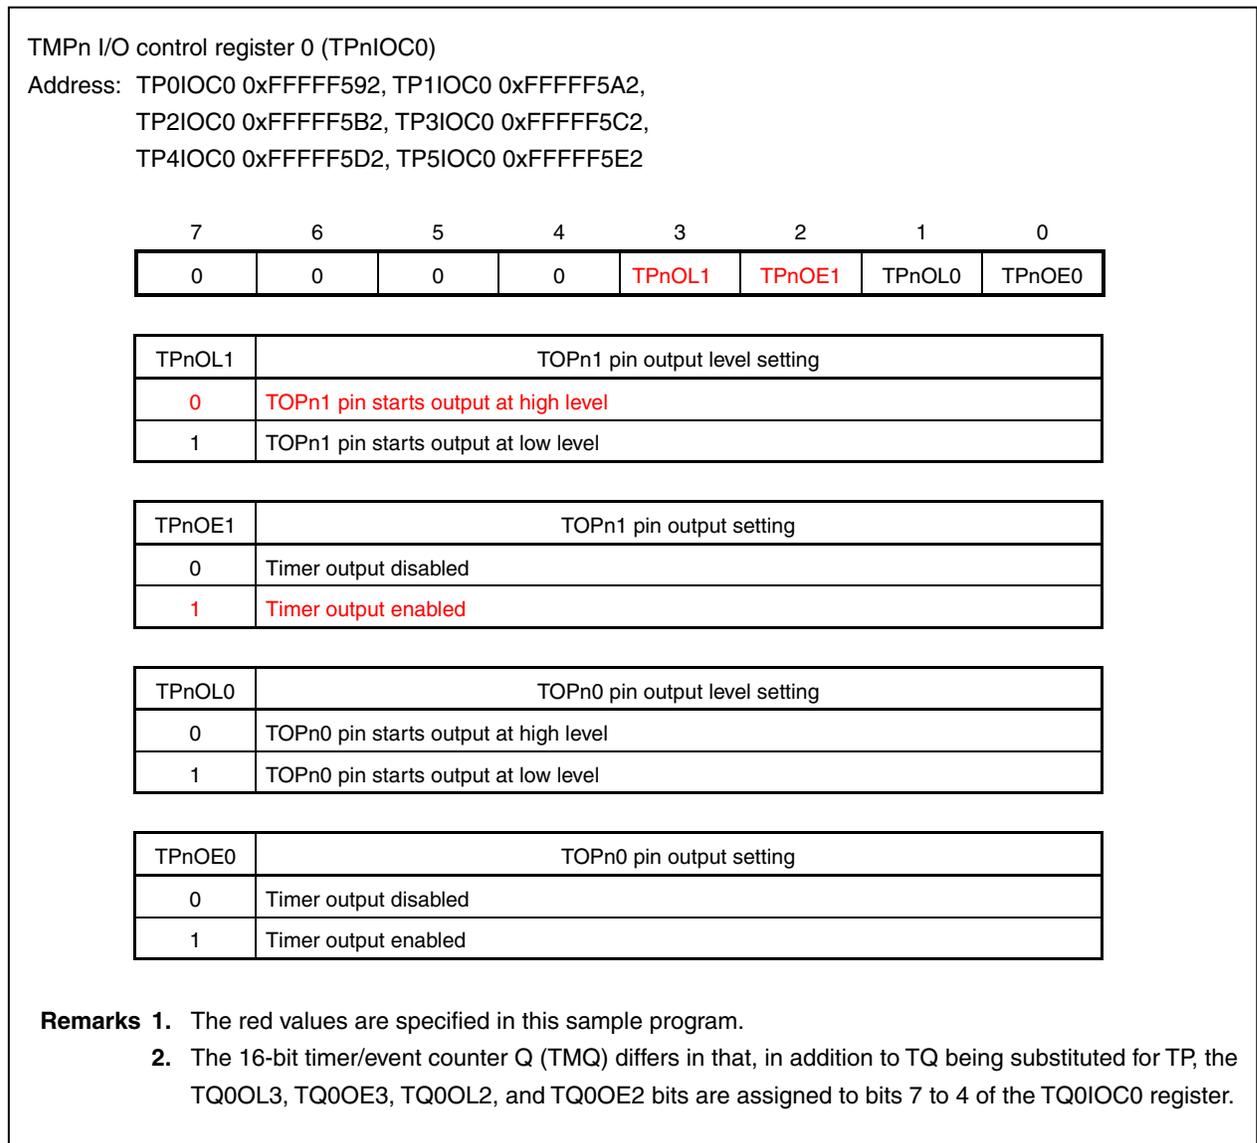

Remark The red values are specified in this sample program.

4.1.3 Controlling timer output

TMPn I/O control register 0 (TPnIOC0) controls timer output.

In this sample program, PWM output from the TOPn1 pin is enabled by setting the TPnOE1 bit to 1 and the active level of the TOPn1 pin is set to high by clearing the TPnOL1 bit to 0.

Figure 4-3. TPnIOC0 Register Format

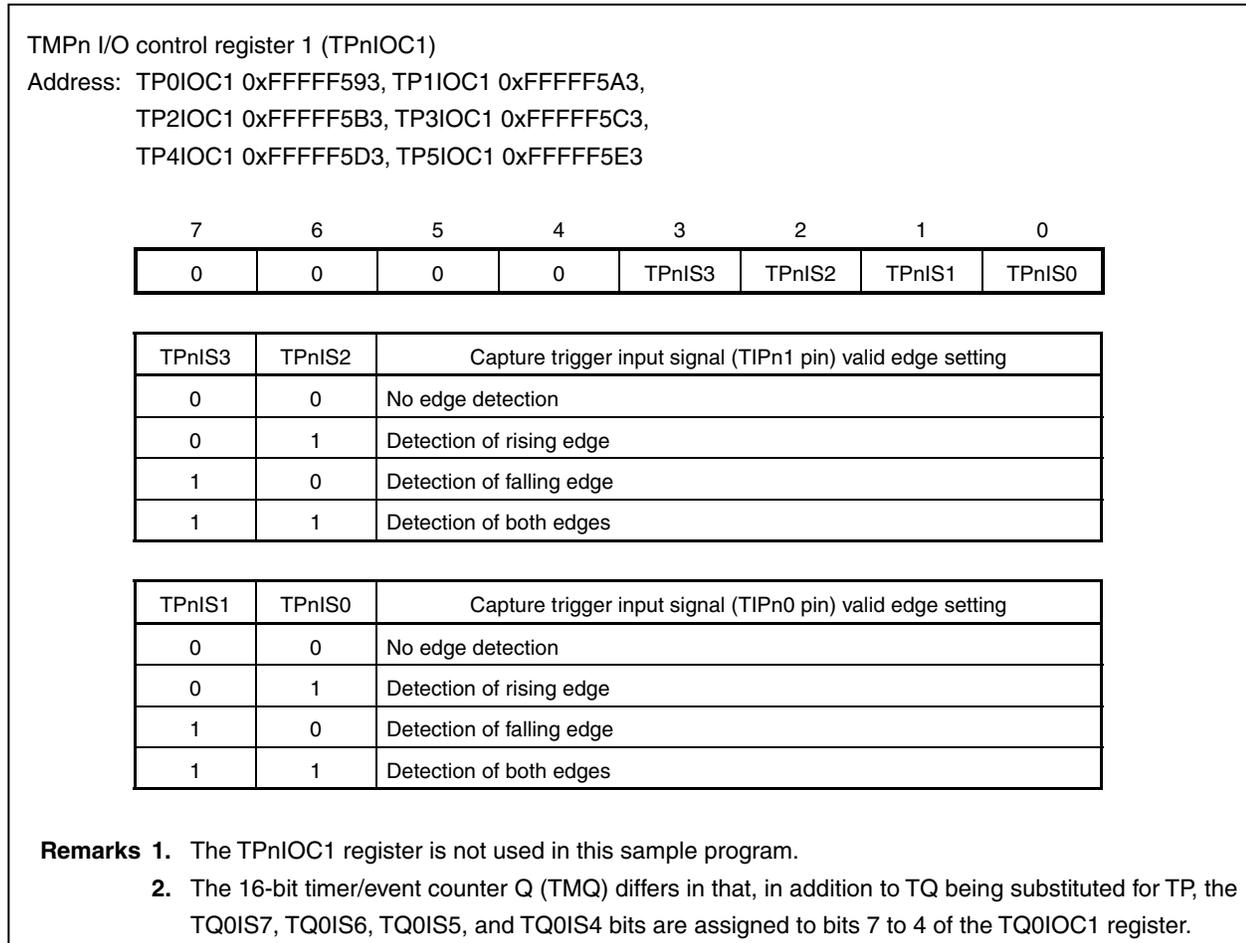

4.1.4 Controlling valid edge of capture trigger input signal

TMPn I/O control register 1 (TPnIOC1) controls the valid edge of the capture trigger input signal (from the TIPn0 and TIPn1 pins).

In the PWM output mode, the TPnIOC1 register does not have to be controlled. Therefore, the register is not controlled in this sample program.

Figure 4-4. TPnIOC1 Register Format

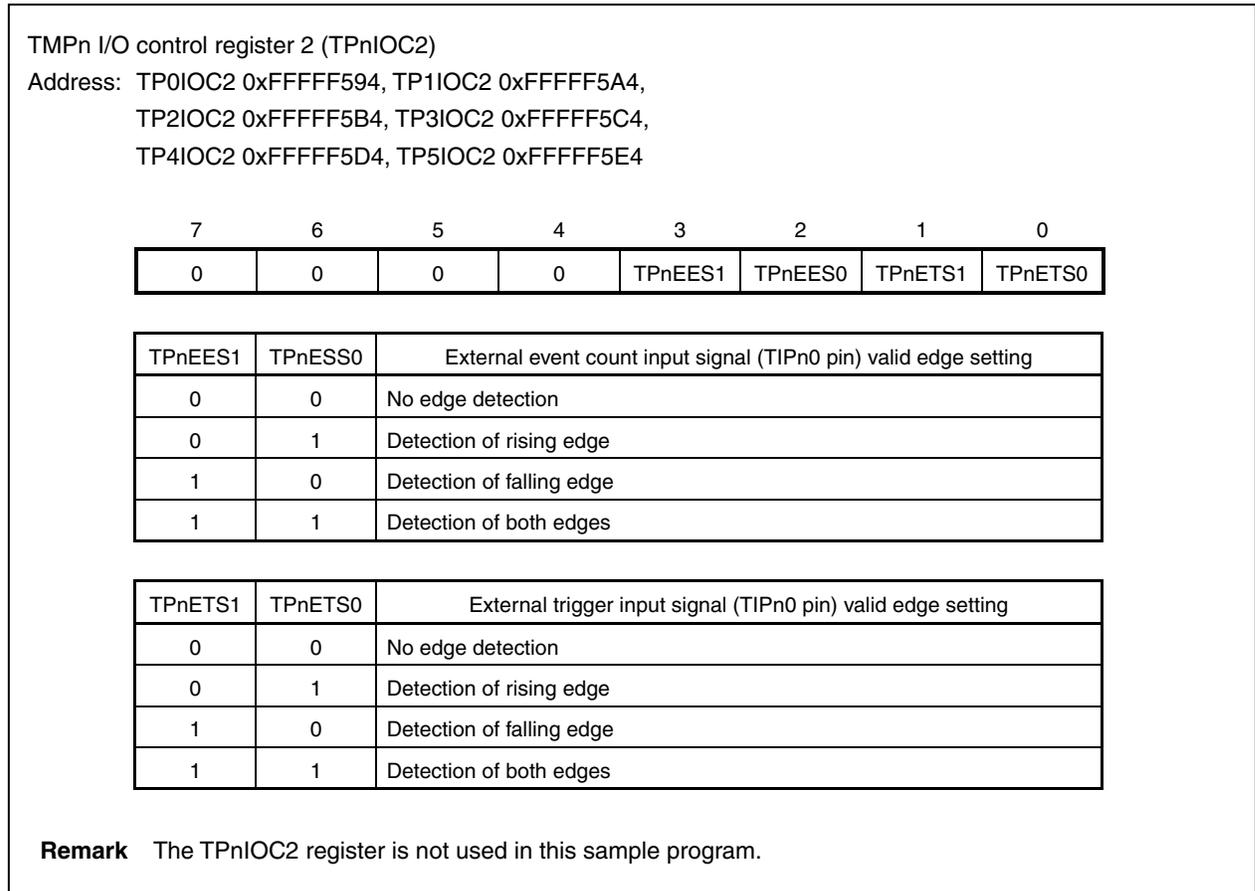

4.1.5 Controlling external input signals

TMPn I/O control register 2 (TPnIOC2) controls the valid edge of the external event count input signal (from the TIPn0 pin) and external trigger input signal (from the TIPn0 pin).

If the internal count clock is selected (TPnCTL1.TPnEEE bit = 0) and the timer runs in the PWM output mode, the TPnIOC2 register does not have to be controlled. Therefore, the register is not controlled in this sample program.

Figure 4-5. TPnIOC2 Register Format

4.1.6 Controlling capture/compare operation

TMPn option register 0 (TPnOPT0) controls the capture/compare operation setting and overflow detection.

In the PWM output mode, the TPnOPT0 register does not have to be controlled. Therefore, the register is not controlled in this sample program.

Figure 4-6. TPnOPT0 Register Format

TMPn option register 0 (TPnOPT0)

Address: TP0OPT0 0xFFFFF595, TP1OPT0 0xFFFFF5A5,
 TP2OPT0 0xFFFFF5B5, TP3OPT0 0xFFFFF5C5,
 TP4OPT0 0xFFFFF5D5, TP5OPT0 0xFFFFF5E5

7	6	5	4	3	2	1	0
0	0	TPnCCS1	TPnCCS0	0	0	0	TPnOVF

TPnCCS1	TPnCCR1 register capture/compare selection
0	Compare register selected
1	Capture register selected

TPnCCS0	TPnCCR0 register capture/compare selection
0	Compare register selected
1	Capture register selected

TPnOVF	TMPn overflow detection flag
Set (1)	Overflow occurred
Reset (0)	TPnOVF bit 0 written or TPnCTL0.TPnCE bit = 0

- Remarks**
1. The TPnOPT0 register is not used in the sample program.
 2. The 16-bit timer/event counter Q (TMQ) differs in that, in addition to TQ being substituted for TP, the TQ0CCS3, TQ0CCS2, TQ0CCS1, and TQ0CCS0 bits are assigned to bits 7 to 4 of the TQ0OPT0 register.

4.1.7 Specifying PWM waveform cycle

Specify the PWM waveform output cycle by using TMPn capture/compare register 0 (TPnCCR0), and specify the active level width by using TMPn capture/compare register 1 (TPnCCR1).

The active level width, cycle, and duty of the PWM waveform are calculated as follows:

- Active level width = (TPnCCR1 register value) / count clock frequency
- Cycle = (TPnCCR0 register value + 1) / count clock frequency
- Duty = (TPnCCR1 register value) / (TPnCCR0 register value + 1)

Remark In this sample program, the undivided fxx is selected as the count clock frequency.

To output the PWM waveform with the 0% duty, set the TPnCCR1 register to 0x0000. To output the PWM waveform with the 100% duty, set the TPnCCR1 register to (TPnCCR0 register value + 1).

The PWM waveform can be changed if the value of the TPnCCRa register (a = 0 or 1) is changed while the timer is running. The new value is applied when the value of the 16-bit counter matches the value of the CCR0 buffer register and the 16-bit counter is cleared to 0x0000.

A compare match interrupt request signal (INTTPnCC0) is generated one cycle after the value of the 16-bit counter matches the value of the CCR0 buffer register. At this time, the 16-bit counter is cleared to 0x0000.

A compare match interrupt request signal (INTTPnCC1) is generated when the value of the 16-bit counter matches the value of the CCR1 buffer register.

In this sample program, the active level width and cycle are specified during initialization, and only the active level width is changed while the timer is running.

- Cautions 1.** To change both the PWM waveform cycle and active level width, first specify a new cycle by using the TPnCCR0 register, and then specify a new active level width by using the TPnCCR1 register.
2. To change only the PWM waveform cycle, first specify a new cycle by using the TPnCCR0 register, and then specify the same value for the TPnCCR1 register.
 3. To change only the active level width (duty) of the PWM waveform, specify a new value by using the TPnCCR1 register.
 4. To write to the TPnCCR1 register and then to the TPnCCR0 or TPnCCR1 register, make sure that the INTTPnCC0 interrupt has been generated. Otherwise, transferring data from the TPnCCRa register to the CCRa buffer register conflicts with writing to the TPnCCRa register, which might result in the value of the CCRa buffer register being undefined. (a = 0 or 1)
 5. If the TPnCCR0 register is set to 0xFFFF, the PWM waveform cannot be output with the 100% duty.

Figure 4-7. TPnCCR0 Register Format

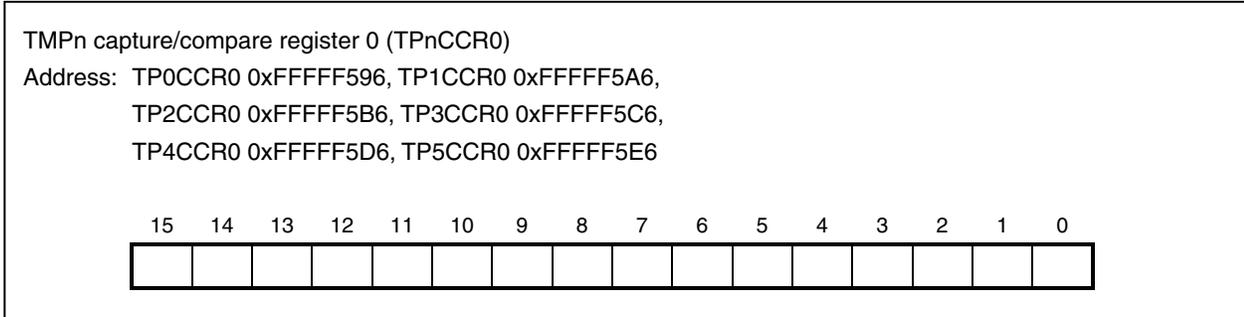

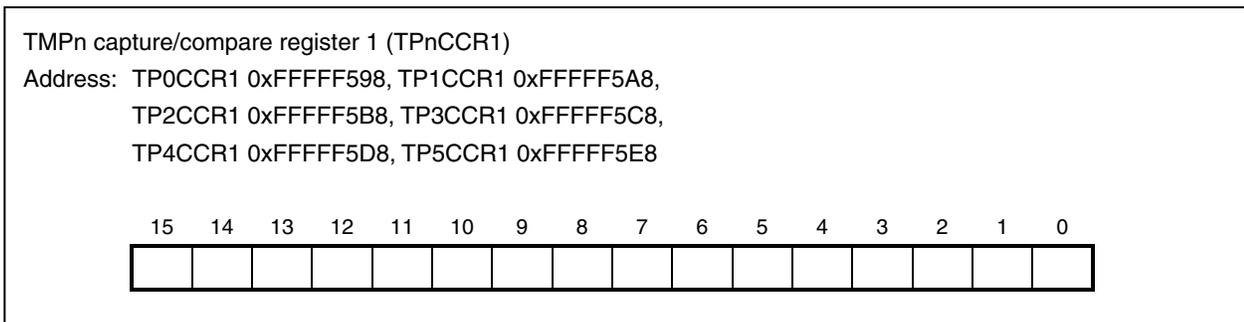

Figure 4-8. TPnCCR1 Register Format

Four capture/compare registers (TQ0CCR0 to TQ0CCR3) are provided for 16-bit timer/event counter Q (TMQ). These registers are used in the same way as the TPnCCR0 and TPnCCR1 registers.

4.1.8 Referencing timer count value

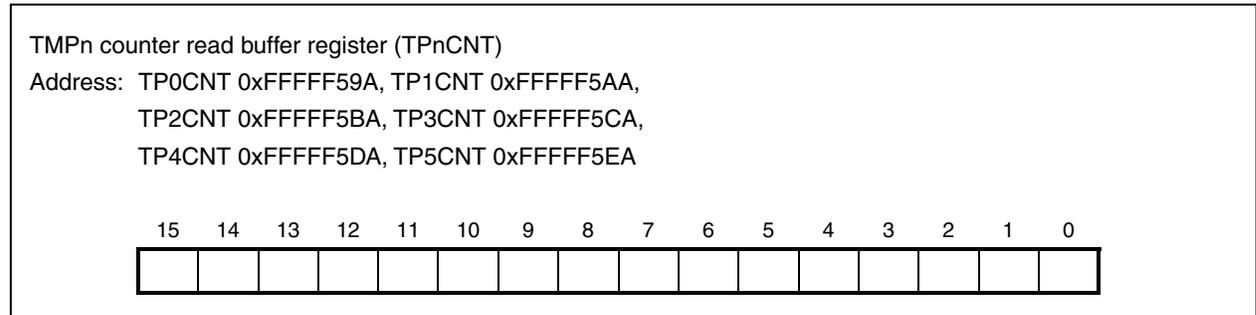

The TPnCNT register is a read buffer register from which a 16-bit counter value can be read.

The current counter value can be read by reading this register while the timer is running (TPnCTL0.TPnCE bit = 1).

If this register is read while the timer is stopped (TPnCTL0.TPnCE bit = 0), 0x0000 is returned.

In the sample program, this register is not used because counter values do not have to be referenced.

Figure 4-9. TPnCNT Register Format

4.1.9 Example of timer settings

[Example 1] When starting the timer with 16-bit timer/event counter P (TMP) set to the external event count mode and the PWM count clock, PWM waveform cycle, and duty specified (same as the sample program)

Setup procedure:

- <1> Specify the undivided fxx (20 MHz) as the count clock frequency.
- <2> Specify the PWM output mode.
- <3> Enable output from the TOP01 pin and specify the active level as high.
- <4> Set the PWM waveform cycle to 2 ms by using capture/compare register 0.
- <5> Set the initial duty of the PWM waveform to 0% by using capture/compare register 1.
- <6> Start the timer.
- <7> Unmask the relevant interrupt.

Program example (same as the sample program)

```

/* Timer P0 settings */
TPOCTL0 = 0x00;          /* Specifies the undivided fxx as the count clock frequency. */ } <1>
                        /* Failsafe: Clears TPOCE to 0 to stop TMP0. */          /* /
TPOCTL1 = 0x04;          /* Specifies the PWM output mode. */ } <2>
TPOIOC0 = 0x04;          /* Specifies the TOP01 pin active level as high. */ }
                        /* Enables TOP01 pin output. */          /* / } <3>
TPOCCR0 = PWM_CYCLE;     /* Sets the PWM cycle to 2 ms. */ } <4>
TPOCCR1 = DUTY_PER_0;    /* Initializes the duty to 0%. */ } <5>
TPOCE = 1;               /* Starts TMP0. */ } <6>
/* Interrupt control register setup */
TPOCCIC0 = 0x07;         /* Sets the priority of INTTP0CC0 to level 7 and unmask it. */ } <7>

```

Specifying the PWM_CYCLE value (40,000 - 1) sets the PWM waveform cycle to 2 ms.

Specifying the DUTY_PER_0 value (0) sets the initial PWM waveform duty to 0%.

[Example 2] When starting the timer with 16-bit timer/event counter Q (TMQ) set to the external event count mode and the PWM count clock, PWM waveform cycle, and duty specified

Setup procedure:

- <1> Specify the undivided f_{xx} (20 MHz) as the count clock frequency.
- <2> Specify the PWM output mode.
- <3> Enable output from the TOQ01 pin and specify the active level as high.
- <4> Set the PWM waveform cycle to 2 ms by using capture/compare register 0.
- <5> Set the initial duty of the PWM waveform to 0% by using capture/compare register 1.
- <6> Start the timer.
- <6> Unmask the relevant interrupt.

Program example (same as the sample program)

```

/* Timer Q0 settings */
TQ0CTL0 = 0x00;          /* Specifies the undivided fxx as the count clock frequency. */ } <1>
                        /* Failsafe: Clears TQ0CE to 0 to stop TMQ0. */          */
TQ0CTL1 = 0x04;          /* Specifies the PWM output mode. */ } <2>
TQ0IOC0 = 0x04;          /* Specifies the TOQ01 pin active level as high. */ } <3>
                        /* Enables TOQ01 pin output. */ }
TQ0CCR0 = PWM_CYCLE;     /* Sets the PWM cycle to 2 ms. */ } <4>
TQ0CCR1 = DUTY_PER_0;    /* Initializes the TOQ01 duty to 0%. */ } <5>
TQ0CE = 1;               /* Starts TMQ0. */ } <6>
/* Interrupt control register setup */
TQ0CCIC0 = 0x07;        /* Sets the priority of INTTP0CC0 to level 7 and unmask it. */ } <7>

```

Specifying the PWM_CYCLE value (40,000 - 1) sets the PWM waveform cycle to 2 ms.

Specifying the DUTY_PER_0 value (0) sets the initial PWM waveform duty to 0%.

4.2 LED1 On/Off Cycle, Cycle of PWM Output to LED2 and Its Duty

In this sample program, the INTTP0CC0 interrupt generated by the 16-bit timer/event counter (TMP0) is used to count the number of INTTP0CC0 interrupts used to generate the timing to change the duty of PWM output to LED2.

LED1 turns on or off when the duty is changed.

- INTTP0CC0 generation timing = (TP0CCR0 register value + 1) / count clock frequency
- LED1 on/off timing = INTTP0CC0 generation × 250 times
- Cycle of output (signal) to LED1 = LED1 on/off × twice
- Cycle of PWM output to LED2 = TP0CCR0 register value + 1
- Duty of PWM output to LED2 = (TP0CCR1 register value) / (TP0CCR0 register value + 1)

Remark In this sample program, the undivided f_{xx} is selected as the count clock frequency.

Example When the count clock frequency for the 16-bit timer/event counter (TMP0) is the undivided f_{xx} (20 MHz), the TP0CCR0 register is set to 39,999, the duty of PWM output to LED2 is changed first to 25% and then to 50% 500 ms later, and LED1 turns on or off each time there is a change

- INTTP0CC0 generation timing = $(39,999 + 1) / 20 \text{ MHz} = 2 \text{ ms}$
- LED1 on/off timing = $2 \text{ ms} \times 250 = 500 \text{ ms}$
- Cycle of output (signal) to LED1 = $500 \text{ ms} \times 2 = 1 \text{ s}$
- Cycle of PWM output to LED2 = $(39,999 + 1) = 40000$
- Duty of PWM output to LED2 = $(20,000) / (39,999 + 1) = 50\%$

Figure 4-10. PWM Output Timing Example (When PWM Cycle Is 2 ms and Duty Is 50%)

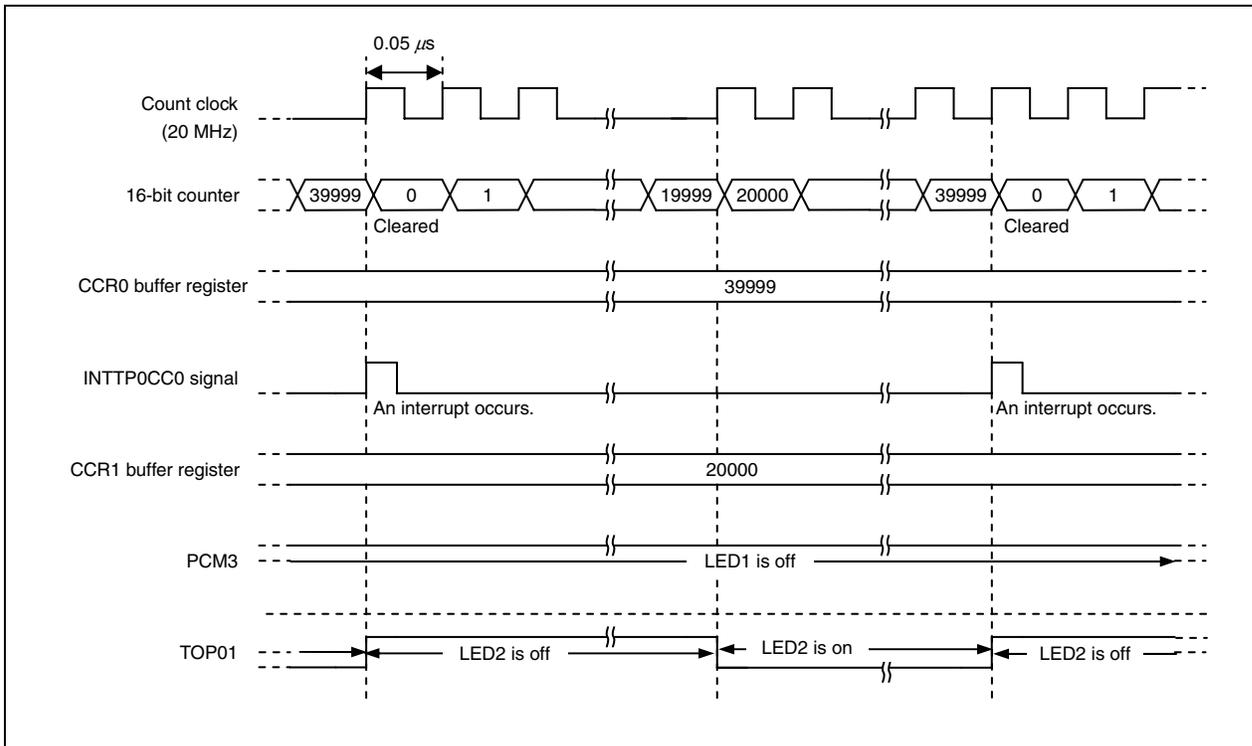

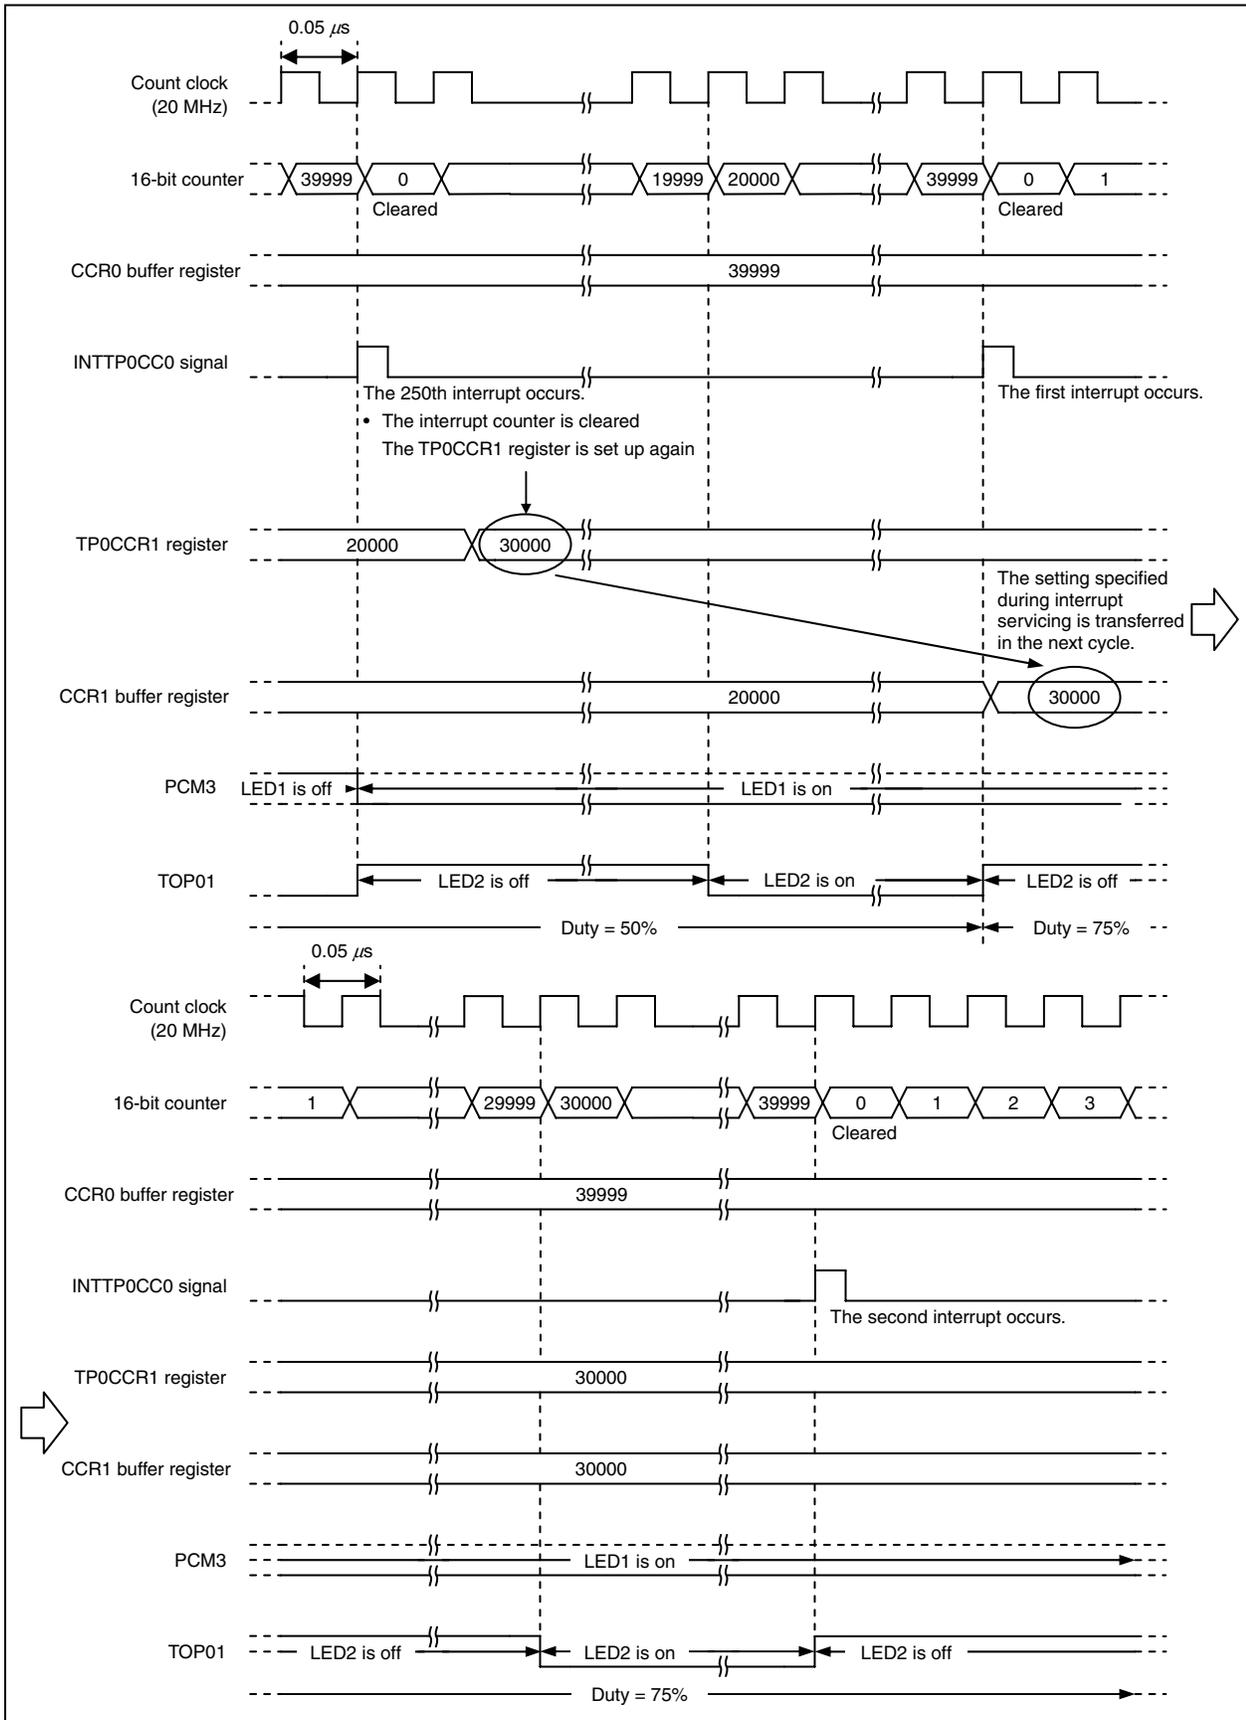

Figure 4-11. PWM Output Timing Example
 (When PWM Cycle Is 2 ms and Duty Is Changed from 50% to 75%)

/*   NEC Electronics   V850ES/Jx3-L microcontroller
/*
/*-----*/
/*   V850ES/JG3-L sample program
/*-----*/
/*   PWM output mode
/*-----*/
/*[History]
/*   2009.6.--   Released
/*-----*/
/*[Overview]
/*   This sample program shows an example of using the PWM output mode
/*   of the 16-bit timer/event counter (TMP0).
/*
/*   Timer P0 (TMP0) is set to PWM output mode to control the LED2 brightness.
/*   The duty is changed every 500 ms to change the LED2 brightness.
/*   LED1 turns on or off when the duty is changed.
/*
/*   Peripherals that stop immediately after a reset and are not used in the sample
/*   program are not specified.
/*
/*
/*   <Main settings>
/*   • Using pragma directives to enable setting up the interrupt handler and specifying
/*     peripheral I/O register names
/*   • Defining the adjustment value to set the timer P0 PWM output interval to 2 ms
/*   • Declaring prototypes
/*   • Setting up a bus wait for on-chip peripheral I/O registers, stopping watchdog timer 2,
/*     and setting up the clock
/*   • Initializing unused ports
/*   • Initializing the TOP01 port and PCM3 port
/*   • Initializing the timer P0 (TMP0)
/*
/*   <Timer P0 settings>
/*   Setting the count clock to fxx (20 MHz) by using the TP0CTL0 register
/*   Setting the operation mode to the PWM output mode by using the TP0CTL1 register
/*   Enabling TOP01 pin output and specifying the active level as high by using
/*   the TP0IOC0 register
/*   Setting the PWM output cycle by using the TP0CCR0 register
/*   Setting the PWM output active period width by using the TP1CCR0 register
/*   Enabling TMP0
/*   Setting the priority of INTTP0CC0 interrupt to level 7 and unmasking it
/*
```

```

/* <Timer P0 interrupt (INTTP0CC0) servicing>

/* LED1 turns on or off when the duty is changed every 500 ms in the following order:
/* +-----+-----+
/* | PWM output duty | 0% | 25% | 50% | 75% | 100% | (Hereafter, repeated from 0%)
/* +-----+-----+
/* | LED2 brightness | 100% | 75% | 50% | 25% | 0% |
/* +-----+-----+
/* # PWM output is high active and LED2 is low active; therefore,
/* LED2 brightness = 100 - duty factor.
/*
/*[I/O port settings]

/* Input: -
/* Output: P33 (TOP01), PCM3
/* Unused ports: P02-P06, P10, P11, P30-P32, P34-P39, P50-P55, P70-P711, P90-P915,

    /* Timer P0 settings */
    TP0CTL0 = 0x00; /* Sets the count clock to fxx. */
    /* Failsafe: Clears TP0CE to 0 and stops TMP0. */
    TP0CTL1 = 0x04; /* Specifies the PWM output mode */
    TP0IOC0 = 0x04; /* Specifies the active level of the TOP01 pin as high */
    /* Enables the output from the TOP01 pin */
    TP0CCR0 = PWM_CYCLE; /* Sets the PWM cycle to 2 ms */
    TP0CCR1 = DUTY_PER_0; /* Sets the initial duty to 0% */
    TP0CE = 1; /* Starts TMP0. */

    /* Caution 1: The registers below are not set up in the PWM output mode: */
    /* <Registers that are not set up> */
    /* - TP0IOC1 register */
    /* - TP0OPT0 register */
    /* - TP0CNT register */
    /* Caution 2: The registers below are not set up if the internal count clock is used */
    /* in the PWM output mode: */
    /* <Registers that are not set up> */
    /* - TP0IOC2 register

    /* Interrupt settings */
    TP0CCIC0 = 0x07; /* Sets the priority of INTTP0CC0 to level 7 and unmask it. */
}

```

For the V850ES/JF3-L, the setting is 0xFC.

For the V850ES/JF3-L, PDH0 and PDH1 are set.

When using TMQ, specify values for the TQ0xxx registers.

TP0CTL0
TP0CTL1
TP0IOC0
TP0CCR0
TP0CCR1
TP0CE

When using TMQ, specify a value for the TQ0CCIC0 register.

```

/*****
/*   Interrupt module   */
/*****
__interrupt
void f_int_inttp0cc0( void )
{

/* Overview                                                    */
/* A timer interrupt that occurs every 2 ms is used to count up to 500 ms.*/
/* LED1 turns on or off 500 ms after changing the duty.        */

usTMP0cnt++;          /* Increments the 500 ms counter.          */

if ( usTMP0cnt >= PWM_INT_CNT ) /* Processing where INTTP0CC0 occurs 250 times */
{
usTMP0cnt = 0;        /* Initializes the 500 ms counter.          */

PCM.3 ^= 1;          /* Turns LED1 on or off.                    */

if ( TP0CCR1 >= DUTY_PER_100 ) /* Processing if the duty is 100% or more */
{
TP0CCR1 = DUTY_PER_0;      /* Initializes the duty to 0%.              */
}
else
{
TP0CCR1 += DUTY_PER_25;    /* Increases the duty by 25%.                */
}
}

return;
}

```

When using TMQ, specify values for the TQ0CCR1 register.
