Descriptor

A template for PCDC descriptors can be found in `ra/fsp/src/r_usb_pcdc/r_usb_pcdc_descriptor.c.template`. Also, please be sure to use your vendor ID.

5.2.6.34 USB PHID (r_usb_phid)

Modules » [Connectivity](#)

This module is USB Peripheral Human Interface Device Class Driver (PHID). It implements the [USB PHID Interface](#).

Functions

Refer to [USB \(r_usb_basic\)](#) for the common API (`r_usb_basic`) to be called from the application.

Detailed Description

Overview

The `r_usb_phid` module combines with the `r_usb_basic` module to provide a USB Peripheral Human Interface Device Class (PHID) driver. The PHID driver conforms to the USB Human Interface Device class specifications and implements communication with a HID host.

Features

The `r_usb_phid` module has the following functions:

- Data transfer to and from a USB host
- Response to HID class requests
- Response to function references from the HID host

Note

This driver is not guaranteed to provide USB HID operation in all scenarios. The developer must verify correct operation when connected to the targeted USB hosts.

Configuration

Build Time Configurations for r_usb_phid

The following build time configurations are defined in `fsp_cfg/r_usb_phid_cfg.h`:

| Configuration | Options | Default | Description |
|--------------------|--|-----------|---|
| Interrupt In Pipe | <ul style="list-style-type: none"> • USB PIPE6 • USB PIPE7 • USB PIPE8 • USB PIPE9 | USB PIPE6 | Select the pipe number for input interrupt events. |
| Interrupt Out Pipe | <ul style="list-style-type: none"> • USB PIPE6 • USB PIPE7 • USB PIPE8 • USB PIPE9 | USB PIPE7 | Select the pipe number for output interrupt events. |

Configurations for Connectivity > USB PHID (r_usb_phid)

This module can be added to the Stacks tab via New Stack > Connectivity > USB PHID (r_usb_phid).

| Configuration | Options | Default | Description |
|---------------|-------------------------------|---------|--------------|
| Name | Name must be a valid C symbol | g_phid0 | Module name. |

Clock Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Pin Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Usage Notes

Class Requests (Host to Peripheral)

This driver notifies the application when receiving the following class requests:

| Request | Code | Description |
|----------------|------|--|
| Get_Report | 0x01 | Receives a report from the HID host |
| Set_Report | 0x09 | Sends a report to the HID host |
| Get_Idle | 0x02 | Receives a duration (time) from the HID host |
| Set_Idle | 0x0A | Sends a duration (time) to the HID host |
| Get_Protocol | 0x03 | Reads a protocol from the HID host |
| Set_Protocol | 0x0B | Sends a protocol to the HID host |
| Get_Descriptor | 0x06 | Transmits a report or HID descriptor |

The data format of supported class requests is described below:

| bmRequestType | bRequest | wValue | wIndex | wLength | Data |
|---------------|---------------------|------------------------|-----------|--------------|------------------------|
| 0xA1 | GET_REPORT (0x01) | ReportType & ReportID | Interface | ReportLength | Report |
| 0x21 | SET_REPORT (0x09) | ReportType & ReportID | Interface | ReportLength | Report |
| 0xA1 | GET_IDLE (0x02) | 0 & ReportID | Interface | 1 | Idle rate |
| 0x21 | SET_IDLE (0x0A) | Duration & ReportID | Interface | 0 | Idle rate |
| 0xA1 | GET_PROTOCOL (0x03) | 0 | Interface | 0 | 0 (Boot) or 1 (Report) |
| 0x21 | SET_PROTOCOL (0x0B) | 0 (Boot) or 1 (Report) | Interface | 0 | Not applicable |

Limitations

- This driver does not support USB Hi-speed mode.
- This driver does not support USB Low-speed mode.
- This driver does not support DMA transfers.
- This driver does not support simultaneous operation with USB Host device class.

Examples

Descriptors

A template for PHID descriptors can be found in `ra/fsp/src/r_usb_phid`. Be sure to replace the vendor ID with your own.

Keyboard templates should be referred to `r_usb_phid_descriptor_keyboard.c.template`.

Mouse templates should be referred to `r_usb_phid_descriptor_mouse.c.template`.

5.2.6.35 USB PMSC (r_usb_pmsc)

[Modules](#) » [Connectivity](#)

This module provides a USB Peripheral Mass Storage Class (PMSC) driver. It implements the [USB PMSC Interface](#).

Functions

Refer to [USB \(r_usb_basic\)](#) for the common API (`r_usb_basic`) to be called from the application.

Detailed Description

Overview

The `r_usb_pmsc` module combines with the `r_usb_basic` module to provide USB Peripheral It operates as a Mass Storage class driver (hereinafter referred to as PMSC).

The USB peripheral mass storage class driver (PMSC) comprises a USB mass storage class bulk-only transport (BOT) protocol.

When combined with a USB peripheral control driver and media driver, it enables communication with a USB host as a BOT-compatible storage device.

Features

The `r_usb_pmsc` module has the following key features:

- Storage command control using the BOT protocol
- Supports only SFF-8070i (ATAPI) Interface Sub-Class
- Response to mass storage device class requests from a USB host

Configuration

Build Time Configurations for r_usb_pmsc

The following build time configurations are defined in fsp_cfg/r_usb_pmsc_cfg.h:

| Configuration | Options | Default | Description |
|----------------------------|---|--------------|--|
| Bulk Input Transfer Pipe | <ul style="list-style-type: none"> • USB PIPE1 • USB PIPE2 • USB PIPE3 • USB PIPE4 • USB PIPE5 | USB PIPE4 | Select the USB pipe to use for bulk input transfers. |
| Bulk Output Transfer Pipe | <ul style="list-style-type: none"> • USB PIPE1 • USB PIPE2 • USB PIPE3 • USB PIPE4 • USB PIPE5 | USB PIPE5 | Select the USB pipe to use for bulk output transfers. |
| Vendor Information | Vendor Information must be 8 bytes long; pad with spaces if shorter. | Vendor | Specify the vendor information field (part of the Inquiry command response). |
| Product Information | Product Information must be 16 bytes long; pad with spaces if shorter. | Mass Storage | Specify the product information field (part of the Inquiry command response). |
| Product Revision Level | Product Revision Level must be 4 bytes long; pad with spaces if shorter. | 1.00 | Specify the product revision level field (part of the Inquiry command response). |
| Sector size | <ul style="list-style-type: none"> • 512 • 4096 | 512 | Specifies the sector size. |
| Number of Transfer Sectors | Please enter a number between 1 and 255. | 8 | Specify the maximum sector size to request with one data transfer. |

Configurations for Connectivity > USB PMSC (r_usb_pmsc)

This module can be added to the Stacks tab via New Stack > Connectivity > USB PMSC (r_usb_pmsc).

| Configuration | Options | Default | Description |
|---------------|-------------------------------|---------|--------------|
| Name | Name must be a valid C symbol | g_pmsc0 | Module name. |

Refer to the [USB \(r_usb_basic\)](#) module for hardware configuration options.

Clock Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Pin Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Usage Notes

Class Requests

The class requests supported by this driver are shown below.

| Request | Code | Description |
|------------------------------|------|---|
| Bulk-Only Mass Storage Reset | 0xFF | Resets the connection interface to the mass storage device. |
| Get Max Logical Unit Number | 0xFE | Reports the logical numbers supported by the device. |

Storage Commands

This driver supports the following storage commands.

| Command | Code | Description |
|----------------------|------|--|
| TEST_UNIT_READY | 0x00 | Checks the state of the peripheral device. |
| REQUEST_SENSE | 0x03 | Gets the error information of the previous storage command execution result. |
| INQUIRY | 0x12 | Gets the parameter information of the logical unit. |
| READ_FORMAT_CAPACITY | 0x23 | Gets the formattable capacity. |
| READ_CAPACITY | 0x25 | Gets the capacity information of the logical unit. |
| READ10 | 0x28 | Reads data. |
| WRITE10 | 0x1A | Writes data. |
| MODE_SENSE10 | 0x5A | Gets the parameters of the logical unit. |

Note

A STALL or FAIL error is sent to the host upon receipt of any command not listed in the above table.

BOT Protocol Overview

BOT (USB MSC Bulk-Only Transport) is a transfer protocol that encapsulates command, data, and status (results of commands) using only two endpoints (one bulk in and one bulk out). The ATAPI storage commands and the response status are embedded in a Command Block Wrapper (CBW) and a Command Status Wrapper (CSW). The below image shows an overview of how the BOT protocol progresses with command and status data flowing between USB host and peripheral.

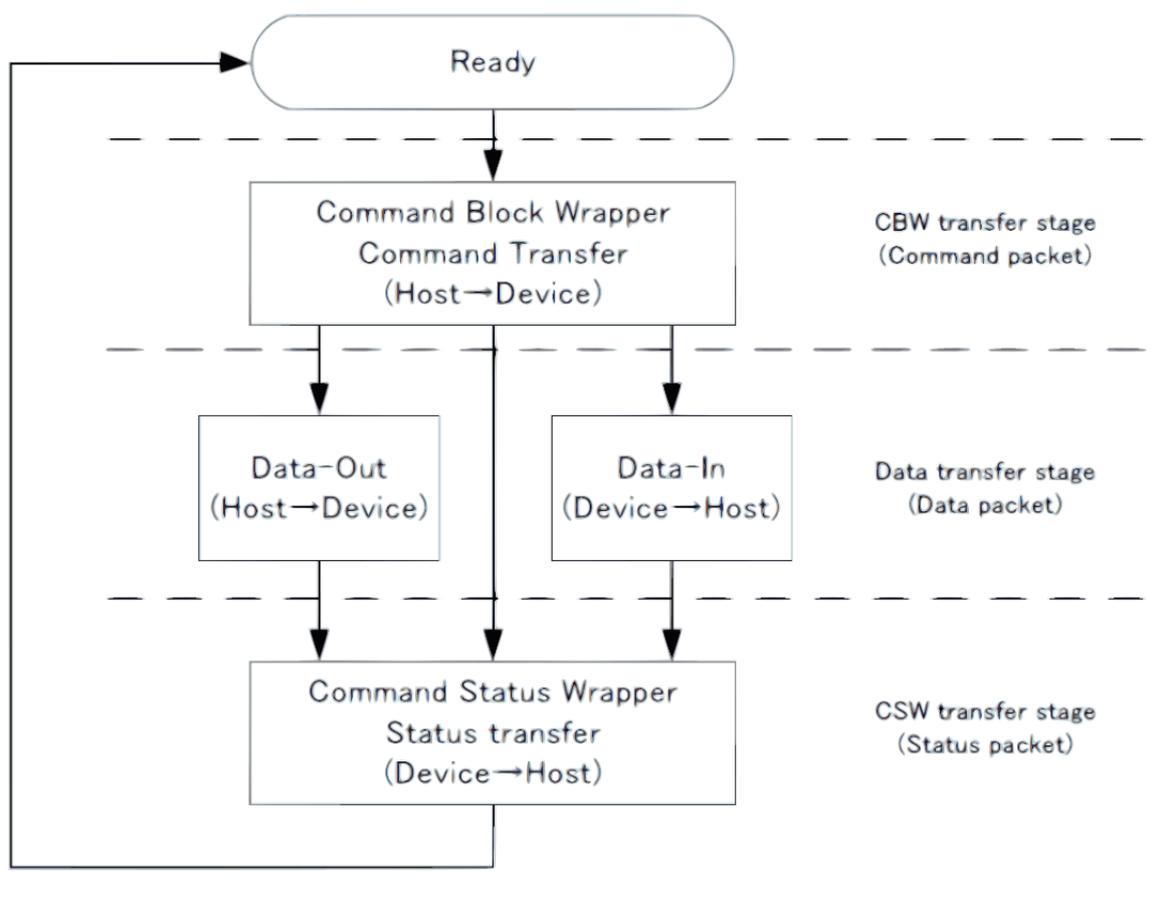

Figure 218: BOT protocol Overview

Block Media Interface

PMSC implements a block media interface to enable access to higher-level modules. If the block media interface supports multiple media, users can select any media to access.

Note

When the user develops the storage media driver, be sure to define the instance named "g_rm_block_media0".

Limitations

1. The driver always returns 0 in response to the GetMaxLun command.
2. The driver supports a sector size of 512 bytes only.
3. The only media currently supported by the block media interface is an SD card. The card must be inserted before initializing the driver.
4. When using DMA for Hi-Speed transfers continuous transfer mode must not be used in the USB Basic driver.
5. The storage area must be formatted before use.
6. When using the SD/MMC Block Media Implementation (rm_block_media_sdmmc), "Card Detection" must be set to "Not Used" in the SD/MMC Host Interface (r_sdhi) settings.
7. The driver does not support Low-speed.
8. This driver does not support simultaneous operation with USB Host device class.

Examples

USB PMSC Example

In this example, when the evaluation board is connected to the host PC it is recognized as a removable disk and reading/writing files is possible. The FAT type is either FAT12, FAT16, or FAT32 depending on the size of the media used.

5.2.6.36 USB PPRN (r_usb_pprn)

Modules » [Connectivity](#)

This module is USB Peripheral Printer Device Class Driver (PPRN). It implements the [USB PPRN Interface](#).

Functions

Refer to [USB \(r_usb_basic\)](#) for the common API (`r_usb_basic`) to be called from the application.

Detailed Description

Overview

The `r_usb_pprn` module combines with the `r_usb_basic` module to provide a USB Peripheral Printer Device Class (PPRN) driver. The PPRN driver conforms to the USB Printer Device class specifications and implements communication with a printer host.

Features

The `r_usb_pprn` module has the following functions:

- Data transfer to and from a USB host
- Response to the printer class requests
- Response to function references from the printer host

Note

This driver is not guaranteed to provide USB printer operation in all scenarios. The developer must verify correct operation when connected to the targeted USB hosts.

Configuration

Build Time Configurations for r_usb_pprn

The following build time configurations are defined in fsp_cfg/r_usb_pprn_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---|-----------|---|
| Bulk In Pipe | <ul style="list-style-type: none"> USB PIPE1 USB PIPE2 USB PIPE3 USB PIPE4 USB PIPE5 | USB PIPE4 | Select the USB pipe to use for bulk in transfer. |
| Bulk Out Pipe | <ul style="list-style-type: none"> USB PIPE1 USB PIPE2 USB PIPE3 USB PIPE4 USB PIPE5 | USB PIPE5 | Select the USB pipe to use for bulk out transfer. |

Configurations for Connectivity > USB PPRN (r_usb_pprn)

This module can be added to the Stacks tab via New Stack > Connectivity > USB PPRN (r_usb_pprn).

| Configuration | Options | Default | Description |
|---------------|-------------------------------|---------|--------------|
| Name | Name must be a valid C symbol | g_pprn0 | Module name. |

Clock Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Pin Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Usage Notes

Class Requests (Host to Peripheral)

This driver notifies the application when receiving the following class requests:

| Request | Code | Description |
|-----------------|------|---|
| GET_DEVICE_ID | 0x00 | Get IEEE 1284 Device ID String |
| GET_PORT_STATUS | 0x01 | Get Printer's Status |
| SOFT_RESET | 0x02 | Flushes all buffers and resets the Bulk OUT and Bulk IN pipes |

The data format of supported class requests is described below:

| bmRequestType | bRequest | wValue | wIndex | wLength | Data |
|---------------|------------------------|--------------|-----------------------------|----------------|-----------------------|
| 0xA1 | GET_DEVICE_ID (0x00) | Config Index | Interface Alternate Setting | Maximum Length | 1284 Device ID String |
| 0xA1 | GET_PORT_STATUS (0x01) | 0 | Interface | 1 | Printer Status |
| 0x21 | SOFT_RESET (0x02) | 0 | Interface | 0 | None |

Limitations

- This driver does not support USB Low-speed mode.
- This driver does not support simultaneous operation with USB Host device class.

USB PPRN Example

This is a minimal example for implementing PPRN in bare metal and FreeRTOS application.

5.2.6.37 USB Peripheral Vendor class (r_usb_pvnd)

Modules » [Connectivity](#)

Functions

Refer to [USB \(r_usb_basic\)](#) for the common API (r_usb_basic) to be called from the application.

Overview

USB Peripheral Vendor class works by combining r_usb_basic module.

How to Configuration

The following shows FSP configuration procedure for USB Peripheral Vendor class.

- Select [New Stack]->[Middleware]->[USB]->[USB Peripheral Vendor class driver on r_usb_pvnd].

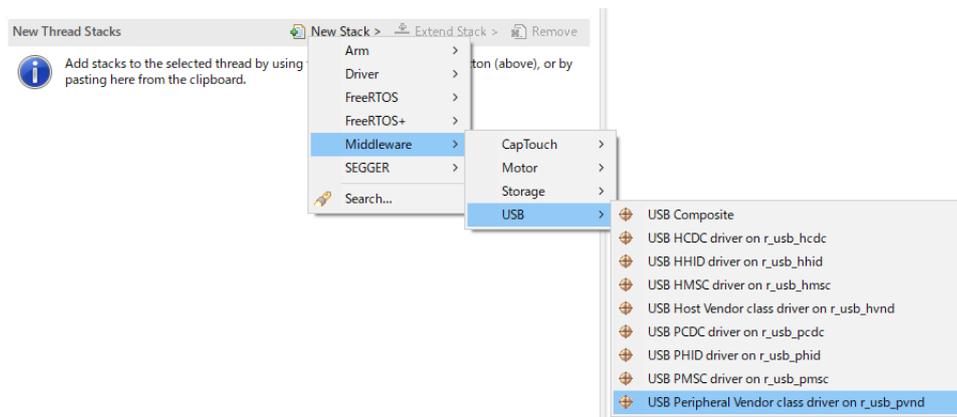

Figure 220: Select USB Peripheral Vendor Class

- The following is displayed when selecting [USB Peripheral Vendor class driver on r_usb_pvnd]. The user does not specify USB pipe number in Vendor class.

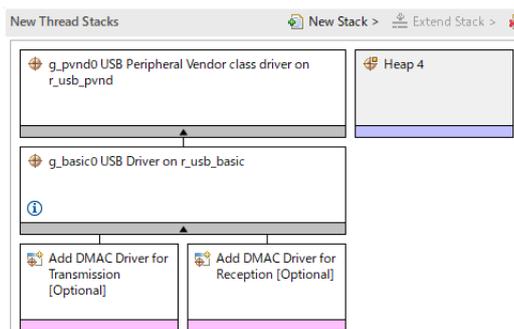

Figure 221: USB Peripheral Vendor Class Stack

API

Use the following APIs in Peripheral Vendor class application program.

- For Data Transfer
Use the following APIs for data transfer for Bulk transfer or Interrupt transfer.
 1. R_USB_PipeRead()
 2. R_USB_PipeWrite()
 3. R_USB_PipeStop()
- For Control Transfer
Use the following API for the class request processing.
 1. R_USB_PeriControlDataGet()
 2. R_USB_PeriControlDataSet()
 3. R_USB_PeriControlStatusSet()

- For USB Pipe Information
The USB driver allocates USB PIPE by analyzing the descriptor of USB device in Vendor class. Use the following APIs to get the allocated USB pipe information.

1. R_USB_UsedPipesGet()
2. R_USB_PipeInfoGet()

USB PIPE Allocation

The USB driver allocates USB PIPE by analyzing the descriptor of USB device in Vendor class. The USB PIPE related to the Endpoint Descriptor are allocated in order from USB PIPE1 according to the description order of the Endpoint Descriptor.

FSP driver pipe configuration behaviors for the PVND Class, when it is used with the Composite PCDC+PVND Class is mentioned below.

- In Composite PCDC+PVND class, PCDC class interface is placed next to the PVND class interface in descriptor file. PVND Class Pipe configurations are as follows.
 - FSP driver(PVND) allocates Pipes in order from USB PIPE1 according to the order of the endpoint in descriptor(Bulk transfer).
 - FSP driver(PVND) allocates Pipes in order(decremental order) from USB PIPE9 according to the order of the endpoint in descriptor(Interrupt transfer).
 - PCDC and PVND must always use different USB PIPEs.

For example:

- In the Composite PCDC+PVND class, if there are 3 number of bulk transfers endpoints and one Interrupt transfer endpoint in descriptor file for PVND class and for this configuration FSP driver configures USB PIPE1, USB PIPE2 and USB PIPE3 for bulk data transfer and USB PIPE9 for Interrupt data transfer.
- Since hardware support total 5 number of Bulk transfer pipe configuration. So, in this scenario, for the PCDC class we have configurable USB PCDC Stack property to select available Pipes(USB PIPE 4 and USB PIPE 5 for Bulk and USB PIPE 6 for Interrupt transfer) from USB PCDC Stack configurator.

Descriptor

Template for Vendor class descriptor can be found in ra/fsp/src/r_usb_pvnd folder. Also, please be sure to use your vendor ID.

Examples

This application program processes the following after the enumeration completes with USB device.

1. Getting USB Pipe Information
2. Vendor Class Request Processing
3. Loopback processing of bulk transfer and interrupt transfer.

5.2.7 DSP

Modules

Detailed Description

DSP Modules.

Modules

[CMSIS DSP H/W Acceleration \(rm_cmsis_dsp\)](#)

Middleware to implement Arm CMSIS DSP by using 32-bit Multiply-Accumulator (MACL).

[IIR Filter Accelerator \(r_iirfa\)](#)

Driver for the IIRFA peripheral on RA MCUs. This module implements the [IIR Interface](#).

5.2.7.1 CMSIS DSP H/W Acceleration (rm_cmsis_dsp)

Modules » [DSP](#)

Middleware to implement Arm CMSIS DSP by using 32-bit Multiply-Accumulator (MACL).

Overview

The 32-bit Multiply-Accumulator (MACL) provides hardware acceleration for calculation of CMSIS DSP functions. After initializing this module, refer to the Arm documentation to use the file system: <https://www.keil.com/pack/doc/CMSIS/DSP/html/index.html>

Features

The MACL module supports the following features:

| No | MACL API | Feature |
|----|----------------------------|---|
| 1 | arm_mult_q31 | Q31 vector multiplication |
| 2 | arm_scale_q31 | Multiplies a Q31 vector by a scalar |
| 3 | arm_mat_mult_q31 | Q31 matrix multiplication |
| 4 | arm_mat_vec_mult_q31 | Q31 matrix and vector multiplication |
| 5 | arm_mat_scale_q31 | Q31 matrix scaling |
| 6 | arm_biquad_cascade_df1_q31 | Processing function for the Q31 Biquad cascade filter |
| 7 | arm_conv_partial_q31 | Partial convolution of Q31 sequences |
| 8 | arm_conv_q31 | Convolution of Q31 sequences |
| 9 | arm_correlate_q31 | Correlation of Q31 sequences |
| 10 | arm_fir_decimate_q31 | Processing function for the Q31 FIR decimator |
| 11 | arm_fir_interpolate_q31 | Processing function for the Q31 FIR interpolator |
| 12 | arm_fir_q31 | Processing function for Q31 FIR filter |
| 13 | arm_fir_sparse_q31 | Processing function for the Q31 sparse FIR filter |
| 14 | arm_lms_norm_q31 | Processing function for Q31 normalized LMS filter |
| 15 | arm_lms_q31 | Processing function for Q31 LMS filter |

Note

The MACL hardware acceleration when executing 5 APIs including arm_scale_q31, arm_mat_scale_q31, arm_correlate_q31, arm_fir_q31, and arm_lms_q31 with 1-element input on IAR compiler will not be better than ARM CMSIS software. The MACL hardware is useful when executing with larger amounts of input.

Configuration

CMSIS DSP Acceleration Configuration

To enable hardware acceleration for Arm CMSIS DSP, the stack "Arm CMSIS5 DSP Acceleration" of CMSIS DSP must be filled with MACL (rm_cmsis_dsp). Otherwise the CMSIS DSP functions will perform the calculation by using software. This can be done at the Stack Configuration.

Usage Notes

Hardware Support

MACL module is required for using this middleware. Refer to the MCU hardware user's manual or datasheet to determine if it has MACL support.

Examples

Basic Example

About examples, how to use the CMSIS DSP APIs refer to the link: <https://github.com/ARM-software/CMSIS-DSP/tree/main/Examples/ARM>.

fsp_err_t R_IIRFA_Close (iir_ctrl_t *const p_api_ctrl)

__STATIC_INLINE float R_IIRFA_SingleFilter (iir_ctrl_t *const p_api_ctrl, float data_in)

Detailed Description

Driver for the IIRFA peripheral on RA MCUs. This module implements the [IIR Interface](#).

Overview

The IIR Filter Accelerator (IIRFA) provides hardware acceleration for calculation of single-precision

floating point direct form 2 biquad IIR filters. Up to 32 biquad stages can be configured at a time.

Features

The IIRFA module supports the following features:

- Up to 16 different concurrent configurations/channels
- 32 biquad filter stages (shared between all channels)
- Runtime filter configuration
- ECC error detection for coefficient and delay data
 - 1-bit error correction, 2-bit error detection

Configuration

Build Time Configurations for r_iirfa

The following build time configurations are defined in fsp_cfg/r_iirfa_cfg.h:

| Configuration | Options | Default | Description |
|----------------------------|---|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Polling Mode | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | When enabled the IIRFA driver will poll for completion before reading the output register. This prevents IIRFA operations from delaying global interrupt processing at the cost of slower filter performance. |
| Software Loop Unroll Depth | Refer to the RA Configuration tool for available options. | 1 Sample | Select the number of samples to process for every loop. This setting generally only affects filters that use 1 biquad stage. |
| ECC Support | <ul style="list-style-type: none"> • Disabled • Enabled • Enabled (no writeback) | Enabled | Select whether to detect ECC errors. When set to 'Enabled (no writeback)' 1-bit ECC errors will not be corrected. |
| Rounding Mode | <ul style="list-style-type: none"> • Nearest • Toward zero | Nearest | Select how to round calculation results. |

Configurations for DSP > IIR Filter Accelerator (r_iirfa)

This module can be added to the Stacks tab via New Stack > DSP > IIR Filter Accelerator (r_iirfa). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---------------|---|----------|---------------------------|
| Name | Name must be a valid C symbol | g_iirfa0 | Module name. |
| Channel | Value must be an integer between 0 and 15 | 0 | Select the IIRFA channel. |

Clock Configuration

The clock source for the IIRFA peripheral is ICLK.

Pin Configuration

IIRFA does not have any pin connections.

Filter Configuration

Before using IIRFA to filter data the coefficients and state variables must be initialized. See the [Filter Configuration](#) example for how to initialize an `iir_filter_cfg_t` struct to pass to `R_IIRFA_Configure`.

Note

There are 32 total biquad stages in the peripheral shared across all channels. Channels may not select the same stages, so it is important to choose `iir_filter_cfg_t::stage_base` and `iir_filter_cfg_t::stage_num` carefully to ensure no overlap.

Usage Notes

Maximizing Performance

The optimum configuration for IIRFA is dependent on the application. It is recommended to consider the following in regards to your project to determine what settings may be ideal.

Regardless of configuration, each filter stage takes 2 ICLK cycles to process per sample and an additional 5 cycles to write state values back to registers. This means single-sample operations only take 2 cycles per stage while multi-sample operations take 7. Additional overhead cycles are required to load and store each sample. The following suggestions may improve performance:

- Either process more data at a time with `R_IIRFA_Filter` or only one sample at a time using `R_IIRFA_SingleFilter`
- Use the unrolled software loop option
 - Provide data in a multiple of the unroll depth
- Disable polling ([see warning](#))

Polling Mode

By default, the driver will poll a status flag for completion after writing input data to IIRFA. Disabling polling significantly improves performance when using a low number of stages, but may cause higher global interrupt latency during processing.

Note

If only one stage is used it is recommended to disable polling as IIRFA will typically execute faster than code resulting in no wait cycles. If polling must be used with a one stage filter, please note that in some situations the Arm CMSIS DSP Library functions `arm_biquad_cascade_df2T_init_f32` and `arm_biquad_cascade_df2T_f32` may provide better performance. It up to the user to evaluate performance within their own project.

Warning

When polling is disabled, filter operation works by writing a value to IIRCHnINP then immediately reading IIRCHnOUT. While this maximizes performance, the core will wait for output data to become available before continuing execution. **While execution waits for IIRCHnOUT no interrupts will be processed by the core.** The maximum wait time for a 32-stage filter may be up to approximately 64 ICLK cycles for single sample processing or 224 ICLK cycles for multi-sample processing (decreasing linearly with the number of stages used).

Single Sample Processing

In applications such as motor control where each sample needs immediate processing, the inline function `R_IIRFA_SingleFilter` is provided. This function has no parameter checking, takes one sample, and returns a filtered sample. Polling is supported by this function (if configured).

ECC Errors

If configured, `R_IIRFA_Filter` will return an error if a 1- or 2-bit ECC error has occurred.

1-bit errors are automatically corrected unless writeback is disabled. 2-bit errors cannot be automatically corrected. Reset the coefficient and filter data by calling `R_IIRFA_Configure` if a non-correctable ECC error is reported.

Limitations

- A total of 32 stages may be configured at any one time across all channels.
- When polling is disabled core execution is halted while waiting for data to become available. (See warning)

Examples

Filter Configuration

Below is an example of how to initialize a filter configuration to pass to `R_IIRFA_Configure`.

```
#define FILTER_STAGE_NUM (2)

/* Biquad coefficients (4th order Butterworth 200Hz lowpass on 44.1KHz input) */
iir_filter_coeffs_t gp_iirfa0_filter_coeffs[FILTER_STAGE_NUM] =
{
    {
        .b0 = 1.000000000F,
        .b1 = 2.000000000F,
```

```
.b2 = 1.000000000F,  
.a1 = -1.947914029F,  
.a2 = 0.948705125F,  
,  
{  
.b0 = 1.000000000F,  
.b1 = 2.000000000F,  
.b2 = 1.000000000F,  
.a1 = -1.977625722F,  
.a2 = 0.978428884F,  
,  
};  
/* Biquad state data (clear to start) */  
iir_filter_state_t gp_iirfa0_filter_state[FILTER_STAGE_NUM] = {0};  
/* Filter configuration */  
iir_filter_cfg_t g_iirfa0_filter_cfg =  
{  
.p_filter_coeffs = gp_iirfa0_filter_coeffs, // Pointer to filter coefficient  
array  
.p_filter_state = gp_iirfa0_filter_state, // Pointer to filter state data array  
.stage_base      = 0, // Which hardware biquad stage to  
start allocation from (0-31)  
.stage_num       = 2, // Number of stages to allocate  
};
```

Software Example

The following is a basic example of configuring and using a filter with IIRFA.

```
#define NUM_SAMPLES (128)  
#define TWO_PI (2.0F * (float) M_PI)  
float gp_data_in[NUM_SAMPLES];  
float gp_data_out[NUM_SAMPLES];  
void iirfa_filter_example (void)  
{
```

```
fsp_err_t err;

/* Initialize the IIRFA module */
err = R_IIRFA_Open(&g_iirfa0_ctrl, &g_iirfa0_cfg);

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

/* Initialize filter coefficients and state variables */
err = R_IIRFA_Configure(&g_iirfa0_ctrl, &g_iirfa0_filter_cfg);
assert(FSP_SUCCESS == err);

/* Get input data to be filtered */
get_input_data(gp_data_in);

/* Filter data */
err = R_IIRFA_Filter(&g_iirfa0_ctrl, gp_data_in, gp_data_out, NUM_SAMPLES);

/* R_IIRFA_Filter will return FSP_ERR_INVALID_RESULT when one or more calculations
results in infinity. */
if (FSP_ERR_INVALID_RESULT == err)
{
    /* Handle error */
}
else
{
    assert(FSP_SUCCESS == err);
}
}
```

Data Structures

struct [iirfa_instance_ctrl_t](#)

Data Structure Documentation

◆ [iirfa_instance_ctrl_t](#)

struct [iirfa_instance_ctrl_t](#)

IIRFA instance control block.

Function Documentation

◆ **R_IIRFA_Open()**

```
fsp_err_t R_IIRFA_Open ( iir_ctrl_t *const p_api_ctrl, iir_cfg_t const *const p_cfg )
```

Prepare an IIR channel for filtering.

Return values

| | |
|--------------------------------|---|
| FSP_SUCCESS | The channel was successfully opened. |
| FSP_ERR_ASSERTION | One or both of the parameters was NULL. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | An invalid channel was selected. |
| FSP_ERR_ALREADY_OPEN | The instance is already opened. |

◆ **R_IIRFA_Filter()**

```
fsp_err_t R_IIRFA_Filter ( iir_ctrl_t *const p_api_ctrl, float const * p_data_in, float * p_data_out,
uint16_t const num_samples )
```

Start a filter operation on the specified data.

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Data has been successfully filtered. |
| FSP_ERR_ASSERTION | One of the provided pointers is NULL. |
| FSP_ERR_NOT_OPEN | Instance is not open. |
| FSP_ERR_INVALID_ARGUMENT | num_samples is zero. |
| FSP_ERR_INVALID_RESULT | The result of one or more calculations was +/- infinity. |
| FSP_ERR_NOT_INITIALIZED | The filter is not configured. |
| FSP_ERR_IIRFA_ECC_1BIT | A 1-bit ECC error was detected. |
| FSP_ERR_IIRFA_ECC_2BIT | A 2-bit ECC error was detected. |

◆ **R_IIRFA_Configure()**

```
fsp_err_t R_IIRFA_Configure ( iir_ctrl_t *const p_api_ctrl, iir_filter_cfg_t const *const p_filter_cfg )
```

Configure filter coefficients and state values.

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Configuration successful. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Instance is not open. |
| FSP_ERR_INVALID_ARGUMENT | Invalid filter stage selection. |
| FSP_ERR_IN_USE | One or more requested filter stages are currently in use. |

◆ **R_IIRFA_StatusGet()**

```
fsp_err_t R_IIRFA_StatusGet ( iir_ctrl_t *const p_api_ctrl, iir_status_t *const p_status )
```

Read the current filter state variables.

Return values

| | |
|-------------------|--------------------------------|
| FSP_SUCCESS | Information read successfully. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Instance is not open. |

◆ **R_IIRFA_Close()**

```
fsp_err_t R_IIRFA_Close ( iir_ctrl_t *const p_api_ctrl)
```

Stop filter operations and close the channel instance.

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | The channel is successfully closed. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Instance is not open. |

◆ R_IIRFA_SingleFilter()

```
__STATIC_INLINE float R_IIRFA_SingleFilter ( iir_ctrl_t *const p_api_ctrl, float data_in )
```

Perform a single inline filter operation.

Note

This function is intended to be used in performance-critical applications. As such, no parameter checking or error validation is provided.

5.2.8 Graphics

Modules

Detailed Description

Graphics Modules.

Modules

[Azure RTOS GUIX Port \(rm_guix_port\)](#)

[Capture Engine Unit \(r_ceu\)](#)

Driver for the CEU peripheral on RA MCUs. This module implements the [CAPTURE Interface](#).

[D/AVE 2D Port Interface \(r_drw\)](#)

Driver for the DRW peripheral on RA MCUs. This module is a port of D/AVE 2D.

[Graphics LCD \(r_glcdc\)](#)

Driver for the GLCDC peripheral on RA MCUs. This module implements the [Display Interface](#).

[JPEG Codec \(r_jpeg\)](#)

Driver for the JPEG peripheral on RA MCUs. This module implements the [JPEG Codec Interface](#).

[MIPI Display Serial Interface \(r_mipi_dsi\)](#)

Driver for the MIPI DSI peripheral on RA MCUs. This module implements the [Display Interface](#).

Parallel Data Capture (r_pdc)

Driver for the PDC peripheral on RA MCUs. This module implements the [CAPTURE Interface](#).

SEGGER emWin RA Port (rm_emwin_port)

SEGGER emWin port for RA MCUs.

Segment LCD (r_slcdc)

Driver for the SLCDC peripheral on RA MCUs. This module implements the [SLCDC Interface](#).

5.2.8.1 Azure RTOS GUIX Port (rm_guix_port)

[Modules](#) » [Graphics](#)

Functions

UINT [rm_guix_port_hw_initialize](#) (GX_DISPLAY *p_display)

Detailed Description**Overview**

The Azure RTOS GUIX Port module provides the configuration and hardware acceleration support necessary for use of GUIX on RA products. The port provides full integration with the graphics peripherals (GLCDC, DRW and JPEG).

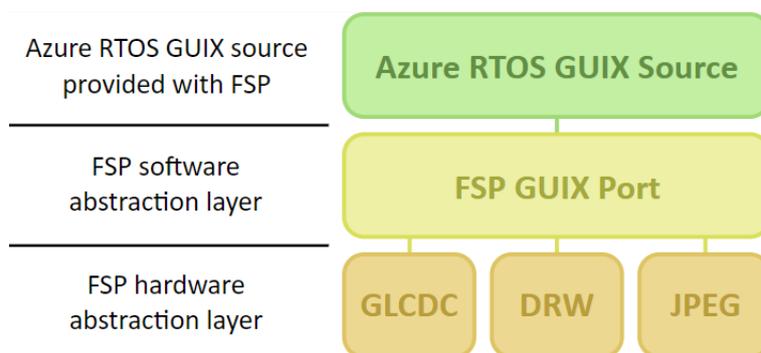

Figure 222: Azure RTOS GUIX Port Block Diagram

Note

This port layer primarily enables hardware acceleration and background handling of many display operations and does not contain code intended to be directly called by the user. For information about how to use GUIX and GUIX

Studio (including example code) please consult the [Azure RTOS GUIX documentation](#).

Hardware Acceleration

The following functions are currently performed with hardware acceleration:

- DRW Engine ([D/AVE 2D Port Interface \(r_drw\)](#))
 - Drawing bitmaps
 - 8, 4 and 1bpp uncompressed and compressed (RLE) font rendering
 - Line and shape drawing
 - Anti-aliased operations
 - Circle stroke and fill
 - Polygon stroke and fill
 - Lines and arcs
- JPEG Codec ([r_jpeg](#))
 - JPEG decoding
- Graphics LCD ([r_glcdd](#))
 - Brightness, contrast and gamma correction
 - Pixel format conversion (framebuffer to LCD)

Configuration

Build Time Configurations for gx

The following build time configurations are defined in `fsp_cfg/azure/gx/gx_user.h`:

| Configuration | Options | Default | Description |
|-----------------------|---|---------|---|
| Hardware Acceleration | | | |
| JPEG Codec Support | MCU Specific Options | | Select whether or not to use the JPEG Codec for hardware acceleration. |
| DRW Engine Support | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | Select whether or not to use the DRW Engine for hardware acceleration. |
| Max DRW Operations | Value must be a positive integer | 30 | Specifies the maximum number of DRW operations before flushing the display list. Reducing this value may reduce the peak heap used by the application but may reduce performance. |
| Internal Thread | | | |
| Stack Size | Value must be greater than zero | 4096 | GUIX internal thread stack size in bytes. Must be greater than zero. |

| | | | |
|----------------------------|---|----------|---|
| Priority | Value must be between 0 to 31 | 30 | Priority of the GUIX Internal Thread. The value must be between 0 to 31. |
| Time Slice | Value must be in range 0 to 0xFFFFFFFF | 10 | Time Slice value of the GUIX Internal Thread. The value must be between 0 (TX_NO_TIME_SLICE) to 0xFFFFFFFF. |
| System Timer (ms) | Value must be greater than or equal to 10 | 20 | GUIX system timer period (GX_SYSTEM_TIMER_MS). This value will be internally converted to RTOS ticks and will be rounded down to the next smallest multiple of the RTOS tick period (1000 / TX_TIMER_TICKS_PER_SECOND). |
| Multithread Support | <ul style="list-style-type: none"> • Disabled • Enabled | Enabled | Must be enabled if GUIX functions are called from multiple threads. Set to Disabled when calling GUIX from only one thread to reduce system overhead. |
| UTF8 Support | <ul style="list-style-type: none"> • Disabled • Enabled | Enabled | Select whether to enable or disable support for UTF8 characters. |
| Event Queue Size | Value must be greater than zero | 48 | Maximum number of events in the GUIX event queue. |
| Enable GX_WIDGET User Data | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Set to Enabled to use the gx_widget_user_data member in the GX_WIDGET structure. |

Build Time Configurations for rm_guix_port

The following build time configurations are defined in fsp_cfg/middleware/rm_guix_port_cfg.h:

| Configuration | Options | Default | Description |
|------------------|---|---------|--|
| DRW Buffer Cache | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | Enabling this option significantly improves DRW Engine |

performance. Set to Disabled only if Display underflow events are triggered under high graphics load.

Configurations for Graphics > Azure RTOS GUIX Port (rm_guix_port)

| Configuration | Options | Default | Description |
|------------------------------|--|----------|---|
| Display Rotation | | | |
| Screen Orientation | <ul style="list-style-type: none"> • None • CW (90 degrees) • FLIP (180 degrees) • CCW (270 degrees) | None | Select the display orientation specified in the GUIX Studio project. The Canvas Buffer must be enabled when rotating 180 degrees (FLIP). |
| Use Canvas Buffer | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | When screen rotation is set to 180 degrees (FLIP), a canvas buffer must be used. The canvas buffer size will be the same as a frame buffer for the display module. |
| Canvas Buffer Memory Section | This property must be a valid section name | bss | Specify the memory section where the GUIX Canvas Buffer will be allocated. |
| JPEG Decoding | | | |
| Work Buffer Size | Must be a positive integer greater than 0 | 0xC800 | Specify the JPEG work buffer size in bytes. A larger buffer can reduce JPEG decode/draw times. The buffer will not be allocated if JPEG Codec support is disabled. Unless you are sure of the subsampling used in and the size of the input JPEG images it is recommended to allocate at least 16 framebuffer lines of memory. |
| Buffer Memory Section | This property must be a valid section name | bss | Specify the memory section where the JPEG Work Buffer will be allocated. |

| | | | |
|----------------------|--|------------------|--|
| Name | Name must be a valid C symbol | g_rm_guix_port0 | Module name. |
| Target Display Layer | <ul style="list-style-type: none"> Graphics Layer 1 Graphics Layer 2 | Graphics Layer 1 | Specify which graphics screen to inherit the buffer and display dimensions from. |
| Callback Function | Must be a valid C symbol | NULL | If a callback function is provided it will be called when Display events occur. |

Hardware Configuration

No clocks or pins are directly required by this module. Please consult the submodules' documentation for their requirements.

Usage Notes

Getting Started

To get started with GUIX in an RA project the following must be performed:

1. In e² studio, open the RA Configuration editor for your GUIX project
2. Select or create a thread
3. Add GUIX to your project in the Stacks view by clicking **New Stack -> Azure RTOS -> GUIX**
4. Ensure the configuration options for GUIX and the port layer are set as necessary for your application
5. Set the properties for the GLCDC module to match the timing and memory requirements of your display panel
6. Set the input color format in the GLCDC module (Input -> Graphics Layer * -> General -> Color format) and the output color format in the JPEG Codec module if applicable (Decode -> Output color format) per your project specification
7. Click the BSP tab in the configuration editor and confirm the heap size in the Properties pane is sufficient (see Note below)
8. Click Generate Project Content to save and commit configuration changes
9. Drop the Quick Setup entry in Developer Assistance into the desired thread entry C file and update the items marked with TODO as necessary
10. Call the Quick Setup function from the thread entry function (or where desired)

At this point the project is now ready to build and run your GUIX Studio project. Please refer to the documentation for Azure RTOS GUIX and GUIX Studio for details on how to create and edit a GUI application.

Note

It is recommended to start with 8K-32K of heap to begin development. Actual heap use is typically far lower than this but must be characterized by the developer.

Using Hardware Acceleration

In most cases there is no need to perform additional configuration to ensure the DRW Engine is used. However, there are some guidelines that should be followed:

- Avoid transparent pixelmaps in 8-bit display mode as they are rendered in software. In particular, ensure PNGs to be used in 8bpp GUIX Studio projects are saved without transparency data if no transparency is needed.
- The following items may require a large heap to draw successfully:
 - Polygons (more sides = more heap)
 - Filled arcs and ellipses (more framebuffer lines occupied = more heap)
 - `gx_canvas_pixelmap_tile` (more tiles = more heap)
- When using hardware acceleration, images used for tile fill of shapes must have dimensions that are a power of 2. This limitation does not apply to `gx_canvas_pixelmap_tile` as well as certain arc/ellipse fill functions as GUIX manually draws pixelmaps to fill these shapes (at the expense of heap space).

Examples

Basic Example

This is a basic example demonstrating how to get GUIX up and running given an existing GUIX Studio project. A template for this code is available in Developer Assistance for the GUIX Port module.

Note

GUIX manages the GLCDC, DRW and JPEG Codec submodules internally; they do not need to be opened directly.

```
GX_WINDOW_ROOT * p_window_root;
void guix_user_start (void)
{
    /* Initialize GUIX */
    gx_system_initialize();

    /* Configure GUIX Studio project main display and get a pointer to the root window
    */
    gx_studio_display_configure(MAIN_DISPLAY,
    rm_guix_port_hw_initialize,
                                MAIN_DISPLAY_LANGUAGE_ENGLISH,
                                MAIN_DISPLAY_THEME,
                                &p_window_root);

    /* Set pointer to the first buffer generated by the configuration
    (rm_guix_port_canvas) */
    gx_canvas_memory_define(p_window_root->gx_window_root_canvas,
                            rm_guix_port_canvas,
                            p_window_root->gx_window_root_canvas->gx_canvas_memory_size);

    /* Create and show the root window in the GUIX Studio project */
```

```

    gx_studio_named_widget_create("root_widget_name", (GX_WIDGET *) p_window_root,
GX_NULL);

    gx_widget_show(p_window_root);

/* Start GUIX */

    gx_system_start();

/* GUIX will continue to run in its own thread */
}

```

Data Structures

| <code>RM_GUIX_PORT_EVENT_DISPLAY_VSYNC</code> | Display interface VSYNC. |
| <code>RM_GUIX_PORT_EVENT_UNDERFLOW</code> | Display interface underflow. |

Function Documentation

◆ rm_guix_port_hw_initialize()

```
UINT rm_guix_port_hw_initialize ( GX_DISPLAY * p_display)
```

Callback function to be passed to gx_studio_display_configure in order to start hardware modules.

Example:

```
/* Configure GUIX Studio project main display and get a pointer to the root window
*/
gx_studio_display_configure(MAIN_DISPLAY,
rm_guix_port_hw_initialize,
MAIN_DISPLAY_LANGUAGE_ENGLISH,
MAIN_DISPLAY_THEME,
&p_window_root);
```

Note

This function should only be called by GUIX.

Return values

| | |
|------------|---|
| GX_SUCCESS | Device driver setup is successfully done. |
| GX_FAILURE | Device driver setup failed. |

5.2.8.2 Capture Engine Unit (r_ceu)

Modules » Graphics

fsp_err_t R_CEU_StatusGet (capture_ctrl_t *const p_ctrl, capture_status_t *p_status)
```

Detailed Description

Driver for the CEU peripheral on RA MCUs. This module implements the [CAPTURE Interface](#).

Overview

The CEU peripheral supports interfacing with external cameras by accepting timing and data signals in order to capture incoming data. A callback is invoked for each V-Sync event, frame of data accepted, or when certain errors occur.

Features

- Supports 8 or 16-bit camera bus
- Capture images up to 5 MP (2560x1920)
- Capture incoming data directly into a user defined memory location without the need for DTC/DMAC
- Capture specified size 'raw' image data using Data Synchronous Fetch mode (e.g. RGB565, YUV422, etc.)
- Capture binary image data using Data Enable fetch mode (e.g. JPEG)
- Perform basic timing signal validation

Configuration

Build Time Configurations for r_ceu

The following build time configurations are defined in fsp_cfg/r_ceu_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Graphics > Capture Engine Unit (r_ceu)

This module can be added to the Stacks tab via New Stack > Graphics > Capture Engine Unit (r_ceu). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---------------------------------|---|---------|--|
| General | | | |
| Name | Name must be a valid C symbol | g_ceu0 | Module name. |
| Input | | | |
| Input > Data Bus Specifications | | | |
| Data Bus Size | <ul style="list-style-type: none"> • 8-bit • 16-bit | 8-bit | Data bus-width of CEU physical connection. |
| HSYNC Polarity | <ul style="list-style-type: none"> • High • Low | High | Specify the active polarity of the HSYNC signal. |
| VSYNC Polarity | <ul style="list-style-type: none"> • High | High | Specify the active |

- Low

polarity of the VSYNC signal.

Input > Capture Specifications

Input > Capture Specifications > Sample Points

| | | | |
|-------------------------------|---|---------------------------------|--|
| Data Sample Point | <ul style="list-style-type: none"> • Rising edge of the camera clock • Falling edge of the camera clock | Rising edge of the camera clock | Specify the external camera clock transition state for fetching the image data (D15 to D0) from the external module. |
| H-Sync Sample Point | <ul style="list-style-type: none"> • Rising edge of the camera clock • Falling edge of the camera clock | Rising edge of the camera clock | Specify the external camera clock transition state for capturing H-Sync from the external module. |
| V-Sync Sample Point | <ul style="list-style-type: none"> • Rising edge of the camera clock • Falling edge of the camera clock | Rising edge of the camera clock | Specify the external camera clock transition state for capturing V-Sync from the external module. |
| Horizontal capture resolution | Value must be an integer. | 640 | Specify the number of horizontal pixels to capture. |
| Vertical capture resolution | Value must be an integer. | 480 | Specify the number of vertical pixels to capture. |
| Horizontal pixel offset | Value must be an integer. | 0 | Number of pixels from H-sync signal up to the start of a valid data period. |
| Vertical pixel offset | Value must be an integer. | 0 | Specify the vertical line to start capturing image data. |
| Capture Mode | <ul style="list-style-type: none"> • Data Synchronous Fetch • Data Enable Fetch | Data Synchronous Fetch | Capture mode of incoming data. |

Output

Output > Buffer

| | | | |
|-------------------------|-----------------------------------|---|---|
| Data Enable Buffer Size | Value must be a positive integer. | 0 | Specify size of image region available for use by CEU data bus. (Only applicable to Data Enable Fetch capture |
|-------------------------|-----------------------------------|---|---|

| | | | |
|---------------------|--|----------------------------|---|
| Byte Swapping | <ul style="list-style-type: none"> • Swap 8-bit units • Swap 16-bit units • Swap 32-bit units | | mode) Byte swapping configuration. Bytes may be swapped in 8-bit, 16-bit, or 32-bit units. |
| Burst Transfer Mode | <ul style="list-style-type: none"> • Transfer in 32-byte units • Transfer in 64-byte units • Transfer in 128-byte units • Transfer in 256-byte units | Transfer in 256-byte units | Specify the unit for transferring data to the bus bridge module. |

Interrupts

Interrupts > Selectable CEU Events

| | | | |
|-----------------------------|---|----------|--|
| One-Frame Capture End Event | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | Capturing one frame from an external module has finished. |
| Horizontal Sync Event | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Horizontal sync signal was input from an external module. |
| Vertical Sync Event | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | Vertical sync signal was input from an external module. |
| CRAM Buffer Overflow Error | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | Data overflowed in the CRAM write buffer. |
| H-Sync Validation Error | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | The number of configured H-sync cycles is different than the H-sync cycles input from the external module. |
| V-Sync Validation Error | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | The number of configured V-sync cycles is different than the V-sync cycles input from the external module. |
| V-Sync Error | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | V-sync has been input while CEU holds data (insufficient vertical-sync front porch). |
| No H-Sync error | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | No H-sync signal was input. |
| No V-Sync error | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | No V-sync signal was input. |

| | | | |
|------------------------|--------------------------------|----------------------|---|
| Callback | Name must be a valid C symbol. | g_ceu0_user_callback | A user callback function must be provided. This callback is invoked for every successful frame capture as well as other status or error conditions. |
| Callback Context | Name must be a valid C symbol. | NULL | Pointer to the context structure to be passed through the callback argument. |
| CEU Interrupt Priority | MCU Specific Options | | Select the CEU interrupt priority. |

Clock Configuration

The CEU peripheral is clocked both from PCLKA and externally, from the camera module (VIO_CLK). The external input clock (VIO_CLK) should have a frequency at most the same as the CEU operating clock (PCLKA) frequency, with jitter on both sides included. The PCLKA frequency may be set using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

Note

At least 10 external clock cycles (VIO_CLK) must elapse after opening the CEU module, before starting a capture.

Pin Configuration

The VIO_CLK pin is a clock input to the MCU and should be connected to the clock output from the camera. The VIO_HD and VIO_VD pins must be connected to the horizontal and vertical sync signal output of the camera respectively. The VIO_D0 to VIO_D15 pins are the data bus input pins and should be connected to the relevant output pins of the camera. For 8-bit camera data bus VIO_D0 to VIO_D7 should be used.

Note

Camera control and serial communication pins must be configured separately and are not controlled by this module.

Capture Resolution

- For Data Synchronous Fetch mode, capture size is calculated using the configured Horizontal Resolution, Vertical Resolution, and Bytes Per Pixel.
- For Data Enable Fetch mode, the capture size is controlled by the external module and is defined as a period from a VD rising edge to the VD falling edge. For this mode Horizontal Resolution and Vertical Resolution are not used. However, the maximum capture size is configured using the 'Data Enable Buffer Size' option, which is used to configure the maximum write 'Firewall Address' location.

Note

For Data Enable Fetch mode, the external module must transmit data in 4-byte units.

Capture Offset

The blanking period from a horizontal or vertical sync signal differs among external modules. Therefore, the capture start location must be specified in terms of external cycles from the sync

signal so that an image can be captured from the valid image area. Some external modules output a horizontal sync signal as a data enable signal. In this case, there is no blanking period so the configured offsets must be cleared to 0.

- The horizontal capture start location must be specified in terms of the number of pixels from a horizontal sync signal.
- The vertical capture start location must be specified in terms of the number of H-cycles from a vertical sync signal.

Note

Capture offset is not used when Data Enable Fetch mode is configured.

Usage Notes

Interrupt Configuration

- CEU V-sync, capture-end, and error interrupts are used by this module for reporting capture status and error events such as overrun, vertical line number setting and other capture errors.

Note

If both a capture complete event and capture error event occur simultaneously, the capture complete event should be disregarded.

CEU Setup With External Camera

- Ensure that the memory pointed to by p_buffer is both valid and large enough to store a complete image.
- When Data Synchronous Fetch mode is configured, the amount of space required (in bytes) may be calculated as $\text{size (bytes)} = \text{image width (pixels)} * \text{image height (lines)} * \text{number of bytes per pixel}$.
- Ensure that the capture buffer address is 4-byte aligned and the buffer size is divisible by 32 bytes.

Note

Any required configuration for external cameras must be performed by the application.

Examples

Basic Example

This is a basic example of minimal use of the CEU in an application. This example shows how this driver can be used for capturing data from an external I/O device such as an image sensor.

```
bool g_ceu_capture_error;
bool g_ceu_capture_complete;
void ceu_minimal_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    g_ceu_capture_error = false;
}
```

```
g_ceu_capture_complete = false;
err = R_CEU_Open(&g_ceu0_ctrl, &g_ceu0_cfg);
assert(FSP_SUCCESS == err);
err = R_CEU_CaptureStart(&g_ceu0_ctrl, g_user_buffer);
assert(FSP_SUCCESS == err);
while (!g_ceu_capture_complete && !g_ceu_capture_error)
{
/* Wait for capture to complete. */
}
/* Process image here if capture was successful. */
err = R_CEU_Close(&g_ceu0_ctrl);
assert(FSP_SUCCESS == err);
}
void ceu_callback (capture_callback_args_t * p_args)
{
/* Multiple event flags may be set simultaneously */
if (p_args->event & (uint32_t) ~(CEU_EVENT_HD | CEU_EVENT_VD | CEU_EVENT_FRAME_END))
{
/* Error processing should occur first. Application should not process complete
event if error occurred. */
g_ceu_capture_error = true;
}
else
{
if (p_args->event & CEU_EVENT_VD)
{
/* Capture has started. Process V-Sync event. */
}
if (p_args->event & CEU_EVENT_FRAME_END)
{
/* Capture is complete and no error has occurred */
g_ceu_capture_complete = true;
}
}
}
```

}

Function Documentation◆ **R_CEU_Open()**

`fsp_err_t R_CEU_Open (capture_ctrl_t *const p_ctrl, capture_cfg_t const *const p_cfg)`

CEU module initialization.

Implements [capture_api_t::open](#)

The function provides initial configuration for the CEU module. Further initialization may be performed in [capture_api_t::captureStart](#). This function should be called once prior to calling any other CEU API functions. After the CEU is opened the Open function should not be called again without first calling the Close function.

Example:

```
err = R_CEU_Open(&g_ceu0_ctrl, &g_ceu0_cfg);
assert(FSP_SUCCESS == err);
```

Return values

| | |
|----------------------|---------------------------------|
| FSP_SUCCESS | Initialization was successful. |
| FSP_ERR_ASSERTION | One or more parameters is NULL. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |

◆ **R_CEU_Close()**

```
fsp_err_t R_CEU_Close ( capture_ctrl_t *const p_ctrl)
```

Stops and closes the transfer interface.

Implements [capture_api_t::close](#)

Stops any active captures, clears internal driver state-data, disables interrupts, and powers off the CEU peripheral.

Example:

```
err = R_CEU_Close(&g_ceu0_ctrl);
assert(FSP_SUCCESS == err);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Initialization was successful. |
| FSP_ERR_ASSERTION | One or more parameters is NULL. |
| FSP_ERR_NOT_OPEN | Open has not been successfully called. |

◆ **R_CEU_CaptureStart()**

```
fsp_err_t R_CEU_CaptureStart ( capture_ctrl_t *const p_ctrl, uint8_t *const p_buffer )
```

Starts a capture.

Implements [capture_api_t::captureStart](#).

Sets up the interface to transfer data from the CEU into the specified buffer. Configures the CEU settings as previously set by the [capture_api_t::open](#) API. When a capture is complete the callback registered during [capture_api_t::open](#) API call or by [capture_api_t::callbackSet](#) API will be called.

Example:

```
err = R_CEU_CaptureStart(&g_ceu0_ctrl, g_user_buffer);
assert(FSP_SUCCESS == err);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Initialization was successful. |
| FSP_ERR_ASSERTION | One or more parameters is NULL. |
| FSP_ERR_NOT_OPEN | Open has not been successfully called. |
| FSP_ERR_INVALID_ADDRESS | Invalid buffer address alignment. |
| FSP_ERR_IN_USE | CEU is already in use. |
| FSP_ERR_NOT_INITIALIZED | Callback function has not been set |

◆ R_CEU_CallbackSet()

```
fsp_err_t R_CEU_CallbackSet ( capture_ctrl_t *const p_ctrl, void(*) (capture_callback_args_t *)
p_callback, void const *const p_context, capture_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure.

Implements `capture_api_t::callbackSet`.

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Initialization was successful. |
| FSP_ERR_ASSERTION | One or more parameters is NULL. |
| FSP_ERR_NOT_OPEN | Open has not been successfully called. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

◆ R_CEU_StatusGet()

```
fsp_err_t R_CEU_StatusGet ( capture_ctrl_t *const p_ctrl, capture_status_t * p_status )
```

Provides the ceu operating status.

Implements `capture_api_t::statusGet`.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Initialization was successful. |
| FSP_ERR_ASSERTION | One or more parameters is NULL. |
| FSP_ERR_NOT_OPEN | Open has not been successfully called. |

5.2.8.3 D/AVE 2D Port Interface (r_drw)

Modules » [Graphics](#)

Driver for the DRW peripheral on RA MCUs. This module is a port of D/AVE 2D.

Overview

Note

The D/AVE 2D Port Interface (D1 layer) is a HAL layer for the D/AVE D2 layer API and does not provide any interfaces to the user. Consult the [TES Dave2D Driver Documentation](#) for further information on using the D2 API.

For cross-platform compatibility purposes the D1 and D2 APIs are not bound by FSP coding guidelines for function names and general module functionality.

Configuration

Build Time Configurations for r_drw

The following build time configurations are defined in fsp_cfg/r_drw_cfg.h:

| Configuration | Options | Default | Description |
|---------------------|---|---------|--|
| Allow Indirect Mode | <ul style="list-style-type: none"> Enabled Disabled | Enabled | Enable indirect mode to allow no-copy mode for d2_addddlist (see the TES Dave2D Driver Documentation for details). |
| Memory Allocation | <ul style="list-style-type: none"> Default Custom | Default | <p>Set Memory Allocation to Default to use built-in dynamic memory allocation for the D2 heap. This will use an RTOS heap if configured; otherwise, standard C malloc and free will be used.</p> <p>Set to Custom to define your own allocation scheme for the D2 heap. In this case, the developer will need to define the following functions:</p> <pre>void * d1_malloc(size_t size) void d1_free(void * ptr)</pre> |

Configurations for Graphics > D/AVE 2D Port Interface (r_drw)

This module can be added to the Stacks tab via New Stack > Graphics > D/AVE 2D Port Interface (r_drw).

| Configuration | Options | Default | Description |
|------------------------|-------------------------------|------------|---|
| D2 Device Handle Name | Name must be a valid C symbol | d2_handle0 | Set the name for the d2_device handle used when calling D2 layer functions. |
| DRW Interrupt Priority | MCU Specific Options | | Select the DRW_INT (display list) |

completion) interrupt priority.

Heap Size

The D1 port layer allows the D2 driver to allocate memory as needed. There are three ways the driver can accomplish this:

1. Allocate memory using the main heap
2. Allocate memory using a heap provided by an RTOS
3. Allocate memory via user-provided functions

When the "Memory Allocation" configuration option is set to "Default" the driver will use an RTOS implementation if available and the main heap otherwise. Setting the option to "Custom" allows the user to define their own scheme using the following prototypes:

```
void * d1_malloc(size_t size);  
void d1_free(void * ptr);
```

Warning

If there is no RTOS-based allocation scheme the main heap will be used. Be sure that it is enabled by setting the "Heap size (bytes)" property under RA Common on the **BSP** tab of the RA Configuration editor.

Note

It is recommended to add 32KB of additional heap space for the D2 driver until the actual usage can be determined in your application.

Interrupt

The D1 port includes one interrupt to handle various events like display list completion or bus error. This interrupt is managed internally by the D2 driver and no callback function is available.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the DRW engine:

- The DRW module supports two additional interrupt types - bus error and render complete. These interrupts are not needed for D2 layer operation and thus are not supported.
- If the DRW module is stopped during rendering the render will continue once the module is started again. If this behavior is undesirable in your application it is recommended to call `d2_flushframe` before stopping the peripheral.

5.2.8.4 Graphics LCD (r_glcddc)

Detailed Description

Driver for the GLCDC peripheral on RA MCUs. This module implements the [Display Interface](#).

Overview

The GLCDC is a multi-stage graphics output peripheral designed to automatically generate timing and data signals for LCD panels. As part of its internal pipeline the two internal graphics layers can be repositioned, alpha blended, color corrected, dithered and converted to and from a wide variety of pixel formats.

Features

The following features are available:

| Feature | Options |
|-------------------------|--|
| Input color formats | ARGB8888, ARGB4444, ARGB1555, RGB888 (32-bit), RGB565, CLUT 8bpp, CLUT 4bpp, CLUT 1bpp |
| Output color formats | RGB888, RGB666, RGB565, Serial RGB888 (8-bit parallel) |
| Correction processes | Alpha blending, positioning, brightness and contrast, gamma correction, dithering |
| Timing signals | Dot clock, Vsync, Hsync, Vertical and horizontal data enable (DE) |
| Maximum resolution | Up to 2038 x 2043 pixels (dependent on sync signal width) |
| Maximum dot clock | 60MHz for serial RGB mode, 54MHz otherwise |
| Internal clock divisors | 1-9, 12, 16, 24, 32 |
| Interrupts | Line detect (Vblank), Layer 1 underflow, Layer 2 underflow |
| Other functions | Byte-order and endianness control, line repeat function |

Configuration

Build Time Configurations for r_glcdc

The following build time configurations are defined in fsp_cfg/r_glcdc_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> Default (BSP) Enabled Disabled | Default (BSP) | If selected, code for parameter checking is included in the build. |
| Color Correction | <ul style="list-style-type: none"> On Off | Off | If selected, code to adjust brightness, contrast and gamma settings is included in the build. When disabled all color correction configuration options are ignored. |

Configurations for Graphics > Graphics LCD (r_glcdc)

This module can be added to the Stacks tab via New Stack > Graphics > Graphics LCD (r_glcdc).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

General

| | | | |
|------------------------------------|--|-----------------|--|
| Name | Name must be a valid C symbol | g_display0 | Module name. |
| Interrupts | | | |
| Callback Function | Name must be a valid C symbol | NULL | A user callback function can be defined here. |
| Line Detect Interrupt Priority | MCU Specific Options | | Select the line detect (Vsync) interrupt priority. |
| Underflow 1 Interrupt Priority | MCU Specific Options | | Select the underflow interrupt priority for layer 1. |
| Underflow 2 Interrupt Priority | MCU Specific Options | | Select the underflow interrupt priority for layer 2. |
| Input | | | |
| Input > Graphics Layer 1 | | | |
| Input > Graphics Layer 1 > General | | | |
| Enabled | <ul style="list-style-type: none"> • Yes • No | Yes | Specify Used if the graphics layer 1 is used. If so a framebuffer will be automatically generated based on the specified height and horizontal stride. |
| Horizontal size | Value must be an integer from 16 to 2040 | 480 | Specify the number of horizontal pixels. |
| Vertical size | Value must be an integer from 16 to 2043 | 854 | Specify the number of vertical pixels. |
| Horizontal position | Must be a valid non-negative integer with a maximum configurable value of 4091 | 0 | Specify the horizontal offset in pixels of the graphics layer from the background layer. |
| Vertical position | Must be a valid non-negative integer with a maximum configurable value of 4094 | 0 | Specify the vertical offset in pixels of the graphics layer from the background layer. |
| Color format | <ul style="list-style-type: none"> • ARGB8888 (32-bit) • RGB888 (32-bit) • RGB565 (16-bit) • ARGB1555 (16-bit) | RGB565 (16-bit) | Specify the graphics layer Input format. If selecting CLUT formats, you must write the CLUT table data before starting output. |

| | | | |
|----------------------|--|----------|--|
| | <ul style="list-style-type: none"> • ARGB4444 (16-bit) • CLUT8 (8-bit) • CLUT4 (4-bit) • CLUT1 (1-bit) | | |
| Line descending mode | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Select Used if the framebuffer starts from the bottom of the line. |

Input > Graphics Layer 1 > Background Color

| | | | |
|-------|--|-----|---|
| Alpha | Value must be an integer from 0 to 255 | 255 | Based on the alpha value, either the graphics Layer 2 (foreground graphics layer) is blended into the graphics Layer 1 (background graphics layer) or the graphics Layer 1 is blended into the monochrome background layer. |
| Red | Value must be an integer from 0 to 255 | 255 | Red component of the background color for layer 1. |
| Green | Value must be an integer from 0 to 255 | 255 | Green component of the background color for layer 1. |
| Blue | Value must be an integer from 0 to 255 | 255 | Blue component of the background color for layer 1. |

Input > Graphics Layer 1 > Framebuffer

| | | | |
|------------------------------------|--|---------------|---|
| Framebuffer name | This property must be a valid C symbol | fb_background | Specify the name for the framebuffer for Layer 1. |
| Number of framebuffers | Must be a valid non-negative integer | 2 | Number of framebuffers allocated for Graphics Layer 1. |
| Section for framebuffer allocation | Manual Entry | .sdram | Specify the section in which to allocate the framebuffer. When Arm Compiler 6 is used to place this memory in on-chip SRAM, the section name must be .bss or start with .bss. to avoid consuming unnecessary ROM space. |

Input > Graphics Layer 1 > Line Repeat

| | | | |
|------------------------------------|---|-----------------|--|
| Enable | <ul style="list-style-type: none"> • On • Off | Off | Select On if the display will be repeated from a smaller section of the framebuffer. |
| Repeat count | Must be a valid non-negative integer with a maximum configurable value of 65535 i.e (vertical size) x (lines repeat times) must be equal to the panel vertical size | 0 | Specify the number of times the image is repeated. |
| Input > Graphics Layer 1 > Fading | | | |
| Mode | <ul style="list-style-type: none"> • None • Fade-in • Fade-out | None | Select the fade method. |
| Speed | Value must be an integer from 0 to 255 | 0 | Specify the number of frames for the fading transition to complete. |
| Input > Graphics Layer 2 | | | |
| Input > Graphics Layer 2 > General | | | |
| Enabled | <ul style="list-style-type: none"> • Yes • No | No | Specify Used if the graphics layer 2 is used. If so a framebuffer will be automatically generated based on the specified height and horizontal stride. |
| Horizontal size | Value must be be an integer from 16 to 2040 | 480 | Specify the number of horizontal pixels. |
| Vertical size | Value must be be an integer from 16 to 2043 | 854 | Specify the number of vertical pixels. |
| Horizontal position | Must be a valid non-negative integer with a maximum configurable value of 4091 | 0 | Specify the horizontal offset in pixels of the graphics layer from the background layer. |
| Vertical position | Must be a valid non-negative integer with a maximum configurable value of 4094 | 0 | Specify the vertical offset in pixels of the graphics layer from the background layer. |
| Color format | <ul style="list-style-type: none"> • ARGB8888 (32-bit) • RGB888 (32-bit) • RGB565 (16-bit) | RGB565 (16-bit) | Specify the graphics layer Input format. If selecting CLUT formats, you must write the |

| | | | |
|---|---|---------------|---|
| | <ul style="list-style-type: none"> • ARGB1555 (16-bit) • ARGB4444 (16-bit) • CLUT8 (8-bit) • CLUT4 (4-bit) • CLUT1 (1-bit) | | CLUT table data before starting output. |
| Line descending mode | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Select Used if the framebuffer starts from the bottom of the line. |

| Speed | Value must be an integer from 0 to 255 | 0 | Specify the number of frames for the fading transition to complete. |

Output

Output > Timing

| | | | |
|--------------------------------|--|-----|--|
| Horizontal total cycles | Value must be an integer from 24 to 2047 | 559 | Specify the total cycles in a horizontal line. Set to the number of cycles defined in the data sheet of LCD panel sheet in your system |
| Horizontal active video cycles | Value must be an integer from 16 to 2040 | 480 | Specify the number of active video cycles in a horizontal line (including front and back porch). Set to the number of cycles defined in the data sheet of LCD panel sheet in your system. |
| Horizontal back porch cycles | Value must be an integer from 5 to 2029 | 5 | Specify the number of back porch cycles in a horizontal line. Back porch starts from the beginning of Hsync cycles, which means back porch cycles contain Hsync cycles. Set to the number of cycles defined in the data sheet of LCD |

panel sheet in your system.

| | | | |
|---------------------------------|---|---------------|---|
| Horizontal sync signal cycles | Value must be an integer from 0 to 2046 | 2 | Specify the number of Hsync signal assertion cycles. Set to the number of cycles defined in the data sheet of LCD panel sheet in your system. |
| Horizontal sync signal polarity | <ul style="list-style-type: none"> • Low active • High active | Low active | Select the polarity of Hsync signal to match your system. |
| Vertical total lines | Value must be an integer from 20 to 2047 | 894 | Specify number of total lines in a frame (including front and back porch). |
| Vertical active video lines | Value must be an integer from 16 to 2043 | 854 | Specify the number of active video lines in a frame. |
| Vertical back porch lines | Value must be an integer from 3 to 2030 | 20 | Specify the number of back porch lines in a frame. Back porch starts from the beginning of Vsync lines, which means back porch lines contain Vsync lines. |
| Vertical sync signal lines | Value must be an integer from 0 to 2046 | 3 | Specify the Vsync signal assertion lines in a frame. |
| Vertical sync signal polarity | <ul style="list-style-type: none"> • Low active • High active | Low active | Select the polarity of Vsync signal to match to your system. |
| Data Enable Signal Polarity | <ul style="list-style-type: none"> • Low active • High active | High active | Select the polarity of Data Enable signal to match to your system. |
| Sync edge | <ul style="list-style-type: none"> • Rising edge • Falling edge | Falling edge | Select the polarity of Sync signals to match to your system. |
| Output > Format | | | |
| Color format | <ul style="list-style-type: none"> • 24bits RGB888 • 18bits RGB666 • 16bits RGB565 • 8bits serial | 24bits RGB888 | Specify the graphics layer output format to match to your LCD panel. |
| Color order | <ul style="list-style-type: none"> • RGB • BGR | RGB | Select data order for output signal to LCD panel. |

| | | | |
|-----------------------------|--|--------------------------|--|
| Endian | <ul style="list-style-type: none"> • Little endian • Big endian | Little endian | Select data endianness for output signal to LCD panel. |
| Output > Background | | | |
| Alpha | Value must be an integer from 0 to 255 | 255 | Alpha component of the background color. |
| Red | Value must be an integer from 0 to 255 | 0 | Red component of the background color. |
| Green | Value must be an integer from 0 to 255 | 0 | Green component of the background color. |
| Blue | Value must be an integer from 0 to 255 | 0 | Blue component of the background color. |
| CLUT | | | |
| Enabled | <ul style="list-style-type: none"> • Yes • No | No | Specify Used if selecting CLUT formats for a graphics layer input format. If used, a buffer (CLUT_buffer) will be automatically generated based on the selected pixel width. |
| Size | Must be a valid non-negative integer with a maximum configurable value of 256 | 256 | Specify the number of entries for the CLUT source data buffer. Each entry consumes 4 bytes (1 word). |
| TCON | | | |
| Hsync pin select | <ul style="list-style-type: none"> • Not used • LCD_TCON0 • LCD_TCON1 • LCD_TCON2 • LCD_TCON3 | LCD_TCON1 | Select the TCON pin used for the Hsync signal to match to your system. |

Clock Configuration

The peripheral clock for this module is PCLKA.

The dot clock is typically generated from the PLL with a maximum output frequency of 54 MHz in most pixel formats (60 MHz for serial RGB). Optionally, a clock signal can be provided to the LCD_EXTCLK pin for finer framerate control (60 MHz maximum input). With either clock source dividers of 1-9, 12, 16, 24 and 32 may be used. Clocks must be initialized and settled prior to starting this module.

Pin Configuration

This module controls a variety of pins necessary for LCD data and timing signal output:

| Pin Name | Function | Notes |
|------------|-----------------------------|---|
| LCD_EXTCLK | External clock signal input | The maximum input clock frequency is 60MHz. |
| LCD_CLK | Dot clock output | The maximum output frequency is 54MHz (60MHz in serial RGB mode). |
| LCD_DATAn | Pixel data output lines | Pin assignment and color order is based on the output block configuration. See the RA6M3 User's Manual (R01UH0886EJ0100) section 58.1.4 "Output Control for Data Format" for details. |
| LCD_TCONn | Panel timing signal output | These pins can be configured to output vertical and horizontal synchronization and data valid signals. |

Note

There are two banks of pins listed for the GLCDC in the RA6M3 User's Manual (_A and _B). In most cases the _B bank will be used as _A conflicts with SDRAM pins. In either case, it is generally recommended to only use pins from only one bank at a time as this allows for superior signal routing both inside and outside the package. If _A and _B pins must be mixed be sure to note the timing precision penalty detailed in Table 60.33 in in the RA6M3 User's Manual.

Usage Notes

Overview

The GLCDC peripheral is a combination of several sub-peripherals that form a pixel data processing pipeline. Each block passes pixel data to the next but otherwise they are disconnected from one another - in other words, changing timing block parameters does not affect the output generation block configuration and vice versa.

Initial Configuration

During R_GLCDC_Open all configured parameters are set in the GLCDC peripheral fully preparing it for operation. Once opened, calling R_GLCDC_Start is typically all that is needed for basic operation. Background generation, timing and output parameters are not configurable at runtime, though layer control and color correction options can be altered.

Framebuffer Allocation

The framebuffer should be allocated in the highest-speed region available without displacing the stack, heap and other program-critical structures. Regardless of the placement two rules must be followed to ensure correct operation of the GLCDC:

- The framebuffer must be aligned on a 64-byte boundary
- The horizontal stride of the buffer must be a multiple of 64 bytes

Note

Framebuffers allocated through the RA Configuraton tool automatically follow the alignment and size requirements.

If your framebuffer will be placed in internal memory it is recommended to avoid any high-speed RAM regions as there is typically no speed advantage for doing so. In particular, it is important to ensure the framebuffer does not push the stack or any heaps outside of high-speed RAM areas to preserve CPU performance.

Graphics Layers and Timing Parameters

The GLCDC synthesizes graphics data through two configurable graphics layers onto a background layer. The background is used as a solid-color canvas upon which to composite data from the graphics layers. The two graphics layers are blended on top of each other (Layer 2 above Layer 1) and overlaid on the background layer based on their individual configuration. The placement of the layers (as well as LCD timing parameters) are detailed in Figure 1. The colors of the dimensions indicate which element of the `display_cfg_t` struct is being referenced - for example, the width of the background layer would be `[display_cfg].output.htiming.display_cyc` as shown in the figure below.

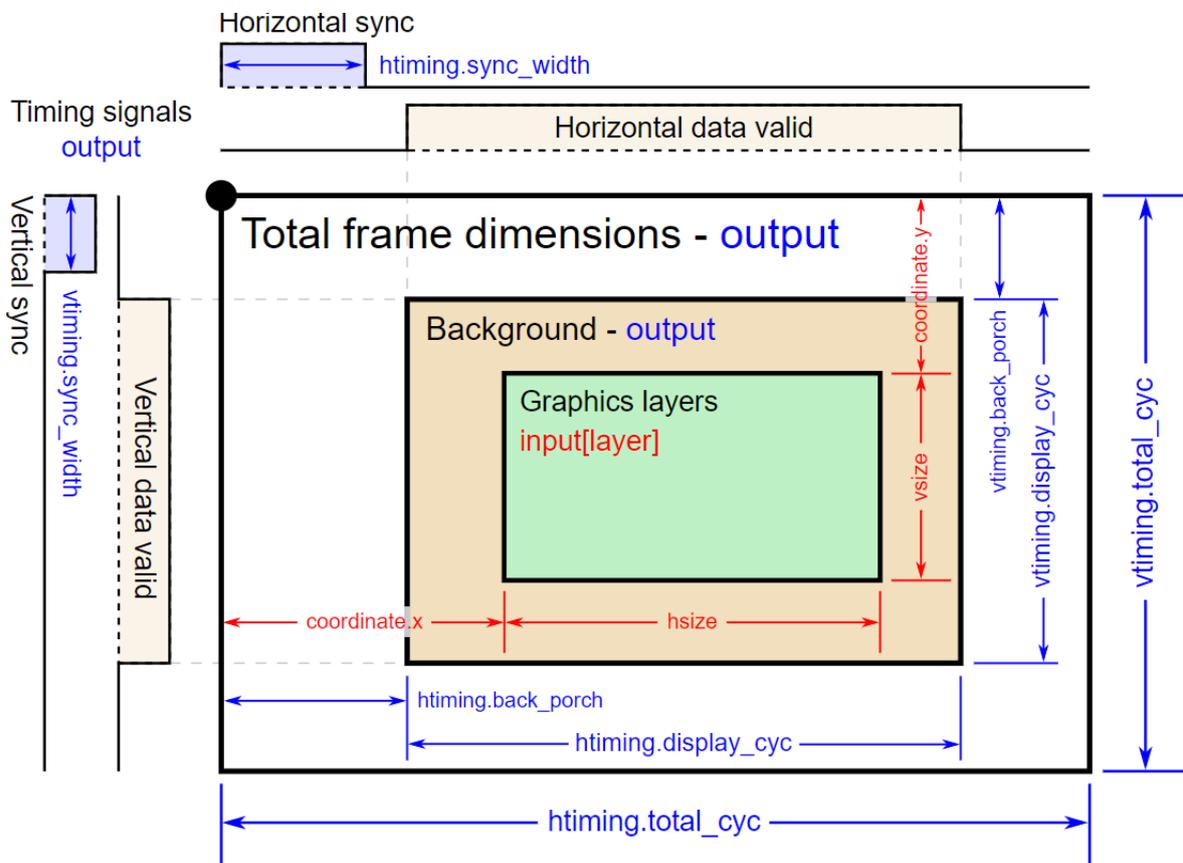

Figure 223: GLCDC layers and timing

Note

The data enable signal (if configured) is the logical AND of the horizontal and vertical data valid signals. In the GLCDC layers and timing figure, only one graphics layer is shown for simplicity. Additionally, in most applications the graphics layer(s) will be the same dimensions as the background layer.

Runtime Configuration Options

Note

All runtime configurations detailed below are also automatically configured during `R_GLCDC_Open` based on the options selected in the RA Configuration editor.

Blend processing

Control of layer positioning, alpha blending and fading is possible at runtime via `R_GLCDC_LayerChange`. This function takes a `display_runtime_cfg_t` parameter which contains the same input and layer elements as the `display_cfg_t` control block. Refer to the documentation for `display_runtime_cfg_t` as well as the [Examples](#) below to see what options are configurable.

Brightness and contrast

Brightness and contrast correction can be controlled through `R_GLCDC_ColorCorrection`. The `display_correction_t` parameter is used to control enabling, disabling and gain values for both corrections as shown below:

```
display_correction_t correction;

/* Brightness values are 0-1023 with +512 offset being neutral */
correction.brightness.r = 512;
correction.brightness.g = 512;
correction.brightness.b = 512;

/* Contrast values are 0-255 representing gain of 0-2 (128 is gain of 1) */
correction.contrast.r = 128;
correction.contrast.g = 128;
correction.contrast.b = 128;

/* Brightness and contrast correction can be enabled or disabled independent of one
another */
correction.brightness.enable = true;
correction.contrast.enable = true;

/* Enable correction */
R_GLCDC_ColorCorrection(&g_disp_ctrl, &correction);
```

Color Look-Up Table (CLUT) Modes

The GLCDC supports 1-, 4- and 8-bit color look-up table (CLUT) formats for input pixel data. By using these modes the framebuffer size in memory can be reduced significantly, allowing even high-resolution displays to be buffered in on-chip SRAM. To enable CLUT modes for a layer the color format must be set to a CLUT mode (either at startup or through `R_GLCDC_LayerChange`) in addition to filling the CLUT as appropriate via `R_GLCDC_ClutUpdate` as shown below:

```
/* Basic 4-bit (16-color) CLUT definition */
uint32_t clut_4[16] =
```

```
{
    0xFF000000,          // Black
    0xFFFFFFFF,        // White
    0xFF0000FF,        // Blue
    0xFF0080FF,        // Turquoise
    0xFF00FFFF,        // Cyan
    0xFF00FF80,        // Mint Green
    0xFF00FF00,        // Green
    0xFF80FF00,        // Lime Green
    0xFFFFFFFF00,     // Yellow
    0xFFFFF800,       // Orange
    0xFFFF0000,       // Red
    0xFFFF0080,       // Pink
    0xFFFF00FF,       // Magenta
    0xFF8000FF,       // Purple
    0xFF808080,       // Gray
    0x00000000        // Transparent
};

/* Define the CLUT configuration */
display_clut_cfg_t clut_cfg =
{
    .start = 0,
    .size  = 16,
    .p_base = clut_4
};

/* Update the CLUT in the GLCDC */
R_GLCDC_ClutUpdate(&g_disp_ctrl, &clut_cfg, DISPLAY_FRAME_LAYER_1);
```

Note

If individual elements of the CLUT must be changed or if elements must be changed one at a time (for instance, when using `emWin`) it is recommended to use `R_GLCDC_ClutEdit` to avoid repeated memcpy operations.

Other Configuration Options

Gamma correction

Gamma correction is performed based on a gain curved defined in the RA Configuration editor. Each

point on the curve is defined by a threshold and a gain value - each gain value represents a multiplier from 0x-2x (set as 0-2047) that sets the Y-value of the slope of the gain curve, while each threshold interval sets the X-value respectively. For a more detailed explanation refer to the RA6M3 User's Manual (R01UH0886EJ0100) Figure 58.12 "Calculation of gamma correction value" and the related description above it.

When setting threshold values three rules must be followed:

- Each threshold value must be greater than the previous value
- Threshold values must be greater than zero and less than 1024
- Threshold values can equal the previous value only if they are 1023 (maximum)

Note

Gamma correction can only be applied via [R_GLCDC_Open](#).

Dithering

Dithering is a method of pixel blending that allows for smoother transitions between colors when using a limited palette. A full description of dithering is outside the scope of this document. For more information on the pattern settings and how to configure them refer to the RA6M3 User's Manual (R01UH0886EJ0100) Figure 58.13 "Configuration of dither correction block" and Figure 58.14 "Addition value selection method for 2x2 pattern dither".

Maximum Resolution

Though the GLCDC is capable of outputting resolutions in excess of HD, maximum clockspeeds and bus throughput limit what can be realistically achieved. Below is a table of maximum recommended widescreen resolutions at various input color depths **based on clock and bus limits at 60 FPS**.

| Device | 8bpp | 16bpp | 24/32bpp |
|--------|-------------------|-----------------|---------------|
| RA6M3 | 960x540 (qHD) | 800x480 (WVGA) | 640x360 (nHD) |
| RA8 | 1920x1200 (WUXGA) | 1280x800 (WXGA) | 960x540 (qHD) |

Note

The above values are estimated conservatively based on effective SDRAM bus throughput at a standard framerate. To calculate estimated maximum values for other situations the following equations can be used:

*bytes per frame = (SDCLK speed (Hz) * SDRAM bus width / 8) / framerate*

*width = sqrt(16/9 * (bytes per frame) / (pixel bit depth / 8))*

*height = 9/16 * width*

These equations provide values that are theoretically possible but may or may not be attainable depending on a number of other factors. It is the responsibility of the developer to test and confirm performance on each system to determine a suitable panel size for the application.

Limitations

Developers should be aware of the following limitations when using the GLCDC API:

- Due to a limitation of the GLCDC hardware, if the horizontal back porch is less than the number of pixels in a graphics burst read (64 bytes) for a layer and the layer is positioned at a negative X-value then the layer X-position will be locked to the nearest 64-byte boundary, rounded toward zero.
- The GLCDC peripheral offers a chroma-key function that can be used to perform a green-screen-like color replacement. This functionality is not exposed through the GLCDC API. See

the descriptions for GR1_AB7/GR2_AB7 through GR1_AB9/GR2_AB9 in the device's User's Manual for further details.

- Use of R_GLCDC_ClutUpdate and R_GLCDC_ClutEdit may not be mixed on the same frame.

Examples

Basic Example

This is a basic example showing the minimum code required to initialize and start the GLCDC module. If the entire display can be drawn within the vertical blanking period no further code may be necessary.

```
void glcdc_init (void)
{
    fsp_err_t err;

    // Open the GLCDC driver
    err = R_GLCDC_Open(&g_disp_ctrl, &g_disp_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    // Start display output
    err = R_GLCDC_Start(&g_disp_ctrl);
    assert(FSP_SUCCESS == err);
}
```

Layer Transitions

This example demonstrates how to set up and execute both a sliding and fading layer transition. This is most useful in static image transition scenarios as switching between two actively-drawing graphics layers may require up to four framebuffers to eliminate tearing.

```
volatile uint32_t g_vsync_count = 0;

/* Callback function for GLCDC interrupts */
static void glcdc_callback (display_callback_args_t * p_args)
{
    if (p_args->event == DISPLAY_EVENT_LINE_DETECTION)
    {
        g_vsync_count++;
    }
}

/* Simple wait that returns 1 if no Vsync happened within the timeout period */
```

```
uint8_t vsync_wait (void)
{
    uint32_t timeout_timer = GLCDC_VSYNC_TIMEOUT;
    g_vsync_count = 0;
    while (!g_vsync_count && --timeout_timer)
    {
        /* Spin here until DISPLAY_EVENT_LINE_DETECTION callback or timeout */
    }
    return timeout_timer ? 0 : 1;
}

/* Initiate a fade on Layer 2
 *
 * Parameters:
 * direction True for fade in, false for fade out
 * speed number of frames over which to fade
 */
void glcdc_layer_transition_fade (display_runtime_cfg_t * disp_rt_cfg, bool
direction, uint16_t speed)
{
    fsp_err_t err;
    if (direction)
    {
        /* Set the runtime struct to the desired buffer */
        disp_rt_cfg->input.p_base = (uint32_t *) g_framebuffer_1;
        disp_rt_cfg->layer.fade_control = DISPLAY_FADE_CONTROL_FADEIN;
    }
    else
    {
        disp_rt_cfg->layer.fade_control = DISPLAY_FADE_CONTROL_FADEOUT;
    }
    /* Ensure speed is at least 1 frame */
    if (!speed)
    {
        speed = 1;
    }
}
```

```
    }

    /* Set the fade speed to the desired change in alpha per frame */
    disp_rt_cfg->layer.fade_speed = UINT8_MAX / speed;

    /* Initiate the fade (will start on the next Vsync) */
    err = R_GLCDC_LayerChange(&g_disp_ctrl, disp_rt_cfg, DISPLAY_FRAME_LAYER_2);
    assert(FSP_SUCCESS == err);
}

/* Slide Layer 1 out to the left while sliding Layer 2 in from the right */
void glcdc_layer_transition_sliding (display_runtime_cfg_t * disp_rt_cfg_in,
display_runtime_cfg_t * disp_rt_cfg_out)
{
    fsp_err_t err;

    /* Set the config for the incoming layer to be just out of bounds on the right side
    */
    disp_rt_cfg_in->input.p_base = (uint32_t *) g_framebuffer_1;
    disp_rt_cfg_in->layer.coordinate.x = DISPLAY_WIDTH;

    /* Move layer 1 out and layer 2 in at a fixed rate of 4 pixels per frame */
    for (int32_t x = disp_rt_cfg_in->layer.coordinate.x; x >= 0; x -= 4)
    {
        /* Wait for a Vsync before starting */
        vsync_wait();

        /* Set the X-coordinate of both layers then update them */
        disp_rt_cfg_out->layer.coordinate.x = (int16_t) (x - DISPLAY_WIDTH);
        disp_rt_cfg_in->layer.coordinate.x = (int16_t) x;

        err = R_GLCDC_LayerChange(&g_disp_ctrl, disp_rt_cfg_out, DISPLAY_FRAME_LAYER_1
);
        assert(FSP_SUCCESS == err);

        err = R_GLCDC_LayerChange(&g_disp_ctrl, disp_rt_cfg_in, DISPLAY_FRAME_LAYER_2
);
        assert(FSP_SUCCESS == err);
    }
}
```

Double-Buffering

Using a double-buffer allows one to be output to the LCD while the other is being drawn to memory, eliminating tearing and in some cases reducing bus load. The following is a basic example showing integration of the line detect (Vsync) interrupt to set the timing for buffer swapping and drawing.

```
/* User-defined function to draw the current display to a framebuffer */
void display_draw (uint8_t * framebuffer)
{
    FSP_PARAMETER_NOT_USED(framebuffer);
    /* Draw buffer here */
}

/* This function is an example of a basic double-buffered display thread */
void display_thread (void)
{
    uint8_t * p_framebuffer = NULL;
    fsp_err_t err;
    /* Initialize and start the R_GLCDC module */
    glcdc_init();
    while (1)
    {
        /* Swap the active framebuffer */
        p_framebuffer = (p_framebuffer == g_framebuffer_0) ? g_framebuffer_1 :
g_framebuffer_0;
        /* Draw the new framebuffer now */
        display_draw(p_framebuffer);
        /* Now that the framebuffer is ready, update the GLCDC buffer pointer on the next
Vsync */
        err = R_GLCDC_BufferChange(&g_disp_ctrl, p_framebuffer, DISPLAY_FRAME_LAYER_1
);
        assert(FSP_SUCCESS == err);
        /* Wait for a Vsync event */
        vsync_wait();
    }
}
```

| <code>GLCDC_DITHERING_OUTPUT_FORMAT_RGB666</code> | Dithering output format RGB666. |
| <code>GLCDC_DITHERING_OUTPUT_FORMAT_RGB565</code> | Dithering output format RGB565. |

Function Documentation

◆ **R_GLCDC_Open()**

```
fsp_err_t R_GLCDC_Open ( display_ctrl_t *const p_api_ctrl, display_cfg_t const *const p_cfg )
```

Open GLCDC module. Implements `display_api_t::open`.

Return values

| | |
|------------------------------------|--|
| FSP_SUCCESS | Device was opened successfully. |
| FSP_ERR_ALREADY_OPEN | Device was already open. |
| FSP_ERR_ASSERTION | Pointer to the control block or the configuration structure is NULL. |
| FSP_ERR_CLOCK_GENERATION | Dot clock cannot be generated from clock source. |
| FSP_ERR_INVALID_TIMING_SETTING | Invalid panel timing parameter. |
| FSP_ERR_INVALID_LAYER_SETTING | Invalid layer setting found. |
| FSP_ERR_INVALID_ALIGNMENT | Input buffer alignment invalid. |
| FSP_ERR_INVALID_GAMMA_SETTING | Invalid gamma correction setting found |
| FSP_ERR_INVALID_BRIGHTNESS_SETTING | Invalid brightness correction setting found |

Note

PCLKA must be supplied to Graphics LCD Controller (GLCDC) and GLCDC pins must be set in IOPORT before calling this API.

◆ **R_GLCDC_Close()**

```
fsp_err_t R_GLCDC_Close ( display_ctrl_t *const p_api_ctrl)
```

Close GLCDC module. Implements `display_api_t::close`.

Return values

| | |
|-------------------------------|--|
| FSP_SUCCESS | Device was closed successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block is NULL. |
| FSP_ERR_NOT_OPEN | The function call is performed when the driver state is not equal to <code>DISPLAY_STATE_CLOSED</code> . |
| FSP_ERR_INVALID_UPDATE_TIMING | A function call is performed when the GLCDC is updating register values internally. |

Note

This API can be called when the driver is not in `DISPLAY_STATE_CLOSED` state. It returns an error if the register update operation for the background screen generation block is being held.

◆ **R_GLCDC_Start()**

```
fsp_err_t R_GLCDC_Start ( display_ctrl_t *const p_api_ctrl)
```

Start GLCDC module. Implements `display_api_t::start`.

Return values

| | |
|-------------------|---------------------------------------|
| FSP_SUCCESS | Device was started successfully. |
| FSP_ERR_NOT_OPEN | GLCDC module has not been opened. |
| FSP_ERR_ASSERTION | Pointer to the control block is NULL. |

Note

This API can be called when the driver is not in `DISPLAY_STATE_OPENED` status.

◆ **R_GLCDC_Stop()**

```
fsp_err_t R_GLCDC_Stop ( display_ctrl_t *const p_api_ctrl)
```

Stop GLCDC module. Implements `display_api_t::stop`.

Return values

| | |
|-------------------------------|---|
| FSP_SUCCESS | Device was stopped successfully |
| FSP_ERR_ASSERTION | Pointer to the control block is NULL |
| FSP_ERR_INVALID_MODE | Function call is performed when the driver state is not <code>DISPLAY_STATE_DISPLAYING</code> . |
| FSP_ERR_INVALID_UPDATE_TIMING | The function call is performed while the GLCDC is updating register values internally. |

Note

This API can be called when the driver is in the `DISPLAY_STATE_DISPLAYING` state. It returns an error if the register update operation for the background screen generation blocks, the graphics data I/F blocks, or the output control block is being held.

◆ **R_GLCDC_LayerChange()**

```
fsp_err_t R_GLCDC_LayerChange ( display_ctrl_t const *const p_api_ctrl, display_runtime_cfg_t
const *const p_cfg, display_frame_layer_t layer )
```

Change layer parameters of GLCDC module at runtime. Implements `display_api_t::layerChange`.

Return values

| | |
|-------------------------------|--|
| FSP_SUCCESS | Changed layer parameters of GLCDC module successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block or the configuration structure is NULL. |
| FSP_ERR_INVALID_MODE | A function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING. |
| FSP_ERR_INVALID_UPDATE_TIMING | A function call is performed while the GLCDC is updating register values internally. |

Note

This API can be called when the driver is in DISPLAY_STATE_DISPLAYING state. It returns an error if the register update operation for the background screen generation blocks or the graphics data I/F block is being held.

◆ **R_GLCDC_BufferChange()**

```
fsp_err_t R_GLCDC_BufferChange ( display_ctrl_t const *const p_api_ctrl, uint8_t *const
framebuffer, display_frame_layer_t layer )
```

Change the framebuffer pointer for a layer. Implements `display_api_t::bufferChange`.

Return values

| | |
|-------------------------------|--|
| FSP_SUCCESS | Changed layer parameters of GLCDC module successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block is NULL. |
| FSP_ERR_INVALID_MODE | A function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING. |
| FSP_ERR_INVALID_ALIGNMENT | The framebuffer pointer is not 64-byte aligned. |
| FSP_ERR_INVALID_UPDATE_TIMING | A function call is performed while the GLCDC is updating register values internally. |

Note

This API can be called when the driver is in DISPLAY_STATE_OPENED state or higher. It returns an error if the register update operation for the background screen generation blocks or the graphics data I/F block is being held.

◆ **R_GLCDC_ColorCorrection()**

```
fsp_err_t R_GLCDC_ColorCorrection ( display_ctrl_t const *const p_api_ctrl, display_correction_t const *const p_correction )
```

Perform color correction through the GLCDC module. Implements `display_api_t::correction`.

Return values

| | |
|------------------------------------|---|
| FSP_SUCCESS | Color correction by GLCDC module was performed successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block or the display correction structure is NULL. |
| FSP_ERR_INVALID_MODE | Function call is performed when the driver state is not <code>DISPLAY_STATE_DISPLAYING</code> . |
| FSP_ERR_INVALID_UPDATE_TIMING | A function call is performed while the GLCDC is updating registers internally. |
| FSP_ERR_UNSUPPORTED | Feature not supported with the current configuration. |
| FSP_ERR_INVALID_BRIGHTNESS_SETTING | Invalid brightness correction setting found |

Note

This API can be called when the driver is in the `DISPLAY_STATE_DISPLAYING` state. It returns an error if the register update operation for the background screen generation blocks or the output control block is being held.

◆ **R_GLCDC_ClutUpdate()**

```
fsp_err_t R_GLCDC_ClutUpdate ( display_ctrl_t const *const p_api_ctrl, display_clut_cfg_t const *const p_clut_cfg, display_frame_layer_t layer )
```

Write an entire color look-up table (CLUT) in the GLCDC module. Implements `display_api_t::clut`.

Return values

| | |
|-------------------------------|---|
| FSP_SUCCESS | CLUT written successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block or CLUT source data is NULL. |
| FSP_ERR_INVALID_UPDATE_TIMING | <code>R_GLCDC_ClutEdit</code> was already used to edit the specified CLUT this frame. |
| FSP_ERR_INVALID_CLUT_ACCESS | Illegal CLUT entry or size is specified. |

Note

This API can be called any time. The written data will be used after the next vertical sync event.

◆ **R_GLCDC_ClutEdit()**

```
fsp_err_t R_GLCDC_ClutEdit ( display_ctrl_t const *const p_api_ctrl, display_frame_layer_t layer,
uint8_t index, uint32_t color )
```

Update an element of a color look-up table (CLUT) in the GLCDC module. Implements `display_api_t::clutEdit`.

Return values

| | |
|-------------------|---------------------------------------|
| FSP_SUCCESS | CLUT element updated successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block is NULL. |

Note

This API can be called any time. The written data will be used after the next vertical sync event.

◆ **R_GLCDC_ColorKeySet()**

```
fsp_err_t R_GLCDC_ColorKeySet ( display_ctrl_t const *const p_api_ctrl, display_colorkeying_layer_t
key_cfg, display_frame_layer_t layer )
```

Configuring color key is not supported for GLCDC.

Return values

| | |
|---------------------|--|
| FSP_ERR_UNSUPPORTED | |
|---------------------|--|

◆ **R_GLCDC_StatusGet()**

```
fsp_err_t R_GLCDC_StatusGet ( display_ctrl_t const *const p_api_ctrl, display_status_t *const
p_status )
```

Get status of GLCDC module. Implements `display_api_t::statusGet`.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Got status successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block or the status structure is NULL. |

Note

The GLCDC hardware starts the fading processing at the first Vsync after the previous LayerChange() call is held. Due to this behavior of the hardware, this API may not return DISPLAY_FADE_STATUS_FADING_UNDERWAY as the fading status, if it is called before the first Vsync after LayerChange() is called. In this case, the API returns DISPLAY_FADE_STATUS_PENDING, instead of DISPLAY_FADE_STATUS_NOT_UNDERWAY.

fsp_err_t R_JPEG_StatusGet (jpeg_ctrl_t *p_api_ctrl, jpeg_status_t *p_status)

Detailed Description

Driver for the JPEG peripheral on RA MCUs. This module implements the [JPEG Codec Interface](#).

Overview

The JPEG Codec is a hardware block providing accelerated JPEG image encode and decode functionality independent of the CPU. Images can optionally be partially processed facilitating streaming applications.

Features

The JPEG Codec provides a number of options useful in a variety of applications:

- Basic encoding and decoding
- Streaming input and/or output
- Decoding JPEGs of unknown size
- Shrink (sub-sample) an image during the decoding process
- Rearrange input and output byte order (byte, word and/or longword swap)
- JPEG error detection

The specifications for the codec are as follows:

| Feature | Options |
|------------------------------|--|
| Decompression input formats | Baseline JPEG Y'CbCr 4:4:4, 4:2:2, 4:2:0 and 4:1:1 |
| Decompression output formats | ARGB8888, RGB565 |
| Compression input formats | Raw Y'CbCr 4:2:2 only |
| Compression output formats | Baseline JPEG Y'CbCr 4:2:2 only |
| Byte reordering | Byte, halfword and/or word swapping on input and output |
| Interrupt sources | Image size acquired, input/output data pause, decode complete, error |
| Compatible image sizes | See Minimum Coded Unit (MCU) below |

Configuration

Build Time Configurations for r_jpeg

The following build time configurations are defined in fsp_cfg/r_jpeg_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|--|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected, code for parameter checking is included in the build. |
| Decode Support | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | If selected, code for decoding JPEG images is included in the build. |
| Encode Support | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | If selected, code for encoding JPEG images is included in the build. |

Configurations for Graphics > JPEG Codec (r_jpeg)

This module can be added to the Stacks tab via New Stack > Graphics > JPEG Codec (r_jpeg).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

General

| | | | |
|------------------------------|--|-----------------|---|
| Name | Name must be a valid C symbol | g_jpeg0 | Module name. |
| Default mode | <ul style="list-style-type: none"> Decode Encode | Decode | Set the mode to use when calling R_JPEG_Open. This parameter is only used when both Encode and Decode support are enabled. |
| Decode | | | |
| Input byte order | MCU Specific Options | | Select the byte order of the input data for decoding. |
| Output byte order | MCU Specific Options | | Select the byte order of the output data for decoding. |
| Output color format | <ul style="list-style-type: none"> ARGB8888 (32-bit) RGB565 (16-bit) | RGB565 (16-bit) | Select the output pixel format for decode operations. |
| Output alpha (ARGB8888 only) | Value must be an 8-bit integer (0-255) | 255 | Specify the alpha value to apply to each output pixel when ARGB8888 format is chosen. |
| Callback | Name must be a valid C symbol | NULL | If a callback function is provided it will be called from the interrupt service routine (ISR) each time a related IRQ triggers. |
| Encode | | | |
| Horizontal resolution | Value cannot be greater than 65535 and must be a non-negative integer divisible by 16 | 480 | Horizontal resolution of the raw image (in pixels). This value can be configured at runtime via R_JPEG_ImageSizeSet. |
| Vertical resolution | Value cannot be greater than 65535 and must be a non-negative integer divisible by 8 | 272 | Vertical resolution of the raw image. This value can be configured at runtime via R_JPEG_ImageSizeSet. |
| Horizontal stride | Value cannot be greater than 65535 and must be a non-negative integer | 480 | Horizontal stride of the raw image buffer (in pixels). This value can be configured at |

runtime via
R_JPEG_ImageSizeSet.

| | | | |
|-----------------------------------|---|------|---|
| Input byte order | MCU Specific Options | | Select the byte order of the input data for encoding. |
| Output byte order | MCU Specific Options | | Select the byte order of the output data for encoding. |
| Reset interval | Value cannot be greater than 65535 and must be a non-negative integer | 512 | Set the number of MCUs between RST markers. A value of 0 will disable DRI and RST marker output. |
| Quality factor | Value must be between 1 and 100 and must be an integer | 50 | Set the quality factor for encoding (1-100). Lower values produce smaller images at the cost of image quality. |
| Callback | Name must be a valid C symbol | NULL | If a callback function is provided it will be called from the interrupt service routine (ISR) each time a related IRQ triggers. |
| Interrupts | | | |
| Decode Process Interrupt Priority | MCU Specific Options | | Select the decompression interrupt priority. |
| Data Transfer Interrupt Priority | MCU Specific Options | | Select the data transfer interrupt priority. |

Clock Configuration

The peripheral clock for this module is PCLKA. No clocks are provided by this module.

Pin Configuration

This module does not have any input or output pin connections.

Usage Notes

Overview

The JPEG Codec contains both decode and encode hardware. While these two functions are largely independent in configuration only one can be used at a time.

To switch from decode to encode mode (or vice versa) use [R_JPEG_ModeSet](#) while the JPEG Codec is idle.

Status

The status value (`jpeg_status_t`) provided by the callback and by `R_JPEG_StatusGet` is a bitfield that encompasses all potential status indication conditions. One or more statuses can be set simultaneously.

Decoding Process

JPEG decoding can be performed in several ways depending on the application:

- To perform the simplest decode operation where all dimensions are known:
 - Set the input buffer, stride and output buffer then wait for a callback with status `JPEG_STATUS_OPERATION_COMPLETE`.
- To pause after decoding the JPEG header (in order to acquire image dimensions and secure an output buffer):
 - Call `R_JPEG_InputBufferSet` before setting the output buffer and wait for a callback with status `JPEG_STATUS_IMAGE_SIZE_READY`.
- To decode a partial JPEG image then pause until the next chunk is available:
 - Specify a size smaller than the full JPEG data when calling `R_JPEG_InputBufferSet`.
- To pause decoding once an output buffer is filled:
 - Specify a size smaller than the full decoded image when calling `R_JPEG_OutputBufferSet`.

The flowchart below illustrates the steps necessary to handle any decode operation. The statuses given in blue are part of `jpeg_status_t` with the `JPEG_DECODE_STATUS` prefix omitted.

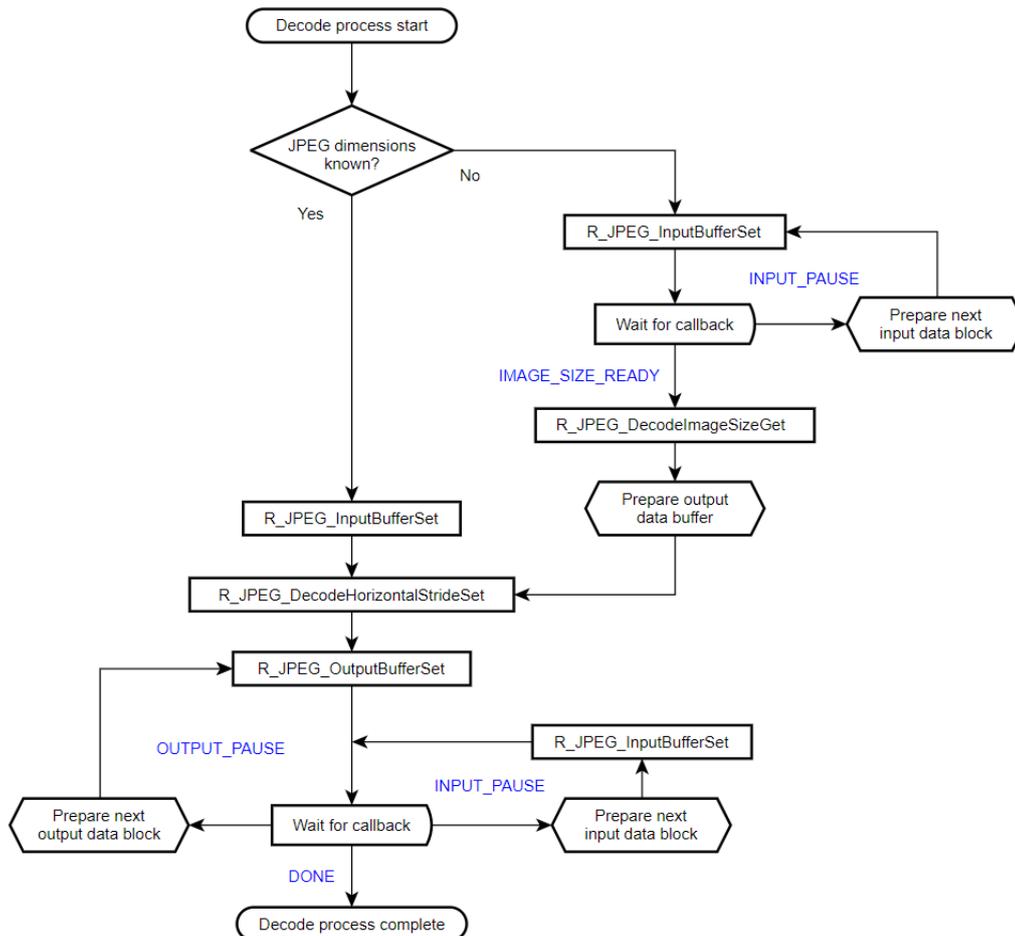

Figure 224: JPEG Decode Operational Flow

Encoding Process

As compared to decoding, encoding is fairly straightforward. The only option available is to stream input data if desired. The flowchart below details the steps needed to compress an image.

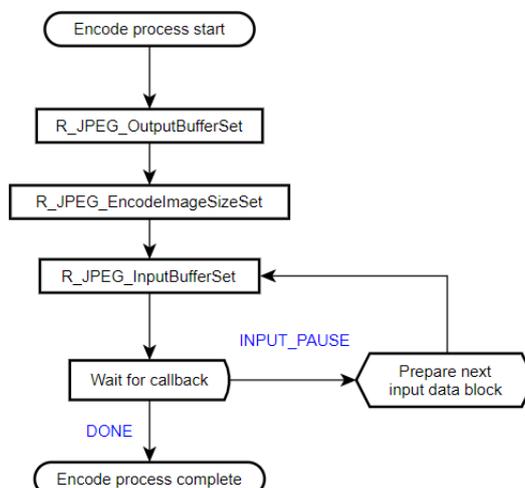

Figure 225: JPEG Encode Operational Flow

Handling Failed Operations

If an encode or decode operation fails or times out while the codec is running, the peripheral must be reset before it is used again. To reset the JPEG Codec simply close and re-open the module by calling [R_JPEG_Close](#) followed by [R_JPEG_Open](#).

Limitations

Developers should be aware of the following limitations when using the JPEG API.

Minimum Coded Unit (MCU)

The JPEG Codec can only correctly process images that are an even increment of minimum coded units (MCUs). In other words, depending on the format the width and height of an image to be encoded or decoded must be divisible by the following:

| Format | Horizontal | Vertical |
|--------------|------------|----------|
| Y'CbCr 4:4:4 | 8 pixels | 8 lines |
| Y'CbCr 4:2:2 | 16 pixels | 8 lines |
| Y'CbCr 4:1:1 | 32 pixels | 8 lines |
| Y'CbCr 4:2:0 | 16 pixels | 16 lines |

Note

Because encoding is limited to Y'CbCr 4:2:2, raw pixel input data must always be in whole increments of 16x8 pixels.

Encoding Input Format

The encoding unit only supports Y'CbCr 4:2:2 input. Raw RGB888 data can be converted to this format as follows:

```
y = (0.299000f * r) + (0.587000f * g) + (0.114000f * b);
cb = 128 - (0.168736f * r) - (0.331264f * g) + (0.500000f * b);
cr = 128 + (0.500000f * r) - (0.418688f * g) - (0.081312f * b);
```

While these equations are mathematically simple they do use the floating-point unit. To speed things up we can multiply the coefficients by 256 and divide the sum by 256...

```
y = ((76.5440f * r) + (150.272f * g) + (29.1840f * b)) / 256;
cb = 128 - ((43.1964f * r) - (84.8036f * g) + (128.000f * b)) / 256;
cr = 128 + ((128.000f * r) - (107.184f * g) - (20.8159f * b)) / 256;
```

...which allows the formulas to be calculated entirely with shifts and addition (coefficients rounded to the nearest integer):

```
y = ( (r << 6) + (r << 3) + (r << 2) + r
      + (g << 7) + (g << 4) + (g << 2) + (g << 1)
      + (b << 4) + (b << 3) + (b << 2) + b
    ) >> 8;

cb = 128 - ( (r << 5) + (r << 3) + (r << 1) + r
            + (g << 6) + (g << 4) + (g << 2) + g
            - (b << 7)
          ) >> 8;

cr = 128 + ( (r << 7)
            - (g << 6) - (g << 5) - (g << 3) - (g << 1) - g
            - (b << 4) - (b << 2) - b
          ) >> 8;
```

To compose the final Y'CbCr 4:2:2 data the chroma of every two pixels must be averaged. **In addition, the JPEG Codec expects chrominance values to be in the range -127..127 instead of the standard 1..255.**

```
cb = (uint8_t) ((int8_t) ((cb0 + cb1 + 1) >> 1) - 128);
cr = (uint8_t) ((int8_t) ((cr0 + cr1 + 1) >> 1) - 128);
```

Finally, the below equation composes two 4:2:2 output pixels at a time with standard byte order (JPEG_DATA_ORDER_NORMAL):

```
out = y0 + (cb << 8) + (y1 << 16) + (cr << 24);
```

Note

RGB565 pixels must be upscaled to RGB888 before using the above formulas. Refer to the below example on [Y'CbCr Conversion](#) for implementation details.

Examples

Basic Decode Example

This is a basic example showing the minimum code required to initialize the JPEG Codec and decode an image.

```
void jpeg_decode_basic (void)
{
    fsp_err_t err;

    /* Open JPEG Codec */
    err = R_JPEG_Open(&g_jpeg_ctrl, &g_jpeg_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Set input buffer */
    err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, JPEG_PTR, JPEG_SIZE_BYTES);
    assert(FSP_SUCCESS == err);

    /* Set horizontal stride of output buffer */
    err = R_JPEG_DecodeHorizontalStrideSet(&g_jpeg_ctrl, JPEG_HSIZE);
    assert(FSP_SUCCESS == err);

    /* Set output buffer */
    err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, decode_buffer, sizeof(decode_buffer));
    assert(FSP_SUCCESS == err);

    /* Wait for decode completion */
    jpeg_status_t status = (jpeg_status_t) 0;
    while (!(status & (JPEG_STATUS_OPERATION_COMPLETE | JPEG_STATUS_ERROR)))
    {
```

```
    err = R_JPEG_StatusGet(&g_jpeg_ctrl, &status);
    assert(FSP_SUCCESS == err);
}
}
```

Streaming Input/Output Example

In this example JPEG data is read in 512-byte chunks. Decoding is paused when a chunk is read and once the JPEG header is decoded. The image is decoded 16 lines at a time.

Note

Streaming is always bypassed when a given buffer's size encompasses the entire input or output image, respectively. Though this example decodes via smaller chunks the input and output data are still contiguous for ease of demonstration. Refer to the comments for further insight as to how to implement streaming with different JPEG/output buffer size combinations.

```
#define JPEG_INPUT_SIZE_BYTES 512U
/* JPEG Codec status */
static volatile jpeg_status_t g_jpeg_status = JPEG_STATUS_NONE;
/* JPEG event flag */
static volatile uint8_t jpeg_event = 0;
/* Callback function for JPEG decode interrupts */
void jpeg_decode_callback (jpeg_callback_args_t * p_args)
{
    /* Get JPEG Codec status */
    g_jpeg_status = p_args->status;
    /* Set JPEG flag */
    jpeg_event = 1;
}
/* Simple wait that returns 1 if no event happened within the timeout period */
static uint8_t jpeg_event_wait (void)
{
    uint32_t timeout_timer = JPEG_EVENT_TIMEOUT;
    while (!jpeg_event && --timeout_timer)
    {
        /* Spin here until an event callback or timeout */
    }
    jpeg_event = 0;
}
```

```
return timeout_timer ? 0 : 1;
}
/* Decode a JPEG image to a buffer using streaming input and output */
void jpeg_decode_streaming (void)
{
    uint8_t      * p_jpeg = (uint8_t *) JPEG_PTR;
    jpeg_status_t status = (jpeg_status_t) 0;
    uint8_t      timeout = 0;
    fsp_err_t    err;
    /* Number of input bytes to read at a time */
    uint32_t input_bytes = JPEG_INPUT_SIZE_BYTES;
    /* Open JPEG unit and start decode */
    err = R_JPEG_Open(&g_jpeg_ctrl, &g_jpeg_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    while (!(status & JPEG_STATUS_ERROR) && !timeout)
    {
        /* Set the input buffer to read `input_bytes` bytes at a time */
        err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, p_jpeg, input_bytes);
        assert(FSP_SUCCESS == err);
        /* This delay is required for streaming input mode to function correctly.
        * (Without this delay the JPEG Codec will not correctly locate markers in the file
        header.) */
        R_BSP_SoftwareDelay(10, BSP_DELAY_UNITS_MICROSECONDS);
        /* Wait for a callback */
        timeout = jpeg_event_wait();
        /* Get the status from the callback */
        status = g_jpeg_status;
        /* Break if the header has finished decoding */
        if (status & JPEG_STATUS_IMAGE_SIZE_READY)
        {
            break;
        }
        /* Move pointer to next block of input data (if needed) */
    }
}
```

```
    p_jpeg = (uint8_t *) ((uint32_t) p_jpeg + input_bytes);
}

/* Get image size */
uint16_t horizontal;
uint16_t vertical;
err = R_JPEG_DecodeImageSizeGet(&g_jpeg_ctrl, &horizontal, &vertical);
assert(FSP_SUCCESS == err);

/* Prepare output data buffer here if needed (already allocated in this example) */
uint8_t * p_output = decode_buffer;

/* Set horizontal stride */
err = R_JPEG_DecodeHorizontalStrideSet(&g_jpeg_ctrl, horizontal);
assert(FSP_SUCCESS == err);

/* Calculate the number of bytes that will fit in the buffer (16 lines in this
example) */
uint32_t output_size = horizontal * 16U * 4U;

/* Start decoding by setting the output buffer */
err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, p_output, output_size);
assert(FSP_SUCCESS == err);

while (!(status & JPEG_STATUS_ERROR) && !timeout)
{
    /* Wait for a callback */
    timeout = jpeg_event_wait();

    /* Get the status from the callback */
    status = g_jpeg_status;

    /* Break if decoding is complete */
    if (status & JPEG_STATUS_OPERATION_COMPLETE)
    {
        break;
    }

    if (status & JPEG_STATUS_OUTPUT_PAUSE)
    {
        /* Draw the JPEG work buffer to the framebuffer here (if needed) */
        /* Move pointer to next block of output data (if needed) */
        p_output += output_size;
    }
}
```

```
/* Set the output buffer to the next 16-line block */
err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, p_output, output_size);
assert(FSP_SUCCESS == err);
}

if (status & JPEG_STATUS_INPUT_PAUSE)
{
/* Get next block of input data */
p_jpeg = (uint8_t *) ((uint32_t) p_jpeg + input_bytes);
/* Set the new input buffer pointer */
err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, p_jpeg, input_bytes);
assert(FSP_SUCCESS == err);
}
}

/* Close driver to allow encode operations if needed */
err = R_JPEG_Close(&g_jpeg_ctrl);
assert(FSP_SUCCESS == err);
}
```

Encode Example

This is a basic example showing the minimum code required to initialize the JPEG Codec and encode an image.

Note

This example assumes image dimensions are provided in the configuration. If this is not the case, [R_JPEG_EncodeImageSizeSet](#) must be used to set the size before calling [R_JPEG_InputBufferSet](#).

```
void jpeg_encode_basic (void)
{
    fsp_err_t err;
    /* Open JPEG Codec */
    err = R_JPEG_Open(&g_jpeg_ctrl, &g_jpeg_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Set output buffer */
    err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, jpeg_buffer, sizeof(jpeg_buffer));
    assert(FSP_SUCCESS == err);
}
```

```
/* Set input buffer */
err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, RAW_YCBCR_IMAGE_PTR, IMAGE_SIZE_BYTES);
assert(FSP_SUCCESS == err);

/* Wait for decode completion */
jpeg_status_t status = (jpeg_status_t) 0;
while (!(status & JPEG_STATUS_OPERATION_COMPLETE))
{
    err = R_JPEG_StatusGet(&g_jpeg_ctrl, &status);
    assert(FSP_SUCCESS == err);
}
}
```

Streaming Encode Example

In this example the raw input data is provided in smaller chunks. This can help significantly reduce buffer size and improve throughput when streaming in raw data from an outside source.

```
/* Callback function for JPEG encode interrupts */
void jpeg_encode_callback (jpeg_callback_args_t * p_args)
{
    /* Get JPEG Codec status */
    g_jpeg_status = p_args->status;

    /* Set JPEG flag */
    jpeg_event = 1;
}

void jpeg_encode_streaming (void)
{
    uint8_t timeout = 0;
    uint8_t * p_chunk = (uint8_t *) RAW_YCBCR_IMAGE_PTR;

    fsp_err_t err;

    /* Open JPEG Codec */
    err = R_JPEG_Open(&g_jpeg_ctrl, &g_jpeg_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Set output buffer */
```

```
err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, jpeg_buffer, sizeof(jpeg_buffer));
assert(FSP_SUCCESS == err);
/* Set the image size */
jpeg_encode_image_size_t image_size;
image_size.horizontal_resolution = X_RESOLUTION;
image_size.vertical_resolution = Y_RESOLUTION;
image_size.horizontal_stride_pixels = H_STRIDE;
err = R_JPEG_EncodeImageSizeSet(&g_jpeg_ctrl, &image_size);
assert(FSP_SUCCESS == err);
/* Calculate the size of the input data chunk (16 lines in this example) */
uint32_t chunk_size = H_STRIDE * 16U * YCBCR_BYTES_PER_PIXEL;
while (!timeout)
{
/* Set the input buffer */
err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, p_chunk, chunk_size);
assert(FSP_SUCCESS == err);
/* Wait for a callback */
timeout = jpeg_event_wait();
if (g_jpeg_status & JPEG_STATUS_OPERATION_COMPLETE)
{
/* Encode complete */
break;
}
if (g_jpeg_status & JPEG_STATUS_INPUT_PAUSE)
{
/* Load next block of input data here (if needed) */
p_chunk += chunk_size;
}
}
}
```

Y'CbCr Conversion

The below function is provided as a reference for how to convert RGB values to Y'CbCr for use with the JPEG Codec.

Note

This function is only partially optimized for clarity. Further application-specific size- or speed-based optimizations should be considered when implementing in an actual project.

```
#define RGB565_G_MASK 0x07E0
#define RGB565_B_MASK 0x001F
#define C_0 128
typedef enum e_pixel_format
{
    PIXEL_FORMAT_ARGB8888,
    PIXEL_FORMAT_RGB565
} pixel_format_t;
/* 5-bit to 8-bit LUT */
const uint8_t lut_32[] =
{
    0,  8,  16, 25, 33, 41, 49, 58,
    66, 74, 82, 90, 99, 107, 115, 123,
    132, 140, 148, 156, 165, 173, 181, 189,
    197, 206, 214, 222, 230, 239, 247, 255
};
/* 6-bit to 8-bit LUT */

| uint16_t | total_lines_decoded | Track the number of lines decoded so far. |
| jpeg_decode_subsampling_t | horizontal_subsampling | Horizontal sub-sample setting. |
| uint16_t | lines_to_encode | Number of lines to encode. |
| uint16_t | vertical_resolution | vertical size |
| uint16_t | total_lines_encoded | Number of lines encoded. |

Function Documentation

◆ R_JPEG_Open()

```
fsp_err_t R_JPEG_Open ( jpeg_ctrl_t *const p_api_ctrl, jpeg_cfg_t const *const p_cfg )
```

Initialize the JPEG Codec module.

Note

This function configures the JPEG Codec for operation and sets up the registers for data format and pixel format based on user-supplied configuration parameters. Interrupts are enabled to support callbacks.

Return values

| | |
|---------------------------|---|
| FSP_SUCCESS | JPEG Codec module is properly configured and is ready to take input data. |
| FSP_ERR_ALREADY_OPEN | JPEG Codec is already open. |
| FSP_ERR_ASSERTION | Pointer to the control block or the configuration structure is NULL. |
| FSP_ERR_IRQ_BSP_DISABLED | JEDI interrupt does not have an IRQ number. |
| FSP_ERR_INVALID_ARGUMENT | (Encode only) Quality factor, horizontal resolution and/or vertical resolution are invalid. |
| FSP_ERR_INVALID_ALIGNMENT | (Encode only) The horizontal resolution (at 16bpp) is not divisible by 8 bytes. |

◆ R_JPEG_OutputBufferSet()

```
fsp_err_t R_JPEG_OutputBufferSet ( jpeg_ctrl_t * p_api_ctrl, void * p_output_buffer, uint32_t
output_buffer_size )
```

Assign a buffer to the JPEG Codec for storing output data.

Note

In Decode mode, the number of image lines to be decoded depends on the size of the buffer and the horizontal stride settings. Once the output buffer size is known, the horizontal stride value is known, and the input pixel format is known (the input pixel format is obtained by the JPEG decoder from the JPEG headers), the driver automatically computes the number of lines that can be decoded into the output buffer. After these lines are decoded, the JPEG engine pauses and a callback function is triggered, so the application is able to provide the next buffer for the JPEG module to resume the operation.

The JPEG decoding operation automatically starts after both the input buffer and the output buffer are set and the output buffer is big enough to hold at least eight lines of decoded image data.

Return values

| | |
|-------------------------------------|---|
| FSP_SUCCESS | The output buffer is properly assigned to JPEG codec device. |
| FSP_ERR_ASSERTION | Pointer to the control block or output_buffer is NULL or output_buffer_size is 0. |
| FSP_ERR_INVALID_ALIGNMENT | Buffer starting address is not 8-byte aligned. |
| FSP_ERR_NOT_OPEN | JPEG not opened. |
| FSP_ERR_JPEG_UNSUPPORTED_IMAGE_SIZE | The number of horizontal pixels exceeds horizontal memory stride. |
| FSP_ERR_JPEG_BUFFERSIZE_NOT_ENOUGH | Invalid buffer size. |
| FSP_ERR_IN_USE | The output buffer cannot be changed during codec operation. |

◆ R_JPEG_InputBufferSet()

```
fsp_err_t R_JPEG_InputBufferSet ( jpeg_ctrl_t *const p_api_ctrl, void * p_data_buffer, uint32_t
data_buffer_size )
```

Assign an input data buffer to the JPEG codec for processing.

Note

After the amount of data is processed, the JPEG driver triggers a callback function with the flag JPEG_PRV_OPERATION_INPUT_PAUSE set. The application supplies the next chunk of data to the driver so processing can resume.

The JPEG decoding operation automatically starts after both the input buffer and the output buffer are set, and the output buffer is big enough to hold at least one line of decoded image data.

If zero is provided for the decode data buffer size the JPEG Codec will never pause for more input data and will continue to read until either an image has been fully decoded or an error condition occurs.

Note

When encoding images the minimum data buffer size is 8 lines by 16 Y'CbCr 4:2:2 pixels (256 bytes). This corresponds to one minimum coded unit (MCU) of the resulting JPEG output.

Return values

| | |
|-------------------------------|--|
| FSP_SUCCESS | The input data buffer is properly assigned to JPEG Codec device. |
| FSP_ERR_ASSERTION | Pointer to the control block is NULL, or the pointer to the input_buffer is NULL, or the input_buffer_size is 0. |
| FSP_ERR_INVALID_ALIGNMENT | Buffer starting address is not 8-byte aligned. |
| FSP_ERR_NOT_OPEN | JPEG not opened. |
| FSP_ERR_IN_USE | The input buffer cannot be changed while the codec is running. |
| FSP_ERR_INVALID_CALL | In encode mode the output buffer must be set first. |
| FSP_ERR_JPEG_IMAGE_SIZE_ERROR | The buffer size is smaller than the minimum coded unit (MCU). |

◆ **R_JPEG_DeclineLinesDecodedGet()**

```
fsp_err_t R_JPEG_DeclineLinesDecodedGet ( jpeg_ctrl_t * p_api_ctrl, uint32_t * p_lines )
```

Returns the number of lines decoded into the output buffer.

Note

Use this function to retrieve the number of image lines written to the output buffer after a partial decode operation. Combined with the horizontal stride settings and the output pixel format the application can compute the amount of data to read from the output buffer.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Line count successfully returned. |
| FSP_ERR_ASSERTION | Pointer to the control block or p_lines is NULL. |
| FSP_ERR_NOT_OPEN | JPEG not opened. |

◆ **R_JPEG_DeclineImageSubsampleSet()**

```
fsp_err_t R_JPEG_DeclineImageSubsampleSet ( jpeg_ctrl_t *const p_api_ctrl,
jpeg_decode_subsample_t horizontal_subsample, jpeg_decode_subsample_t vertical_subsample )
```

Configure horizontal and vertical subsampling.

Note

This function can be used to scale the output of decoded image data.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Horizontal subsample value is properly configured. |
| FSP_ERR_ASSERTION | Pointer to the control block is NULL. |
| FSP_ERR_NOT_OPEN | JPEG not opened. |

◆ R_JPEG_DeCodeHorizontalStrideSet()

```
fsp_err_t R_JPEG_DeCodeHorizontalStrideSet ( jpeg_ctrl_t * p_api_ctrl, uint32_t horizontal_stride )
```

Configure horizontal stride setting for decode operations.

Note

If the image size is known prior to the open call and/or the output buffer stride is constant, pass the horizontal stride value in the `jpeg_cfg_t` structure. Otherwise, after the image size becomes available use this function to set the output buffer horizontal stride value.

Return values

| | |
|---------------------------|---|
| FSP_SUCCESS | Horizontal stride value is properly configured. |
| FSP_ERR_ASSERTION | Pointer to the control block is NULL. |
| FSP_ERR_INVALID_ALIGNMENT | Horizontal stride is zero or is not 8-byte aligned. |
| FSP_ERR_NOT_OPEN | JPEG not opened. |

◆ R_JPEG_DeCodeImageSizeGet()

```
fsp_err_t R_JPEG_DeCodeImageSizeGet ( jpeg_ctrl_t * p_api_ctrl, uint16_t * p_horizontal_size, uint16_t * p_vertical_size )
```

Obtain the size of an image being decoded.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | The image size is available and the horizontal and vertical values are stored in the memory pointed to by <code>p_horizontal_size</code> and <code>p_vertical_size</code> . |
| FSP_ERR_ASSERTION | Pointer to the control block is NULL and/or size is not ready. |
| FSP_ERR_NOT_OPEN | JPEG is not opened. |

◆ R_JPEG_DeclarePixelFormatGet()

```
fsp_err_t R_JPEG_DeclarePixelFormatGet ( jpeg_ctrl_t * p_api_ctrl, jpeg_color_space_t *
p_color_space )
```

Get the color format of the JPEG being decoded.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | The color format was successfully retrieved. |
| FSP_ERR_ASSERTION | Pointer to the control block is NULL. |
| FSP_ERR_NOT_OPEN | JPEG is not opened. |

◆ R_JPEG_EncodeImageSizeSet()

```
fsp_err_t R_JPEG_EncodeImageSizeSet ( jpeg_ctrl_t *const p_api_ctrl, jpeg_encode_image_size_t *
p_image_size )
```

Set the image dimensions for an encode operation.

Note

Image dimensions must be set before setting the input buffer.

Return values

| | |
|---------------------------|--|
| FSP_SUCCESS | Image size was successfully written to the JPEG Codec. |
| FSP_ERR_ASSERTION | Pointer to the control block or p_image_size is NULL. |
| FSP_ERR_INVALID_ALIGNMENT | Horizontal stride is not 8-byte aligned. |
| FSP_ERR_INVALID_ARGUMENT | Horizontal or vertical resolution is invalid or zero. |
| FSP_ERR_NOT_OPEN | JPEG not opened. |
| FSP_ERR_IN_USE | Image parameters cannot be changed while the codec is running. |

◆ **R_JPEG_ModeSet()**

```
fsp_err_t R_JPEG_ModeSet ( jpeg_ctrl_t *const p_api_ctrl, jpeg_mode_t mode )
```

Switch between encode and decode mode (or vice-versa).

Note

The codec must not be idle in order to switch modes.

Return values

| | |
|---------------------------|---|
| FSP_SUCCESS | Mode changed successfully. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_IN_USE | JPEG Codec is currently in use. |
| FSP_ERR_INVALID_ARGUMENT | (Encode only) Quality factor, horizontal resolution and/or vertical resolution are invalid. |
| FSP_ERR_INVALID_ALIGNMENT | (Encode only) The horizontal resolution (at 16bpp) is not divisible by 8 bytes. |

◆ **R_JPEG_Close()**

```
fsp_err_t R_JPEG_Close ( jpeg_ctrl_t * p_api_ctrl)
```

Cancel an outstanding JPEG codec operation and close the device.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | The JPEG unit is stopped and the driver is closed. |
| FSP_ERR_ASSERTION | Pointer to the control block is NULL. |
| FSP_ERR_NOT_OPEN | JPEG not opened. |

◆ R_JPEG_StatusGet()

```
fsp_err_t R_JPEG_StatusGet ( jpeg_ctrl_t * p_api_ctrl, jpeg_status_t * p_status )
```

Get the status of the JPEG codec. This function can also be used to poll the device.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | The status information is successfully retrieved. |
| FSP_ERR_ASSERTION | Pointer to the control block or p_status is NULL. |
| FSP_ERR_NOT_OPEN | JPEG is not opened. |

5.2.8.6 MIPI Display Serial Interface (r_mipi_dsi)

Modules » Graphics

Functions

```
fsp_err_t R_MIPI_DSI_Open ( mipi_dsi_ctrl_t *const p_api_ctrl, mipi_dsi_cfg_t
const *const p_cfg)
```

```
fsp_err_t R_MIPI_DSI_Close ( mipi_dsi_ctrl_t *const p_api_ctrl)
```

```
fsp_err_t R_MIPI_DSI_Start ( mipi_dsi_ctrl_t *const p_api_ctrl)
```

```
fsp_err_t R_MIPI_DSI_Stop ( mipi_dsi_ctrl_t *const p_api_ctrl)
```

```
fsp_err_t R_MIPI_DSI_UlpsEnter ( mipi_dsi_ctrl_t *const p_api_ctrl,
mipi_dsi_lane_t lane)
```

```
fsp_err_t R_MIPI_DSI_UlpsExit ( mipi_dsi_ctrl_t *const p_api_ctrl, mipi_dsi_lane_t
lane)
```

```
fsp_err_t R_MIPI_DSI_Command ( mipi_dsi_ctrl_t *const p_api_ctrl,
mipi_dsi_cmd_t *p_cmd)
```

```
fsp_err_t R_MIPI_DSI_StatusGet ( mipi_dsi_ctrl_t *const p_api_ctrl,
mipi_dsi_status_t *p_status)
```

Detailed Description

Driver for the MIPI DSI peripheral on RA MCUs. This module implements the [Display Interface](#).

Overview

The MIPI DSI peripheral consists of the Display Serial Interface (DSI-2) Host, physical layer (D-PHY), and supporting sub-systems. Together, these form a high-speed graphics serial bus that formats data from the GLCDC layer and sends it to an external display. The DSI-2 and D-Phy support MIPI Alliance Specification 2 and 2.1 respectively.

Features

The following features are available:

| Feature | Options |
|--------------------|------------------------------------|
| Pixel formats | RGB888, RGB666, RGB565 |
| Number of lanes | Up to 2 |
| Maximum resolution | See GLCDC specifications |
| Maximum bandwidth | Up to 750 Mbps per high-speed lane |

Features:

- Supports up to 2 Lanes.
- Bidirectional LP mode transfer/receipt (LP-TX / LP-RX).
- Unidirectional High-Speed mode transfer (HS-TX).
- Data rates of up to 720 Mbps per lane.
- Ultra-Low-Power State (ULPS).
- Video input from GLCDC (RGB888, RGB666, RGB565).
- ECC/Checksum generation and verification for packets.
- Generation of scrambled packets.
- Automatic transition from HP to LP during blanking/porch periods.

Configuration

Build Time Configurations for r_mipi_dsi

The following build time configurations are defined in fsp_cfg/r_mipi_dsi_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Graphics > MIPI Physical Layer (r_mipi_phy)

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

General

| | | | |
|------|-------------------------------|-------------|--------------|
| Name | Name must be a valid C symbol | g_mipi_phy0 | Module name. |
|------|-------------------------------|-------------|--------------|

Timing

Timing > THSPREP

| | | | |
|----|--|----|---|
| ns | Value must be a number, greater than or equal to zero. | 40 | (Nanosecond portion) Duration of the data lane LP-00 state, immediately before entry to the HS-0 state (ns) |
| UI | Value must be a number, greater than or equal to zero. | 5 | (UI portion) Duration of the data lane LP-00 state, immediately before entry to the HS-0 state (UI) |

Timing > THSZERO

| | | | |
|----|--|-----|--|
| ns | Value must be a number, greater than or equal to zero. | 140 | (Nanosecond portion) Specify the data lane zero time before sending data (ns). |
| UI | Value must be a number, greater than or equal to zero. | 10 | (UI portion) Specify the data lane zero time before sending data (UI). |

Timing > THSTRAIL

| | | | |
|----|--|----|--|
| ns | Value must be a number, greater than or equal to zero. | 60 | (Nanosecond portion) Specify the data lane trail time before exiting HS mode (ns). |
| UI | Value must be a number, greater than or equal to zero. | 4 | (UI portion) Specify the data lane trail time before exiting HS mode (UI). |

Timing > TCLKPOST

| | | | |
|----|--|----|--|
| ns | Value must be a number, greater than or equal to zero. | 60 | (Nanosecond portion) Specify the duration after HS data lane trail time elapses before stopping the clock lane (ns). |
| UI | Value must be a number, greater than or equal to zero. | 52 | (UI portion) Specify the duration after HS data lane trail time elapses before stopping the clock lane (UI). |

Timing > TCLKPRE

| | | | |
|----|--|---|--|
| ns | Value must be a number, greater than or equal to zero. | 0 | (Nanosecond portion) Specify the time clock is active before transitioning data lane |
|----|--|---|--|

into HS mode (ns).

| | | | |
|----|--|---|---|
| UI | Value must be a number, greater than or equal to zero. | 8 | (UI portion) Specify the time clock is active before transitioning data lane into HS mode (UI). |
|----|--|---|---|

Timing > TCLKPREP

| | | | |
|----|--|----|--|
| ns | Value must be a number, greater than or equal to zero. | 75 | (Nanosecond portion) Duration of the clock lane LP-00 state, immediately before entry to the HS-0 state (ns) |
|----|--|----|--|

| | | | |
|----|--|---|--|
| UI | Value must be a number, greater than or equal to zero. | 0 | (UI portion) Duration of the clock lane LP-00 state, immediately before entry to the HS-0 state (UI) |
|----|--|---|--|

Timing > TLPX

| | | | |
|----|--|----|---|
| ns | Value must be a number, greater than or equal to zero. | 60 | (Nanosecond portion) Specify the time for the clock lane to exit low power mode (ns). |
|----|--|----|---|

| | | | |
|----|--|---|---|
| UI | Value must be a number, greater than or equal to zero. | 0 | (UI portion) Specify the time for the clock lane to exit low power mode (UI). |
|----|--|---|---|

Timing > TCLKTRL

| | | | |
|----|--|----|--|
| ns | Value must be a number, greater than or equal to zero. | 60 | (Nanosecond portion) Specify the time after clock lane stop before exiting HS mode (ns). |
|----|--|----|--|

| | | | |
|----|--|---|--|
| UI | Value must be a number, greater than or equal to zero. | 0 | (UI portion) Specify the time after clock lane stop before exiting HS mode (UI). |
|----|--|---|--|

Timing > TCLKZERO

| | | | |
|----|--|-----|---|
| ns | Value must be a number, greater than or equal to zero. | 230 | (Nanosecond portion) Specify the time clock lane is zero before starting in HS mode (ns). |
|----|--|-----|---|

| | | | |
|----|--|---|--|
| UI | Value must be a number, greater than or equal to zero. | 0 | (UI portion) Specify the time clock lane is zero before starting in HS mode (UI) |
|----|--|---|--|

Timing > THSEXIT

| | | | |
|-------------------------|--|---------|--|
| ns | Value must be a number, greater than or equal to zero. | 100 | (Nanosecond portion) Specify the data lane HS mode exit time (ns). |
| UI | Value must be a number, greater than or equal to zero. | 0 | (UI portion) Specify the data lane HS mode exit time (UI) |
| LP Clock Divider | Value must be an integer. | 5 | Specify the MIPI PHY LP clock division ratio (Resulting frequency must be from 2-17 MHz) |
| TINIT (ns) | Value must be a number, greater than or equal to zero. | 600000 | Minimum duration of the TINIT state (ns) |
| DSI PLL Frequency (MHz) | Value must be between 160 MHz and 1440.0 MHz. | 1000.00 | Specify the MIPI PHY PLL frequency in MHz. |

Configurations for Graphics > MIPI Display (r_mipi_dsi)

| Configuration | Options | Default | Description |
|-----------------------|---|-------------|---|
| General | | | |
| Name | Name must be a valid C symbol | g_mipi_dsi0 | Module name. |
| Options | | | |
| LCD External Clock Hz | Value must be an integer. | 0 | Specify the GLCDC external clock frequency in Hz (Set to 0 when GLCDC clock source is set to Internal). |
| Data Scramble Enable | <ul style="list-style-type: none"> • Disable • Enable | Disable | Data Scramble Enable. Do not enable unless peripheral has data scramble function. |
| EoTP Enable | <ul style="list-style-type: none"> • Disable • Enable | Enable | Disable to support devices that do not support EoTP transmission. |
| ECC Check Enable | <ul style="list-style-type: none"> • Disable • Enable | Enable | ECC Check support enable. |
| CRC Enable | <ul style="list-style-type: none"> • Virtual Channel 0 • Virtual Channel 1 • Virtual Channel | | |

- 2
 • Virtual Channel
 3

| | | | |
|--|---|--------|--|
| Maximum Return Packet Size | Value must be an integer. | 1 | Specify the maximum return packet size to be received in LP-RX mode. |
| External Tearing Effect Detection Sense Select | <ul style="list-style-type: none"> • Rising Edge • Falling Edge | 1 | Specify the maximum return packet size to be received in LP-RX mode. |
| HS-TX Timeout Count (us) | Value must be an integer. | 0 | Set LP-RX Timeout (LRX-H_TO) value. (0 is disabled) |
| LP-RX Host Processor Timeout (us) | Value must be an integer. | 0 | Set LP-RX Timeout (LRX-H_TO) value. (0 is disabled) |
| Turnaround Acknowledge Timeout (us) | Value must be an integer. | 0 | Set Turnaround Acknowledge Timeout value. (0 is disabled) |
| Peripheral Response Timeout (us) | Value must be an integer. | 0 | Set Peripheral Response Timeout BTA value. (0 is disabled) |
| LP Write Response Timeout (us) | Value must be an integer. | 0 | Set Low Power Write Acknowledge Timeout value. (0 is disabled) |
| LP Read Response Timeout (us) | Value must be an integer. | 0 | Set Low Power Read Acknowledge Timeout value. (0 is disabled) |
| HS Write Response Timeout (us) | Value must be an integer. | 0 | Set High Speed Write Acknowledge Timeout value. (0 is disabled) |
| HS Read Response Timeout (us) | Value must be an integer. | 0 | Set High Speed Read Acknowledge Timeout value. (0 is disabled) |
| Low Power | | | |
| Ultra Low Power State Wakeup Period (us) | Value must be a positive integer or zero. | 1000 | Set ultra low power state wakeup period (us). |
| Clock Lane | | | |
| Continuous Mode | <ul style="list-style-type: none"> • Disable • Enable | Enable | Enable or disable continuous clock mode. |
| Data Lane | | | |
| Number of Data Lanes | Value must be an integer. | 2 | Specify the number of data lanes. Note: not |

all data lanes are capable of HS operation. See Usage Notes for additional information.

Video Mode

Video Mode > Pixel Packet

| | | | |
|-------------------------------|---|---------------------------------|---|
| Sync Pulse | <ul style="list-style-type: none"> • HSE and VSE are not transmitted • HSE and VSE are transmitted | HSE and VSE are not transmitted | Select if HSE and VSE are transmitted. Disable for Burst Mode sequence or Non-Burst Mode with Sync Events. |
| Virtual Channel ID | Value must be an integer. | 0 | Select the video mode virtual channel ID. |
| Delay Override (0 to disable) | Value must be an integer. | 0 | Override FSP calculated delay value (not recommended for most users). Delay for DSI Host between first data reception from display module until DSI output begins. (Unit: 32xUI). Set to 0 to use FSP calculated value (recommended). |
| Prevent LP Transition | <ul style="list-style-type: none"> • No LP during the HSA period • No LP during the HBP period • No LP during the HFP period | | Prevent LP transition during specified periods. |

| | | <ul style="list-style-type: none"> • Data Fail • Receive Correctable Error Interrupt • Receive Acknowledge and Error Report Packet | driver.mipi_dsi.sqch1ie. rxcorerr,module.driver. mipi_dsi.sqch1ie.rxake | |
| Callback | Name must be a valid C symbol | | mipi_dsi0_callback | A user callback function. If this callback function is provided it is called from the interrupt service routine (ISR) each time any interrupt occurs. |
| Callback Context | Name must be a valid C symbol | | NULL | Pointer to the context structure to be passed through the callback argument. |

Clock Configuration

The MIPI DSI D-PHY has a dedicated regulator (D-PHY LDO) and PLL (D-PHY PLL), which are managed by the driver. The D-PHY PLL frequency must be configured between 160 MHz and 1.44 GHz.

Note

The D-PHY High-Speed data transmission rate is determined by the following formula: Line rate [Mbps] = $f_{DPHYPLL}$ [MHz] / 2

Pin Configuration

Communication to the external display occurs via one or more data lanes and one clock lane. Each of these lanes has dedicated pins. Lane 0 is capable of low-power data transfer and bidirectional communication with a display. Lane 1 is capable of low-power or high-speed data transfer to the external display. Additionally, an optional tearing effect connection (DSI_TE) may be used with this module.

Usage Notes

Display Data

The DSI-2 Host consumes data from the GLCDC module and prepares it for output via the D-PHY and connections to the display.

MIPI DSI Operating Modes

MIPI DSI is capable of several operating modes: Non-Burst Mode with Sync Pulse, Non-Burst Mode with Sync Event, and Burst Mode. Each operational mode is achieved by configuring the peripheral with specific timing and option settings.

Non-Burst Mode with Sync Pulse:

- GLCDC Video Clock bandwidth == MIPI Phy PLL bandwidth

- Sync Pulse is enabled (HSE and VSE are transmitted)

Non-Burst Mode with Sync Event:

- GLCDC Video Clock bandwidth == MIPI Phy PLL bandwidth
- Sync Pulse is disabled (HSE and VSE are not transmitted)

Burst Mode:

- GLCDC Video Clock bandwidth < MIPI Phy PLL bandwidth
- Sync Pulse is disabled (HSE and VSE are not transmitted)

For the purpose of this section:

- GLCDC Video Clock bandwidth is defined as: (Panel Clock MHz) * (Bits per pixel)
- MIPI Phy PLL bandwidth is defined as: (MIPI Phy PLL Clock MHz / 2) * (Number of MIPI data lanes) * 8 - (Configuration Dependent Transmission Overhead)

MIPI PHY Data Lanes

The DSI-2 Host supports two basic types of operations: Command Mode and Video Mode. While a data lane is in Low-Power (LP) operation, Command Mode may be used for bi-directional communication with a connected display using a pre-defined set of command descriptors.

Note

GLCDC Video Clock bandwidth must not exceed Data Bus bandwidth or MIPI Phy PLL bandwidth.

MIPI PHY Timing Configuration

The MIPI DSI D-PHY configuration controls timing aspects of Low Power (LP) and High Speed (HS) communication. Configure these values to match specifications listed in the datasheet for the display.

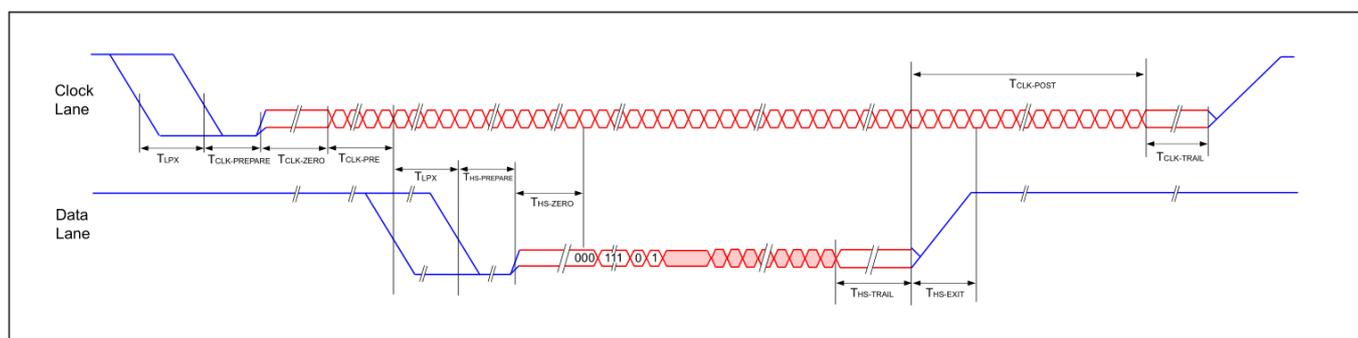

Figure 226: High-Speed data transmission in normal mode

Command Mode Operation

Two internal channels may be used for command mode operations, available for all physical lane configurations. Channel-0 supports only LP mode (LP-TX, LP-RX), while Channel-1 supports LP mode (LP-TX, LP-RX) and HS mode (HS-TX).

There are two basic packet formats, short and long. Each format may be transmitted in high-speed or low-power modes. Packets may be followed by a Bus Turn-Around (BTA) request for reading

information from the display. Once configured and started, video packets are transmitted automatically, until video output is stopped.

In addition to the full set of MIPI DSI commands, the application may trigger any of four special commands by setting flags in the message structure. These special commands are Reset Signal, Initial Skew Calibration, Periodic Skew Calibration, and No-Operation.

Note

For peripherals with more than one lane, physical Lane 0 is used for all peripheral-to-processor transmissions. Other lanes are unidirectional, from the host processor to the peripheral.

Acknowledge and Error Reporting

The application is notified of Acknowledge and Error Reporting (AwER) via an optional receive interrupt event. The most recent and accumulated AwER data may be retrieved by calling [R_MIPI_DSI_StatusGet\(\)](#). The application may send a [MIPI_DSI_CMD_FLAG_BTA_NO_WRITE](#) message with tx size of zero to request AwER from the peripheral.

Ultra-low Power State

Ultra-low Power State (ULPS) may be activated when HS and LP operations are not occurring. Clock and Data lanes may be transitioned into ULPS independently from each other.

Limitations

Developers should be aware of the following limitations when using the MIPI DSI API:

- MIPI DSI must be closed before transitioning MCU into low-power modes.
- Data bus bandwidth limitations should be considered when setting GLCDC and MIPI DSI clock speeds.
- When the MIPI DSI is used, voltage of VCC and AVCC_MIPi pin must be same and 3V or larger($VCC=AVCC_MIPi \geq 3V$)

Interrupt Configuration

When enabled, Interrupts will invoke the configured callback function. Low-power and High-Speed command status should be determined by checking Sequence 0 and Sequence 1 events, respectively. See the DSI Error Handling section of the user manual for information about how to handle error events.

MIPI DSI Setup with External Display

Especially for use with display middleware such as emWin or GUIX, the callback will be invoked with post-open and pre-video-start events. Depending on your hardware, it may be necessary to use these events to configure the display.

Examples

Basic Example

This is a basic example showing the minimum code required to initialize and start the MIPI DSI module.

```
void mipi_dsi_minimal_example (void)
```

```
{
    fsp_err_t err = FSP_SUCCESS;

    err = R_MIPI_DSI_Open(&g_mipi_dsi0_ctrl, &g_mipi_dsi0_cfg);
    assert(FSP_SUCCESS == err);

    /* Application to perform display specific initialization. */
    uint8_t cmd_tx_buffer[] = {0x30, 0x01}; // NOLINT(readability-magic-
numbers)

    mipi_dsi_cmd_t cmd =
    {
        .channel = 0,
        .cmd_id = MIPI_DSI_CMD_ID_DCS_SHORT_WRITE_1_PARAM,
        .flags = (mipi_dsi_cmd_flag_t) (MIPI_DSI_CMD_FLAG_LOW_POWER |
MIPI_DSI_CMD_FLAG_BTA_READ),
        .tx_len = 1,
        .p_tx_buffer = cmd_tx_buffer,
    };

    err = R_MIPI_DSI_Command(&g_mipi_dsi0_ctrl, &cmd);
    assert(FSP_SUCCESS == err);

    /* Wait for tx/rx complete before sending additional messages */
    while (!message_tx_complete)
    {
        ;
    }

    while (!message_rx_complete)
    {
        ;
    }

    err = R_MIPI_DSI_Start(&g_mipi_dsi0_ctrl);
    assert(FSP_SUCCESS == err);

    /* Trigger status message from peripheral by sending LP BTA
    * NOTE: This is required for ack_err status data to be populated */
    mipi_dsi_cmd_t read_cmd = {0};

    read_cmd.cmd_id = MIPI_DSI_CMD_ID_DCS_READ;
    read_cmd.flags |= MIPI_DSI_CMD_FLAG_BTA_NO_WRITE | MIPI_DSI_CMD_FLAG_LOW_POWER;
```

```
message_rx_complete = false;

err                = R_MIPI_DSI_Command(&g_mipi_dsi0_ctrl, &read_cmd);
assert(FSP_SUCCESS == err);

while (!message_rx_complete)
{
    ;
}

/* Read peripheral and local MIPI DSI status
 * Note: peripheral ack_err status is cleared each time it is read using StatusGet
 */
mipi_dsi_status_t status;

err = R_MIPI_DSI_StatusGet(&g_mipi_dsi0_ctrl, &status);
assert(FSP_SUCCESS == err);

err = R_MIPI_DSI_Stop(&g_mipi_dsi0_ctrl);
assert(FSP_SUCCESS == err);

err = R_MIPI_DSI_UlpsEnter(&g_mipi_dsi0_ctrl, (mipi_dsi_lane_t)
(MIPI_DSI_LANE_CLOCK | MIPI_DSI_LANE_DATA_ALL));
assert(FSP_SUCCESS == err);

err = R_MIPI_DSI_UlpsExit(&g_mipi_dsi0_ctrl, (mipi_dsi_lane_t)
(MIPI_DSI_LANE_CLOCK | MIPI_DSI_LANE_DATA_ALL));
assert(FSP_SUCCESS == err);

err = R_MIPI_DSI_Close(&g_mipi_dsi0_ctrl);
assert(FSP_SUCCESS == err);
}

void mipi_dsi0_callback (mipi_dsi_callback_args_t * p_args)
{
    switch (p_args->event)
    {
        case MIPI_DSI_EVENT_POST_OPEN:
            {
                /* Application to configure peripheral using necessary interface and commands */
                configure_dsi_peripheral();
            }
        break;
    }
}
```

```

case MIPI_DSI_EVENT_RECEIVE:
    {
    /* Application to perform receive processing */
        message_rx_complete = true;

    break;
    }
case MIPI_DSI_EVENT_SEQUENCE_0:
    {
        message_tx_complete = (p_args->tx_status ==
MIPI_DSI_SEQUENCE_STATUS_DESCRIPTOR_FINISHED);

    break;
    }
default:
    {
    break;
    }
}
}
void configure_dsi_peripheral (void)
{
    /* Send necessary commands to configure LCD */
}

Function Documentation

◆ R_MIPI_DSI_Open()

```
fsp_err_t R_MIPI_DSI_Open ( mipi_dsi_ctrl_t *const p_api_ctrl, mipi_dsi_cfg_t const *const p_cfg )
```

Initialize the MIPI DSI peripheral.

Return values

| | |
|-----------------------|---|
| FSP_SUCCESS | The channel was successfully opened. |
| FSP_ERR_ASSERTION | One or both of the parameters was NULL. |
| FSP_ERR_ALREADY_OPEN | The instance is already opened. |
| FSP_ERR_INVALID_STATE | Display module must be opened before DSI. |

◆ **R_MIPI_DSI_Close()**

```
fsp_err_t R_MIPI_DSI_Close ( mipi_dsi_ctrl_t *const p_api_ctrl)
```

Close MIPI DSI and display data instances, disable interrupts, and power-off the module.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | The channel is successfully closed. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Instance is not open. |
| FSP_ERR_IN_USE | Operation in progress and must be stopped before closing. |

◆ **R_MIPI_DSI_Start()**

```
fsp_err_t R_MIPI_DSI_Start ( mipi_dsi_ctrl_t *const p_api_ctrl)
```

Start video output. Initialize Video Output Registers Perform sequence steps 3 to 5 from section 58.3.6.1 in RA8D1 hardware manual R01UH0995EJ0060.

Return values

| | |
|-----------------------|--|
| FSP_SUCCESS | Data is successfully written to the D/A Converter. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Instance is not open. |
| FSP_ERR_IN_USE | The physical interface is currently in use. |
| FSP_ERR_INVALID_STATE | DSI is already in video mode. |

◆ **R_MIPI_DSI_Stop()**

```
fsp_err_t R_MIPI_DSI_Stop ( mipi_dsi_ctrl_t *const p_api_ctrl)
```

Stop video output.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Data is successfully written to the D/A Converter. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Instance is not open. |
| FSP_ERR_IN_USE | DSI cannot be closed while ULPS is active. |

◆ **R_MIPI_DSI_UlpsEnter()**

```
fsp_err_t R_MIPI_DSI_UlpsEnter ( mipi_dsi_ctrl_t *const p_api_ctrl, mipi_dsi_lane_t lane )
```

Enter Ultra-low Power State (ULPS).

Return values

| | |
|----------------------|--------------------------------|
| FSP_SUCCESS | Information read successfully. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Instance is not open. |
| FSP_ERR_INVALID_MODE | Invalid mode for transition. |

◆ **R_MIPI_DSI_UlpsExit()**

```
fsp_err_t R_MIPI_DSI_UlpsExit ( mipi_dsi_ctrl_t *const p_api_ctrl, mipi_dsi_lane_t lane )
```

Exit Ultra-low Power State (ULPS).

Return values

| | |
|-------------------|--------------------------------|
| FSP_SUCCESS | Information read successfully. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Instance is not open. |

◆ **R_MIPI_DSI_Command()**

```
fsp_err_t R_MIPI_DSI_Command ( mipi_dsi_ctrl_t *const p_api_ctrl, mipi_dsi_cmd_t * p_cmd )
```

Send a command to the peripheral device.

Note

*p_data will be used as either write data or a read buffer depending on the data id.
p_data memory must not be updated until sequence operation is complete if byte_count is greater than 16.*

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Command(s) queued successfully. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. cmd_id specifies a long packet but p_data is NULL. |
| FSP_ERR_NOT_OPEN | Instance is not open. |
| FSP_ERR_IN_USE | The physical interface is currently in use or video mode is in operation. |
| FSP_ERR_INVALID_POINTER | Invalid pointer provided |
| FSP_ERR_INVALID_ARGUMENT | Invalid message configuration |
| FSP_ERR_INVALID_CHANNEL | Invalid channel for provided message configuration |

◆ **R_MIPI_DSI_StatusGet()**

```
fsp_err_t R_MIPI_DSI_StatusGet ( mipi_dsi_ctrl_t *const p_api_ctrl, mipi_dsi_status_t * p_status )
```

Provide information about current MIPI DSI status.

Note: Acknowledge and Error Status is only cleared when read by calling this function.

Return values

| | |
|-------------------|--------------------------------|
| FSP_SUCCESS | Information read successfully. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Instance is not open. |

Powers on PDC, handles required initialization described in the hardware manual. [More...](#)

`fsp_err_t R_PDC_Close (capture_ctrl_t *const p_ctrl)`

Stops and closes the transfer interface, disables and powers off the PDC, clears internal driver data and disables interrupts. [More...](#)

`fsp_err_t R_PDC_CaptureStart (capture_ctrl_t *const p_ctrl, uint8_t *const p_buffer)`

Starts a capture. Enables interrupts. [More...](#)

`fsp_err_t R_PDC_StatusGet (capture_ctrl_t *const p_ctrl, capture_status_t *p_status)`

`fsp_err_t R_PDC_CallbackSet (capture_ctrl_t *const p_ctrl, void(*p_callback)(capture_callback_args_t *), void const *const p_context, capture_callback_args_t *const p_callback_memory)`

Detailed Description

Driver for the PDC peripheral on RA MCUs. This module implements the [CAPTURE Interface](#).

Overview

The PDC peripheral supports interfacing with external cameras by accepting timing and data signals in order to capture incoming data. A callback is invoked every time a frame of data is accepted.

Features

- Capture incoming data into a user defined buffer
- Data bytes per pixel can be configured
- Endianness of the incoming data can be specified
- Supports configuring capture width and height
- Supports configuring vertical and horizontal sync polarity
- Horizontal and Vertical position for image/data capture can be specified
- External clock to the camera module can be adjusted
- Choice between DMA and DTC to transfer out the captured data
- The specified user callback is invoked when a data frame is captured

Configuration

Build Time Configurations for r_pdc

The following build time configurations are defined in `fsp_cfg/r_pdc_cfg.h`:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

| | | | |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
|--------------------|--|---------------|---|

Configurations for Graphics > Parallel Data Capture (r_pdc)

This module can be added to the Stacks tab via New Stack > Graphics > Parallel Data Capture (r_pdc).

| Configuration | Options | Default | Description |
|--|---|---------|---|
| General | | | |
| Name | Name must be a valid C symbol | g_pdc0 | Module name. |
| Input | | | |
| Input > Signal polarity | | | |
| HSYNC | <ul style="list-style-type: none"> • High • Low | High | Specify the active polarity of the HSYNC signal. |
| VSYNC | <ul style="list-style-type: none"> • High • Low | High | Specify the active polarity of the VSYNC signal. |
| Input > Capture Specifications | | | |
| Number of pixels to capture horizontally | Value must be an integer greater than 0 | 640 | Specify the number of horizontal pixels to capture. |
| Number of lines to capture vertically | Value must be an integer greater than 0 | 480 | Specify the number of vertical pixels to capture. |
| Horizontal pixel to start capture from | Value must be an integer | 0 | Specify the horizontal pixel to start capturing image data from. Allows an image smaller than the native resolution of a camera to be captured. |
| Line to start capture from | Value must be an integer | 0 | Specify the vertical line to start capturing image data from. Allows an image smaller than the native resolution of a camera to be captured. |
| Bytes per pixel | Value must be an integer greater than 0 | 2 | Specify the number of bytes per pixel of the captured image data. |
| Clock divider | <ul style="list-style-type: none"> • CLK/2 | CLK/2 | Specify the clock |

| | | | |
|-------------------------|---|---------------------|---|
| | <ul style="list-style-type: none"> • CLK/4 • CLK/6 • CLK/8 • CLK/10 • CLK/12 • CLK/14 • CLK/16 | | divider for clock frequency of the clock input PCKO to the PDC peripheral. |
| Endianness | <ul style="list-style-type: none"> • Little • Big | Little | Specify the endianness of the captured image data. |
| Output | | | |
| Output > Buffer | | | |
| Number of image buffers | Value must be an integer greater than 0 | 1 | Specify the number of buffers to create. |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | g_pdc_user_callback | A user callback function must be provided. This callback is invoked for every successful frame capture and any error conditions |
| PDC Interrupt Priority | MCU Specific Options | | Select the PDC interrupt priority. |
| DTC Interrupt Priority | MCU Specific Options | | Select the DTC interrupt priority. |

Clock Configuration

The PDC peripheral module uses the PCLKB as its clock source. The maximum clock to the camera module is PCLKB / 2.

Pin Configuration

The PCKO pin is a clock output and should be connected to the clock input of the camera. The PIXCLK pin is a clock input and should be connected to the output pixel clock of the camera. Likewise, the HSYNC and VSYNC pins must be connected to the horizontal and vertical sync signals of the camera, respectively. The PIXD0-PIXD7 pins are the 8-bit data bus input and should be connected to the relevant output pins of the camera.

Note

Camera control and serial communication pins must be configured separately and are not controlled by this module.

Usage Notes

Interrupt Configuration

- PDC error interrupts are used by this module for reporting errors such as overrun, underrun,

vertical line number setting and horizontal byte number setting errors.

- In addition to the PDC error interrupts, DMA or DTC interrupts are also used internally to perform data transfer from this peripheral to the specified image buffer.
- Receive data ready interrupt is used as activation source for DMA and DTC trigger.

Enabling Transfer Modules

- An option to select between DMAC or DTC is provided with DMA as the default transfer choice.
- For further details on DMA please refer [Transfer \(r_dmac\)](#)
- For further details on DTC please refer [Transfer \(r_dtc\)](#)

PDC setup with external camera

- Before configuring the external camera device the PDC Open API must be called in order to start clock output.
- Ensure that the memory pointed to by p_buffer is both valid and large enough to store a complete image.
- The amount of space required (in bytes) can be calculated as: size (bytes) = image width (pixels) * image height (lines) * number of bytes per pixel
- Ensure that the size above is divisible by and aligned to 32 bytes.

Examples

Basic Example

This is a basic example of minimal use of the PDC in an application. This example shows how this driver can be used for capturing data from an external I/O device such as an image sensor.

```
void g_pdc_user_callback (capture_callback_args_t * p_args)
{
    if (PDC_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
        g_capture_ready = true;
    }
}

void basic_example (void)
{
    fsp_err_t err;

    /* Initialize the PDC module */
    err = R_PDC_Open(&g_pdc0_ctrl, &g_pdc0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Initialize the camera module at this point. This implementation is camera vendor
    specific. */
```

```
camera_module_initialization();

/* Initialize capture ready flag to false. This gets set to true in PDC callback
upon successful frame capture. */
g_capture_ready = false;
err = R_PDC_CaptureStart(&g_pdc0_ctrl, g_user_buffer);
assert(FSP_SUCCESS == err);
uint32_t timeout_ms = PDC_DELAY_MS;

/* Since there is nothing else to do, block until Callback triggers*/
while ((true != g_capture_ready) && timeout_ms)
{
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;
}
if (0U == timeout_ms)
{
    __BKPT(0);
}
}

static void camera_module_initialization (void)
{
/* Camera vendor specific initialization to be done here */
}
```

| Enumerator | |
| PDC_VSYNC_POLARITY_HIGH | VSYNC signal is active high. |
| PDC_VSYNC_POLARITY_LOW | VSYNC signal is active low. |

Function Documentation

◆ **R_PDC_Open()**

```
fsp_err_t R_PDC_Open ( capture_ctrl_t *const p_ctrl, capture_cfg_t const *const p_cfg )
```

Powers on PDC, handles required initialization described in the hardware manual.

Implements `capture_api_t::open`.

The Open function provides initial configuration for the PDC module. It powers on the module and enables the PCLKO output and the PIXCLK input. Further initialization requires the PIXCLK input to be running in order to be able to reset the PDC as part of its initialization. This clock is input from a camera module and so the reset and further initialization is performed in `capture_api_t::captureStart`. This function should be called once prior to calling any other PDC API functions. After the PDC is opened the Open function should not be called again without first calling the Close function.

Example:

```
/* Initialize the PDC module */
err = R_PDC_Open(&g_pdc0_ctrl, &g_pdc0_cfg);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Initialization was successful. |
| FSP_ERR_ASSERTION | One or more of the following parameters is NULL <ol style="list-style-type: none"> 1. p_cfg is NULL 2. p_api_ctrl is NULL 3. The pointer to the transfer interface in the p_cfg parameter is NULL 4. Callback parameter is NULL. 5. Invalid IRQ number assigned |
| FSP_ERR_INVALID_ARGUMENT | One or more of the following parameters is incorrect <ol style="list-style-type: none"> 1. bytes_per_pixel is zero 2. x_capture_pixels is zero 3. y_capture_pixels is zero 4. x_capture_start_pixel + x_capture_pixels is greater than 4095, OR 5. y_capture_start_pixel + y_capture_pixels is greater than 4095 |
| FSP_ERR_ALREADY_OPEN | Module is already open. |

◆ **R_PDC_Close()**

```
fsp_err_t R_PDC_Close ( capture_ctrl_t *const p_ctrl)
```

Stops and closes the transfer interface, disables and powers off the PDC, clears internal driver data and disables interrupts.

Implements `capture_api_t::close`.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Successful close. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL |
| FSP_ERR_NOT_OPEN | Open has not been successfully called. |

◆ **R_PDC_CaptureStart()**

```
fsp_err_t R_PDC_CaptureStart ( capture_ctrl_t *const p_ctrl, uint8_t *const p_buffer )
```

Starts a capture. Enables interrupts.

Implements `capture_api_t::captureStart`.

Sets up the transfer interface to transfer data from the PDC into the specified buffer. Configures the PDC settings as previously set by the `capture_api_t::open` API. These settings are configured here as the PIXCLK input must be active for the PDC reset operation. When a capture is complete the callback registered during `capture_api_t::open` API call will be called.

Example:

```
err = R_PDC_CaptureStart(&g_pdc0_ctrl, g_user_buffer);
assert(FSP_SUCCESS == err);
```

Return values

| | |
|-------------------------|---|
| FSP_SUCCESS | Capture start successful. |
| FSP_ERR_ASSERTION | One or more of the following parameters is NULL 1. p_api_ctrl is NULL 2. p_buffer is NULL |
| FSP_ERR_NOT_OPEN | Open has not been successfully called. |
| FSP_ERR_IN_USE | PDC transfer is already in progress. |
| FSP_ERR_TIMEOUT | Reset operation timed out. |
| FSP_ERR_NOT_INITIALIZED | Callback function has not been set |

◆ R_PDC_StatusGet()

```
fsp_err_t R_PDC_StatusGet ( capture_ctrl_t *const p_ctrl, capture_status_t * p_status )
```

Provides the pdc operating status.

Implements [capture_api_t::statusGet](#).

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Initialization was successful. |
| FSP_ERR_ASSERTION | One or more parameters is NULL. |
| FSP_ERR_NOT_OPEN | Open has not been successfully called. |

◆ R_PDC_CallbackSet()

```
fsp_err_t R_PDC_CallbackSet ( capture_ctrl_t *const p_ctrl, void(*) (capture_callback_args_t *)  
p_callback, void const *const p_context, capture_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure.

Implements [capture_api_t::callbackSet](#).

Return values

| | |
|---------------------|--------------------------------|
| FSP_ERR_UNSUPPORTED | This is just a stub at present |
|---------------------|--------------------------------|

5.2.8.8 SEGGER emWin RA Port (rm_emwin_port)

[Modules](#) » [Graphics](#)

SEGGER emWin port for RA MCUs.

Overview

The SEGGER emWin RA Port module provides the configuration and hardware acceleration support necessary for use of emWin on RA products. The port provides full integration with the graphics peripherals (GLCDC, DRW and JPEG) as well as FreeRTOS.

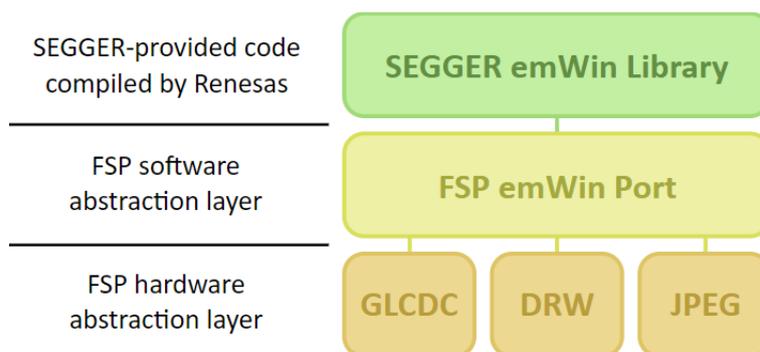

Figure 227: SEGGER emWin FSP Port Block Diagram

Note

This port layer primarily enables hardware acceleration and background handling of many display operations and does not contain code intended to be directly called by the user. Please consult the SEGGER emWin User Guide (UM03001) for details on how to use emWin in your project.

Hardware Acceleration

The following functions are currently performed with hardware acceleration:

- DRW Engine (r_drw)
 - Drawing bitmaps (ARGB8888 and RGB565)
 - 4bpp font rendering
 - Rectangle fill
 - Line and shape drawing
 - Anti-aliased operations
 - Circle stroke and fill
 - Polygon stroke and fill
 - Lines and arcs
- JPEG Codec (r_jpeg)
 - JPEG decoding
- Graphics LCD Controller (r_glcdc)
 - Brightness, contrast and gamma correction
 - Pixel format conversion (framebuffer to LCD)

Configuration**Build Time Configurations for rm_emwin_port**

The following build time configurations are defined in fsp_cfg/rm_emwin_port_cfg.h:

| Configuration | Options | Default | Description |
|----------------------|--------------------------------------|---------|--|
| Memory Allocation | | | |
| GUI Heap Size | Value must be a non-negative integer | 32768 | Set the size of the heap to be allocated for use exclusively by emWin. |
| Section for GUI Heap | Manual Entry | .noinit | Specify the section in which to allocate the GUI heap. When Arm |

Compiler 6 is used to place this memory in on-chip SRAM, the section name must be .bss or start with .bss. to avoid consuming unnecessary ROM space.

Set the maximum number of available display layers in emWin.

This setting is not related to GLCDC Layer 1 or 2.

Set the size of the conversion buffer for anti-aliased font glyphs. This should be set to the size (in bytes) of the largest AA character to be rendered.

Maximum Layers

Value must be a non-negative integer

16

AA Font Conversion Buffer Size

Value must be a non-negative integer

400

LCD Settings

Wait for Vertical Sync

- Enabled
- Disabled

Enabled

When enabled emWin will wait for a vertical sync event each time the display is updated. If an RTOS is used the thread will yield; otherwise each frame will block until Vsync.

WARNING: Disabling vertical sync will result in tearing. It is recommended to always leave this setting Enabled if an RTOS is used.

JPEG Decoding

JPEG Decoding > General

Input Alignment

- 8-byte aligned (faster)
- Unaligned (slower)

8-byte aligned (faster)

Setting this option to 8-bit alignment can allow the hardware JPEG Codec to directly read JPEG data. This speeds up JPEG decoding operations and reduces RAM

overhead, but all JPEG images must reside on an 8-byte boundary.

When this option is enabled the input buffer is not allocated.

Enable this option to configure JPEG decoding operations to use a double-buffered output pipeline. This allows the JPEG to be rendered to the display at the same time as decoding at the cost of additional RAM usage.

Enabling this option automatically allocates double the output buffer size.

Set the timeout for JPEG decoding operations (in RTOS ticks) in the event of a decode error.

Set the size of the JPEG decode input buffer (in bytes). This buffer is used to ensure 8-byte alignment of input data. Specifying a size smaller than the size of the JPEG to decode will use additional interrupts to stream data in during the decoding process.

Set the size of the JPEG decode output buffer (in bytes). An output buffer smaller than the size of a decoded image will use additional interrupts to stream the data into a framebuffer.

Unless you are sure of the subsampling used

| | | |
|----------------------|---|----------|
| Double-Buffer Output | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled |
|----------------------|---|----------|

| | | |
|---------------|--------------------------------------|----|
| Error Timeout | Value must be a non-negative integer | 50 |
|---------------|--------------------------------------|----|

JPEG Decoding > Buffers

| | | |
|-------------------|--------------------------------------|--------|
| Input Buffer Size | Value must be a non-negative integer | 0x1000 |
|-------------------|--------------------------------------|--------|

| | | |
|--------------------|--------------------------------------|--------|
| Output Buffer Size | Value must be a non-negative integer | 0x3C00 |
|--------------------|--------------------------------------|--------|

in and the size of the input JPEG images it is recommended to allocate at least 16 framebuffer lines of memory.

Specify the section in which to allocate the JPEG work buffers. When Arm Compiler 6 is used to place this memory in on-chip SRAM, the section name must be `.bss` or start with `.bss.` to avoid consuming unnecessary ROM space.

Section for Buffers Manual Entry `.noinit`

Hardware Configuration

No clocks or pins are directly required by this module. Please consult the submodules' documentation for their requirements.

Library Configuration

emWin is provided as a pre-compiled library. To maximize compatibility the build-time options are configured as follows:

```
#define GUI_OS (1) // Context switch support enabled
#define GUI_MAXTASK (1) // One task supported by default (can be increased at runtime
via GUITASK_SetMaxTask())
#define GUI_NUM_LAYERS (3) // Up to three displays supported
#define GUI_SUPPORT_TOUCH (1) // Support touch screens
#define GUI_SUPPORT_MOUSE (1) // Support a mouse
#define GUI_SUPPORT_MEMDEV (1) // Memory devices available
#define GUI_WINSUPPORT (1) // Window manager available
#define GUI_SUPPORT_BIDI (1) // Bidirectional text enabled
#define GUI_DEBUG_LEVEL (2) // Parameter and consistency checks enabled (no logging)
```

All other options are left at the default settings in `GUI_ConfDefaults.h`.

Usage Notes

Getting Started

To get started with emWin in an RA project the following must be performed:

1. Open the RA Configuration editor for your project
2. Add emWin to your project in the Stacks view by clicking **New Stack -> SEGGER -> SEGGER emWin**
3. Ensure the configuration options for emWin are set as necessary for your application
4. Set the properties for the GLCDC module to match the timing and memory requirements of your display panel
5. Set the JPEG decode color depth to the desired value (if applicable)
6. Ensure interrupts on all modules are enabled:
 - GLCDC Vertical Position (Vpos) Interrupt
 - DRW Interrupt (if applicable)
 - JPEG Encode/Decode and Data Transfer Interrupts (if applicable)
7. Confirm stack and heap are configured as needed
 - When starting development a minimum stack of 0x1000 (4K) and heap of 0x4000 (16K) are recommended until actual usage can be characterized
8. Click Generate Project Content to save and commit configuration changes

At this point the project is now ready to build with emWin. Please refer to the SEGGER emWin User Guide (UM03001) as well as demo and sample code for details on how to create a GUI application.

Using Hardware Acceleration

In most cases there is no need to perform additional configuration to ensure the DRW Engine is used. However, there are some guidelines that should be followed depending on the item in question:

- Bitmaps:
 - ARGB8888, RGB888 and RGB565 bitmaps require no additional settings.
- Anti-aliased shapes:
 - Anti-aliased lines, circles, polygons, polygon outlines and arcs are rendered with the DRW Engine.
- Anti-aliased (4bpp) fonts:
 - Set the text mode to GUI_TM_TRANS or create the relevant widget with WM_CF_HASTRANS set.
 - Ensure the "AA Font Conversion Buffer Size" configuration option is set to a size equal to or greater than the size (in bytes) of the largest glyph.
- 8bpp palletized images:
 - When creating these images ensure transparency is not enabled as the SEGGER method for this is not compatible with the DRW Engine.
- RLE-encoded images:
 - Hardware acceleration is not available for SEGGER's RLE format.
- JPEG images:
 - Align any user-declared JPEG data to an 8-byte boundary. If 8-byte alignment cannot be guaranteed disable the **JPEG Decoding -> General -> Input Alignment** option in the RA Configuration.

Multi-thread Support

When the "Multi-thread Support" configuration is enabled, emWin can be called from multiple threads. This comes with advantages and disadvantages:

Advantages:

- High flexibility in development of applications
- Threads can pend and post on emWin events

Disadvantages:

- Slightly higher RAM/ROM use
- Large GUI projects can become difficult to debug

Note

Multi-thread support is independent of RTOS support. RTOS support is managed internally and cannot be manually configured.

Limitations

Developers should be aware of the following limitations when using SEGGER emWin with FSP:

- Hardware acceleration is not available when using color modes lower than 16 bits.
- Hardware acceleration is not available for SEGGER's RLE image format.
- Rotated screen modes are not supported.
- Because emWin is provided as a pre-compiled library the build-time options are fixed. See the [Library Configuration](#) section for the supplied configuration.

Examples

Basic Example

This is a basic example demonstrating a very simple emWin application. The screen is cleared to white and "Hello World!" is printed in the center.

Note

emWin manages the GLCDC, DRW and JPEG Codec submodules internally; they do not need to be opened directly.

```
#include "DIALOG.h"

#define COLOR_WHITE 0x00FFFFFFU
#define COLOR_BLACK 0x00000000U
#define GUI_DRAW_DELAY 100

static void _cbMain (WM_MESSAGE * pMsg)
{
    GUI_RECT Rect;

    switch (pMsg->MsgId)
    {
        case WM_CREATE:
            {
                break;
            }

        case WM_PAINT:
```

```
    {
/* Clear background to white */
        GUI_SetBkColor(COLOR_WHITE);

        GUI_Clear();

/* Draw "Hello World!" in black in the center */
        WM_GetClientRect(&Rect);

        GUI_SetColor(COLOR_BLACK);

        GUI_DispStringInRect("Hello World!", &Rect, GUI_TA_VCENTER |
GUI_TA_HCENTER);

        break;
    }
default:
    {
        WM_DefaultProc(pMsg);

        break;
    }
}

void emWinTask (void)
{
    int32_t xSize;
    int32_t ySize;

/* Initialize emWin */
    GUI_Init();

/* Get screen dimensions */
    xSize = LCD_GetXSize();
    ySize = LCD_GetYSize();

/* Create main window */
    WM_CreateWindowAsChild(0, 0, xSize, ySize, WM_HBKWIN, WM_CF_SHOW, _cbMain, 0);

/* Enter main drawing loop */
while (1)
    {
        GUI_Delay(GUI_DRAW_DELAY);
    }
}
```

}

Note

For further example code please consult SEGGER emWin documentation, which can be downloaded [here](#), as well as the Quick Start Guide and example project(s) provided with your Evaluation Kit (if applicable).

| fsp_err_t | R_SLCDC_Close (slcdc_ctrl_t *const p_ctrl) |

Detailed Description

Driver for the SLCDC peripheral on RA MCUs. This module implements the [SLCDC Interface](#).

Overview

The segment LCD controller (SLCDC) utilizes two to four reference voltages to provide AC signals for driving traditional segment LCD panels. Depending on the LCD and MCU package, up to 272 segments can be driven. A built-in link to the RTC allows for up to 152 segments to switch between two patterns at regular intervals. An on-chip boost driver can be used to provide configurable reference voltages up to 5.25V allowing for simple contrast adjustment.

Features

The SLCDC module can perform the following functions:

- Initialize, start and stop the SLCDC
- Set and modify the output pattern
- Blink between two patterns based on a periodic RTC interrupt signal
- Adjust display contrast (only when using internal voltage boosting)
- Select reference voltage mode: VL1 reference mode (1/3 or 1/4 Bias) and VL2 reference mode (1/3 Bias) can be selected at internal voltage boosting method, conventional VCC reference mode (1/3 Bias) and VL4 reference mode (1/3) Bias can be selected at capacitor split method

Configuration

Build Time Configurations for r_slcdc

The following build time configurations are defined in fsp_cfg/r_slcdc_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Graphics > Segment LCD (r_slcdc)

This module can be added to the Stacks tab via New Stack > Graphics > Segment LCD (r_slcdc).

| Configuration | Options | Default | Description |
|---------------|--|------------|--|
| General | | | |
| Name | Name must be a valid C symbol | g_slcdc0 | Module Name |
| Clock | | | |
| Source | MCU Specific Options | | Select the clock source. |
| Divisor | MCU Specific Options | | Select the clock divisor. |
| Output | | | |
| Bias method | <ul style="list-style-type: none"> • 1/2 bias • 1/3 bias • 1/4 bias | 1/2 bias | Select the bias method. This determines the number of voltage levels used to create the waveforms. |
| Timeslice | MCU Specific Options | | Select the LCD time slice. The number of slices should match the number of common (COM) pins for your LCD panel. |
| Waveform | <ul style="list-style-type: none"> • Waveform A | Waveform A | Select the LCD |

| | | | |
|---------------------------------|--|------------------------------|------------------------------------|
| | <ul style="list-style-type: none"> • Waveform B | | waveform. |
| Drive method | <ul style="list-style-type: none"> • External resistance division • Internal voltage boosting • Capacitor split | External resistance division | Select the LCD drive method. |
| Reference Voltage | MCU Specific Options | | Select the LCD reference voltage. |
| Default contrast (if available) | MCU Specific Options | | Select the default contrast level. |

Valid Configurations

Though there are many setting combinations only a limited subset are supported by the SLCDC peripheral hardware:

Boards have feature Select reference voltage mode (see User's Manual (r01uh1005ej0050) for details)

| Waveform | Slices | Bias | External Resistance | Internal boosting VL1 | Internal boosting VL2 | Capacitor split VCC | Capacitor split VL4 |

| B | 8 | 1/4 | Available | Available | Available |
| B | 4 | 1/3 | Available | Available | — |

Clock Configuration

User's Manual (r01uh1005ej0050): The SLCDC clock can be sourced from the main clock (MOSC), sub-clock (SOSC), HOCO, LOCO or MOCO. Dividers of 4 to 1024 are available for SOSC/LOCO and 256 to 1048576 are for MOSC/HOCO/MOCO. It is recommended to adjust the divisor such that the resulting clock provides a frame frequency of 32-128 Hz (some conditions have a frame frequency 24 to 128 Hz - see Table 36.10 in the User's Manual (r01uh1005ej0050) for details).

Others: The SLCDC clock can be sourced from the main clock (MOSC), sub-clock (SOSC), HOCO or LOCO. Dividers of 4 to 1024 are available for SOSC/LOCO and 256 to 524288 for MOSC/HOCO. It is recommended to adjust the divisor such that the resulting clock provides a frame frequency of 32-128 Hz.

Note

*Make sure your desired source clock is enabled and running before starting SLCDC output.
Do not set the segment LCD clock over 512 Hz when using internal boost or capacitor split modes.*

Pin Configuration

This module controls a variety of pins necessary for segment LCD voltage generation and signal output:

| Pin Name | Function | Notes |
|------------|-----------------------------------|--|
| SEGN | Segment data output | Connect these signals to the segment pins of the LCD. |
| COMn | Common signal output | Connect these signals to the common pins of the LCD. |
| VLn | Voltage reference | These pins should be connected to passive components based on the selected drive method (see section 45.7 "Supplying LCD Drive Voltages VL1, VL2, VL3, and VL4" in the RA4M1 User's Manual (R01UH0887EJ0100)). |
| CAPH, CAPL | Drive voltage generator capacitor | Connect a nonpolar 0.47uF capacitor across these pins when using internal boost or capacitor split modes. This pin is not needed when using |

resistance division.

Interrupt Configuration

The SLCDC provides no interrupt signals.

Note

Blinking output timing is driven directly from the RTC periodic interrupt. Once the interrupt is enabled setting the display to `SLCDC_DISP_BLINK` will swap between A- and B-pattern each time it occurs. The ELC is not required for this functionality.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the SLCDC:

- Different packages provide different numbers of segment pins. Check the User's Manual for your device to confirm availability and mapping of segment signals.
- When using internal boost mode a delay of 5ms is required between calling `R_SLCDC_Open` and `R_SLCDC_Start` to allow the boost circuit to charge.
- When using the internal boost or capacitor split method do not set the segment LCD clock higher than 512 Hz.

Examples

Basic Example

Below is a basic example of minimal use of the SLCDC in an application. The SLCDC driver is initialized, output is started and a pattern is written to the segment registers.

```
void slcdc_init (void)
{
    fsp_err_t err;

    /* Open SLCDC driver */
    err = R_SLCDC_Open(&g_slcdc_ctrl, &g_slcdc_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* When using internal boost mode this delay is required to allow the boost circuit
to charge. See RA4M1 User's
    * Manual (R01UH0887EJ0100) 8.2.18 "Segment LCD Source Clock Control Register
(SLCDSCKCR)" for details. */
    R_BSP_SoftwareDelay(5, BSP_DELAY_UNITS_MILLISECONDS);

    /* Start SLCDC output */
    err = R_SLCDC_Start(&g_slcdc_ctrl);
}
```

```
    assert(FSP_SUCCESS == err);
/* Write pattern to display */
    err = R_SLCDC_Write(&g_slcdc_ctrl, 0, segment_data, NUM_SEGMENTS);
    assert(FSP_SUCCESS == err);
}
```

Note

While the SLCDC is running, pattern data is constantly being output. No latching or buffering is required when writing or reading segment data.

Blinking Output

This example demonstrates how to set up blinking output using the RTC periodic interrupt. In this example it is assumed that the SLCDC has already been started.

```
void slcdc_blink (void)
{
    fsp_err_t err;
/* Open RTC and set time/date */
    err = R_RTC_Open(&r_rtc_ctrl, &r_rtc_cfg);
/* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    err = R_RTC_CalendarTimeSet(&r_rtc_ctrl, &g_rtc_time);
    assert(FSP_SUCCESS == err);
/* Set RTC periodic interrupt to 2 Hz (display blink cycle will be 1 Hz) */
    err = R_RTC_PeriodicIrqRateSet(&r_rtc_ctrl,
RTC_PERIODIC_IRQ_SELECT_1_DIV_BY_2_SECOND);
    assert(FSP_SUCCESS == err);
/* Set display to blink */
    err = R_SLCDC_SetDisplayArea(&g_slcdc_ctrl, SLCDC_DISP_BLINK);
    assert(FSP_SUCCESS == err);
/* Display will now continuously blink */
}
```

Data Structures

```
struct slcdc_instance_ctrl_t
```

Data Structure Documentation

◆ slcdc_instance_ctrl_t

```
struct slcdc_instance_ctrl_t
```

SLCDC control block. DO NOT INITIALIZE. Initialization occurs when `slcdc_api_t::open` is called

Function Documentation

◆ R_SLCDC_Open()

```
fsp_err_t R_SLCDC_Open ( slcdc_ctrl_t *const p_ctrl, slcdc_cfg_t const *const p_cfg )
```

Opens the SLCDC driver. Implements `slcdc_api_t::open`.

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Device was opened successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block or the configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_UNSUPPORTED | Invalid display mode. |

◆ R_SLCDC_Write()

```
fsp_err_t R_SLCDC_Write ( slcdc_ctrl_t *const p_ctrl, uint8_t const start_segment, uint8_t const *p_data, uint8_t const segment_count )
```

Writes a sequence of display data to the segment data registers. Implements `slcdc_api_t::write`.

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Data was written successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block or data is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Segment index is (or will be) out of range. |
| FSP_ERR_NOT_OPEN | Device is not opened or initialized. |

◆ **R_SLCDC_Modify()**

```
fsp_err_t R_SLCDC_Modify ( slcdc_ctrl_t *const p_ctrl, uint8_t const segment, uint8_t const data,
uint8_t const data_mask )
```

Modifies a single segment register based on a mask and the desired data. Implements `slcdc_api_t::modify`.

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Device was opened successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block structure is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Invalid parameter in the argument. |
| FSP_ERR_NOT_OPEN | Device is not opened or initialized |

◆ **R_SLCDC_Start()**

```
fsp_err_t R_SLCDC_Start ( slcdc_ctrl_t *const p_ctrl)
```

Starts output of LCD signals. Implements `slcdc_api_t::start`.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Device was opened successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block structure is NULL. |
| FSP_ERR_NOT_OPEN | Device is not opened or initialized |

◆ **R_SLCDC_Stop()**

```
fsp_err_t R_SLCDC_Stop ( slcdc_ctrl_t *const p_ctrl)
```

Stops output of LCD signals. Implements `slcdc_api_t::stop`.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Device was opened successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block structure is NULL. |
| FSP_ERR_NOT_OPEN | Device is not opened or initialized |

◆ **R_SLCDC_SetContrast()**

```
fsp_err_t R_SLCDC_SetContrast ( slcdc_ctrl_t *const p_ctrl, slcdc_contrast_t const contrast )
```

Sets contrast to the specified level. Implements `slcdc_api_t::setContrast`.

Note

Contrast can be adjusted when the SLCDC is operating in internal boost mode only. The range of values is 0-5 when 1/4 bias setting is used and 0-15 otherwise. See RA4M1 User's Manual (R01UH0887EJ0100) section 45.2.4 "LCD Boost Level Control Register (VLCD)" for voltage levels at each setting.

Return values

| | |
|---------------------|---|
| FSP_SUCCESS | Device was opened successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block structure is NULL. |
| FSP_ERR_NOT_OPEN | Device is not opened or initialized |
| FSP_ERR_UNSUPPORTED | Unsupported operation |

◆ **R_SLCDC_SetDisplayArea()**

```
fsp_err_t R_SLCDC_SetDisplayArea ( slcdc_ctrl_t *const p_ctrl, slcdc_display_area_t const display_area )
```

Sets output to Waveform A, Waveform B or blinking output. Implements `slcdc_api_t::setDisplayArea`.

Return values

| | |
|---------------------|---|
| FSP_SUCCESS | Device was opened successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block structure is NULL. |
| FSP_ERR_UNSUPPORTED | Pattern selection has no effect in 8-time-slice mode. |
| FSP_ERR_NOT_OPEN | Device is not opened or initialized. |

◆ R_SLCDC_Close()

```
fsp_err_t R_SLCDC_Close ( slcdc_ctrl_t *const p_ctrl)
```

Closes the SLCDC driver. Implements `slcdc_api_t::close`.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Device was closed successfully. |
| FSP_ERR_ASSERTION | Pointer to the control block structure is NULL. |
| FSP_ERR_NOT_OPEN | Device is not opened or initialized |

Detailed Description

Driver for the ICU peripheral on RA MCUs. This module implements the [External IRQ Interface](#).

Overview

The Interrupt Controller Unit (ICU) controls which event signals are linked to the NVIC, DTC, and DMAC modules. The R_ICU software module only implements the [External IRQ Interface](#). The external_irq interface is for configuring interrupts to fire when a trigger condition is detected on an external IRQ pin.

Note

Multiple instances are used when more than one external interrupt is needed. Configure each instance with different channels and properties as needed for the specific interrupt.

Features

- Supports configuring interrupts for IRQ pins on the target MCUs
 - Enabling and disabling interrupt generation.
 - Configuring interrupt trigger on rising edge, falling edge, both edges, or low level signal.
 - Enabling and disabling the IRQ noise filter.
- Supports configuring a user callback function, which will be invoked by the HAL module when an external pin interrupt is generated.

Configuration

Build Time Configurations for r_icu

The following build time configurations are defined in fsp_cfg/r_icu_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Input > External IRQ (r_icu)

This module can be added to the Stacks tab via New Stack > Input > External IRQ (r_icu). Non-secure callable guard functions can be generated for this module by right clicking the module in the

RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|-----------------|---|
| Name | Name must be a valid C symbol | g_external_irq0 | Module name. |
| Channel | Value must be an integer between 0 and 15 | 0 | Specify the hardware channel. |
| Trigger | MCU Specific Options | | Select the signal edge or state that triggers an interrupt. |
| Digital Filtering | MCU Specific Options | | Select if the digital noise filter should be enabled. |
| Digital Filtering Sample Clock (Only valid when Digital Filtering is Enabled) | MCU Specific Options | | Select the clock divider for the digital noise filter. |
| Callback | Name must be a valid C symbol | NULL | A user callback function can be provided here. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the IRQn triggers |
| Pin Interrupt Priority | MCU Specific Options | | Select the PIN interrupt priority. |

Clock Configuration

The ICU peripheral module doesn't require any specific clock settings.

Note

The digital filter uses PCLKB as the clock source for sampling the IRQ pin.

Pin Configuration

The pin for the external interrupt channel must be configured as an input with IRQ Input Enabled.

Limitation

Pin configuration does not show conflicts when same IRQ is used by multiple pins.

Usage Notes

Digital Filter

The digital filter is used to reject trigger conditions that are too short. The trigger condition must be

longer than three periods of the filter clock. The filter clock frequency is determined by PCLKB and the `external_irq_pclk_div_t` setting.

$$\text{MIN_PULSE_WIDTH} = \text{EXTERNAL_IRQ_PCLKB_DIV} / \text{PCLKB_FREQUENCY} * 3$$

DMAC/DTC

When using an External IRQ pin to trigger a DMAC/DTC transfer, the External IRQ pin must be opened before the transfer instance is opened.

Examples

Basic Example

This is a basic example of minimal use of the ICU in an application.

```
#define ICU_IRQN_PIN BSP_IO_PORT_02_PIN_06
#define ICU_IRQN 6
/* Called from icu_irq_isr */
void external_irq_callback (external_irq_callback_args_t * p_args)
{
    (void) p_args;
    g_external_irq_complete = 1;
}
void simple_example ()
{
    /* Example Configuration */
    external_irq_cfg_t icu_cfg =
    {
        .channel          = ICU_IRQN,
        .trigger          = EXTERNAL_IRQ_TRIG_RISING,
        .filter_enable    = false,
        .clock_source_div = EXTERNAL_IRQ_CLOCK_SOURCE_DIV_1,
        .p_callback       = external_irq_callback,
        .p_context        = 0,
        .ipl              = 0,
        .irq              = (IRQn_Type) 0,
    };
    /* Configure the external interrupt. */
    fsp_err_t err = R_ICU_ExternalIrqOpen(&g_icu_ctrl, &icu_cfg);
```

```

assert(FSP_SUCCESS == err);

/* Enable the external interrupt. */
/* Enable not required when used with ELC or DMAC. */
err = R_ICU_ExternalIrqEnable(&g_icu_ctrl);
assert(FSP_SUCCESS == err);

while (0 == g_external_irq_complete)
{
/* Wait for interrupt. */
}
}

```

Data Structures

struct [icu_instance_ctrl_t](#)

Data Structure Documentation

◆ icu_instance_ctrl_t

struct [icu_instance_ctrl_t](#)

ICU private control block. DO NOT MODIFY. Initialization occurs when [R_ICU_ExternalIrqOpen](#) is called.

Data Fields

| | | |
|--------------|---------------------------|---|
| uint32_t | open | |
| | | Used to determine if channel control block is in use. |
| IRQn_Type | irq | |
| | | NVIC interrupt number. |
| uint8_t | channel | |
| | | Channel. |
| void const * | p_context | |

Field Documentation

◆ **p_context**

```
void const* icu_instance_ctrl_t::p_context
```

Placeholder for user data. Passed to the user callback in [external_irq_callback_args_t](#).

Function Documentation◆ **R_ICU_ExternalIrqOpen()**

```
fsp_err_t R_ICU_ExternalIrqOpen ( external_irq_ctrl_t *const p_api_ctrl, external_irq_cfg_t const *const p_cfg )
```

Configure an IRQ input pin for use with the external interrupt interface. Implements [external_irq_api_t::open](#).

The Open function is responsible for preparing an external IRQ pin for operation.

Return values

| | |
|--------------------------------|---|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | One of the following is invalid: <ul style="list-style-type: none"> • p_ctrl or p_cfg is NULL |
| FSP_ERR_ALREADY_OPEN | The channel specified has already been opened. No configurations were changed. Call the associated Close function to reconfigure the channel. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | The channel requested in p_cfg is not available on the device selected in r_bsp_cfg.h. |
| FSP_ERR_INVALID_ARGUMENT | p_cfg->p_callback is not NULL, but ISR is not enabled. ISR must be enabled to use callback function. |
| FSP_ERR_UNSUPPORTED | An input argument is not supported by selected mode. |

Note

This function is reentrant for different channels. It is not reentrant for the same channel.

◆ R_ICU_ExternalIrqEnable()

```
fsp_err_t R_ICU_ExternalIrqEnable ( external_irq_ctrl_t *const p_api_ctrl)
```

Enable external interrupt for specified channel at NVIC. Implements [external_irq_api_t::enable](#).

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Interrupt Enabled successfully. |
| FSP_ERR_ASSERTION | The p_ctrl parameter was null. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |
| FSP_ERR_IRQ_BSP_DISABLED | Requested IRQ is not defined in this system |

◆ R_ICU_ExternalIrqDisable()

```
fsp_err_t R_ICU_ExternalIrqDisable ( external_irq_ctrl_t *const p_api_ctrl)
```

Disable external interrupt for specified channel at NVIC. Implements [external_irq_api_t::disable](#).

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Interrupt disabled successfully. |
| FSP_ERR_ASSERTION | The p_ctrl parameter was null. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |
| FSP_ERR_IRQ_BSP_DISABLED | Requested IRQ is not defined in this system |

◆ R_ICU_ExternalIrqCallbackSet()

```
fsp_err_t R_ICU_ExternalIrqCallbackSet ( external_irq_ctrl_t *const p_api_ctrl,
void(*) (external_irq_callback_args_t *) p_callback, void const *const p_context,
external_irq_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [external_irq_api_t::callbackSet](#)

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

◆ R_ICU_ExternalIrqClose()

```
fsp_err_t R_ICU_ExternalIrqClose ( external_irq_ctrl_t *const p_api_ctrl)
```

Close the external interrupt channel. Implements [external_irq_api_t::close](#).

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |

5.2.9.2 Key Matrix (r_kint)

Modules » [Input](#)

Functions

```
fsp_err_t R_KINT_Open (keymatrix_ctrl_t *const p_api_ctrl, keymatrix_cfg_t
const *const p_cfg)
```

```
fsp_err_t R_KINT_Close (keymatrix_ctrl_t *const p_api_ctrl)
```

```
fsp_err_t R_KINT_Enable (keymatrix_ctrl_t *const p_api_ctrl)
```

```
fsp_err_t R_KINT_Disable (keymatrix_ctrl_t *const p_api_ctrl)
```

Detailed Description

Driver for the KINT peripheral on RA MCUs. This module implements the [Key Matrix Interface](#).

Overview

The KINT module configures the Key Interrupt (KINT) peripheral to detect rising or falling edges on any of the KINT channels. When such an event is detected on any of the configured pins, the module generates an interrupt.

Features

- Detect rising or falling edges on KINT channels
- Callback for notifying the application when edges are detected on the configured channels

Configuration

Build Time Configurations for r_kint

The following build time configurations are defined in fsp_cfg/r_kint_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> Default (BSP) Enabled Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Input > Key Matrix (r_kint)

This module can be added to the Stacks tab via New Stack > Input > Key Matrix (r_kint).

| Configuration | Options | Default | Description |
|-------------------------|---|---------------|---|
| General | | | |
| Name | Name must be a valid C symbol | g_kint0 | Module name. |
| Input | | | |
| Key Interrupt Flag Mask | MCU Specific Options | | Select channels to enable. |
| Interrupts | | | |
| Trigger Type | <ul style="list-style-type: none"> Falling Edge Rising Edge | Rising Edge | Specifies if the enabled channels detect a rising edge or a falling edge. NOTE: either all channels detecting a rising edge or all channels detecting a falling edge. |
| Callback | Name must be a valid C symbol | kint_callback | A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR) each time the IRQ triggers. |
| Key Interrupt Priority | MCU Specific Options | | Select the key interrupt priority. |

Clock Configuration

The KINT peripheral runs on PCLKB.

Pin Configuration

The KRn pins are key switch matrix row input pins.

Usage Notes

Connecting a Switch Matrix

The KINT module is designed to scan the rows of a switch matrix where each row is connected to a number of columns through switches. A periodic timer (or other mechanism) sets one column pin high at a time. Any switches that are pressed on the driven column cause a rising (or falling) edge on the row pin (KRn) causing an interrupt.

Note

In applications where multiple keys may be pressed at the same time it is recommended to put a diode inline with each switch to prevent ghosting.

Handling Multiple Pins

When an edge is detected on multiple pins at the same time, a single IRQ will be generated. A mask of all the pins that detected an edge will be passed to the callback.

Examples

Basic Example

This is a basic example of minimal use of the KINT in an application.

```
static volatile uint32_t g_channel_mask;
static volatile uint32_t g_kint_edge_detected = 0U;
/* Called from key_int_isr */
void r_kint_callback (keymatrix_callback_args_t * p_args)
{
    g_channel_mask      = p_args->channel_mask;
    g_kint_edge_detected = 1U;
}
void r_kint_example ()
{
    /* Configure the KINT. */
    fsp_err_t err = R_KINT_Open(&g_kint_ctrl, &g_kint_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Enable the KINT. */
    err = R_KINT_Enable(&g_kint_ctrl);
    assert(FSP_SUCCESS == err);
    while (0 == g_kint_edge_detected)
    {
```

```

/* Wait for interrupt. */
}
}

```

Data Structures

```
struct kint_instance_ctrl_t
```

Data Structure Documentation

◆ kint_instance_ctrl_t

```
struct kint_instance_ctrl_t
```

Channel instance control block. DO NOT INITIALIZE. Initialization occurs when [keymatrix_api_t::open](#) is called.

Function Documentation

◆ R_KINT_Open()

```
fsp_err_t R_KINT_Open ( keymatrix_ctrl_t *const p_api_ctrl, keymatrix_cfg_t const *const p_cfg )
```

Configure all the Key Input (KINT) channels and provides a handle for use with the rest of the KINT API functions. Implements [keymatrix_api_t::open](#).

Return values

| | |
|--------------------------------|--|
| FSP_SUCCESS | Initialization was successful. |
| FSP_ERR_ASSERTION | One of the following parameters may be NULL: p_cfg, or p_ctrl or the callback. |
| FSP_ERR_ALREADY_OPEN | The module has already been opened. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | The channel mask is invalid. |

◆ R_KINT_Close()

```
fsp_err_t R_KINT_Close ( keymatrix_ctrl_t *const p_api_ctrl)
```

Clear the KINT configuration and disable the KINT IRQ. Implements [keymatrix_api_t::close](#).

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Successful close. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | The module is not opened. |

◆ **R_KINT_Enable()**

```
fsp_err_t R_KINT_Enable ( keymatrix_ctrl_t *const p_api_ctrl)
```

This function enables interrupts for the KINT peripheral after clearing any pending requests. Implements [keymatrix_api_t::enable](#).

Return values

| | |
|-------------------|---------------------------------|
| FSP_SUCCESS | Interrupt enabled successfully. |
| FSP_ERR_ASSERTION | The p_ctrl parameter was null. |
| FSP_ERR_NOT_OPEN | The peripheral is not opened. |

◆ **R_KINT_Disable()**

```
fsp_err_t R_KINT_Disable ( keymatrix_ctrl_t *const p_api_ctrl)
```

This function disables interrupts for the KINT peripheral. Implements [keymatrix_api_t::disable](#).

Return values

| | |
|-------------------|----------------------------------|
| FSP_SUCCESS | Interrupt disabled successfully. |
| FSP_ERR_ASSERTION | The p_ctrl parameter was null. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |

fsp_err_t R_CRC_SnoopEnable (crc_ctrl_t *const p_ctrl, uint32_t crc_seed)

fsp_err_t R_CRC_SnoopDisable (crc_ctrl_t *const p_ctrl)

Detailed Description

Driver for the CRC peripheral on RA MCUs. This module implements the [CRC Interface](#).

Overview

The CRC module provides a API to calculate 8, 16 and 32-bit CRC values on a block of data in memory or a stream of data over a Serial Communication Interface (SCI) channel using industry-standard polynomials.

Features

- CRC module supports the following 8 and 16 bit CRC polynomials which operates on 8-bit data in parallel
 - X^8+X^2+X+1 (CRC-8)
 - $X^{16}+X^{15}+X^2+1$ (CRC-16)
 - $X^{16}+X^{12}+X^5+1$ (CRC-CCITT)
- CRC module supports the following 32 bit CRC polynomials which operates on 32-bit data in parallel
 - $X^{32}+X^{26}+X^{23}+X^{22}+X^{16}+X^{12}+X^{11}+X^{10}+X^8+X^7+X^5+X^4+X^2+X+1$ (CRC-32)
 - $X^{32}+X^{28}+X^{27}+X^{26}+X^{25}+X^{23}+X^{22}+X^{20}+X^{19}+X^{18}+X^{14}+X^{13}+X^{11}+X^{10}+X^9+X^8+X^6+1$ (CRC-32C)
- CRC module can calculate CRC with LSB first or MSB first bit order.

Configuration

Build Time Configurations for r_crc

The following build time configurations are defined in fsp_cfg/r_crc_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Monitoring > CRC (r_crc)

This module can be added to the Stacks tab via New Stack > Monitoring > CRC (r_crc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|----------------|-------------------------------|---------|---|
| Name | Name must be a valid C symbol | g_crc0 | Module name. |
| CRC Polynomial | MCU Specific Options | | Select the CRC polynomial. |
| Bit Order | MCU Specific Options | | Select the CRC bit order. |
| Snoop Address | MCU Specific Options | | Select the SCI register address CRC snoop |

Clock Configuration

There is no clock configuration for the CRC module.

Pin Configuration

This module does not use I/O pins.

Usage Notes

CRC Snoop

The CRC snoop function monitors reads from and writes to a specified I/O register address and performs CRC calculation on the data read from and written to the register address automatically. Instead of calling `R_CRC_Calculate` on a block of data, `R_CRC_SnoopEnable` is called to start monitoring reads/writes and `R_CRC_CalculatedValueGet` is used to obtain the current CRC.

Note

Snoop mode is available for transmit/receive operations on SCI only.

Limitations

When using CRC32 polynomial functions the CRC module produces the same results as popular online CRC32 calculators, but it is important to remember a few important points.

- Online CRC32 calculators allow the input to be any number of bytes. The FSP CRC32 API function uses 32-bit words. This means the online calculations must be 'padded' to end on a 32-bit boundary.
- Online CRC32 calculators usually invert the output prior to presenting it as a result. It is up to the application program to include this step if needed.
- The seed value of `0xFFFFFFFF` needs to be used by both the online calculator and the `R_CRC` module API (CRC32 polynomials)
- Make sure the bit orientation of the `R_CRC` CRC32 is set for LSB and that you have CRC32 selected and not CRC32C.
- Some online CRC tools XOR the final result with `0xFFFFFFFF`.

Examples

Basic Example

This is a basic example of minimal use of the CRC module in an application.

```
void crc_example ()
{
    uint32_t length;
    uint32_t uint8_calculated_value;
    length = sizeof(g_data_8bit) / sizeof(g_data_8bit[0]);
    crc_input_t example_input =
    {
        .p_input_buffer = g_data_8bit,
        .num_bytes      = length,
    }
}
```

```

        .crc_seed      = 0,
    };

    /* Open CRC module with 8 bit polynomial */
    R_CRC_Open(&crc_ctrl, &g_crc_test_cfg);

    /* 8-bit CRC calculation */
    R_CRC_Calculate(&crc_ctrl, &example_input, &uint8_calculated_value);
}

```

Snoop Example

This example demonstrates CRC snoop operation.

```

void crc_snoop_example ()
{
    /* Open CRC module with 8 bit polynomial */
    R_CRC_Open(&crc_ctrl, &g_crc_test_cfg);

    /* Open SCI Driver */
    /* Configure Snoop address and enable snoop mode */
    R_CRC_SnoopEnable(&crc_ctrl, 0);

    /* Perform SCI read/write operation depending on the SCI snoop address configure */
    /* Read CRC value */
    R_CRC_CalculatedValueGet(&crc_ctrl, &g_crc_buff);
}

```

Data Structures

struct [crc_instance_ctrl_t](#)

Data Structure Documentation

◆ [crc_instance_ctrl_t](#)

struct [crc_instance_ctrl_t](#)

Driver instance control structure.

Function Documentation

◆ **R_CRC_Open()**

```
fsp_err_t R_CRC_Open ( crc_ctrl_t *const p_ctrl, crc_cfg_t const *const p_cfg )
```

Open the CRC driver module

Implements `crc_api_t::open`

Open the CRC driver module and initialize the driver control block according to the passed-in configuration structure.

Return values

| | |
|----------------------|------------------------------------|
| FSP_SUCCESS | Configuration was successful. |
| FSP_ERR_ASSERTION | p_ctrl or p_cfg is NULL. |
| FSP_ERR_ALREADY_OPEN | Module already open |
| FSP_ERR_UNSUPPORTED | Hardware not support this feature. |

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Configuration was successful. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | The driver is not opened. |

◆ **R_CRC_Calculate()**

```
fsp_err_t R_CRC_Calculate ( crc_ctrl_t *const p_ctrl, crc_input_t *const p_crc_input, uint32_t *
calculatedValue )
```

Perform a CRC calculation on a block of 8-bit/32-bit (for 32-bit polynomial) data.

Implements [crc_api_t::calculate](#)

This function performs a CRC calculation on an array of 8-bit/32-bit (for 32-bit polynomial) values and returns an 8-bit/32-bit (for 32-bit polynomial) calculated value

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Calculation successful. |
| FSP_ERR_ASSERTION | Either p_ctrl, inputBuffer, or calculatedValue is NULL. |
| FSP_ERR_INVALID_ARGUMENT | length value is NULL. |
| FSP_ERR_NOT_OPEN | The driver is not opened. |

◆ **R_CRC_CalculatedValueGet()**

```
fsp_err_t R_CRC_CalculatedValueGet ( crc_ctrl_t *const p_ctrl, uint32_t * calculatedValue )
```

Return the current calculated value.

Implements [crc_api_t::crcResultGet](#)

CRC calculation operates on a running value. This function returns the current calculated value.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Return of calculated value successful. |
| FSP_ERR_ASSERTION | Either p_ctrl or calculatedValue is NULL. |
| FSP_ERR_NOT_OPEN | The driver is not opened. |

◆ **R_CRC_SnoopEnable()**

```
fsp_err_t R_CRC_SnoopEnable ( crc_ctrl_t *const p_ctrl, uint32_t crc_seed )
```

Configure the snoop channel and set the CRC seed.

Implements `crc_api_t::snoopEnable`

The CRC calculator can operate on reads and writes over any of the first ten SCI channels. For example, if set to channel 0, transmit, every byte written out SCI channel 0 is also sent to the CRC calculator as if the value was explicitly written directly to the CRC calculator.

Return values

| | |
|---------------------|--------------------------------------|
| FSP_SUCCESS | Snoop configured successfully. |
| FSP_ERR_ASSERTION | Pointer to control structure is NULL |
| FSP_ERR_NOT_OPEN | The driver is not opened. |
| FSP_ERR_UNSUPPORTED | SNOOP operation is not supported. |

◆ **R_CRC_SnoopDisable()**

```
fsp_err_t R_CRC_SnoopDisable ( crc_ctrl_t *const p_ctrl)
```

Disable snooping.

Implements `crc_api_t::snoopDisable`

Return values

| | |
|---------------------|-----------------------------------|
| FSP_SUCCESS | Snoop disabled. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | The driver is not opened. |
| FSP_ERR_UNSUPPORTED | SNOOP operation is not supported. |

5.2.10.2 Clock Accuracy Circuit (r_cac)

Modules » [Monitoring](#)

Functions

```

```
fsp_err_t R_CAC_StopMeasurement (cac_ctrl_t *const p_ctrl)
```

```
fsp_err_t R_CAC_Read (cac_ctrl_t *const p_ctrl, uint32_t *const p_counter)
```

```
fsp_err_t R_CAC_CallbackSet (cac_ctrl_t *const p_ctrl,
void(*p_callback)(cac_callback_args_t *), void const *const
p_context, cac_callback_args_t *const p_callback_memory)
```

```
fsp_err_t R_CAC_Close (cac_ctrl_t *const p_ctrl)
```

Detailed Description

Driver for the CAC peripheral on RA MCUs. This module implements the [CAC Interface](#).

Overview

The interface for the clock frequency accuracy measurement circuit (CAC) peripheral is used to check a system clock frequency with a reference clock signal by counting the number of measurement clock edges that occur between two edges of the reference clock.

Features

- Supports clock frequency-measurement and monitoring based on a reference signal input
- Reference can be either an externally supplied clock source or an internal clock source
- An interrupt request may optionally be generated by a completed measurement, a detected frequency error, or a counter overflow.
- A digital filter is available for an externally supplied reference clock, and dividers are available for both internally supplied measurement and reference clocks.
- Edge-detection options for the reference clock are configurable as rising, falling, or both.

Configuration

Build Time Configurations for r_cac

The following build time configurations are defined in fsp_cfg/r_cac_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Monitoring > Clock Accuracy Circuit (r_cac)

This module can be added to the Stacks tab via New Stack > Monitoring > Clock Accuracy Circuit (r_cac). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---------------|-------------------------------|---------|--------------|
| Name | Name must be a valid C symbol | g_cac0 | Module name. |

| | | | |
|------------------------------------|---|----------|---|
| Reference clock divider | <ul style="list-style-type: none"> • 32 • 128 • 1024 • 8192 | 32 | Reference clock divider. |
| Reference clock source | MCU Specific Options | | Reference clock source. |
| Reference clock digital filter | <ul style="list-style-type: none"> • Disabled • Sampling clock =Measuring freq • Sampling clock =Measuring freq/4 • Sampling clock =Measuring freq/16 | Disabled | Reference clock digital filter. |
| Reference clock edge detect | <ul style="list-style-type: none"> • Rising • Falling • Both | Rising | Reference clock edge detection. |
| Measurement clock divider | <ul style="list-style-type: none"> • 1 • 4 • 8 • 32 | 1 | Measurement clock divider. |
| Measurement clock source | MCU Specific Options | | Measurement clock source. |
| Upper Limit Threshold | Value must be a non-negative integer, between 0 to 65535 | 0 | Top end of allowable range for measurement completion. |
| Lower Limit Threshold | Value must be a non-negative integer, between 0 to 65535 | 0 | Bottom end of allowable range for measurement completion. |
| Frequency Error Interrupt Priority | MCU Specific Options | | CAC frequency error interrupt priority. |
| Measurement End Interrupt Priority | MCU Specific Options | | CAC measurement end interrupt priority. |
| Overflow Interrupt Priority | MCU Specific Options | | CAC overflow interrupt priority. |
| Callback | Name must be a valid C symbol | NULL | Function name for callback |

Clock Configuration

The CAC measurement clock source can be configured as the following:

1. MAIN_OSC
2. SUBCLOCK
3. HOCO

4. MOCO
5. LOCO
6. PCLKB
7. IWDT

The CAC reference clock source can be configured as the following:

1. MAIN_OSC
2. SUBCLOCK
3. HOCO
4. MOCO
5. LOCO
6. PCLKB
7. IWDT
8. External Clock Source (CACREF)

Pin Configuration

The CACREF pin can be configured to provide the reference clock for CAC measurements.

Usage Notes

Measurement Accuracy

The clock measurement result may be off by up to one pulse depending on the phase difference between the edge detection circuit, digital filter, and CACREF pin signal, if applicable.

Frequency Error Interrupt

The frequency error interrupt is only triggered at the end of a CAC measurement. This means that there will be a measurement complete interrupt in addition to the frequency error interrupt.

Examples

Basic Example

This is a basic example of minimal use of the CAC in an application.

```
volatile uint32_t g_callback_complete;
void cac_basic_example ()
{
    g_callback_complete = 0;
    fsp_err_t err = R_CAC_Open(&g_cac_ctrl, &g_cac_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    (void) R_CAC_StartMeasurement(&g_cac_ctrl);
    /* Wait for measurement to complete. */
    while (0 == g_callback_complete)
```

```

{
}

uint32_t value;
/* Read the CAC measurement. */
(void) R_CAC_Read(&g_cac_ctrl, &value);
}
/* Called when measurement is completed. */
static void r_cac_callback (cac_callback_args_t * p_args)
{
if (CAC_EVENT_MEASUREMENT_COMPLETE == p_args->event)
{
g_callback_complete = 1U;
}
}
}

```

Data Structures

struct [cac_instance_ctrl_t](#)

Data Structure Documentation

◆ cac_instance_ctrl_t

struct [cac_instance_ctrl_t](#)

CAC instance control block. DO NOT INITIALIZE.

Function Documentation

◆ R_CAC_Open()

[fsp_err_t](#) R_CAC_Open ([cac_ctrl_t](#) *const *p_ctrl*, [cac_cfg_t](#) const *const *p_cfg*)

The Open function configures the CAC based on the provided user configuration settings.

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | CAC is available and available for measurement(s). |
| FSP_ERR_ASSERTION | An argument is invalid. |
| FSP_ERR_ALREADY_OPEN | The CAC has already been opened. |

Note

There is only a single CAC peripheral.

◆ **R_CAC_StartMeasurement()**

```
fsp_err_t R_CAC_StartMeasurement ( cac_ctrl_t *const p_ctrl)
```

Start the CAC measurement process.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | CAC measurement started. |
| FSP_ERR_ASSERTION | NULL provided for p_instance_ctrl or p_cfg. |
| FSP_ERR_NOT_OPEN | R_CAC_Open() has not been successfully called. |

◆ **R_CAC_StopMeasurement()**

```
fsp_err_t R_CAC_StopMeasurement ( cac_ctrl_t *const p_ctrl)
```

Stop the CAC measurement process.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | CAC measuring has been stopped. |
| FSP_ERR_ASSERTION | NULL provided for p_instance_ctrl or p_cfg. |
| FSP_ERR_NOT_OPEN | R_CAC_Open() has not been successfully called. |

◆ **R_CAC_Read()**

```
fsp_err_t R_CAC_Read ( cac_ctrl_t *const p_ctrl, uint32_t *const p_counter )
```

Read and return the CAC status and counter registers.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | CAC read successful. |
| FSP_ERR_ASSERTION | An argument is NULL. |
| FSP_ERR_NOT_OPEN | R_CAC_Open() has not been successfully called. |

◆ **R_CAC_CallbackSet()**

```
fsp_err_t R_CAC_CallbackSet ( cac_ctrl_t *const p_ctrl, void(*) (cac_callback_args_t *) p_callback,
void const *const p_context, cac_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `cac_api_t::callbackSet`.

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | <code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL. |

◆ **R_CAC_Close()**

```
fsp_err_t R_CAC_Close ( cac_ctrl_t *const p_ctrl)
```

Release any resources that were allocated by the `Open()` or any subsequent CAC operations.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Successful close. |
| FSP_ERR_ASSERTION | NULL provided for <code>p_instance_ctrl</code> or <code>p_cfg</code> . |
| FSP_ERR_NOT_OPEN | <code>R_CAC_Open()</code> has not been successfully called. |

5.2.10.3 Data Operation Circuit (r_doc)

Modules » Monitoring

Functions

```
fsp_err_t R_DOC_Open (doc_ctrl_t *const p_api_ctrl, doc_cfg_t const *const
p_cfg)
```

```
fsp_err_t R_DOC_Close (doc_ctrl_t *const p_api_ctrl)
```

```
fsp_err_t R_DOC_Read (doc_ctrl_t *const p_api_ctrl, uint32_t *p_result)
```

```
fsp_err_t R_DOC_Write (doc_ctrl_t *const p_api_ctrl, uint32_t data)
```

```
fsp_err_t R_DOC_CallbackSet (doc_ctrl_t *const p_api_ctrl,
void(*p_callback)(doc_callback_args_t *), void const *const
p_context, doc_callback_args_t *const p_callback_memory)
```

Detailed Description

Driver for the DOC peripheral on RA MCUs. This module implements the [DOC Interface](#).

Overview

Features

The DOC HAL module peripheral is used to compare, add or subtract 16-bit or 32-bit¹ data and can detect the following events:

- Comparison Mode
 - Data is equal to the configured reference data setting.
 - Data is not equal to the configured reference data setting.
 - Data is less than the configured reference data setting².
 - Data is greater than the configured reference data setting².
 - Data is inside of a configurable pair of reference data settings².
 - Data is outside of a configurable pair of reference data settings².
- Addition Mode - Overflow of an addition operation
- Subtraction Mode - Underflow of a subtraction operation

A user-defined callback can be created to inform the CPU when any of above events occur.

Note

1. Operating on 32-bit data is not supported on all MCUs.
2. This comparison mode is not supported on all MCUs.

Configuration

Build Time Configurations for r_doc

The following build time configurations are defined in fsp_cfg/r_doc_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Monitoring > Data Operation Circuit (r_doc)

This module can be added to the Stacks tab via New Stack > Monitoring > Data Operation Circuit (r_doc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

| | | | |
|---------------------------|--|--------|---|
| Name | Name must be a valid C symbol | g_doc0 | Module name. |
| Event | MCU Specific Options | | Select the event that will trigger the DOC interrupt. |
| Bit Width | MCU Specific Options | | The bit width for DOC operations. |
| Reference/Initial Data | Value must be an integer greater than or equal to 0. | 0 | Enter Initial Value for Addition/Subtraction or enter reference value for comparison. |
| Additional Reference Data | Value must be an integer greater than or equal to 0. | 0 | Additional reference data used for Window Compare modes. |
| Callback | Name must be a valid C symbol | NULL | A user callback function must be provided. This will be called from the interrupt service routine (ISR) when the configured DOC event occurs. |
| DOC Interrupt Priority | MCU Specific Options | | Select the DOC interrupt priority. |

Clock Configuration

The DOC HAL module does not require a specific clock configuration.

Pin Configuration

The DOC HAL module does not require and specific pin configurations.

Usage Notes

DMAC/DTC Integration

DOC can be used with [Transfer \(r_dmac\)](#) or [Transfer \(r_dtc\)](#) to write to the input register without CPU intervention. DMAC is more useful for most DOC applications because it can be started directly from software. To write DOC input data with DTC/DMAC, set [transfer_info_t::p_dest](#) to R_DOC->DODIR.

Examples

Basic Example

This is a basic example of minimal use of the R_DOC in an application. This example shows how this driver can be used for continuous 16 bit addition operation while reading the result at every overflow event.

```
#define DOC_EXAMPLE_VALUE 0xF000
```

```
uint32_t g_callback_event_counter = 0;

/* This callback is called when DOC overflow event occurs. It is registered in
doc_cfg_t when R_DOC_Open is
 * called. */
void doc_callback (doc_callback_args_t * p_args)
{
    FSP_PARAMETER_NOT_USED(p_args);
    g_callback_event_counter++;
}

void basic_example (void)
{
    fsp_err_t err;

    /* Initialize the DOC module for addition with initial value specified in
doc_cfg_t::doc_data. */
    err = R_DOC_Open(&g_doc_ctrl, &g_doc_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Write data to the DOC Data Input Register and read the result of addition from
status register when an
 * interrupt occurs. */
    for (int i = 0; i < 5; i++)
    {
        err = R_DOC_Write(&g_doc_ctrl, DOC_EXAMPLE_VALUE);
        assert(FSP_SUCCESS == err);
    }
    if (g_callback_event_counter >= 1)
    {
        uint32_t result;
        /* Read the result of the operation */
        err = R_DOC_Read(&g_doc_ctrl, &result);
        assert(FSP_SUCCESS == err);
    }
}
}
```

Function Documentation

◆ R_DOC_Open()

```
fsp_err_t R_DOC_Open ( doc_ctrl_t *const p_api_ctrl, doc_cfg_t const *const p_cfg )
```

Opens and configures the Data Operation Circuit (DOC) in comparison, addition or subtraction mode and sets initial data for addition or subtraction, or reference data for comparison.

Example:

```
/* Initialize the DOC module for addition with initial value specified in
doc_cfg_t::doc_data. */
err = R_DOC_Open(&g_doc_ctrl, &g_doc_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | DOC successfully configured. |
| FSP_ERR_ALREADY_OPEN | Module already open. |
| FSP_ERR_ASSERTION | One or more pointers point to NULL or callback is NULL or the interrupt vector is invalid. |

◆ R_DOC_Close()

```
fsp_err_t R_DOC_Close ( doc_ctrl_t *const p_api_ctrl)
```

Closes the module driver. Enables module stop mode.

Return values

| | |
|-------------------|-----------------------------|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_NOT_OPEN | Driver not open. |
| FSP_ERR_ASSERTION | Pointer pointing to NULL. |

Note

This function will disable the DOC interrupt in the NVIC.

◆ **R_DOC_Read()**

```
fsp_err_t R_DOC_Read ( doc_ctrl_t*const p_api_ctrl, uint32_t* p_result )
```

Returns the result of addition/subtraction.

Example:

```
uint32_t result;
/* Read the result of the operation */
err = R_DOC_Read(&g_doc_ctrl, &result);
assert(FSP_SUCCESS == err);
```

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Status successfully read. |
| FSP_ERR_NOT_OPEN | Driver not open. |
| FSP_ERR_ASSERTION | One or more pointers point to NULL. |

◆ **R_DOC_Write()**

```
fsp_err_t R_DOC_Write ( doc_ctrl_t*const p_api_ctrl, uint32_t data )
```

Writes to the DODIR - DOC Input Register.

Example:

```
err = R_DOC_Write(&g_doc_ctrl, DOC_EXAMPLE_VALUE);
assert(FSP_SUCCESS == err);
```

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Values successfully written to the registers. |
| FSP_ERR_NOT_OPEN | Driver not open. |
| FSP_ERR_ASSERTION | One or more pointers point to NULL. |

◆ R_DOC_CallbackSet()

```
fsp_err_t R_DOC_CallbackSet ( doc_ctrl_t *const p_api_ctrl, void (*)(doc_callback_args_t *)
p_callback, void const *const p_context, doc_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `doc_api_t::callbackSet`

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | <code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL. |

void (*p_callback)(wdt_callback_args_t *), void const *const
p_context, wdt_callback_args_t *const p_callback_memory)
```

Detailed Description

Driver for the IWDT peripheral on RA MCUs. This module implements the [WDT Interface](#).

Overview

The independent watchdog timer is used to recover from unexpected errors in an application. The timer must be refreshed periodically in the permitted count window by the application. If the count is allowed to underflow or refresh occurs outside of the valid refresh period, the IWDT resets the device or generates an NMI.

Features

The IWDT HAL module has the following key features:

- When the IWDT underflows or is refreshed outside of the permitted refresh window, one of the following events can occur:
 - Resetting of the device
 - Generation of an NMI
- The WDT supports following modes:¹
 - In auto start mode, the WDT begins counting at reset.
 - In register start mode, the WDT can be started from the application¹.

Selecting a Watchdog

RA MCUs have two watchdog peripherals: the watchdog timer (WDT) and the independent watchdog timer (IWDT). When selecting between them, consider these factors:

| | WDT | IWDT |
|--------------|---|--|
| Start Mode | The WDT can be started from the application (register start mode) or configured by hardware to start automatically (auto start mode). | On most of MCUs, the IWDT can only be configured by hardware to start automatically ¹ . |
| Clock Source | The WDT runs off a peripheral clock. | The IWDT has its own clock source which improves safety. |

Note

1. Refer to the MCU hardware user's manual or datasheet to determine if IWDT supports register start mode.

Configuration

When using register start mode, configure the watchdog timer on the Stacks tab.

Note

When using auto start mode, configurations on the **Stacks** tab are ignored. Configure the watchdog using the **OFS** settings on the **BSP** tab. These settings include the following:

- *Start Mode*
- *Timeout Period*
- *Dedicated Clock Frequency Divisor*
- *Window End Position*
- *Window Start Position*
- *Reset Interrupt Request Select*
- *Stop Control*

Review the OFSO properties window to see additional details.

Build Time Configurations for r_iwdt

The following build time configurations are defined in fsp_cfg/r_iwdt_cfg.h:

| Configuration | Options | Default | Description |
|----------------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> Default (BSP) Enabled Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Register Start NMI Support | MCU Specific Options | | If enabled, code for NMI support in register start mode is included in the build. |

Configurations for Monitoring > Independent Watchdog (r_iwdt)

This module can be added to the Stacks tab via New Stack > Monitoring > Independent Watchdog (r_iwdt). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|-----------------------|-------------------------------|---------|---|
| Name | Name must be a valid C symbol | g_wdt0 | Module name. |
| Timeout | MCU Specific Options | | Select the independent watchdog timeout in cycles. |
| Clock Division Ratio | MCU Specific Options | | Select the independent watchdog clock divisor. |
| Window Start Position | MCU Specific Options | | Select the allowed independent watchdog refresh start point in %. |
| Window End Position | MCU Specific Options | | Select the allowed independent watchdog refresh end point in %. |
| Reset Control | MCU Specific Options | | Select what happens when the independent watchdog timer expires. |
| Stop Control | MCU Specific Options | | Select the independent watchdog state in low power mode. |
| NMI callback | Name must be a valid C symbol | NULL | A user callback function can be provided here. If this callback function is |

provided, it is called from the interrupt service routine (ISR) when the watchdog triggers.

Clock Configuration

The IWDT clock is based on the IWDTCLK frequency. You can set the IWDTCLK frequency divider using the **BSP** tab of the RA Configuration editor.

Pin Configuration

This module does not use I/O pins.

Usage Notes

NMI Interrupt

The independent watchdog timer uses the NMI, which is enabled by default. No special configuration is required. When the NMI is triggered, the callback function registered during open is called.

Note

When using the IWDT in software start mode with NMI and the timer underflows, the IWDT status must be reset by calling [R_IWDT_StatusClear](#) before restarting the timer via [R_IWDT_Refresh](#).

Period Calculation

The IWDT operates from IWDTCLK. With a IWDTCLK of 15000 Hz, the maximum time from the last refresh to device reset or NMI generation will be just below 35 seconds as detailed below.

IWDTCLK = 15000 Hz
Clock division ratio = IWDTCLK / 256
Timeout period = 2048 cycles
WDT clock frequency = 15000 Hz / 256 = 58.59 Hz
Cycle time = 1 / 58.59 Hz = 17.067 ms
Timeout = 17.067 ms x 2048 cycles = 34.95 seconds

Limitations

Developers should be aware of the following limitations when using the IWDT:

- When using a J-Link debugger the IWDT counter does not count and therefore will not reset the device or generate an NMI. To enable the watchdog to count and generate a reset or NMI while debugging, add this line of code in the application:

```
/* (Optional) Enable the IWDT to count and generate NMI or reset when the
 * debugger is connected. */
R_DEBUG->DBGSTOPCR_b.DBGSTOP_IWDT = 0;
```

- If the IWDT is configured to stop the counter in low power mode, then your application must restart the watchdog by calling [R_IWDT_Refresh\(\)](#) after the MCU wakes from low power mode.

Examples

IWDT Basic Example

This is a basic example of minimal use of the IWDT in an application.

```
void iwdt_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* In auto start mode, the IWDT starts counting immediately when the MCU is powered
    on. */

    /* Initializes the module. */
    err = R_IWDT_Open(&g_iwdt0_ctrl, &g_iwdt0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    while (true)
    {
        /* Application work here. */

        /* Refresh before the counter underflows to prevent reset or NMI based on the
        setting. */
        (void) R_IWDT_Refresh(&g_iwdt0_ctrl);
    }
}
```

IWDT Advanced Example

This example demonstrates using a start window and gives an example callback to handle an NMI generated by an underflow or refresh error.

```
#define IWDT_TIMEOUT_COUNTS (2048U)
#define IWDT_MAX_COUNTER (IWDT_TIMEOUT_COUNTS - 1U)
#define IWDT_START_WINDOW_75 ((IWDT_MAX_COUNTER * 3) / 4)

/* Example callback called when a watchdog NMI occurs. */
void iwdt_callback (wdt_callback_args_t * p_args)
{
    FSP_PARAMETER_NOT_USED(p_args);

    fsp_err_t err = FSP_SUCCESS;
```

```
/* (Optional) Determine the source of the NMI. */
wdt_status_t status = WDT_STATUS_NO_ERROR;

err = R_IWDT_StatusGet(&g_iwdt0_ctrl, &status);
assert(FSP_SUCCESS == err);

/* (Optional) Log source of NMI and any other debug information. */
/* (Optional) Clear the error flags. */
err = R_IWDT_StatusClear(&g_iwdt0_ctrl, status);
assert(FSP_SUCCESS == err);

/* (Optional) Issue a software reset to reset the MCU. */
__NVIC_SystemReset();
}

void iwdt_advanced_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* (Optional) Enable the IWDT to count and generate NMI or reset when the
     * debugger is connected. */
    R_DEBUG->DBGSTOPPCR_b.DBGSTOP_IWDT = 0;

    /* (Optional) Check if the IWDTRF flag is set to know if the system is
     * recovering from a IWDT reset. */
    if (R_SYSTEM->RSTSR1_b.IWDTRF)
    {
        /* Clear the flag. */
        R_SYSTEM->RSTSR1 = 0U;
    }

    /* Open the module. */
    err = R_IWDT_Open(&g_iwdt0_ctrl, &g_iwdt0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Initialize other application code. */
    /* Do not call R_IWDT_Refresh() in auto start mode unless the
     * counter is in the acceptable refresh window. */
    (void) R_IWDT_Refresh(&g_iwdt0_ctrl);

    while (true)
    {
```

```

/* Application work here. */
/* (Optional) If there is a chance the application takes less time than
 * the start window, verify the IWDT counter is past the start window
 * before refreshing the IWDT. */
    uint32_t iwdt_counter = 0U;
do
    {
/* Read the current IWDT counter value. */
        err = R_IWDT_CounterGet(&g_iwdt0_ctrl, &iwdt_counter);
        assert(FSP_SUCCESS == err);
    } while (iwdt_counter >= IWDT_START_WINDOW_75);
/* Refresh before the counter underflows to prevent reset or NMI. */
    (void) R_IWDT_Refresh(&g_iwdt0_ctrl);
    }
}

```

Data Structures

struct [iwdt_instance_ctrl_t](#)

Data Structure Documentation

◆ iwdt_instance_ctrl_t

| struct iwdt_instance_ctrl_t | |
|--|---|
| IWDT control block. DO NOT INITIALIZE. Initialization occurs when wdt_api_t::open is called. | |
| Data Fields | |
| uint32_t | wdt_open |
| | Indicates whether the open() API has been successfully called. |
| void const * | p_context |
| | Placeholder for user data. Passed to the user callback in wdt_callback_args_t . |
| void(* | p_callback)(wdt_callback_args_t *p_args) |
| | Callback provided when a WDT NMI ISR occurs. |

Function Documentation

◆ R_IWDT_Open()

```
fsp_err_t R_IWDT_Open ( wdt_ctrl_t *const p_api_ctrl, wdt_cfg_t const *const p_cfg )
```

Register the IWDT NMI callback.

Example:

```
/* Initializes the module. */
err = R_IWDT_Open(&g_iwdt0_ctrl, &g_iwdt0_cfg);
```

Return values

| | |
|-----------------------|---|
| FSP_SUCCESS | IWDT successfully configured. |
| FSP_ERR_ASSERTION | Null Pointer. |
| FSP_ERR_NOT_ENABLED | An attempt to open the IWDT when the OFS0 register is not configured for auto-start mode. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_STATE | The security state of the NMI and the module do not match. |

◆ R_IWDT_Refresh()

```
fsp_err_t R_IWDT_Refresh ( wdt_ctrl_t *const p_api_ctrl)
```

Refresh the Independent Watchdog Timer. If the refresh fails due to being performed outside of the permitted refresh period the device will either reset or trigger an NMI ISR to run.

Example:

```
/* Refresh before the counter underflows to prevent reset or NMI based on the
setting. */
(void) R_IWDT_Refresh(&g_iwdt0_ctrl);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | IWDT successfully refreshed. |
| FSP_ERR_ASSERTION | One or more parameters are NULL pointers. |
| FSP_ERR_NOT_OPEN | The driver has not been opened. Perform R_IWDT_Open() first. |

◆ **R_IWDT_StatusGet()**

```
fsp_err_t R_IWDT_StatusGet ( wdt_ctrl_t*const p_api_ctrl, wdt_status_t*const p_status )
```

Read the IWDT status flags.

Indicates both status and error conditions.

Example:

```
/* (Optional) Determine the source of the NMI. */
wdt_status_t status = WDT_STATUS_NO_ERROR;
err = R_IWDT_StatusGet(&g_iwdt0_ctrl, &status);
assert(FSP_SUCCESS == err);
```

Return values

| | |
|---------------------|--|
| FSP_SUCCESS | IWDT status successfully read. |
| FSP_ERR_ASSERTION | Null pointer as a parameter. |
| FSP_ERR_NOT_OPEN | The driver has not been opened. Perform R_IWDT_Open() first. |
| FSP_ERR_UNSUPPORTED | This function is only valid if the IWDT generates an NMI when an error occurs. |

Note

When the IWDT is configured to output a reset on underflow or refresh error reading the status and error flags serves no purpose as they will always indicate that no underflow has occurred and there is no refresh error. Reading the status and error flags is only valid when interrupt request output is enabled.

◆ **R_IWDT_StatusClear()**

```
fsp_err_t R_IWDT_StatusClear ( wdt_ctrl_t *const p_api_ctrl, const wdt_status_t status )
```

Clear the IWDT status and error flags. Implements `wdt_api_t::statusClear`.

Example:

```
/* (Optional) Clear the error flags. */
err = R_IWDT_StatusClear(&g_iwdt0_ctrl, status);
assert(FSP_SUCCESS == err);
```

Return values

| | |
|---------------------|--|
| FSP_SUCCESS | IWDT flag(s) successfully cleared. |
| FSP_ERR_ASSERTION | Null pointer as a parameter. |
| FSP_ERR_NOT_OPEN | The driver has not been opened. Perform R_IWDT_Open() first. |
| FSP_ERR_UNSUPPORTED | This function is only valid if the IWDT generates an NMI when an error occurs. |

Note

When the IWDT is configured to output a reset on underflow or refresh error reading the status and error flags serves no purpose as they will always indicate that no underflow has occurred and there is no refresh error. Reading the status and error flags is only valid when interrupt request output is enabled.

◆ **R_IWDT_CounterGet()**

```
fsp_err_t R_IWDT_CounterGet ( wdt_ctrl_t *const p_api_ctrl, uint32_t *const p_count )
```

Read the current count value of the IWDT. Implements `wdt_api_t::counterGet`.

Example:

```
/* Read the current IWDT counter value. */
err = R_IWDT_CounterGet(&g_iwdt0_ctrl, &iwdt_counter);
assert(FSP_SUCCESS == err);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | IWDT current count successfully read. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | The driver has not been opened. Perform R_IWDT_Open() first. |

◆ **R_IWDT_TimeoutGet()**

```
fsp_err_t R_IWDT_TimeoutGet ( wdt_ctrl_t *const p_api_ctrl, wdt_timeout_values_t *const p_timeout )
```

Read timeout information for the watchdog timer. Implements `wdt_api_t::timeoutGet`.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | IWDT timeout information retrieved successfully. |
| FSP_ERR_ASSERTION | One or more parameters are NULL pointers. |
| FSP_ERR_NOT_OPEN | The driver has not been opened. Perform <code>R_IWDT_Open()</code> first. |

◆ **R_IWDT_CallbackSet()**

```
fsp_err_t R_IWDT_CallbackSet ( wdt_ctrl_t *const p_ctrl, void(*) (wdt_callback_args_t *) p_callback, void const *const p_context, wdt_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `wdt_api_t::callbackSet`

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | <code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL. |

5.2.10.5 Low/Programmable Voltage Detection (r_lvd)

Modules » [Monitoring](#)

Driver for the LVD and PVD peripherals on RA MCUs. This module implements the [Low Voltage Detection Interface](#).

Note

In the below usage notes, "LVD" refers to both LVD and PVD.

Overview

The Low Voltage Detection module configures the voltage monitors to detect when a power supply pin or a voltage detector pin voltages crosses a specified threshold.

Features

The LVD HAL module supports the following functions:

- Five run-time configurable voltage monitors (Voltage Monitor 1, Voltage Monitor 2, LVD VBAT, LVD VRTC, EXLVD)
 - Configurable voltage threshold
 - Digital filter (Available on specific MCUs)
 - Support for both interrupt or polling
 - NMI or maskable interrupt can be configured (NMI support for Voltage Monitor 1 & Voltage Monitor 2 only).
 - Voltage monitor interrupt generation condition can be configured (rising, falling, or both edge event detection).
 - Support for resetting the MCU when V_{CC} falls below/rises above configured threshold.

Configuration

Build Time Configurations for r_lvd

The following build time configurations are defined in fsp_cfg/r_lvd_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Monitoring > Low/Programmable Voltage Detection (r_lvd)

This module can be added to the Stacks tab via New Stack > Monitoring > Low/Programmable Voltage Detection (r_lvd). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|--------------------|-------------------------------|---------|--|
| Name | Name must be a valid C symbol | g_lvd0 | Module name. |
| Monitor Number | MCU Specific Options | | Select the LVD monitor. |
| Digital Filter | MCU Specific Options | | Enable the digital filter and select the digital filter clock divider. |
| Voltage Threshold | MCU Specific Options | | Select the low voltage detection threshold. |
| Detection Response | MCU Specific Options | | Select what happens when the voltage crosses the threshold |

voltage.

| | | | |
|--------------------------------|--------------------------------|------|---|
| Voltage Slope | MCU Specific Options | | Select interrupt generation on rising voltage, falling voltage or both. |
| Negation Delay | MCU Specific Options | | Negation of the monitor signal can either be delayed from the reset event or from voltage returning to normal range. |
| Monitor Interrupt Callback | Name must be a valid C symbol. | NULL | A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR) each time the IRQ triggers. |
| LVD Monitor Interrupt Priority | MCU Specific Options | | Select the LVD Monitor interrupt priority. |

Clock Configuration

The LOCO clock must be enabled in order to use the digital filter.

Pin Configuration

To use LVD module, you need to switch pin function of EXLVDVBAT pin, VRTC pin, EXLVD pin to enable LVD function on this pin.

Usage Notes

Startup Edge Detection

If V_{CC} is below the threshold prior to configuring the voltage monitor for falling edge detection, the monitor will immediately detect the a falling edge condition. If V_{CC} is above the threshold prior to configuring the monitor for rising edge detection, the monitor will not detect a rising edge condition until V_{CC} falls below the threshold and then rises above it again.

Voltage Monitor 0

The LVD HAL module only supports configuring voltage monitor 1 and voltage monitor 2. Voltage monitor 0 can be configured by setting the appropriate bits in the OFS1 register. This means that voltage monitor 0 settings cannot be changed at runtime.

Voltage monitor 0 supports the following features

- Configurable Voltage Threshold (V_{DET0})
- Reset the device when V_{CC} falls below V_{DET0}

Limitations

- The digital filter must be disabled when using voltage monitors in Software Standby or Deep Software Standby.
- Deep Software Standby mode is not possible if the voltage monitor is configured to reset the MCU.
- Reset generated by the VCC-rise detection is supported only on devices with PVD.
- On RA0, when LVD0 is used the detection voltage of LVD1 must be higher than LVD0's. See the section "LVD1CR : Voltage Monitor 1 Circuit Control Register" of the RA0 Hardware User's Manual (r01uh1040ej0100).

Examples

Basic Example

This is a basic example of minimal use of the LVD in an application.

```
void basic_example (void)
{
    fsp_err_t err = R_LVD_Open(&g_lvd_ctrl, &g_lvd_cfg);
    assert(FSP_SUCCESS == err);
    while (1)
    {
        lvd_status_t status;
        err = R_LVD_StatusGet(&g_lvd_ctrl, &status);
        assert(FSP_SUCCESS == err);
        if (LVD_THRESHOLD_CROSSING_DETECTED == status.crossing_detected)
        {
            err = R_LVD_StatusClear(&g_lvd_ctrl);
            assert(FSP_SUCCESS == err);
            /* Do something */
        }
    }
}
```

Interrupt Example

This is a basic example of using a LVD instance that is configured to generate an interrupt.

```
void interrupt_example (void)
{
```

```
fsp_err_t err = R_LVD_Open(&g_lvd_ctrl, &g_lvd_cfg);

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

while (1)
{
    /* Application Process */

    /* Application will be interrupted when Vcc crosses the configured threshold. */
}

/* Called when Vcc crosses configured threshold. */
void lvd_callback (lvd_callback_args_t * p_args)
{
    if (LVD_CURRENT_STATE_BELOW_THRESHOLD == p_args->current_state)
    {
        /* Do Something */
    }
}
```

Reset Example

This is a basic example of using a LVD instance that is configured to reset the MCU.

```
void reset_example (void)
{
    if (1U == R_SYSTEM->RSTSR0_b.LVD1RF)
    {
        /* The system is coming out of reset because Vcc crossed configured voltage
        threshold. */

        /* Clear Voltage Monitor 1 Reset Detect Flag. */
        R_SYSTEM->RSTSR0_b.LVD1RF = 0;
    }

    fsp_err_t err = R_LVD_Open(&g_lvd_ctrl, &g_lvd_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    while (1)
```

```

{
/* Application Process */
/* Application will reset when Vcc crosses the configured threshold. */
}
}

```

Detailed Description

Driver for the WDT peripheral on RA MCUs. This module implements the [WDT Interface](#).

Overview

The watchdog timer is used to recover from unexpected errors in an application. The watchdog timer must be refreshed periodically in the permitted count window by the application. If the count is allowed to underflow or refresh occurs outside of the valid refresh period, the WDT resets the device or generates an NMI.

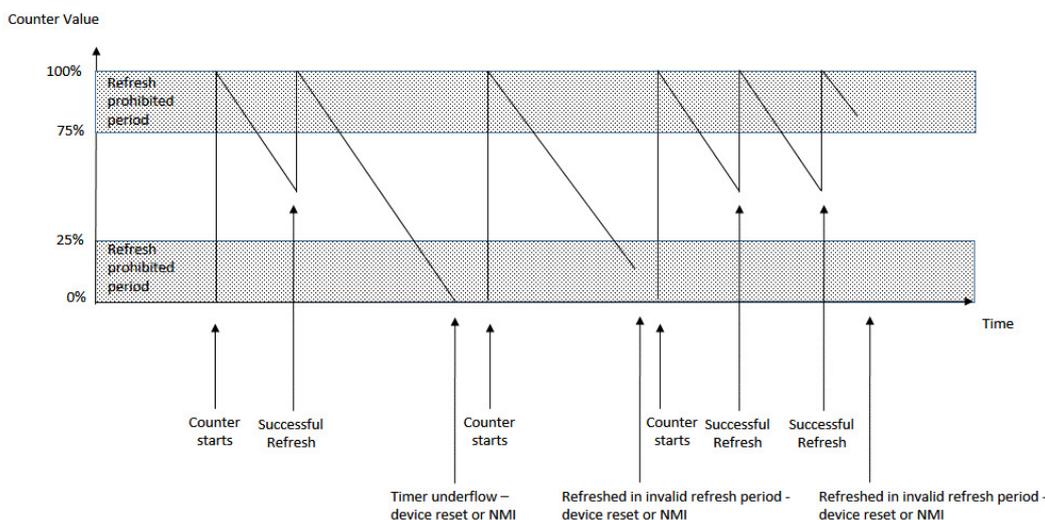

Figure 228: Watchdog Timer Operation Example

Features

The WDT HAL module has the following key features:

- When the WDT underflows or is refreshed outside of the permitted refresh window, one of the following events can occur:
 - Resetting of the device
 - Generation of an NMI
- The WDT has two supported modes:
 - In auto start mode, the WDT begins counting at reset.
 - In register start mode, the WDT can be started from the application.

Selecting a Watchdog

RA MCUs have two watchdog peripherals: the watchdog timer (WDT) and the independent watchdog timer (IWDT). When selecting between them, consider these factors:

| | WDT | IWDT |
|--------------|---|---|
| Start Mode | The WDT can be started from the application (register start mode) or configured by hardware to start automatically (auto start mode). | The IWDT can only be configured by hardware to start automatically. |
| Clock Source | The WDT runs off a peripheral clock. | The IWDT has its own clock source which improves safety. |

Configuration

When using register start mode, configure the watchdog timer on the Stacks tab.

Note

When using auto start mode, configurations on the **Stacks** tab are ignored. Configure the watchdog using the **OFS** settings on the **BSP** tab.

Build Time Configurations for r_wdt

The following build time configurations are defined in fsp_cfg/r_wdt_cfg.h:

| Configuration | Options | Default | Description |
|----------------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> Default (BSP) Enabled Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Register Start NMI Support | <ul style="list-style-type: none"> Enabled Disabled | Disabled | If enabled, code for NMI support in register start mode is included in the build. |

Configurations for Monitoring > Watchdog (r_wdt)

This module can be added to the Stacks tab via New Stack > Monitoring > Watchdog (r_wdt). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|-----------------------|---|-------------------------------------|---|
| Name | Name must be a valid C symbol | g_wdt0 | Module name. |
| Timeout | <ul style="list-style-type: none"> 1,024 Cycles 4,096 Cycles 8,192 Cycles 16,384 Cycles | 16,384 Cycles | Select the watchdog timeout in cycles. |
| Clock Division Ratio | <ul style="list-style-type: none"> PCLK/4 PCLK/64 PCLK/128 PCLK/512 PCLK/2048 PCLK/8192 | PCLK/8192 | Select the watchdog clock divisor. |
| Window Start Position | <ul style="list-style-type: none"> 100 (Window Position Not Specified) 75 50 25 | 100 (Window Position Not Specified) | Select the allowed watchdog refresh start point in %. |
| Window End Position | <ul style="list-style-type: none"> 0 (Window Position Not Specified) | 0 (Window Position Not Specified) | Select the allowed watchdog refresh end |

| | | | |
|---------------|---|--------------------------------------|---|
| | Specified) | | point in %. |
| | <ul style="list-style-type: none"> • 25 • 50 • 75 | | |
| Reset Control | <ul style="list-style-type: none"> • Reset Output • NMI Generated | Reset Output | Select what happens when the watchdog timer expires. |
| Stop Control | <ul style="list-style-type: none"> • WDT Count Enabled in Low Power Mode • WDT Count Disabled in Low Power Mode | WDT Count Disabled in Low Power Mode | Select the watchdog state in low power mode. |
| NMI Callback | Name must be a valid C symbol | NULL | A user callback function must be provided if the WDT is configured to generate an NMI when the timer underflows or a refresh error occurs. If this callback function is provided, it will be called from the NMI handler each time the watchdog triggers. |

Clock Configuration

The WDT clock is based on the PCLKB frequency. You can set the PCLKB frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time. The maximum timeout period with PCLKB running at 60 MHz is approximately 2.2 seconds.

Pin Configuration

This module does not use I/O pins.

Usage Notes

NMI Interrupt

The watchdog timer uses the NMI, which is enabled by default. No special configuration is required. When the NMI is triggered, the callback function registered during open is called.

Note

When using the WDT in software start mode with NMI and the timer underflows, the WDT status must be reset by calling [R_WDT_StatusClear](#) before restarting the timer via [R_WDT_Refresh](#).

Period Calculation

The WDT operates from PCLKB. With a PCLKB of 60 MHz, the maximum time from the last refresh to device reset or NMI generation will be just over 2.2 seconds as detailed below.

PLCKB = 60 MHz

Clock division ratio = PCLKB / 8192
Timeout period = 16384 cycles
WDT clock frequency = 60 MHz / 8192 = 7.324 kHz
Cycle time = 1 / 7.324 kHz = 136.53 us
Timeout = 136.53 us x 16384 cycles = 2.23 seconds

Limitations

Developers should be aware of the following limitations when using the WDT:

- When using a J-Link debugger the WDT counter does not count and therefore will not reset the device or generate an NMI. To enable the watchdog to count and generate a reset or NMI while debugging, add this line of code in the application:

```
/* (Optional) Enable the WDT to count and generate NMI or reset when the
 * debugger is connected. */
R_DEBUG->DBGSTOPCR_b.DBGSTOP_WDT = 0;
```

- If the WDT is configured to stop the counter in low power mode, then your application must restart the watchdog by calling `R_WDT_Refresh()` after the MCU wakes from low power mode.

Examples

WDT Basic Example

This is a basic example of minimal use of the WDT in an application.

```
void wdt_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* In auto start mode, the WDT starts counting immediately when the MCU is powered
    on. */

    /* Initializes the module. */
    err = R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* In register start mode, start the watchdog by calling R_WDT_Refresh. */
    err = R_WDT_Refresh(&g_wdt0_ctrl);
    assert(FSP_SUCCESS == err);

    while (true)
    {
        /* Application work here. */
    }
}
```

```
/* Refresh before the counter underflows to prevent reset or NMI. */
    err = R_WDT_Refresh(&g_wdt0_ctrl);
    assert(FSP_SUCCESS == err);
}
}
```

WDT Advanced Example

This example demonstrates using a start window and gives an example callback to handle an NMI generated by an underflow or refresh error.

```
#define WDT_TIMEOUT_COUNTS (16384U)
#define WDT_MAX_COUNTER (WDT_TIMEOUT_COUNTS - 1U)
#define WDT_START_WINDOW_75 ((WDT_MAX_COUNTER * 3) / 4)
/* Example callback called when a watchdog NMI occurs. */
void wdt_callback (wdt_callback_args_t * p_args)
{
    FSP_PARAMETER_NOT_USED(p_args);
    fsp_err_t err = FSP_SUCCESS;
    /* (Optional) Determine the source of the NMI. */
    wdt_status_t status = WDT_STATUS_NO_ERROR;
    err = R_WDT_StatusGet(&g_wdt0_ctrl, &status);
    assert(FSP_SUCCESS == err);
    /* (Optional) Log source of NMI and any other debug information. */
    /* (Optional) Clear the error flags. */
    err = R_WDT_StatusClear(&g_wdt0_ctrl, status);
    assert(FSP_SUCCESS == err);
    /* (Register start mode) In register start mode, call R_WDT_Refresh() to
    * continue using the watchdog after an error. */
    err = R_WDT_Refresh(&g_wdt0_ctrl);
    assert(FSP_SUCCESS == err);
    /* (Optional) Issue a software reset to reset the MCU. */
    __NVIC_SystemReset();
}
void wdt_advanced_example (void)
```

```
{
    fsp_err_t err = FSP_SUCCESS;

    /* (Optional) Enable the WDT to count and generate NMI or reset when the
     * debugger is connected. */
    R_DEBUG->DBGSTOPCR_b.DBGSTOP_WDT = 0;

    /* (Optional) Check if the WDTRF flag is set to know if the system is
     * recovering from a WDT reset. */
    if (R_SYSTEM->RSTSR1_b.WDTRF)
    {
        /* Clear the flag. */
        R_SYSTEM->RSTSR1 = 0U;
    }

    /* Open the module. */
    err = R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Initialize other application code. */
    /* (Register start mode) Call R_WDT_Refresh() to start the WDT in register
     * start mode. Do not call R_WDT_Refresh() in auto start mode unless the
     * counter is in the acceptable refresh window. */
    err = R_WDT_Refresh(&g_wdt0_ctrl);
    assert(FSP_SUCCESS == err);

    while (true)
    {
        /* Application work here. */
        /* (Optional) If there is a chance the application takes less time than
         * the start window, verify the WDT counter is past the start window
         * before refreshing the WDT. */
        uint32_t wdt_counter = 0U;

    do
        {
            /* Read the current WDT counter value. */
            err = R_WDT_CounterGet(&g_wdt0_ctrl, &wdt_counter);
            assert(FSP_SUCCESS == err);
```

```

    } while (wdt_counter >= WDT_START_WINDOW_75);

/* Refresh before the counter underflows to prevent reset or NMI. */
err = R_WDT_Refresh(&g_wdt0_ctrl);
assert(FSP_SUCCESS == err);
}
}

```

Data Structures

```
struct wdt_instance_ctrl_t
```

Data Structure Documentation

◆ wdt_instance_ctrl_t

```
struct wdt_instance_ctrl_t
```

WDT private control block. DO NOT MODIFY. Initialization occurs when [R_WDT_Open\(\)](#) is called.

Function Documentation

◆ R_WDT_Open()

```
fsp_err_t R_WDT_Open ( wdt_ctrl_t *const p_ctrl, wdt_cfg_t const *const p_cfg )
```

Configure the WDT in register start mode. In auto-start_mode the NMI callback can be registered. Implements [wdt_api_t::open](#).

This function should only be called once as WDT configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```

/* Initializes the module. */
err = R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);

```

Return values

| | |
|-----------------------|--|
| FSP_SUCCESS | WDT successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_STATE | The security state of the NMI and the module do not match. |

Note

In auto start mode the only valid configuration option is for registering the callback for the NMI ISR if NMI output has been selected.

◆ R_WDT_TimeoutGet()

```
fsp_err_t R_WDT_TimeoutGet ( wdt_ctrl_t *const p_ctrl, wdt_timeout_values_t *const p_timeout )
```

Read timeout information for the watchdog timer. Implements `wdt_api_t::timeoutGet`.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | WDT timeout information retrieved successfully. |
| FSP_ERR_ASSERTION | Null Pointer. |
| FSP_ERR_NOT_OPEN | Instance control block is not initialized. |

◆ R_WDT_Refresh()

```
fsp_err_t R_WDT_Refresh ( wdt_ctrl_t *const p_ctrl)
```

Refresh the watchdog timer. Implements `wdt_api_t::refresh`.

In addition to refreshing the watchdog counter this function can be used to start the counter in register start mode.

Example:

```
/* Refresh before the counter underflows to prevent reset or NMI. */
err = R_WDT_Refresh(&g_wdt0_ctrl);
assert(FSP_SUCCESS == err);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | WDT successfully refreshed. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not initialized. |

Note

This function only returns FSP_SUCCESS. If the refresh fails due to being performed outside of the permitted refresh period the device will either reset or trigger an NMI ISR to run.

◆ **R_WDT_StatusGet()**

```
fsp_err_t R_WDT_StatusGet ( wdt_ctrl_t *const p_ctrl, wdt_status_t *const p_status )
```

Read the WDT status flags. Implements `wdt_api_t::statusGet`.

Indicates both status and error conditions.

Example:

```
/* (Optional) Determine the source of the NMI. */
wdt_status_t status = WDT_STATUS_NO_ERROR;
err = R_WDT_StatusGet(&g_wdt0_ctrl, &status);
assert(FSP_SUCCESS == err);
```

Return values

| | |
|---------------------|--|
| FSP_SUCCESS | WDT status successfully read. |
| FSP_ERR_ASSERTION | Null pointer as a parameter. |
| FSP_ERR_NOT_OPEN | Instance control block is not initialized. |
| FSP_ERR_UNSUPPORTED | This function is only valid if the watchdog generates an NMI when an error occurs. |

Note

When the WDT is configured to output a reset on underflow or refresh error reading the status and error flags serves no purpose as they will always indicate that no underflow has occurred and there is no refresh error. Reading the status and error flags is only valid when interrupt request output is enabled.

◆ **R_WDT_StatusClear()**

```
fsp_err_t R_WDT_StatusClear ( wdt_ctrl_t *const p_ctrl, const wdt_status_t status )
```

Clear the WDT status and error flags. Implements `wdt_api_t::statusClear`.

Example:

```
/* (Optional) Clear the error flags. */
err = R_WDT_StatusClear(&g_wdt0_ctrl, status);
assert(FSP_SUCCESS == err);
```

Return values

| | |
|---------------------|--|
| FSP_SUCCESS | WDT flag(s) successfully cleared. |
| FSP_ERR_ASSERTION | Null pointer as a parameter. |
| FSP_ERR_NOT_OPEN | Instance control block is not initialized. |
| FSP_ERR_UNSUPPORTED | This function is only valid if the watchdog generates an NMI when an error occurs. |

Note

When the WDT is configured to output a reset on underflow or refresh error reading the status and error flags serves no purpose as they will always indicate that no underflow has occurred and there is no refresh error. Reading the status and error flags is only valid when interrupt request output is enabled.

◆ **R_WDT_CounterGet()**

```
fsp_err_t R_WDT_CounterGet ( wdt_ctrl_t *const p_ctrl, uint32_t *const p_count )
```

Read the current count value of the WDT. Implements `wdt_api_t::counterGet`.

Example:

```
/* Read the current WDT counter value. */
err = R_WDT_CounterGet(&g_wdt0_ctrl, &wdt_counter);
assert(FSP_SUCCESS == err);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | WDT current count successfully read. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Instance control block is not initialized. |

◆ R_WDT_CallbackSet()

```
fsp_err_t R_WDT_CallbackSet ( wdt_ctrl_t *const p_ctrl, void (*)(wdt_callback_args_t *) p_callback,
void const *const p_context, wdt_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `wdt_api_t::callbackSet`

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | <code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL. |

5.2.11 Motor

Modules

Detailed Description

Motor Modules.

Modules

[120-degree conduction control sensorless \(rm_motor_120_control_sensorless\)](#)

Calculation process for the motor control on RA MCUs. This module implements the [Motor 120-Degree Control Interface](#).

[120-degree conduction control with Hall sensors \(rm_motor_120_control_hall\)](#)

Calculation process for the motor control on RA MCUs. This module implements the [Motor 120-Degree Control Interface](#).

[ADC and PWM Modulation \(rm_motor_driver\)](#)

Calculation process for the motor control on RA MCUs. This module implements the [Motor driver Interface](#).

[ADC and PWM modulation \(rm_motor_120_driver\)](#)

Calculation process for the motor control on RA MCUs. This module implements the [Motor 120-Degree Driver Interface](#).

[Motor 120 degree control \(rm_motor_120_degree\)](#)

Usual control of a SPM (Surface Permanent Magnet) motor on RA MCUs. This module implements the [Motor 120 degree control \(rm_motor_120_degree\)](#).

[Motor Angle \(rm_motor_estimate\)](#)

Calculation process for the motor control on RA MCUs. This module implements the [Motor angle Interface](#).

[Motor Angle \(rm_motor_sense_encoder\)](#)

Calculation process for the motor control on RA MCUs. This module implements the [Motor angle Interface](#).

[Motor Angle and Speed Calculation with Hall sensors \(rm_motor_sense_hall\)](#)

Calculation process for the motor control on RA MCUs. This module implements the [Motor angle Interface](#).

[Motor Angle and Speed Calculation with induction sensor \(rm_motor_sense_induction\)](#)

Calculation process for the motor control on RA MCUs. This module implements the [Motor angle Interface](#).

[Motor Current Controller \(rm_motor_current\)](#)

Calculation process for the motor control on RA MCUs. This module implements the [Motor current Interface](#).

[Motor Encoder Vector Control \(rm_motor_encoder\)](#)

Control a SPM motor on RA MCUs. This module implements the [Motor Encoder Vector Control \(rm_motor_encoder\)](#).

[Motor Inertia estimate \(rm_motor_inertia_estimate\)](#)

Measurement and calculation process for the motor control on RA MCUs. This module implements the [Motor Inertia Estimate Interface](#).

Motor Position Controller (rm_motor_position)

Calculation process for the motor control on RA MCUs. This module implements the [Motor position Interface](#).

Motor Sensorless Vector Control (rm_motor_sensorless)

Usual control of a SPM motor on RA MCUs. This module implements the [Motor Sensorless Vector Control \(rm_motor_sensorless\)](#).

Motor Speed Controller (rm_motor_speed)

Calculation process for the motor control on RA MCUs. This module implements the [Motor speed Interface](#).

Motor Vector Control with hall sensors (rm_motor_hall)

Usual control of a SPM motor on RA MCUs. This module implements the [Motor Vector Control with hall sensors \(rm_motor_hall\)](#).

Motor return origin (rm_motor_return_origin)

Search origin position process for the motor control on RA MCUs. This module implements the [Motor Return Origin Function Interface](#).

Motor vector control with induction sensor (rm_motor_induction)

Control a SPM motor on RA MCUs. This module implements the [Motor vector control with induction sensor \(rm_motor_induction\)](#).

5.2.11.1 120-degree conduction control sensorless (rm_motor_120_control_sensorless)

[Modules](#) » [Motor](#)

Functions

`fsp_err_t` [RM_MOTOR_120_CONTROL_SENSORLESS_Open](#)
(`motor_120_control_ctrl_t *const p_ctrl`, `motor_120_control_cfg_t const *const p_cfg`)

Opens and configures the motor sensorless 120 detection module. Implements [motor_120_control_api_t::open](#). [More...](#)

`fsp_err_t` [RM_MOTOR_120_CONTROL_SENSORLESS_Close](#)
(`motor_120_control_ctrl_t *const p_ctrl`)

Disables specified motor sensorless 120 detection module.
Implements [motor_120_control_api_t::close](#). [More...](#)

`fsp_err_t` [RM_MOTOR_120_CONTROL_SENSORLESS_Run](#)
([motor_120_control_ctrl_t](#) *const p_ctrl)

Run motor (Start motor rotation). Implements
[motor_120_control_api_t::run](#). [More...](#)

`fsp_err_t` [RM_MOTOR_120_CONTROL_SENSORLESS_Stop](#)
([motor_120_control_ctrl_t](#) *const p_ctrl)

Stop motor (Stop motor rotation). Implements
[motor_120_control_api_t::stop](#). [More...](#)

`fsp_err_t` [RM_MOTOR_120_CONTROL_SENSORLESS_Reset](#)
([motor_120_control_ctrl_t](#) *const p_ctrl)

Reset variables of motor sensorless 120 detection module.
Implements [motor_120_control_api_t::reset](#). [More...](#)

`fsp_err_t` [RM_MOTOR_120_CONTROL_SENSORLESS_SpeedSet](#)
([motor_120_control_ctrl_t](#) *const p_ctrl, float const speed_rpm)

Set speed[rpm]. Implements [motor_120_control_api_t::speedSet](#).
[More...](#)

`fsp_err_t` [RM_MOTOR_120_CONTROL_SENSORLESS_SpeedGet](#)
([motor_120_control_ctrl_t](#) *const p_ctrl, float *const p_speed_rpm)

Get speed. Implements [motor_120_control_api_t::speedGet](#). [More...](#)

`fsp_err_t` [RM_MOTOR_120_CONTROL_SENSORLESS_CurrentGet](#)
([motor_120_control_ctrl_t](#) *const p_ctrl,
[motor_120_driver_current_status_t](#) *const p_current_status)

Get current. Implements [motor_120_control_api_t::currentGet](#).
[More...](#)

`fsp_err_t` [RM_MOTOR_120_CONTROL_SENSORLESS_WaitStopFlagGet](#)
([motor_120_control_ctrl_t](#) *const p_ctrl,
[motor_120_control_wait_stop_flag_t](#) *const p_flag)

Get wait stop flag. Implements
[motor_120_control_api_t::waitStopFlagGet](#). [More...](#)

`fsp_err_t` [RM_MOTOR_120_CONTROL_SENSORLESS_TimeoutErrorFlagGet](#)

```
(motor_120_control_ctrl_t *const p_ctrl,
motor_120_control_timeout_error_flag_t *const p_timeout_error_flag)
```

Get timeout error flag. Implements [motor_120_control_api_t::timeoutErrorFlagGet](#). [More...](#)

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_PatternErrorFlagGet
(motor_120_control_ctrl_t *const p_ctrl,
motor_120_control_pattern_error_flag_t *const p_pattern_error_flag)
```

Get pattern error flag. Implements [motor_120_control_api_t::patternErrorFlagGet](#). [More...](#)

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_VoltageRefGet
(motor_120_control_ctrl_t *const p_ctrl,
motor_120_control_voltage_ref_t *const p_voltage_ref)
```

Get voltage ref. Implements [motor_120_control_api_t::voltageRefGet](#). [More...](#)

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_ParameterUpdate
(motor_120_control_ctrl_t *const p_ctrl, motor_120_control_cfg_t
const *const p_cfg)
```

Update the parameters of sensorless 120 detection module. Implements [motor_120_control_api_t::parameterUpdate](#). [More...](#)

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor 120-Degree Control Interface](#).

Overview

The motor current is used to control the electric current of motor rotation in an application. This module should be called cyclically after the A/D conversion of electric current of each phase in an application. This module calculates each phase voltage with input current reference, electric current and rotor angle.

Features

The motor 120 control sensorless module has below features.

- Calculate each phase(U/V/W) voltage.
- Decoupling control.
- Voltage error compensation.

Configuration

Build Time Configurations for rm_motor_120_control_sensorless

The following build time configurations are defined in fsp_cfg/rm_motor_120_control_sensorless_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > 120-degree conduction control sensorless (rm_motor_120_control_sensorless)

This module can be added to the Stacks tab via New Stack > Motor > 120-degree conduction control sensorless (rm_motor_120_control_sensorless).

| Configuration | Options | Default | Description |
|--------------------------------|--|---------------------------------|--|
| General | | | |
| Name | Name must be a valid C symbol | g_motor_120_control_sensorless0 | Module name. |
| Conduction type | <ul style="list-style-type: none"> • First 60 degree PWM • Complementary First 60 degree PWM | First 60 degree PWM | Select conduction type |
| Stop BEMF | Must be a valid non-negative value. | 0.5 | Value of stop motor BEMF (U+V+W) |
| Timeout counts (msec) | Must be a valid non-negative value. | 2000 | Undetected time |
| Maximum voltage for BOOT (V) | Must be a valid non-negative value. | 8.0 | Maximum output voltage for boot mode (V) |
| Maximum voltage (V) | Must be a valid non-negative value. | 20.0 | Maximum output voltage (V) |
| Minimum voltage (V) | Must be a valid non-negative value. | 3.0 | Minimum output voltage (V) |
| Carrier frequency (kHz) | Must be a valid non-negative value. | 20.0 | PWM carrier frequency (kHz) |
| Adjusting angle | Manual Entry | 0 | Adjusting angle |
| Speed PI decimation | Must be a valid non-negative value. | 1 | Speed PI control decimation count |
| Free run timer frequency (MHz) | Must be a valid non-negative value. | 120 | Freerun timer frequency (MHz) |
| Speed LPF K | Must be a valid non-negative value. | 1.0 | Speed LPF parameter |

| | | | |
|-------------------------------|-------------------------------------|---------|---|
| Step of speed change | Must be a valid non-negative value. | 0.2 | Speed reference change step |
| Boot reference voltage (V) | Must be a valid non-negative value. | 3.0 | Voltage reference for boot mode |
| Voltage lamping time | Must be a valid non-negative value. | 128 | Voltage lamping time |
| Voltage constant adjust time | Must be a valid non-negative value. | 64 | Voltage constant adjust time value (msec) |
| Open loop start speed (rpm) | Manual Entry | 150 | Open loop start speed (rpm) |
| Open loop mode2 speed (rpm) | Manual Entry | 185 | to mode2 change speed (rpm) |
| Open loop mode3 speed (rpm) | Manual Entry | 1000 | to mode3 change speed (rpm) |
| Open loop start voltage (V) | Must be a valid non-negative value. | 3.0 | start reference voltage (V) |
| Open loop mode1 speed rate | Must be a valid non-negative value. | 0.25 | increase rate of reference speed (rpm/control period) |
| Open loop mode2 voltage rate | Must be a valid non-negative value. | 0.00285 | increase rate of reference voltage (v/control period) |
| Open loop mode2 speed rate | Must be a valid non-negative value. | 0.71 | increase rate of reference speed (rpm/control period) |
| Open loop mode3 voltage rate | Must be a valid non-negative value. | 0.002 | increase rate of reference voltage (v/control period) |
| Open loop maximum voltage (V) | Must be a valid non-negative value. | 6.5 | openloop maximum voltage (V) |
| PI control KP | Must be a valid non-negative value. | 0.02 | PI control gain of proportional term |
| PI control KI | Must be a valid non-negative value. | 0.004 | PI control gain of integral term |
| PI control limit | Must be a valid non-negative value. | 24.0 | PI control limit of integral term |
| Motor Parameter | | | |
| Pole pairs | Must be a valid non-negative value. | 2 | Pole pairs |
| Resistance (ohm) | Must be a valid non-negative value. | 6.447 | Resistance |
| Inductance of d-axis (H) | Must be a valid non-negative value. | 0.0045 | Inductance of d-axis |

| | | | |
|---|-------------------------------------|---------|-------------------------|
| Inductance of q-axis (H) | Must be a valid non-negative value. | 0.0045 | Inductance of q-axis |
| Permanent magnetic flux (Wb) | Must be a valid non-negative value. | 0.02159 | Permanent magnetic flux |
| Motor Parameter > Rotor inertia (kgm ²) | Must be a valid non-negative value. | 1.8 | Rotor inertia |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | NULL | callback function |

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

- Set the period of current control with none-negative value.
- Set the reference voltage with none-negative value.

Examples

Basic Example

This is a basic example of minimal use of the motor 120 control sensorless in an application.

```
void motor_120_control_sensorless_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err =
    RM_MOTOR_120_CONTROL_SENSORLESS_Open(g_motor_120_control_sensorless0.p_ctrl,
                                         g_motor_120_control_sensorless0.p_cfg);
    assert(FSP_SUCCESS == err);
    /* Set speed reference before motor run */
    (void)
    RM_MOTOR_120_CONTROL_SENSORLESS_SpeedSet(g_motor_120_control_sensorless0.p_ctrl,
    DEF_120_CONTROL_SENSORLESSHALL_TEST_OVSPD_LIM);
}
```

```
/* Start motor rotation */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_Run(g_motor_120_control_sensorless0.p_ctrl);
/* Get current motor speed */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_SpeedGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_speed);
/* Get current */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_CurrentGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_current_status);
/* Get wait stop flag */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_WaitStopFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
&smpl_wait_stop_flag);
/* Get timeout error flag */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_TimeoutErrorFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
&smpl_timeout_error_flag);
/* Get pattern error flag */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_PatternErrorFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
&smpl_pattern_error_flag);
/* Get voltage ref */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_VoltageRefGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_voltage_ref);
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_ParameterUpdate
```

```

(g_motor_120_control_sensorless0.p_ctrl,

g_motor_120_control_sensorless0.p_cfg);

/* Stop motor rotation */

(void)

RM_MOTOR_120_CONTROL_SENSORLESS_Stop(g_motor_120_control_sensorless0.p_ctrl);

/* Reset the process. */

(void)

RM_MOTOR_120_CONTROL_SENSORLESS_Reset(g_motor_120_control_sensorless0.p_ctrl);

/* Close the module. */

(void)

RM_MOTOR_120_CONTROL_SENSORLESS_Close(g_motor_120_control_sensorless0.p_ctrl);
}

```

Enumeration Type Documentation

◆ motor_120_control_sensorless_draw_in_position_t

| | |
|--|---|
| enum motor_120_control_sensorless_draw_in_position_t | |
| Draw in a initial position | |
| Enumerator | |
| MOTOR_120_CONTROL_SENSORLESS_DRAW_IN_POSITION_INIT | Initial parameter. |
| MOTOR_120_CONTROL_SENSORLESS_DRAW_IN_POSITION_1ST_TIME | Draw in a initial position of the 1st time. |
| MOTOR_120_CONTROL_SENSORLESS_DRAW_IN_POSITION_2ND_TIME | Draw in a initial position of the 2nd time. |

◆ motor_120_control_sensorless_pattern_change_flag_t

| | |
|---|-------------------------|
| enum motor_120_control_sensorless_pattern_change_flag_t | |
| Pattern change | |
| Enumerator | |
| MOTOR_120_CONTROL_SENSORLESS_PATTERN_CHANGE_FLAG_CLEAR | Initial parameter. |
| MOTOR_120_CONTROL_SENSORLESS_PATTERN_CHANGE_FLAG_SET | Voltage pattern change. |

Function Documentation

◆ RM_MOTOR_120_CONTROL_SENSORLESS_Open()

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Open ( motor_120_control_ctrl_t *const p_ctrl,
motor_120_control_cfg_t const *const p_cfg )
```

Opens and configures the motor sensorless 120 detection module. Implements `motor_120_control_api_t::open`.

Example:

```
/* Initializes the module. */
err =
RM_MOTOR_120_CONTROL_SENSORLESS_Open(g_motor_120_control_sensorless0.p_ctrl,
g_motor_120_control_sensorless0.p_cfg);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Motor driver successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ RM_MOTOR_120_CONTROL_SENSORLESS_Close()

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Close ( motor_120_control_ctrl_t *const p_ctrl)
```

Disables specified motor sensorless 120 detection module. Implements `motor_120_control_api_t::close`.

Example:

```
/* Close the module. */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_Close(g_motor_120_control_sensorless0.p_ctrl);
```

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_120_CONTROL_SENSORLESS_Run()**

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Run ( motor_120_control_ctrl_t *const p_ctrl)
```

Run motor (Start motor rotation). Implements `motor_120_control_api_t::run`.

Example:

```
/* Start motor rotation */
```

```
(void)
```

```
RM_MOTOR_120_CONTROL_SENSORLESS_Run(g_motor_120_control_sensorless0.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_120_CONTROL_SENSORLESS_Stop()**

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Stop ( motor_120_control_ctrl_t *const p_ctrl)
```

Stop motor (Stop motor rotation). Implements `motor_120_control_api_t::stop`.

Example:

```
/* Stop motor rotation */
```

```
(void)
```

```
RM_MOTOR_120_CONTROL_SENSORLESS_Stop(g_motor_120_control_sensorless0.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_MOTOR_120_CONTROL_SENSORLESS_Reset()

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Reset ( motor_120_control_ctrl_t *const p_ctrl)
```

Reset variables of motor sensorless 120 detection module. Implements `motor_120_control_api_t::reset`.

Example:

```
/* Reset the process. */
```

```
(void)
```

```
RM_MOTOR_120_CONTROL_SENSORLESS_Reset(g_motor_120_control_sensorless0.p_ctrl);
```

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_MOTOR_120_CONTROL_SENSORLESS_SpeedSet()

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_SpeedSet ( motor_120_control_ctrl_t *const p_ctrl, float const speed_rpm )
```

Set speed[rpm]. Implements `motor_120_control_api_t::speedSet`.

Example:

```
/* Set speed reference before motor run */
```

```
(void)
```

```
RM_MOTOR_120_CONTROL_SENSORLESS_SpeedSet(g_motor_120_control_sensorless0.p_ctrl,
```

```
DEF_120_CONTROL_SENSORLESSHALL_TEST_OVSPD_LIM);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_120_CONTROL_SENSORLESS_SpeedGet()**

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_SpeedGet ( motor_120_control_ctrl_t *const
p_ctrl, float *const p_speed_rpm )
```

Get speed. Implements `motor_120_control_api_t::speedGet`.

Example:

```
/* Get current motor speed */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_SpeedGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_speed);
```

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ **RM_MOTOR_120_CONTROL_SENSORLESS_CurrentGet()**

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_CurrentGet ( motor_120_control_ctrl_t *const
p_ctrl, motor_120_driver_current_status_t *const p_current_status )
```

Get current. Implements `motor_120_control_api_t::currentGet`.

Example:

```
/* Get current */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_CurrentGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_current_status);
```

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ **RM_MOTOR_120_CONTROL_SENSORLESS_WaitStopFlagGet()**

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_WaitStopFlagGet ( motor_120_control_ctrl_t
*const p_ctrl, motor_120_control_wait_stop_flag_t *const p_flag )
```

Get wait stop flag. Implements `motor_120_control_api_t::waitStopFlagGet`.

Example:

```
/* Get wait stop flag */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_WaitStopFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
&smpl_wait_stop_flag);
```

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ RM_MOTOR_120_CONTROL_SENSORLESS_TimeoutErrorFlagGet()

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_TimeoutErrorFlagGet ( motor_120_control_ctrl_t
*const p_ctrl, motor_120_control_timeout_error_flag_t *const p_timeout_error_flag )
```

Get timeout error flag. Implements `motor_120_control_api_t::timeoutErrorFlagGet`.

Example:

```
/* Get timeout error flag */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_TimeoutErrorFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
                                     &smpl_timeout_error_fl
ag);
```

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ RM_MOTOR_120_CONTROL_SENSORLESS_PatternErrorFlagGet()

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_PatternErrorFlagGet ( motor_120_control_ctrl_t
*const p_ctrl, motor_120_control_pattern_error_flag_t *const p_pattern_error_flag )
```

Get pattern error flag. Implements `motor_120_control_api_t::patternErrorFlagGet`.

Example:

```
/* Get pattern error flag */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_PatternErrorFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
&smp1_pattern_error_flag);
```

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ RM_MOTOR_120_CONTROL_SENSORLESS_VoltageRefGet()

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_VoltageRefGet ( motor_120_control_ctrl_t
*const p_ctrl, motor_120_control_voltage_ref_t *const p_voltage_ref )
```

Get voltage ref. Implements `motor_120_control_api_t::voltageRefGet`.

Example:

```
/* Get voltage ref */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_VoltageRefGet(g_motor_120_control_sensorless0.p_ctrl,
&smp1_voltage_ref);
```

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ RM_MOTOR_120_CONTROL_SENSORLESS_ParameterUpdate()

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_ParameterUpdate ( motor_120_control_ctrl_t
*const p_ctrl, motor_120_control_cfg_t const *const p_cfg )
```

Update the parameters of sensorless 120 detection module. Implements [motor_120_control_api_t::parameterUpdate](#).

Example:

```
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_ParameterUpdate
(g_motor_120_control_sensorless0.p_ctrl,
g_motor_120_control_sensorless0.p_cfg);
```

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Successfully data was updated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor 120-Degree Control Interface](#).

Overview

The motor current is used to control the electric current of motor rotation in an application. This module should be called cyclically after the A/D conversion of electric current of each phase in an application. This module calculates each phase voltage with input current reference, electric current and rotor angle.

Features

The motor 120 control hall module has below features.

- Calculate each phase(U/V/W) voltage.
- Decoupling control.
- Voltage error compensation.

Configuration

Build Time Configurations for `rm_motor_120_control_hall`

The following build time configurations are defined in `fsp_cfg/rm_motor_120_control_hall_cfg.h`:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > 120-degree conduction control with Hall sensors

(rm_motor_120_control_hall)

This module can be added to the Stacks tab via New Stack > Motor > 120-degree conduction control with Hall sensors (rm_motor_120_control_hall).

| Configuration | Options | Default | Description |
|--------------------------------|--|---------------------------|---|
| General | | | |
| Name | Name must be a valid C symbol | g_motor_120_control_hall0 | Module name. |
| Conduction type | <ul style="list-style-type: none"> First 60 degree PWM Complementary First 60 degree PWM | First 60 degree PWM | Select conduction type |
| Timeout counts (msec) | Must be a valid non-negative value. | 200 | Counts to judge rotor unrotate |
| Maximum voltage (V) | Must be a valid non-negative value. | 20.0 | Maximum output voltage (V) |
| Minimum voltage (V) | Must be a valid non-negative value. | 3.0 | Minimum output voltage (V) |
| Speed PI decimation | Must be a valid non-negative value. | 0 | Speed PI control decimation count |
| Freerun timer frequency (MHz) | Must be a valid non-negative value. | 120 | Freerun timer frequency (MHz) |
| Speed LPF | Must be a valid non-negative value. | 1.0 | Speed LPF parameter |
| Step of speed reference change | Must be a valid non-negative value. | 0.2 | Speed ref change step |
| Start reference voltage (V) | Must be a valid non-negative value. | 5.8 | Reference voltage for boot mode (V) |
| Hall wait counts | Must be a valid non-negative value. | 12 | Wait counts of hall interrupts to start speed calculation |
| Stop judge time | Must be a valid non-negative value. | 1000 | Stop judge time |
| Minimum limit speed (rpm) | Must be a valid non-negative value. | 550 | Minimum limit speed (rpm) (mechanical angle) |
| PI control KP | Must be a valid non-negative value. | 0.02 | PI control gain of proportional term |
| PI control KI | Must be a valid non-negative value. | 0.0005 | PI control gain of integral term |
| PI control limit | Must be a valid non-negative value. | 24.0 | PI control limit of integral term |

| | | | |
|---|-------------------------------------|----------------------|---|
| Hall interrupt mask value | Must be a valid non-negative value. | 15 | For limiting hall interrupt processing. Limited by the number of ADC interrupts |
| Motor Parameter | | | |
| Pole pairs | Must be a valid non-negative value. | 2 | Pole pairs |
| Resistance (ohm) | Must be a valid non-negative value. | 6.447 | Resistance |
| Inductance of d-axis (H) | Must be a valid non-negative value. | 0.0045 | Inductance of d-axis |
| Inductance of q-axis (H) | Must be a valid non-negative value. | 0.0045 | Inductance of q-axis |
| Permanent magnetic flux (Wb) | Must be a valid non-negative value. | 0.02159 | Permanent magnetic flux |
| Motor Parameter > Rotor inertia (kgm ²) | Must be a valid non-negative value. | 1.8 | Rotor inertia |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | NULL | Callback function |
| Hall sensor port U | Manual Entry | BSP_IO_PORT_04_PIN_1 | Hall sensor port U |
| Hall sensor port V | Manual Entry | BSP_IO_PORT_04_PIN_1 | Hall sensor port V |
| Hall sensor port W | Manual Entry | BSP_IO_PORT_04_PIN_0 | Hall sensor port W |

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

Depend on included ICU module.

Usage Notes

Limitations

- Set the period of current control with none-negative value.
- Set the reference voltage with none-negative value.

Examples

Basic Example

This is a basic example of minimal use of the motor 120 control hall in an application.

```
void motor_120_control_hall_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = RM_MOTOR_120_CONTROL_HALL_Open(g_motor_120_control_hall0.p_ctrl,
g_motor_120_control_hall0.p_cfg);
    assert(FSP_SUCCESS == err);
    /* Set speed reference before motor run */
    (void) RM_MOTOR_120_CONTROL_HALL_SpeedSet(g_motor_120_control_hall0.p_ctrl,
DEF_120_CONTROL_HALL_TEST_SPEED_REF);
    /* Start motor rotation */
    (void) RM_MOTOR_120_CONTROL_HALL_Run(g_motor_120_control_hall0.p_ctrl);
    /* Get current motor speed */
    (void) RM_MOTOR_120_CONTROL_HALL_SpeedGet(g_motor_120_control_hall0.p_ctrl,
&smpl_speed);
    /* Get current */
    (void) RM_MOTOR_120_CONTROL_HALL_CurrentGet(g_motor_120_control_hall0.p_ctrl,
&smpl_current_status);
    /* Get wait stop flag */
    (void)
RM_MOTOR_120_CONTROL_HALL_WaitStopFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_wait_stop_flag);
    /* Get timeout error flag */
    (void)
RM_MOTOR_120_CONTROL_HALL_TimeoutErrorFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_timeout_error_flag);
    /* Get pattern error flag */
    (void)
RM_MOTOR_120_CONTROL_HALL_PatternErrorFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_pattern_error_flag);
    /* Get voltage ref */
    (void) RM_MOTOR_120_CONTROL_HALL_VoltageRefGet(g_motor_120_control_hall0.p_ctrl,
&smpl_voltage_ref);
}
```

```

(void)
RM_MOTOR_120_CONTROL_HALL_ParameterUpdate(g_motor_120_control_hall0.p_ctrl,
g_motor_120_control_hall0.p_cfg);

/* Stop motor rotation */

(void) RM_MOTOR_120_CONTROL_HALL_Stop(g_motor_120_control_hall0.p_ctrl);

/* Reset the process. */

(void) RM_MOTOR_120_CONTROL_HALL_Reset(g_motor_120_control_hall0.p_ctrl);

/* Close the module. */

(void) RM_MOTOR_120_CONTROL_HALL_Close(g_motor_120_control_hall0.p_ctrl);
}

```

Data Structures

```
struct motor_120_control_hall_extended_cfg_t
```

```
struct motor_120_control_hall_instance_ctrl_t
```

| t | | |
| uint32_t | u4_cnt_timeout | Counter for timeout error. |
| uint32_t | u4_hall_timer_cnt | Value of timer counter. |
| uint32_t | u4_pre_hall_timer_cnt | Previous value of timer counter. |
| int32_t | s4_timer_cnt_ave | Counts for 360 degrees. |
| uint32_t | u4_timer_cnt_buf[MOTOR_120_CONTROL_HALL_TIMES] | Counts for 60 degrees. |
| uint32_t | u4_timer_cnt_num | Array element number before 360 degrees. |
| float | f4_pi_ctrl_err | PI control error. |
| float | f4_pi_ctrl_refi | PI control buffer of integral term. |
| uint32_t | u4_hall_intr_cnt | For start timing of speed calculation. |
| uint32_t | u4_adc_interrupt_cnt | Number of ADC interrupt processing. |
| motor_120_control_cfg_t const * | p_cfg | Pointer of configuration structure. |
| timer_direction_t | timer_direction | Hold timer direction. |
| external_irq_callback_args_t | hall_interrupt_args | For call IRQ callbackSet function. |
| timer_callback_args_t | timer_args | For call timer callbackSet function. |

Function Documentation

◆ **RM_MOTOR_120_CONTROL_HALL_Open()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_Open ( motor_120_control_ctrl_t *const p_ctrl,
motor_120_control_cfg_t const *const p_cfg )
```

Opens and configures the motor hall 120 detection module. Implements `motor_120_control_api_t::open`.

Example:

```
/* Initializes the module. */
err = RM_MOTOR_120_CONTROL_HALL_Open(g_motor_120_control_hall0.p_ctrl,
g_motor_120_control_hall0.p_cfg);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Motor 120 driver successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ **RM_MOTOR_120_CONTROL_HALL_Close()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_Close ( motor_120_control_ctrl_t *const p_ctrl)
```

Disables specified motor hall 120 detection module. Implements `motor_120_control_api_t::close`.

Example:

```
/* Close the module. */
(void) RM_MOTOR_120_CONTROL_HALL_Close(g_motor_120_control_hall0.p_ctrl);
```

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_120_CONTROL_HALL_Run()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_Run ( motor_120_control_ctrl_t *const p_ctrl)
```

Run motor (Start motor rotation). Implements `motor_120_control_api_t::run`.

Example:

```
/* Start motor rotation */
(void) RM_MOTOR_120_CONTROL_HALL_Run(g_motor_120_control_hall0.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_120_CONTROL_HALL_Stop()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_Stop ( motor_120_control_ctrl_t *const p_ctrl)
```

Stop motor (Stop motor rotation). Implements `motor_120_control_api_t::stop`.

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_120_CONTROL_HALL_Stop(g_motor_120_control_hall0.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_120_CONTROL_HALL_Reset()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_Reset ( motor_120_control_ctrl_t *const p_ctrl)
```

Reset variables of motor hall 120 detection module. Implements `motor_120_control_api_t::reset`.

Example:

```
/* Reset the process. */
(void) RM_MOTOR_120_CONTROL_HALL_Reset(g_motor_120_control_hall0.p_ctrl);
```

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_120_CONTROL_HALL_SpeedSet()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_SpeedSet ( motor_120_control_ctrl_t *const p_ctrl, float
const speed_rpm )
```

Set speed[rpm]. Implements `motor_120_control_api_t::speedSet`.

Example:

```
/* Set speed reference before motor run */
(void) RM_MOTOR_120_CONTROL_HALL_SpeedSet(g_motor_120_control_hall0.p_ctrl,
DEF_120_CONTROL_HALL_TEST_SPEED_REF);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_120_CONTROL_HALL_SpeedGet()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_SpeedGet ( motor_120_control_ctrl_t *const p_ctrl, float
*const p_speed_rpm )
```

Get speed. Implements `motor_120_control_api_t::speedGet`.

Example:

```
/* Get current motor speed */
(void) RM_MOTOR_120_CONTROL_HALL_SpeedGet(g_motor_120_control_hall0.p_ctrl,
&smpl_speed);
```

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ **RM_MOTOR_120_CONTROL_HALL_CurrentGet()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_CurrentGet ( motor_120_control_ctrl_t *const p_ctrl,
motor_120_driver_current_status_t *const p_current_status )
```

Get current. Implements `motor_120_control_api_t::currentGet`.

Example:

```
/* Get current */
(void) RM_MOTOR_120_CONTROL_HALL_CurrentGet(g_motor_120_control_hall0.p_ctrl,
&smpl_current_status);
```

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ **RM_MOTOR_120_CONTROL_HALL_WaitStopFlagGet()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_WaitStopFlagGet ( motor_120_control_ctrl_t *const
p_ctrl, motor_120_control_wait_stop_flag_t *const p_flag )
```

Get wait stop flag. Implements `motor_120_control_api_t::waitStopFlagGet`.

Example:

```
/* Get wait stop flag */
(void)
RM_MOTOR_120_CONTROL_HALL_WaitStopFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_wait_stop_flag);
```

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ **RM_MOTOR_120_CONTROL_HALL_TimeoutErrorFlagGet()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_TimeoutErrorFlagGet ( motor_120_control_ctrl_t *const
p_ctrl, motor_120_control_timeout_error_flag_t *const p_timeout_error_flag )
```

Get timeout error flag. Implements `motor_120_control_api_t::timeoutErrorFlagGet`.

Example:

```
/* Get timeout error flag */
(void)
RM_MOTOR_120_CONTROL_HALL_TimeoutErrorFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_timeout_error_flag);
```

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ **RM_MOTOR_120_CONTROL_HALL_PatternErrorFlagGet()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_PatternErrorFlagGet ( motor_120_control_ctrl_t *const p_ctrl, motor_120_control_pattern_error_flag_t *const p_pattern_error_flag )
```

Get pattern error flag. Implements `motor_120_control_api_t::patternErrorFlagGet`.

Example:

```
/* Get pattern error flag */
(void)
RM_MOTOR_120_CONTROL_HALL_PatternErrorFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_pattern_error_flag);
```

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ **RM_MOTOR_120_CONTROL_HALL_VoltageRefGet()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_VoltageRefGet ( motor_120_control_ctrl_t *const p_ctrl, motor_120_control_voltage_ref_t *const p_voltage_ref )
```

Get voltage ref. Implements `motor_120_control_api_t::voltageRefGet`.

Example:

```
/* Get voltage ref */
(void) RM_MOTOR_120_CONTROL_HALL_VoltageRefGet(g_motor_120_control_hall0.p_ctrl,
&smpl_voltage_ref);
```

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ RM_MOTOR_120_CONTROL_HALL_ParameterUpdate()

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_ParameterUpdate ( motor_120_control_ctrl_t *const
p_ctrl, motor_120_control_cfg_t const *const p_cfg )
```

Update the parameters of hall 120 detection module. Implements `motor_120_control_api_t::parameterUpdate`.

Example:

```
(void)
RM_MOTOR_120_CONTROL_HALL_ParameterUpdate(g_motor_120_control_hall0.p_ctrl,
g_motor_120_control_hall0.p_cfg);
```

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Successfully data was updated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

[fsp_err_t](#) [RM_MOTOR_DRIVER_CurrentOffsetRestart](#) ([motor_driver_ctrl_t](#) *const p_ctrl)

Restart the current offset detection. Implements [motor_driver_api_t::currentOffsetRestart](#). [More...](#)

[fsp_err_t](#) [RM_MOTOR_DRIVER_ParameterUpdate](#) ([motor_driver_ctrl_t](#) *const p_ctrl, [motor_driver_cfg_t](#) const *const p_cfg)

Update the parameters of Driver Module. Implements [motor_driver_api_t::parameterUpdate](#). [More...](#)

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor driver Interface](#).

Overview

The motor driver module is used to translate phase voltage to PWM duty and output PWM, and detect phase current and main line voltage. This module should be called cyclically at included A/D Conversion finish interrupt.

Features

The Motor Driver Module has below features.

- Calculate each phase(U/V/W) PWM duty according to reference and output PWM.
- Detect each phase current and main line voltage.
- Detect and correct A/D offset at phase current channel

Configuration

Build Time Configurations for rm_motor_driver

The following build time configurations are defined in fsp_cfg/rm_motor_driver_cfg.h:

| Configuration | Options | Default | Description |
|------------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| ADC_B Support | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Select ADC_B module support. |
| Shared ADC support | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Select Shared ADC support. |
| Supported Motor Number | Must be greater than 1. | 1 | |

Configurations for Motor > ADC and PWM Modulation (rm_motor_driver)

This module can be added to the Stacks tab via New Stack > Motor > ADC and PWM Modulation (rm_motor_driver).

| Configuration | Options | Default | Description |
|-----------------------------------|---|-----------------|----------------------------------|
| General | | | |
| Name | Name must be a valid C symbol | g_motor_driver0 | Module name. |
| Shunt type | <ul style="list-style-type: none"> • 1 shunt • 2 shunt • 3 shunt | 2 shunt | Select shunt type |
| Modulation method | <ul style="list-style-type: none"> • SVPWM • SPWM | SVPWM | Select PWM modulation method |
| PWM output port UP | Manual Entry | 0 | PWM output port UP |
| PWM output port UN | Manual Entry | 0 | PWM output port UN |
| PWM output port VP | Manual Entry | 0 | PWM output port VP |
| PWM output port VN | Manual Entry | 0 | PWM output port VN |
| PWM output port WP | Manual Entry | 0 | PWM output port WP |
| PWM output port WN | Manual Entry | 0 | PWM output port WN |
| PWM Timer Frequency (MHz) | Must be a valid non-negative value. | 120 | GPT PWM timer frequency |
| PWM Carrier Period (Microseconds) | Must be a valid non-negative value. | 50 | GPT PWM carrier period |
| Dead Time (Raw Counts) | Must be a valid non-negative value. | 240 | GPT PWM dead time |
| Current Range (A) | Must be a valid value | 27.5F | Current range to measure(Maximum |

| | | | |
|--|--|--------|---|
| Voltage Range (V) | Must be a valid value | 111.0F | input current) Voltage range to measure(Maximum input Main Line Voltage) |
| Counts for current offset measurement | Must be a valid non-negative value. | 500 | How many times to measure current offset |
| A/D conversion channel for U Phase current | Value must be a supported channel number | 0 | Specify the A/D channel for U phase current (channel availability varies by MCU) |
| A/D conversion channel for W Phase current | Value must be a supported channel number | 2 | Specify the A/D channel for W phase current (channel availability varies by MCU) |
| A/D conversion channel for Main Line Voltage | Value must be a supported channel number | 5 | Specify the A/D channel for main line voltage (channel availability varies by MCU) |
| A/D conversion channel for V Phase current | Value must be a supported channel number | 1 | Specify the A/D channel for V phase current (channel availability varies by MCU) |
| A/D conversion channel for sin signal | Value must be a supported channel number | 27 | Specify the A/D channel for sin signal of induction sensor (channel availability varies by MCU) |
| A/D conversion channel for cos signal | Value must be a supported channel number | 28 | Specify the A/D channel for cos signal of induction sensor (channel availability varies by MCU) |
| Using ADC Scan Group | Manual Entry | 0 | For MCUs with ADC_B, select the scan group used. |
| A/D conversion unit for U Phase current | Manual Entry | 0 | Select the A/D conversion module for U phase current (only valid with adc module) |
| A/D conversion unit for W Phase current | Manual Entry | 0 | Select the A/D conversion module for W phase current (only valid with adc module) |

| | | | |
|--|---|----------------|--|
| A/D conversion unit for main line voltage | Manual Entry | 0 | Select the A/D conversion module for main line voltage (only valid with adc module) |
| A/D conversion unit for V Phase current | Manual Entry | 0 | Select the A/D conversion module for V phase current (only valid with adc module) |
| A/D conversion unit for sin signal | Manual Entry | 0 | Select the A/D conversion module for sin signal of induction sensor (only valid with adc module) |
| A/D conversion unit for cos signal | Manual Entry | 0 | Select the A/D conversion module for cos signal of induction sensor (only valid with adc module) |
| ADC interrupt module | <ul style="list-style-type: none"> • 1st • 2nd | 1st | Select from which module ADC interrupt happens (only valid with adc module) |
| Adjustment value to current A/D | Must be a valid non-negative value. | 20.0 | Value to adjust 1shunt A/D double buffer |
| Minimum difference of PWM duty | Must be a valid non-negative value. | 300 | Minimum difference of PWM duty |
| Adjustment delay of A/D conversion | Must be a valid non-negative value. | 240 | Adjustment delay of A/D conversion |
| 1shunt interrupt phase | <ul style="list-style-type: none"> • PHASE_U • PHASE_V • PHASE_W | PHASE_U | Select the phase which occurs ADC end interrupt. (Only valid with 1shunt) |
| Input Voltage (V) | Must be a valid value | 24.0F | Input voltage |
| Resolution of A/D conversion | Must be a valid Resolution of ADC. | 0xFFF | Resolution of A/D conversion |
| Offset of A/D conversion for current | Must be a valid non-negative value. | 0x745 | Offset of A/D conversion for current |
| Conversion level of A/D conversion for voltage | Must be a valid value | 0.66F | Conversion level of A/D conversion for voltage |
| GTIOCA Stop Level | <ul style="list-style-type: none"> • Pin Level Low • Pin Level High | Pin Level High | Select the behavior of the output pin when the timer is stopped. |
| GTIOCB Stop Level | <ul style="list-style-type: none"> • Pin Level Low • Pin Level High | Pin Level High | Select the behavior of the output pin when the timer is stopped. |

Modulation

| | | | |
|--------------|-------------------------------|---------|---|
| Maximum Duty | Must be a valid value | 0.9375F | Maximum duty of PWM |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | NULL | A user callback function. If this callback function is provided, it is called at A/D conversion finish interrupt. |

Clock Configuration

Set used clock with included GPT timer.

Pin Configuration

Depend on included GPT Three Phase Module and ADC Module.

Usage Notes

When shared ADC instance is used, please perform below sequence.

1. Add (New) shared ADC instance.
2. Set configurations of below ADC module for your use.
3. Select "Common | Shared ADC support" to "Enabled".

Limitations

Basically no limitation exists.

Examples

Basic Example

This is a basic example of minimal use of the Motor Driver in an application.

```
void motor_driver_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = RM_MOTOR_DRIVER_Open(&g_motor_driver0.p_ctrl, &g_motor_driver0.p_cfg);
    assert(FSP_SUCCESS == err);
    /* Basically run this module at cyclic interrupt (e.g. included GPT PWM Carrier
    interrupt).
    * This implementation is an example. */
    // while (true)
```

```

{
/* Application work here. */
/* Get electric current, main line voltage and maximum voltage component */
    (void) RM_MOTOR_DRIVER_CurrentGet(&g_motor_driver0.p_ctrl, &f_get_iu,
&f_get_iw, &f_get_vdc, &f_get_va_max);
/* Get the flag of A/D converted current offset */
    (void) RM_MOTOR_DRIVER_FlagCurrentOffsetGet(&g_motor_driver0.p_ctrl,
&ul_get_flg_offset);
// Perform current control process here
/* Set phase voltage */
    (void) RM_MOTOR_DRIVER_PhaseVoltageSet(&g_motor_driver0.p_ctrl, 1.0F, 1.0F,
1.0F);
    (void) RM_MOTOR_DRIVER_ParameterUpdate(&g_motor_driver0.p_ctrl,
&g_motor_driver0.p_cfg);
}
(void) RM_MOTOR_DRIVER_Reset(&g_motor_driver0.p_ctrl);
//

(void) RM_MOTOR_DRIVER_Close(&g_motor_driver0.p_ctrl);
}

```

Function Documentation

◆ **RM_MOTOR_DRIVER_Open()**

```
fsp_err_t RM_MOTOR_DRIVER_Open ( motor_driver_ctrl_t *const p_ctrl, motor_driver_cfg_t const *const p_cfg )
```

Opens and configures the Motor Driver module. Implements `motor_driver_api_t::open`.

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Motor Driver successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |

◆ **RM_MOTOR_DRIVER_Close()**

```
fsp_err_t RM_MOTOR_DRIVER_Close ( motor_driver_ctrl_t *const p_ctrl)
```

Disables specified Motor Driver Module. Implements `motor_driver_api_t::close`.

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_DRIVER_Reset()**

```
fsp_err_t RM_MOTOR_DRIVER_Reset ( motor_driver_ctrl_t *const p_ctrl)
```

Reset variables of Motor Driver Module. Implements `motor_driver_api_t::reset`.

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_DRIVER_PhaseVoltageSet()**

```
fsp_err_t RM_MOTOR_DRIVER_PhaseVoltageSet ( motor_driver_ctrl_t *const p_ctrl, float const u_voltage, float const v_voltage, float const w_voltage )
```

Set Phase Voltage Data to calculate PWM duty. Implements `motor_driver_api_t::phaseVoltageSet`.

Return values

| | |
|-------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_DRIVER_CurrentGet()**

```
fsp_err_t RM_MOTOR_DRIVER_CurrentGet ( motor_driver_ctrl_t *const p_ctrl, motor_driver_current_get_t *const p_current_get )
```

Get calculated phase Current, Vdc & Va_max data. Implements `motor_driver_api_t::currentGet`.

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ **RM_MOTOR_DRIVER_FlagCurrentOffsetGet()**

```
fsp_err_t RM_MOTOR_DRIVER_FlagCurrentOffsetGet ( motor_driver_ctrl_t *const p_ctrl, uint8_t *const p_flag_offset )
```

Get the flag of finish current offset detection. Implements `motor_driver_api_t::flagCurrentOffsetGet`.

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ **RM_MOTOR_DRIVER_CurrentOffsetRestart()**

```
fsp_err_t RM_MOTOR_DRIVER_CurrentOffsetRestart ( motor_driver_ctrl_t *const p_ctrl)
```

Restart the current offset detection. Implements `motor_driver_api_t::currentOffsetRestart`.

Return values

| | |
|-------------------|-------------------------|
| FSP_SUCCESS | Successfully restarted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_DRIVER_ParameterUpdate()**

```
fsp_err_t RM_MOTOR_DRIVER_ParameterUpdate ( motor_driver_ctrl_t *const p_ctrl,
motor_driver_cfg_t const *const p_cfg )
```

Update the parameters of Driver Module. Implements `motor_driver_api_t::parameterUpdate`.

Return values

| | |
|-------------------|--------------------------------|
| FSP_SUCCESS | Successfully data was updated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor 120-Degree Driver Interface](#).

Overview

The motor 120 degree driver module is used to translate phase voltage to PWM duty and output PWM, and detect phase current, voltage and main line voltage. This module should be called cyclically at included A/D conversion finish interrupt.

BLOCK DIAGRAM OF SENSORLESS VECTOR CONTROL

It is a block diagram of sensorless vector control. This shows the correspondence between modules and functional blocks.

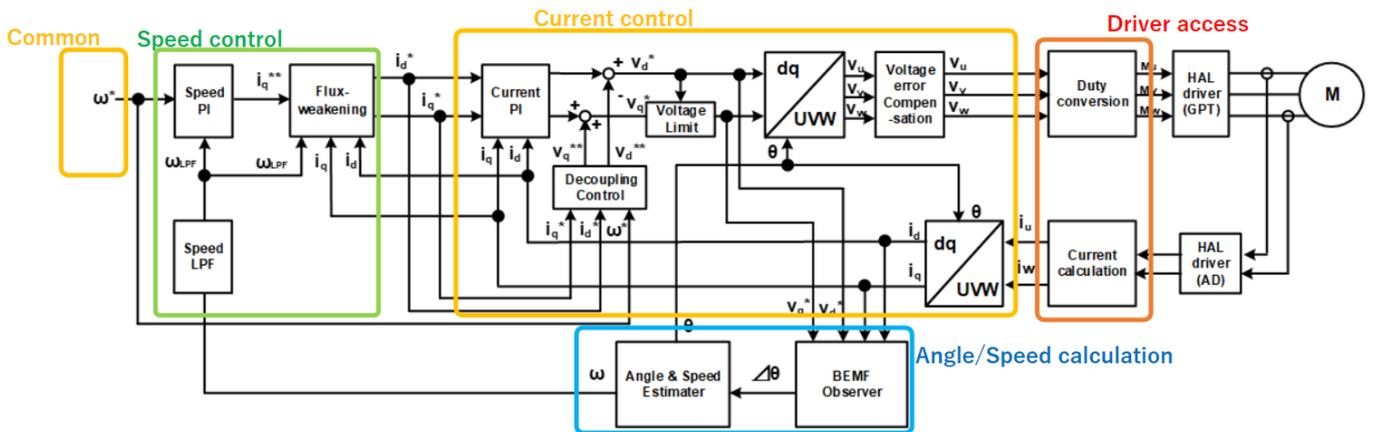

Figure 229: Image of Current Control Module(yellow block)

Features

The motor 120 degree driver module has below features.

- Calculate each phase(U/V/W) PWM duty according to reference and output PWM.
- Detect each phase current, phase voltage and main line voltage.
- Detect and correct A/D offset at phase current and voltage channel

Configuration

Build Time Configurations for `rm_motor_120_driver`

The following build time configurations are defined in `fsp_cfg/rm_motor_120_driver_cfg.h`:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| ADC_B Support | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Select ADC_B module support. |
| Shared ADC support | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Select Shared ADC support. |

Support Motor Number Must be greater than 1. 1

Configurations for Motor > ADC and PWM modulation (rm_motor_120_driver)

This module can be added to the Stacks tab via New Stack > Motor > ADC and PWM modulation (rm_motor_120_driver).

| Configuration | Options | Default | Description |
|-----------------------------------|--|---------------------------|---|
| General | | | |
| Name | Name must be a valid C symbol | g_motor_120_driver0 | Module name. |
| 120 degree control type | <ul style="list-style-type: none"> • Sensorless • Hall | Sensorless | 120 degree control type |
| PWM output port UP | Manual Entry | BSP_IO_PORT_06_PIN_0 1 | PWM output port UP |
| PWM output port UN | Manual Entry | BSP_IO_PORT_06_PIN_0 0 | PWM output port UN |
| PWM output port VP | Manual Entry | BSP_IO_PORT_01_PIN_1 3 | PWM output port VP |
| PWM output port VN | Manual Entry | BSP_IO_PORT_01_PIN_1 4 | PWM output port VN |
| PWM output port WP | Manual Entry | BSP_IO_PORT_01_PIN_1 1 | PWM output port WP |
| PWM output port WN | Manual Entry | BSP_IO_PORT_01_PIN_1 2 | PWM output port WN |
| PWM timer frequency (MHz) | Must be a valid non-negative value. | 120.0 | GPT PWM timer frequency |
| PWM carrier period (Microseconds) | Must be a valid non-negative value. | 50.0 | GPT PWM carrier period |
| Dead time (Raw counts) | Must be a valid non-negative value. | 240 | GPT PWM dead time |
| Current range (A) | Must be a valid non-negative value. | 27.5 | Current range to measure(Maximum input current) |
| Voltage range (V) | Must be a valid non- | 111.0 | Voltage range to |

| | | | |
|--|---|----------------|--|
| | negative value. | | measure(Maximum input main line voltage) |
| Resolution of A/D conversion | Must be a valid Resolution of ADC. | 0xFFF | Resolution of A/D conversion |
| Offset of A/D conversion for current | Must be a valid non-negative value. | 0x745 | Offset of A/D conversion for current |
| Conversion level of A/D conversion for voltage | Must be a valid non-negative value. | 0.66 | Conversion level of A/D conversion for voltage |
| Counts for current offset measurement | Must be a valid non-negative value. | 500 | How many times to measure current offset |
| Input voltage | Must be a valid non-negative value. | 24.0 | Input voltage |
| A/D conversion channel for U phase current | Value must be a supported channel number | 0 | Specify the A/D channel for U phase current |
| A/D conversion channel for W phase current | Value must be a supported channel number | 2 | Specify the A/D channel for W phase current |
| A/D conversion channel for main line voltage | Value must be a supported channel number | 5 | Specify the A/D channel for main line voltage |
| A/D conversion channel for U phase voltage | Value must be a supported channel number | 18 | Specify the A/D channel for U phase voltage |
| A/D conversion channel for V phase voltage | Value must be a supported channel number | 20 | Specify the A/D channel for V phase voltage |
| A/D conversion channel for W phase voltage | Value must be a supported channel number | 6 | Specify the A/D channel for W phase voltage |
| A/D conversion unit for U phase current | Must be a valid non-negative value. | 0 | Specify the A/D unit for U phase current |
| A/D conversion unit for W phase current | Must be a valid non-negative value. | 0 | Specify the A/D unit for W phase current |
| A/D conversion unit for main line voltage | Must be a valid non-negative value. | 0 | Specify the A/D unit for main line voltage |
| A/D conversion unit for U phase voltage | Must be a valid non-negative value. | 0 | Specify the A/D unit for U phase voltage |
| A/D conversion unit for V phase voltage | Must be a valid non-negative value. | 0 | Specify the A/D unit for V phase voltage |
| A/D conversion unit for W phase voltage | Must be a valid non-negative value. | 0 | Specify the A/D unit for W phase voltage |
| GTIOCA stop level | <ul style="list-style-type: none"> Pin Level Low | Pin Level High | Select the behavior of |

| | | | |
|----------------------|-------------------------------------|----------------|---|
| | • Pin Level High | | the output pin when the timer is stopped. |
| GTIOCB stop level | • Pin Level Low • Pin Level High | Pin Level High | Select the behavior of the output pin when the timer is stopped. |
| ADC interrupt module | • 1st • 2nd | 1st | Select from which module ADC interrupt happens |
| Modulation | | | |
| Maximum duty | Must be a valid non-negative value. | 0.9375 | Maximum duty of PWM |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | NULL | A user callback function. If this callback function is provided, it is called at A/D conversion finish interrupt. |

Clock Configuration

Set used clock with included GPT timer.

Pin Configuration

Depend on included GPT three phase module and ADC module.

Usage Notes

Limitations

Basically no limitation exists.

Examples

Basic Example

This is a basic example of minimal use of the Motor 120 degree driver in an application.

```
void motor_120_driver_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the module. */
    err = RM_MOTOR_120_DRIVER_Open(&g_motor_120_driver0.p_ctrl,
    &g_motor_120_driver0.p_cfg);

    /* Start PWM output */
}
```

```
err = RM_MOTOR_120_DRIVER_Run(&g_motor_120_driver0.p_ctrl);
assert(FSP_SUCCESS == err);

/* Basically run this module at cyclic interrupt (e.g. included GPT PWM carrier
interrupt).

* This implementation is an example. */
// while (true)
{
/* Application work here. */
/* Caclutarion of current offset */
(void) RM_MOTOR_120_DRIVER_CurrentOffsetCalc(&g_motor_120_driver0.p_ctrl);
/* Get electric current, main line voltage and maximum voltage component */
(void) RM_MOTOR_120_DRIVER_CurrentGet(&g_motor_120_driver0.p_ctrl,
&g_current_status);
/* Get the flag of A/D converted current offset */
(void) RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet(&g_motor_120_driver0.p_ctrl,
&ul_get_flg_offset);
// Perform current control process here
/* Set phase voltage */
(void) RM_MOTOR_120_DRIVER_PhaseVoltageSet(&g_motor_120_driver0.p_ctrl, 1.0F,
1.0F, 1.0F);
/* Set phase pattern */
(void) RM_MOTOR_120_DRIVER_PhasePatternSet(&g_motor_120_driver0.p_ctrl,
MOTOR_120_DRIVER_API_VP_ON_WN_PWM);
(void) RM_MOTOR_120_DRIVER_ParameterUpdate(&g_motor_120_driver0.p_ctrl,
&g_motor_120_driver0.p_cfg);
}
(void) RM_MOTOR_120_DRIVER_Stop(&g_motor_120_driver0.p_ctrl);
(void) RM_MOTOR_120_DRIVER_Reset(&g_motor_120_driver0.p_ctrl);
//

(void) RM_MOTOR_120_DRIVER_Close(&g_motor_120_driver0.p_ctrl);
}
```

Function Documentation

◆ RM_MOTOR_120_DRIVER_Open()

```
fsp_err_t RM_MOTOR_120_DRIVER_Open ( motor_120_driver_ctrl_t *const p_ctrl,
motor_120_driver_cfg_t const *const p_cfg )
```

Opens and configures the motor 120 driver module. Implements `motor_120_driver_api_t::open`.

Example:

```
/* Initializes the module. */
err = RM_MOTOR_120_DRIVER_Open(&g_motor_120_driver0.p_ctrl,
&g_motor_120_driver0.p_cfg);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Motor 120 driver successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ RM_MOTOR_120_DRIVER_Close()

```
fsp_err_t RM_MOTOR_120_DRIVER_Close ( motor_120_driver_ctrl_t *const p_ctrl)
```

Disables specified motor 120 driver module. Implements `motor_120_driver_api_t::close`.

Example:

```
(void) RM_MOTOR_120_DRIVER_Close(&g_motor_120_driver0.p_ctrl);
```

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_120_DRIVER_Run()**

```
fsp_err_t RM_MOTOR_120_DRIVER_Run ( motor_120_driver_ctrl_t *const p_ctrl)
```

Run motor (Start motor rotation). Implements `motor_120_driver_api_t::run`.

Example:

```
/* Start PWM output */
err = RM_MOTOR_120_DRIVER_Run(&g_motor_120_driver0.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_120_DRIVER_Stop()**

```
fsp_err_t RM_MOTOR_120_DRIVER_Stop ( motor_120_driver_ctrl_t *const p_ctrl)
```

Stop motor (Stop motor rotation). Implements `motor_120_driver_api_t::stop`.

Example:

```
(void) RM_MOTOR_120_DRIVER_Stop(&g_motor_120_driver0.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_120_DRIVER_Reset()**

```
fsp_err_t RM_MOTOR_120_DRIVER_Reset ( motor_120_driver_ctrl_t *const p_ctrl)
```

Reset variables of motor 120 driver module. Implements `motor_120_driver_api_t::reset`.

Example:

```
(void) RM_MOTOR_120_DRIVER_Reset(&g_motor_120_driver0.p_ctrl);
```

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_120_DRIVER_PhaseVoltageSet()**

```
fsp_err_t RM_MOTOR_120_DRIVER_PhaseVoltageSet ( motor_120_driver_ctrl_t *const p_ctrl, float
const u_voltage, float const v_voltage, float const w_voltage )
```

Set phase voltage data to calculate PWM duty. Implements `motor_120_driver_api_t::phaseVoltageSet`.

Example:

```
/* Set phase voltage */
(void) RM_MOTOR_120_DRIVER_PhaseVoltageSet(&g_motor_120_driver0.p_ctrl, 1.0F,
1.0F, 1.0F);
```

Return values

| | |
|-------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_MOTOR_120_DRIVER_PhasePatternSet()

```
fsp_err_t RM_MOTOR_120_DRIVER_PhasePatternSet ( motor_120_driver_ctrl_t *const p_ctrl,
motor_120_driver_phase_pattern_t const pattern )
```

Set phase voltage pattern. Implements `motor_120_driver_api_t::phasePatternSet`.

Example:

```
/* Set phase pattern */
(void) RM_MOTOR_120_DRIVER_PhasePatternSet(&g_motor_120_driver0.p_ctrl,
MOTOR_120_DRIVER_API_VP_ON_WN_PWM);
```

Return values

| | |
|-------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_MOTOR_120_DRIVER_CurrentGet()

```
fsp_err_t RM_MOTOR_120_DRIVER_CurrentGet ( motor_120_driver_ctrl_t *const p_ctrl,
motor_120_driver_current_status_t *const p_current_status )
```

Get calculated phase current, Vdc & Va_max data. Implements `motor_120_driver_api_t::currentGet`.

Example:

```
/* Get electric current, main line voltage and maximum voltage component */
(void) RM_MOTOR_120_DRIVER_CurrentGet(&g_motor_120_driver0.p_ctrl,
&g_current_status);
```

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ RM_MOTOR_120_DRIVER_CurrentOffsetCalc()

```
fsp_err_t RM_MOTOR_120_DRIVER_CurrentOffsetCalc ( motor_120_driver_ctrl_t *const p_ctrl)
```

current offset detection. Implements `motor_120_driver_api_t::currentOffsetCalc`

Example:

```
/* Caclutarion of current offset */
(void) RM_MOTOR_120_DRIVER_CurrentOffsetCalc(&g_motor_120_driver0.p_ctrl);
```

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet()

```
fsp_err_t RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet ( motor_120_driver_ctrl_t *const p_ctrl,
motor_120_driver_flag_offset_calc_t *const p_flag_offset )
```

Get the flag of finish current offset detection. Implements `motor_120_driver_api_t::flagCurrentOffsetGet`.

Example:

```
/* Get the flag of A/D converted current offset */
(void) RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet(&g_motor_120_driver0.p_ctrl,
&ul_get_flg_offset);
```

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ RM_MOTOR_120_DRIVER_ParameterUpdate()

```
fsp_err_t RM_MOTOR_120_DRIVER_ParameterUpdate ( motor_120_driver_ctrl_t *const p_ctrl,
motor_120_driver_cfg_t const *const p_cfg )
```

Update the parameters of 120 driver module. Implements `motor_120_driver_api_t::parameterUpdate`.

Example:

```
(void) RM_MOTOR_120_DRIVER_ParameterUpdate(&g_motor_120_driver0.p_ctrl,
&g_motor_120_driver0.p_cfg);
```

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Successfully data was updated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

5.2.11.5 Motor 120 degree control (rm_motor_120_degree)

Modules » Motor

Functions

```
fsp_err_t RM_MOTOR_120_DEGREE_Open (motor_ctrl_t *const p_ctrl,
motor_cfg_t const *const p_cfg)
```

Configure the motor in register start mode. Implements `motor_api_t::open`. [More...](#)

```

`fsp_err_t RM_MOTOR_120_DEGREE_ErrorSet (motor_ctrl_t *const p_ctrl, motor_error_t const error)`
Set error information. Implements `motor_api_t::errorSet`. [More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_SpeedSet (motor_ctrl_t *const p_ctrl, float const speed_rpm)`
Set speed reference[rpm]. Implements `motor_api_t::speedSet`.
[More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_StatusGet (motor_ctrl_t *const p_ctrl, uint8_t *const p_status)`
Get current control status. Implements `motor_api_t::statusGet`.
[More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_SpeedGet (motor_ctrl_t *const p_ctrl, float *const p_speed_rpm)`
Get rotational speed. Implements `motor_api_t::speedGet`. [More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_WaitStopFlagGet (motor_ctrl_t *const p_ctrl, motor_wait_stop_flag_t *const p_flag_wait_stop)`
Get wait stop flag. Implements `motor_api_t::waitStopFlagGet`. [More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_ErrorCheck (motor_ctrl_t *const p_ctrl, uint16_t *const p_error)`
Check the occurrence of error. Implements `motor_api_t::errorCheck`.
[More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_PositionSet (motor_ctrl_t *const p_ctrl, motor_speed_position_data_t const *const p_position)`
Set position reference. Implements `motor_api_t::positionSet`. [More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_AngleGet (motor_ctrl_t *const p_ctrl, float *const p_angle_rad)`
Set position reference. Implements `motor_api_t::angleGet`. [More...](#)

```
fsp_err_t RM_MOTOR_120_DEGREE_FunctionSelect (motor_ctrl_t *const p_ctrl,  
motor_function_select_t const function)
```

Select using function. Implements [motor_api_t::functionSelect](#).
[More...](#)

Detailed Description

Usual control of a SPM (Surface Permanent Magnet) motor on RA MCUs. This module implements the [Motor 120 degree control \(rm_motor_120_degree\)](#).

Overview

The motor 120 degree control is used to control a motor rotation in an application. This module is implemented with using a SPM motor. User can start/stop motor rotation simply.

Features

The motor 120 degree module has below features.

- Start/Stop a motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

Target Hardware

The below figure shows examples of target hardware of this Motor 120-degree Module.

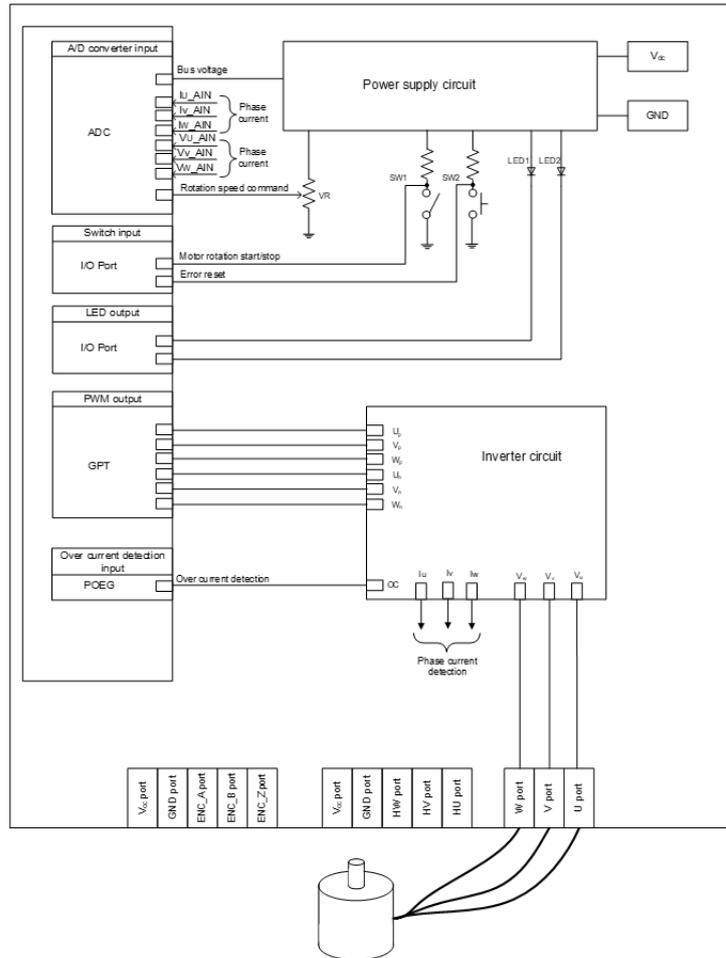

Figure 230: Example of target hardware of motor 120-degree sensorless

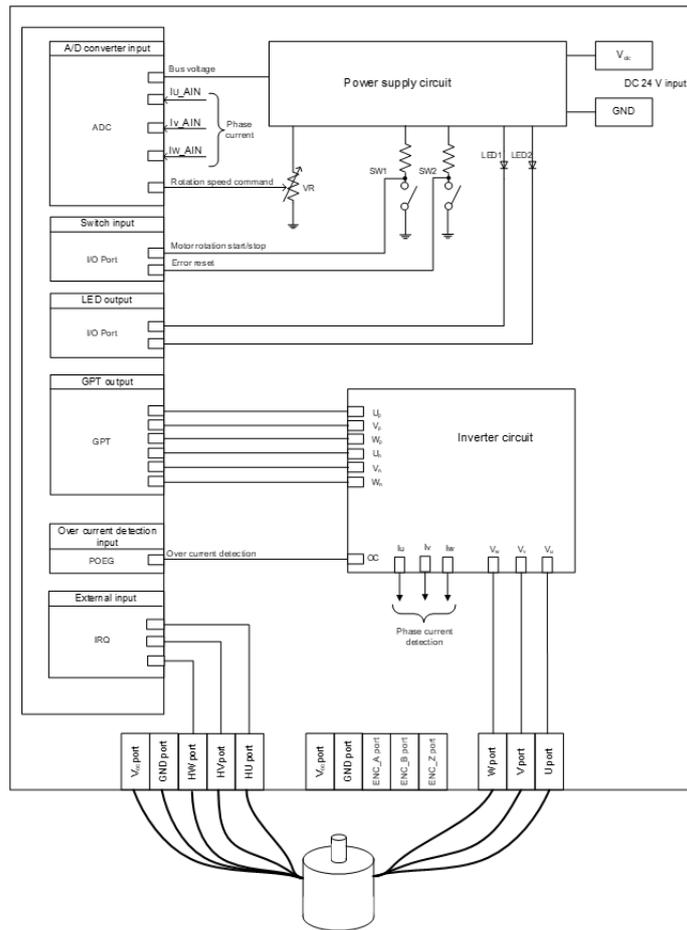

Figure 231: Example of target hardware of motor 120-degree with hall sensor

Modulation

The modulation factor "m" is defined as follows.

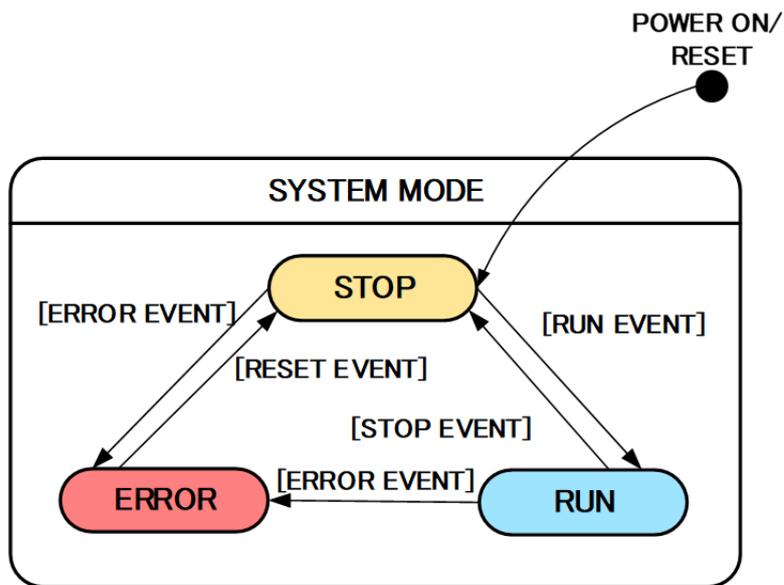

$$m = \frac{V}{E}$$

m: Modulation ratio V: Reference voltage E: Inverter input voltage

Figure 232: Modulation factor

State transition

The below figure shows a state transition diagram. Internal state is managed by "SYSTEM MODE".

| | | MODE | | |
|-------|-------|-------|-------|-------|
| | | STOP | RUN | ERROR |
| EVENT | STOP | STOP | STOP | ERROR |
| | RUN | RUN | RUN | ERROR |
| | ERROR | ERROR | ERROR | ERROR |
| | RESET | STOP | RUN | STOP |

Figure 233: State transition diagram

(1) SYSTEM MODE "SYSTEM MODE" indicates the operating states of the system. The state transits on occurrence of each event (EVENT). "SYSTEM MODE" has 3 states that are motor drive stop (INACTIVE), motor drive (ACTIVE), and abnormal condition (ERROR).

(2) EVENT When "EVENT" occurs in each "SYSTEM MODE", "SYSTEM MODE" changes as shown the table in above figure, according to that "EVENT". The occurrence factors of each event are shown below.

| EVENT name | Occurrence factor |
|------------|----------------------------------|
| STOP | by user operation |
| RUN | by user operation |
| ERROR | when the system detects an error |
| RESET | by user operation |

Flowchart

The below figures show flowcharts of motor 120-degree module.

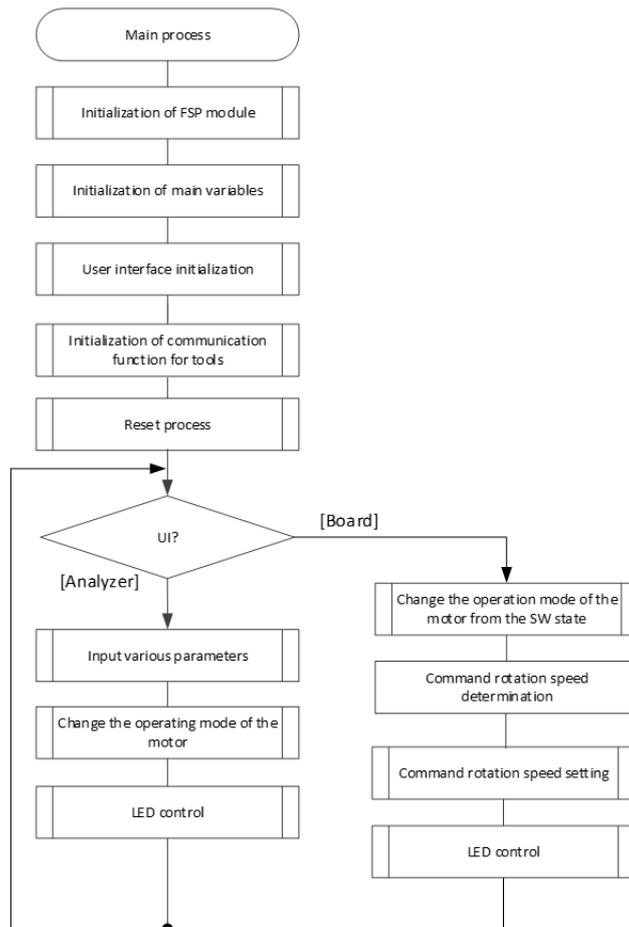

Figure 234: Main process

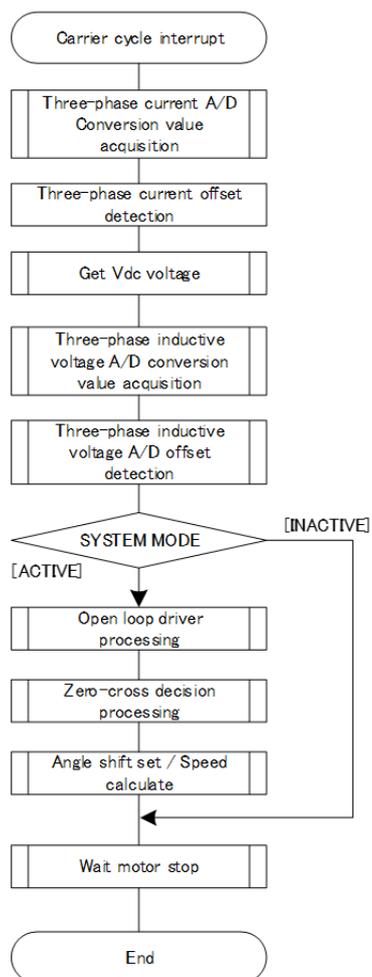

Figure 235: Current control process of 120-degree sensorless

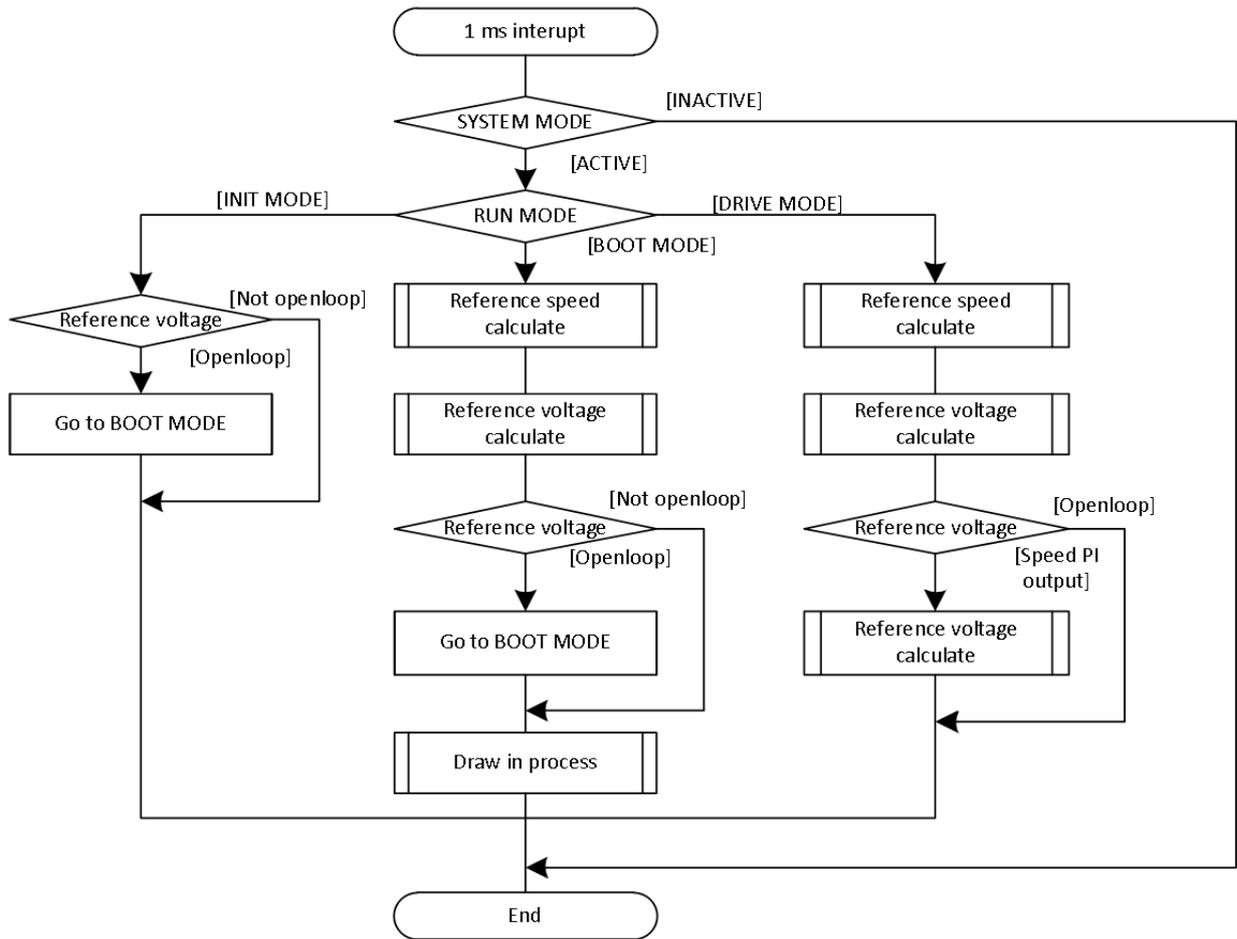

Figure 236: Speed control process of 120-degree sensorless

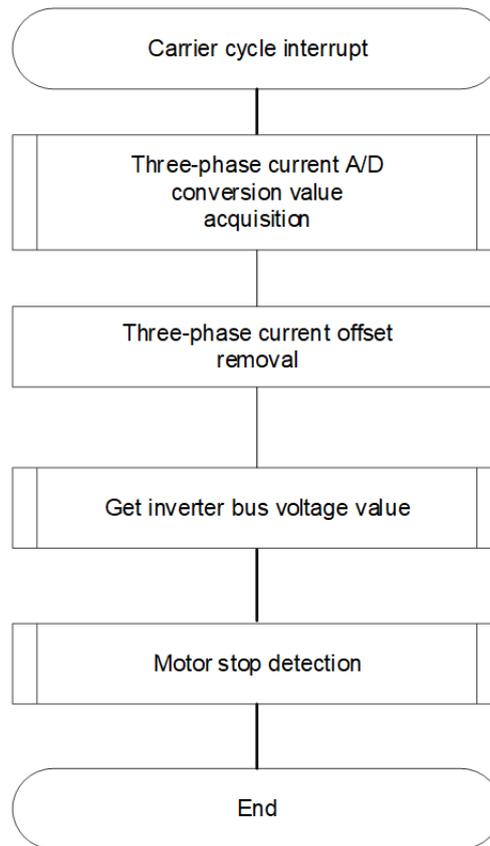

Figure 237: Current control process of 120-degree with hall sensor

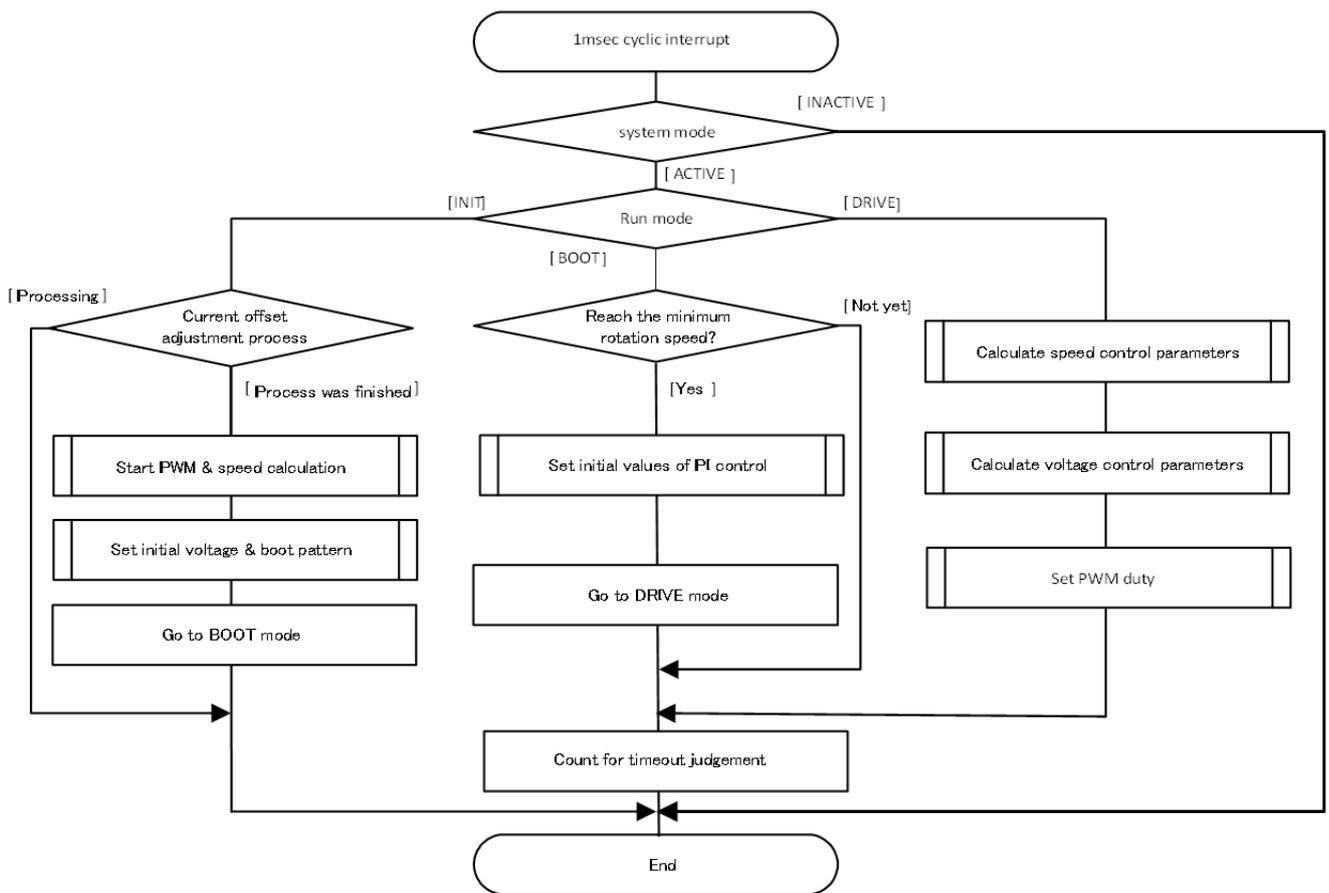

Figure 238: Speed control process of 120-degree with hall sensor

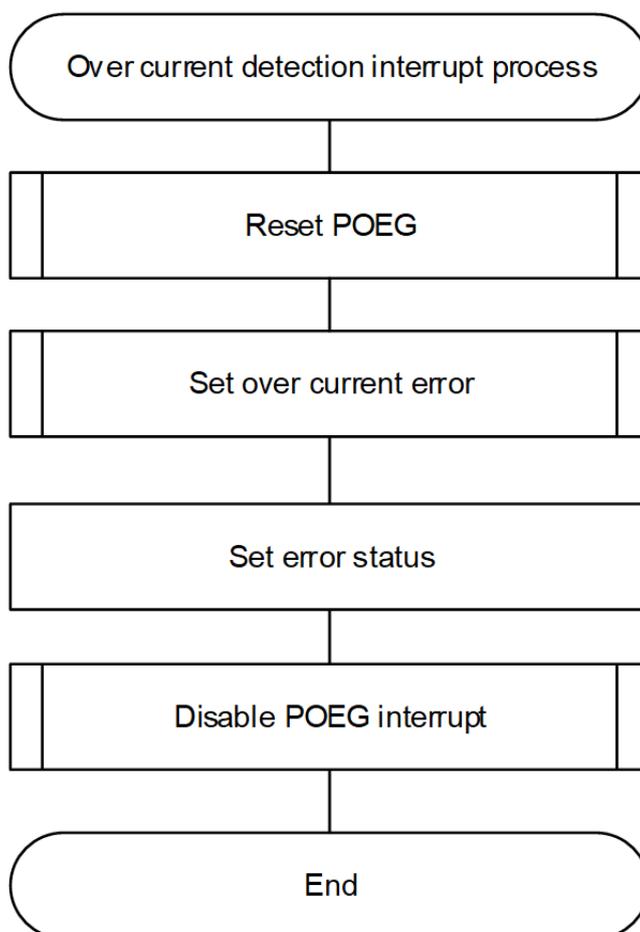

Figure 239: Over current detection interrupt process

Configuration

Build Time Configurations for rm_motor_120_degree

The following build time configurations are defined in fsp_cfg/rm_motor_120_degree_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > Motor 120 degree control (rm_motor_120_degree)

This module can be added to the Stacks tab via New Stack > Motor > Motor 120 degree control (rm_motor_120_degree).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

General

| | | | |
|---------------------------|-------------------------------------|---------------------|---|
| Name | Name must be a valid C symbol | g_motor_120_degree0 | Module name. |
| Limit of over current (A) | Must be a valid non-negative value. | 4.0 | Limit of over current.(Detection threshold) |
| Limit of over voltage (V) | Must be a valid non-negative value. | 28.0 | Limit of over voltage.(Detection threshold) |
| Limit of over speed (rpm) | Must be a valid non-negative value. | 3000.0 | Limit of over speed.(Detection threshold) |
| Limit of low voltage (V) | Must be a valid non-negative value. | 14.0 | Limit of low voltage.(Detection threshold) |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | NULL | A user callback function. |

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

Pin Configuration

This module does not use I/O pins. Please set used pins on configuration of each hardware modules.

Usage Notes

Limitations

- Set the limit of electric current with non-negative value.
- Set the limit of input voltage with non-negative value.
- Set the limit of rotational speed with non-negative value.

Examples

Basic Example

This is a basic example of minimal use of the motor 120 degree in an application.

```
void motor_120_degree_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the module. */
    err = RM_MOTOR_120_DEGREE_Open(g_motor_120_degree0.p_ctrl,
    g_motor_120_degree0.p_cfg);
}
```

```
    assert(FSP_SUCCESS == err);

    /* Set speed reference before motor run */
    (void) RM_MOTOR_120_DEGREE_SpeedSet(g_motor_120_degree0.p_ctrl,
DEF_120_DEGREE_SPEED_REF);

    /* Start motor rotation */
    (void) RM_MOTOR_120_DEGREE_Run(g_motor_120_degree0.p_ctrl);

    /* Get current status */
    (void) RM_MOTOR_120_DEGREE_StatusGet(g_motor_120_degree0.p_ctrl, &smpl_status);

    /* Get current motor speed */
    (void) RM_MOTOR_120_DEGREE_SpeedGet(g_motor_120_degree0.p_ctrl, &smpl_speed);

    /* Get wait stop flag */
    (void) RM_MOTOR_120_DEGREE_WaitStopFlagGet(g_motor_120_degree0.p_ctrl,
&smpl_wait_stop_flag);

    /* Check error */
    (void) RM_MOTOR_120_DEGREE_ErrorCheck(g_motor_120_degree0.p_ctrl, &smpl_error);

    /* Stop motor rotation */
    (void) RM_MOTOR_120_DEGREE_Stop(g_motor_120_degree0.p_ctrl);
    (void) RM_MOTOR_120_DEGREE_ErrorSet(g_motor_120_degree0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);

    /* Reset the process. */
    (void) RM_MOTOR_120_DEGREE_Reset(g_motor_120_degree0.p_ctrl);

    /* Close the module. */
    (void) RM_MOTOR_120_DEGREE_Close(g_motor_120_degree0.p_ctrl);
}
```

Function Documentation◆ **RM_MOTOR_120_DEGREE_Open()**

```
fsp_err_t RM_MOTOR_120_DEGREE_Open ( motor_ctrl_t *const p_ctrl, motor_cfg_t const *const p_cfg )
```

Configure the motor in register start mode. Implements `motor_api_t::open`.

Example:

```
/* Initializes the module. */
err = RM_MOTOR_120_DEGREE_Open(g_motor_120_degree0.p_ctrl,
g_motor_120_degree0.p_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |

Note

This function should only be called once as motor configuration registers can only be written to once so subsequent calls will have no effect.

◆ **RM_MOTOR_120_DEGREE_Close()**

```
fsp_err_t RM_MOTOR_120_DEGREE_Close ( motor_ctrl_t *const p_ctrl)
```

Disables specified motor control block. Implements `motor_api_t::close`.

Example:

```
/* Close the module. */
(void) RM_MOTOR_120_DEGREE_Close(g_motor_120_degree0.p_ctrl);
```

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_120_DEGREE_Reset()**

```
fsp_err_t RM_MOTOR_120_DEGREE_Reset ( motor_ctrl_t *const p_ctrl)
```

Reset motor control block. Implements `motor_api_t::reset`.

Example:

```
/* Reset the process. */
(void) RM_MOTOR_120_DEGREE_Reset(g_motor_120_degree0.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_120_DEGREE_Run()**

```
fsp_err_t RM_MOTOR_120_DEGREE_Run ( motor_ctrl_t *const p_ctrl)
```

Run motor (Start motor rotation). Implements `motor_api_t::run`.

Example:

```
/* Start motor rotation */
(void) RM_MOTOR_120_DEGREE_Run(g_motor_120_degree0.p_ctrl);
```

Return values

| | |
|-------------------|-----------------------|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_120_DEGREE_Stop()**

```
fsp_err_t RM_MOTOR_120_DEGREE_Stop ( motor_ctrl_t *const p_ctrl)
```

Stop motor (Stop motor rotation). Implements `motor_api_t::stop`.

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_120_DEGREE_Stop(g_motor_120_degree0.p_ctrl);
```

Return values

| | |
|-------------------|-----------------------|
| FSP_SUCCESS | Successfully stopped. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ RM_MOTOR_120_DEGREE_ErrorSet()

```
fsp_err_t RM_MOTOR_120_DEGREE_ErrorSet ( motor_ctrl_t *const p_ctrl, motor_error_t const error )
```

Set error information. Implements `motor_api_t::errorSet`.

Example:

```
(void) RM_MOTOR_120_DEGREE_ErrorSet(g_motor_120_degree0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Successfully set error information. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ RM_MOTOR_120_DEGREE_SpeedSet()

```
fsp_err_t RM_MOTOR_120_DEGREE_SpeedSet ( motor_ctrl_t *const p_ctrl, float const speed_rpm )
```

Set speed reference[rpm]. Implements `motor_api_t::speedSet`.

Example:

```
/* Set speed reference before motor run */
(void) RM_MOTOR_120_DEGREE_SpeedSet(g_motor_120_degree0.p_ctrl,
DEF_120_DEGREE_SPEED_REF);
```

Return values

| | |
|-------------------|-----------------------------------|
| FSP_SUCCESS | Successfully set speed reference. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_120_DEGREE_StatusGet()**

```
fsp_err_t RM_MOTOR_120_DEGREE_StatusGet ( motor_ctrl_t *const p_ctrl, uint8_t *const p_status )
```

Get current control status. Implements `motor_api_t::statusGet`.

Example:

```
/* Get current status */
(void) RM_MOTOR_120_DEGREE_StatusGet(g_motor_120_degree0.p_ctrl, &smpl_status);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Successfully got current control status. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_POINTER | Data received pointer is invalid. |

Note

◆ **RM_MOTOR_120_DEGREE_SpeedGet()**

```
fsp_err_t RM_MOTOR_120_DEGREE_SpeedGet ( motor_ctrl_t *const p_ctrl, float *const p_speed_rpm )
```

Get rotational speed. Implements `motor_api_t::speedGet`.

Example:

```
/* Get current motor speed */
(void) RM_MOTOR_120_DEGREE_SpeedGet(g_motor_120_degree0.p_ctrl, &smpl_speed);
```

Return values

| | |
|-------------------------|------------------------------------|
| FSP_SUCCESS | Successfully got rotational speed. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_POINTER | Data received pointer is invalid. |

Note

◆ **RM_MOTOR_120_DEGREE_WaitStopFlagGet()**

```
fsp_err_t RM_MOTOR_120_DEGREE_WaitStopFlagGet ( motor_ctrl_t *const p_ctrl,
motor_wait_stop_flag_t *const p_flag_wait_stop )
```

Get wait stop flag. Implements `motor_api_t::waitStopFlagGet`.

Example:

```
/* Get wait stop flag */
(void) RM_MOTOR_120_DEGREE_WaitStopFlagGet(g_motor_120_degree0.p_ctrl,
&smpl_wait_stop_flag);
```

Return values

| | |
|-------------------------|-----------------------------------|
| FSP_SUCCESS | Successfully got wait stop flag. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_POINTER | Data received pointer is invalid. |

Note

◆ **RM_MOTOR_120_DEGREE_ErrorCheck()**

```
fsp_err_t RM_MOTOR_120_DEGREE_ErrorCheck ( motor_ctrl_t *const p_ctrl, uint16_t *const
p_error )
```

Check the occurrence of error. Implements `motor_api_t::errorCheck`.

Example:

```
/* Check error */
(void) RM_MOTOR_120_DEGREE_ErrorCheck(g_motor_120_degree0.p_ctrl, &smpl_error);
```

Return values

| | |
|-------------------------|------------------------------------|
| FSP_SUCCESS | Successfully error checke process. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_POINTER | Data received pointer is invalid. |

Note

◆ **RM_MOTOR_120_DEGREE_PositionSet()**

```
fsp_err_t RM_MOTOR_120_DEGREE_PositionSet ( motor_ctrl_t *const p_ctrl,
motor_speed_position_data_t const *const p_position )
```

Set position reference. Implements `motor_api_t::positionSet`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

Note

◆ **RM_MOTOR_120_DEGREE_AngleGet()**

```
fsp_err_t RM_MOTOR_120_DEGREE_AngleGet ( motor_ctrl_t *const p_ctrl, float *const p_angle_rad
)
```

Set position reference. Implements `motor_api_t::angleGet`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

Note

◆ **RM_MOTOR_120_DEGREE_FunctionSelect()**

```
fsp_err_t RM_MOTOR_120_DEGREE_FunctionSelect ( motor_ctrl_t *const p_ctrl,
motor_function_select_t const function )
```

Select using function. Implements `motor_api_t::functionSelect`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

Note

5.2.11.6 Motor Angle (rm_motor_estimate)

Modules » [Motor](#)

Functions

```
fsp_err_t RM_MOTOR_ESTIMATE_Open (motor_angle_ctrl_t *const p_ctrl,
motor_angle_cfg_t const *const p_cfg)
```

Opens and configures the Angle Estimation module. Implements [motor_angle_api_t::open](#). [More...](#)

`fsp_err_t` [RM_MOTOR_ESTIMATE_Close](#) (`motor_angle_ctrl_t *const p_ctrl`)

Disables specified Angle Estimation module. Implements [motor_angle_api_t::close](#). [More...](#)

`fsp_err_t` [RM_MOTOR_ESTIMATE_Reset](#) (`motor_angle_ctrl_t *const p_ctrl`)

Reset variables of Angle Estimation module. Implements [motor_angle_api_t::reset](#). [More...](#)

`fsp_err_t` [RM_MOTOR_ESTIMATE_CurrentSet](#) (`motor_angle_ctrl_t *const p_ctrl`,
`motor_angle_current_t *const p_st_current`,
`motor_angle_voltage_reference_t *const p_st_voltage`)

Set d/q-axis Current Data & Voltage Reference. Implements [motor_angle_api_t::currentSet](#). [More...](#)

`fsp_err_t` [RM_MOTOR_ESTIMATE_SpeedSet](#) (`motor_angle_ctrl_t *const p_ctrl`,
`float const speed_ctrl`, `float const damp_speed`)

Set Speed Information. Implements [motor_angle_api_t::speedSet](#). [More...](#)

`fsp_err_t` [RM_MOTOR_ESTIMATE_FlagPiCtrlSet](#) (`motor_angle_ctrl_t *const p_ctrl`,
`uint32_t const flag_pi`)

Set the flag of PI Control runs. Implements [motor_angle_api_t::flagPiCtrlSet](#). [More...](#)

`fsp_err_t` [RM_MOTOR_ESTIMATE_AngleSpeedGet](#) (`motor_angle_ctrl_t *const p_ctrl`,
`float *const p_angle`, `float *const p_speed`, `float *const p_phase_err`)

Gets the current rotor's angle and rotation speed. Implements [motor_angle_api_t::angleSpeedGet](#). [More...](#)

`fsp_err_t` [RM_MOTOR_ESTIMATE_EstimatedComponentGet](#) (`motor_angle_ctrl_t *const p_ctrl`,
`float *const p_ed`, `float *const p_eq`)

Gets estimated d/q-axis component. Implements [motor_angle_api_t::estimatedComponentGet](#). [More...](#)

`fsp_err_t` [RM_MOTOR_ESTIMATE_ParameterUpdate](#) (`motor_angle_ctrl_t *const p_ctrl`,
`motor_angle_cfg_t const *const p_cfg`)

Update the parameters of Angle&Speed Estimation. Implements [motor_angle_api_t::parameterUpdate](#). [More...](#)

[fsp_err_t](#) [RM_MOTOR_ESTIMATE_InternalCalculate](#) ([motor_angle_ctrl_t](#) *const [p_ctrl](#))

Calculate internal parameters. Implements [motor_angle_api_t::internalCalculate](#). [More...](#)

[fsp_err_t](#) [RM_MOTOR_ESTIMATE_AngleAdjust](#) ([motor_angle_ctrl_t](#) *const [p_ctrl](#))

Angle Adjustment Process. Implements [motor_angle_api_t::angleAdjust](#). [More...](#)

[fsp_err_t](#) [RM_MOTOR_ESTIMATE_EncoderCyclic](#) ([motor_angle_ctrl_t](#) *const [p_ctrl](#))

Encoder Cyclic Process (Call in cyclic timer). Implements [motor_angle_api_t::encoderCyclic](#). [More...](#)

[fsp_err_t](#) [RM_MOTOR_ESTIMATE_InfoGet](#) ([motor_angle_ctrl_t](#) *const [p_ctrl](#), [motor_angle_encoder_info_t](#) *const [p_info](#))

Gets information of Encoder Angle Module. Implements [motor_angle_api_t::infoGet](#). [More...](#)

[fsp_err_t](#) [RM_MOTOR_ESTIMATE_CyclicProcess](#) ([motor_angle_ctrl_t](#) *const [p_ctrl](#))

Perform induction cyclic process. Implements [motor_angle_api_t::cyclicProcess](#). [More...](#)

[fsp_err_t](#) [RM_MOTOR_ESTIMATE_SensorDataSet](#) ([motor_angle_ctrl_t](#) *const [p_ctrl](#), [motor_angle_ad_data_t](#) *const [p_ad_data](#))

Set sensor data. Implements [motor_angle_api_t::sensorDataSet](#). [More...](#)

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor angle Interface](#).

Overview

The motor angle and speed estimation module is used to calculate rotor angle and rotational speed

in an application. This module should be called cyclically after the A/D conversion of electric current of each phase in an application.

Features

The Motor Angle and Speed Estimation Module has below features.

- Calculate rotor angle [radian].
- Calculate rotational speed [radian/second].

Configuration

Build Time Configurations for rm_motor_estimate

The following build time configurations are defined in fsp_cfg/rm_motor_estimate_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > Motor Angle and Speed Estimation (rm_motor_estimate)

This module can be added to the Stacks tab via New Stack > Motor > Motor Angle and Speed Estimation (rm_motor_estimate).

| Configuration | Options | Default | Description |
|--|---|----------------|---|
| Motor Parameter | | | |
| Pole pairs | Must be a valid non-negative value. | 2 | Pole pairs |
| Motor Parameter > Resistance[ohm] | Must be a valid value | 8.5F | Resistance |
| Motor Parameter > Inductance of d-axis[H] | Must be a valid value | 0.0045F | Inductance of d-axis |
| Motor Parameter > Inductance of q-axis[H] | Must be a valid value | 0.0045F | Inductance of q-axis |
| Motor Parameter > Permanent magnetic flux[Wb] | Must be a valid value | 0.02159F | Permanent magnetic flux |
| Motor Parameter > Rotor inertia[kgm ²] | Must be a valid value | 0.0000028F | Rotor inertia |
| Motor Parameter > Nominal current[Arms] | Must be a valid value | 1.67 | Nominal current |
| Name | Name must be a valid C symbol | g_motor_angle0 | Module name. |
| Openloop damping | <ul style="list-style-type: none"> • Disable • Enable | Enable | Openloop damping functionally enable or |

disable

| | | | |
|--|-----------------------|----------|--|
| Natural frequency of BEMF observer | Must be a valid value | 1000.0F | Natural frequency of BEMF observer |
| Damping ratio of BEMF observer | Must be a valid value | 1.0F | Damping ratio of BEMF observer |
| Natural frequency of PLL Speed estimate loop | Must be a valid value | 20.0F | Natural frequency of PLL Speed estimate loop |
| Damping ratio of PLL Speed estimate loop | Must be a valid value | 1.0F | Damping ratio of PLL Speed estimate loop |
| Control period | Must be a valid value | 0.00005F | Control period |

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the Motor Angle and Speed Estimation:

Examples

Basic Example

This is a basic example of minimal use of the Motor Angle and Speed Estimation in an application.

```
void motor_estimate_basic_example (void)
{
    fsp_err_t          err = FSP_SUCCESS;
    motor_angle_current_t  smpl_current;
    motor_angle_voltage_reference_t  smpl_voltage;

    /* Initializes the module. */
    err = RM_MOTOR_ESTIMATE_Open(&g_mtr_angle0_ctrl, &g_mtr_angle_set0_cfg);
    assert(FSP_SUCCESS == err);

    /* Basically run this module at A/D conversion finish interrupt.
     * This implementation is an example. */
    while (true)
```

```
{
/* Application work here. */
/* Set PI Control Flag before get Angle/Speed and Estimated Component */
    (void) RM_MOTOR_ESTIMATE_FlagPiCtrlSet(&g_mtr_angle0_ctrl, 1U);
    smpl_current.id = 1.0F;
    smpl_current.iq = 1.0F;
    smpl_voltage.vd = 10.0F;
    smpl_voltage.vq = 10.0F;
/* Set Current and Speed data before get Angle/Speed and Estimated Component */
    (void) RM_MOTOR_ESTIMATE_CurrentSet(&g_mtr_angle0_ctrl, smpl_current,
smpl_voltage);
/* Set Internal Speed Reference & damping speed data before get Angle/Speed and
Estimated Component */
    (void) RM_MOTOR_ESTIMATE_SpeedSet(&g_mtr_angle0_ctrl, 104.27F, 10.0F);
/* Get Angle/Speed data */
    (void) RM_MOTOR_ESTIMATE_AngleSpeedGet(&g_mtr_angle0_ctrl, &f_get_angle,
&f_get_speed, &f_get_phase_err);
/* Get Estimated Component */
    (void) RM_MOTOR_ESTIMATE_EstimatedComponentGet(&g_mtr_angle0_ctrl, &f_get_ed,
&f_get_eq);
}
}
```

Function Documentation

◆ **RM_MOTOR_ESTIMATE_Open()**

```
fsp_err_t RM_MOTOR_ESTIMATE_Open ( motor_angle_ctrl_t *const p_ctrl, motor_angle_cfg_t const *const p_cfg )
```

Opens and configures the Angle Estimation module. Implements [motor_angle_api_t::open](#).

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | MTR_ANGL_EST successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

◆ **RM_MOTOR_ESTIMATE_Close()**

```
fsp_err_t RM_MOTOR_ESTIMATE_Close ( motor_angle_ctrl_t *const p_ctrl)
```

Disables specified Angle Estimation module. Implements [motor_angle_api_t::close](#).

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_ESTIMATE_Reset()**

```
fsp_err_t RM_MOTOR_ESTIMATE_Reset ( motor_angle_ctrl_t *const p_ctrl)
```

Reset variables of Angle Estimation module. Implements [motor_angle_api_t::reset](#).

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_ESTIMATE_CurrentSet()**

```
fsp_err_t RM_MOTOR_ESTIMATE_CurrentSet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_current_t *const p_st_current, motor_angle_voltage_reference_t *const p_st_voltage
)
```

Set d/q-axis Current Data & Voltage Reference. Implements `motor_angle_api_t::currentSet`.

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_ESTIMATE_SpeedSet()**

```
fsp_err_t RM_MOTOR_ESTIMATE_SpeedSet ( motor_angle_ctrl_t *const p_ctrl, float const
speed_ctrl, float const damp_speed )
```

Set Speed Information. Implements `motor_angle_api_t::speedSet`.

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_ESTIMATE_FlagPiCtrlSet()**

```
fsp_err_t RM_MOTOR_ESTIMATE_FlagPiCtrlSet ( motor_angle_ctrl_t *const p_ctrl, uint32_t const
flag_pi )
```

Set the flag of PI Control runs. Implements `motor_angle_api_t::flagPiCtrlSet`.

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_ESTIMATE_AngleSpeedGet()**

```
fsp_err_t RM_MOTOR_ESTIMATE_AngleSpeedGet ( motor_angle_ctrl_t *const p_ctrl, float *const p_angle, float *const p_speed, float *const p_phase_err )
```

Gets the current rotor's angle and rotation speed. Implements [motor_angle_api_t::angleSpeedGet](#).

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_ESTIMATE_EstimatedComponentGet()**

```
fsp_err_t RM_MOTOR_ESTIMATE_EstimatedComponentGet ( motor_angle_ctrl_t *const p_ctrl, float *const p_ed, float *const p_eq )
```

Gets estimated d/q-axis component. Implements [motor_angle_api_t::estimatedComponentGet](#).

Return values

| | |
|-------------------|---------------------------|
| FSP_SUCCESS | Successfully data gotten. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_ESTIMATE_ParameterUpdate()**

```
fsp_err_t RM_MOTOR_ESTIMATE_ParameterUpdate ( motor_angle_ctrl_t *const p_ctrl, motor_angle_cfg_t const *const p_cfg )
```

Update the parameters of Angle&Speed Estimation. Implements [motor_angle_api_t::parameterUpdate](#).

Return values

| | |
|-------------------|------------------------------|
| FSP_SUCCESS | Successfully data is update. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_ESTIMATE_InternalCalculate()**

`fsp_err_t RM_MOTOR_ESTIMATE_InternalCalculate (motor_angle_ctrl_t *const p_ctrl)`

Calculate internal parameters. Implements `motor_angle_api_t::internalCalculate`.

Return values

| | |
|---------------------|---------------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_ESTIMATE_AngleAdjust()**

`fsp_err_t RM_MOTOR_ESTIMATE_AngleAdjust (motor_angle_ctrl_t *const p_ctrl)`

Angle Adjustment Process. Implements `motor_angle_api_t::angleAdjust`.

Return values

| | |
|---------------------|---------------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_ESTIMATE_EncoderCyclic()**

`fsp_err_t RM_MOTOR_ESTIMATE_EncoderCyclic (motor_angle_ctrl_t *const p_ctrl)`

Encoder Cyclic Process (Call in cyclic timer). Implements `motor_angle_api_t::encoderCyclic`.

Return values

| | |
|---------------------|---------------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_ESTIMATE_InfoGet()**

```
fsp_err_t RM_MOTOR_ESTIMATE_InfoGet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_encoder_info_t *const p_info )
```

Gets information of Encoder Angle Module. Implements [motor_angle_api_t::infoGet](#).

Return values

| | |
|---------------------|---------------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_ESTIMATE_CyclicProcess()**

```
fsp_err_t RM_MOTOR_ESTIMATE_CyclicProcess ( motor_angle_ctrl_t *const p_ctrl)
```

Perform induction cyclic process. Implements [motor_angle_api_t::cyclicProcess](#).

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

◆ **RM_MOTOR_ESTIMATE_SensorDataSet()**

```
fsp_err_t RM_MOTOR_ESTIMATE_SensorDataSet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_ad_data_t *const p_ad_data )
```

Set sensor data. Implements [motor_angle_api_t::sensorDataSet](#).

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor angle Interface](#).

Overview

The motor angle and speed calculation with an encoder module is used to calculate rotor angle and rotational speed in an application. This module is designed to be used with the motor current module ([rm_motor_current](#)).

Features

The motor angle and speed calculation with an encoder module has the features listed below.

- Calculate rotor angle [radian].
- Calculate rotational speed [radian/second].

Configuration

Build Time Configurations for rm_motor_sense_encoder

The following build time configurations are defined in fsp_cfg/rm_motor_sense_encoder_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > Motor Angle and Speed Calculation with encoder (rm_motor_sense_encoder)

This module can be added to the Stacks tab via New Stack > Motor > Motor Angle and Speed Calculation with encoder (rm_motor_sense_encoder).

| Configuration | Options | Default | Description |
|---|---|----------------------------|---------------------------|
| General | | | |
| Name | Name must be a valid C symbol | g_motor_sense_encode r0 | Module name. |
| Motor Parameter | | | |
| Pole pairs | Must be a valid non-negative value. | 7 | Pole pairs |
| Resistance (ohm) | Must be a valid value | 0.453F | Resistance |
| Inductance of d-axis (H) | Must be a valid value | 0.0009447F | Inductance of d-axis |
| Inductance of q-axis (H) | Must be a valid value | 0.0009447F | Inductance of q-axis |
| Permanent magnetic flux (Wb) | Must be a valid value | 0.006198F | Permanent magnetic flux |
| Motor Parameter > Rotor inertia (kgm ²) | Must be a valid value | 0.00000962F | Rotor inertia |
| Control Type | <ul style="list-style-type: none"> • Speed • Position | Position | Select control Type |
| Period of Current control (kHz) | Must be a valid value | 20.0F | Period of Current control |
| Period of Speed control (sec) | Must be a valid value | 0.0005F | Period of Speed control |

| | | | |
|------------------------------------|-------------------------------------|-----------|--|
| PWM Carrier Frequency (kHz) | Must be a valid value | 20.0F | PWM Carrier Frequency |
| Decimation of Interrupt | Manual Entry | 0U | Decimation of Interrupt |
| Counts per Rotation | Must be a valid non-negative value. | 1200U | Encoder Counts per One Rotation |
| Counts for Angle Adjust | Must be a valid non-negative value. | 512U | Counts for Angle Adjust (as working time) |
| Zero speed counts | Must be a valid non-negative value. | 20000000U | Threshold counts to judge zero speed |
| Occupancy Time | Must be a valid value | 0.30F | Occupancy time of carrier interrupt |
| Carrier Time | Must be a valid value | 0.000013F | Processing time of carrier interrupt |
| Process Time | Must be a valid value | 0.000001F | Processing time of encoder interrupt |
| Highspeed Change Margin (rpm) | Must be a valid non-negative value. | 150U | Margin of toggle speed for high speed mode |
| LPF parameter for Highspeed Filter | Must be a valid value | 0.1F | Highspeed mode speed LPF parameter |
| Counts to change speed | Must be a valid non-negative value. | 8U | Counts for mode change of position speed calculation |

Clock Configuration

Pin Configuration

Usage Notes

Limitations

Developers should be aware of the following limitations when using the motor angle and speed calculation with an encoder: all configurations should be set as positive values.

Examples

Basic Example

This is a basic example of minimal use of the motor angle and speed calculation with an encoder in an application.

```
void motor_sense_encoder_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
}
```

```
err = RM_MOTOR_SENSE_ENCODER_Open(&g_mtr_angle0_ctrl, &g_mtr_angle_set0_cfg);
assert(FSP_SUCCESS == err);

/* Basically run this module at A/D conversion finish interrupt.
 * This implementation is an example. */
// while (true)
{
/* Application work here. */
/* Initialize motor with the encoder */
    (void) RM_MOTOR_SENSE_ENCODER_AngleAdjust(&g_mtr_angle0_ctrl);
/* Perform cyclic encoder process*/
    (void) RM_MOTOR_SENSE_ENCODER_CyclicProcess(&g_mtr_angle0_ctrl);
/* Calculate information with encoder signal input */
    (void) RM_MOTOR_SENSE_ENCODER_InternalCalculate(&g_mtr_angle0_ctrl);
/* Get angle/speed data */
    (void) RM_MOTOR_SENSE_ENCODER_AngleSpeedGet(&g_mtr_angle0_ctrl, &f_get_angle,
&f_get_speed, &f_get_phase_err);
/* Get calculated component */
    (void) RM_MOTOR_SENSE_ENCODER_InfoGet(&g_mtr_angle0_ctrl, &temp_info);
}
/* Reset the module */
    (void) RM_MOTOR_SENSE_ENCODER_Reset(&g_mtr_angle0_ctrl);
/* Close the module */
    (void) RM_MOTOR_SENSE_ENCODER_Close(&g_mtr_angle0_ctrl);
}
```

Enumerations

```
enum motor_sense_encoder_loop_t
```

```
enum motor_sense_encoder_mode_t
```

Enumeration Type Documentation

◆ **motor_sense_encoder_loop_t**

| enum motor_sense_encoder_loop_t | |
|-----------------------------------|------------------------|
| Enumerator | |
| MOTOR_SENSE_ENCODER_LOOP_SPEED | Speed control mode. |
| MOTOR_SENSE_ENCODER_LOOP_POSITION | Position control mode. |

◆ **motor_sense_encoder_mode_t**

| enum motor_sense_encoder_mode_t | |
|---------------------------------|-------------------------------------|
| Enumerator | |
| MOTOR_SENSE_ENCODER_MODE_INIT | Initialize mode (Start status) |
| MOTOR_SENSE_ENCODER_MODE_BOOT | Boot mode (Angle adjustment status) |
| MOTOR_SENSE_ENCODER_MODE_DRIVE | Drive mode (Normal work status) |

Function Documentation◆ **RM_MOTOR_SENSE_ENCODER_Open()**

`fsp_err_t RM_MOTOR_SENSE_ENCODER_Open (motor_angle_ctrl_t *const p_ctrl, motor_angle_cfg_t const *const p_cfg)`

Opens and configures the Angle Encoder module. Implements `motor_angle_api_t::open`.

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Angle Encoder module successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

◆ **RM_MOTOR_SENSE_ENCODER_Close()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_Close ( motor_angle_ctrl_t *const p_ctrl)
```

Disables specified Angle Encoder module. Implements [motor_angle_api_t::close](#).

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_ENCODER_Reset()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_Reset ( motor_angle_ctrl_t *const p_ctrl)
```

Reset variables of Angle Encoder module. Implements [motor_angle_api_t::reset](#).

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_ENCODER_InternalCalculate()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_InternalCalculate ( motor_angle_ctrl_t *const p_ctrl)
```

Calculate internal parameters. Implements [motor_angle_api_t::internalCalculate](#).

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_ENCODER_AngleSpeedGet()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_AngleSpeedGet ( motor_angle_ctrl_t *const p_ctrl, float
*const p_angle, float *const p_speed, float *const p_phase_err )
```

Gets the current rotor's angle and rotation speed. Implements `motor_angle_api_t::angleSpeedGet`.

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Successfully data calculated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_ENCODER_AngleAdjust()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_AngleAdjust ( motor_angle_ctrl_t *const p_ctrl)
```

Angle Adjustment Process. Implements `motor_angle_api_t::angleAdjust`.

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Successfully data calculated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_ENCODER_EncoderCyclic()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_EncoderCyclic ( motor_angle_ctrl_t *const p_ctrl)
```

Encoder Cyclic Process (Call in cyclic timer). Implements `motor_angle_api_t::encoderCyclic`.

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Successfully data calculated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_ENCODER_CyclicProcess()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_CyclicProcess ( motor_angle_ctrl_t *const p_ctrl)
```

Perform cyclic process. Implements `motor_angle_api_t::cyclicProcess`.

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Successfully data calculated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_ENCODER_InfoGet()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_InfoGet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_encoder_info_t *const p_info )
```

Gets information of Encoder Angle Module. Implements `motor_angle_api_t::infoGet`.

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Successfully data calculated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_ENCODER_ParameterUpdate()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_ParameterUpdate ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_cfg_t const *const p_cfg )
```

Update the parameters of Angle&Speed calculation with an encoder. Implements `motor_angle_api_t::parameterUpdate`.

Return values

| | |
|-------------------|------------------------------|
| FSP_SUCCESS | Successfully data is update. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_ENCODER_CurrentSet()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_CurrentSet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_current_t *const p_st_current, motor_angle_voltage_reference_t *const p_st_voltage
)
```

Set d/q-axis Current Data & Voltage Reference. Implements `motor_angle_api_t::currentSet`.

Return values

| | |
|---------------------|---|

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor angle Interface](#).

Overview

The motor angle and speed calculation with hall sensors module is used to calculate rotor angle and rotational speed in an application. This module is designed to be used with the motor current module (rm_motor_current).

Features

The motor angle and speed calculation with hall sensors module has the features listed below.

- Calculate rotor angle [radian].
- Calculate rotational speed [radian/second].

Configuration

Build Time Configurations for rm_motor_sense_hall

The following build time configurations are defined in `fsp_cfg/rm_motor_sense_hall_cfg.h`:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > Motor Angle and Speed Calculation with Hall sensors (rm_motor_sense_hall)

This module can be added to the Stacks tab via `New Stack > Motor > Motor Angle and Speed Calculation with Hall sensors (rm_motor_sense_hall)`.

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

General

| | | | |
|--|-------------------------------------|---------------------------|---|
| Name | Name must be a valid C symbol | g_motor_angle0 | Module name. |
| Hall sensor | | | |
| U phase input port | Manual Entry | BSP_IO_PORT_12_PIN_0 4 | Hall sensor port U |
| V phase input port | Manual Entry | BSP_IO_PORT_12_PIN_0 5 | Hall sensor port V |
| W phase input port | Manual Entry | BSP_IO_PORT_11_PIN_0 1 | Hall sensor port W |
| sensor pattern #1 | Manual Entry | 1 | Hall sensor pattern #1 |
| sensor pattern #2 | Manual Entry | 5 | Hall sensor pattern #2 |
| sensor pattern #3 | Manual Entry | 4 | Hall sensor pattern #3 |
| sensor pattern #4 | Manual Entry | 6 | Hall sensor pattern #4 |
| sensor pattern #5 | Manual Entry | 2 | Hall sensor pattern #5 |
| sensor pattern #6 | Manual Entry | 3 | Hall sensor pattern #6 |
| Process Frequency (kHz) | Must be a valid value | 20.0F | Frequency to perform the process. |
| Correction parameter of rotor angle | Must be a valid value | 0.0F | Correction parameter of rotor angle |
| Default counts of carrier interrupt | Must be a valid non-negative value. | 300U | Default counts of carrier interrupt during a period of Hall signal change |
| Maximum counts of one rotation | Must be a valid non-negative value. | 500U | Maximum counts of carrier interrupt during one rotor rotation |
| Target value for pseudo speed (rad/s) | Must be a valid non-negative value. | 100.0 | Target value for pseudo speed (rad/s). |
| Target time until the pseudo speed update reaches (msec) | Must be a valid non-negative value. | 300.0 | Target time until the pseudo speed update reaches (msec). |
| Rotation counts to start speed estimation | Must be a valid non-negative value. | 2 | Rotation counts to start of speed estimation. |
| Carrier counts at startup | Must be a valid non-negative value. | 400 | Carrier counts to wait the start timing of pseudo speed update |
| Speed to judge start | Must be a valid non-negative value. | 250.0 | Speed to judge start PI calculation. |

Clock Configuration**Pin Configuration**

Usage Notes

Limitations

Developers should be aware of the following limitations when using the motor angle and speed calculation with hall sensors: all configurations should be set as positive values.

Examples

Basic Example

This is a basic example of minimal use of the motor angle and speed calculation with hall sensors in an application.

```
void motor_sense_hall_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the module. */
    err = RM_MOTOR_SENSE_HALL_Open(&g_mtr_angle0_ctrl, &g_mtr_angle_set0_cfg);
    assert(FSP_SUCCESS == err);

    /* Basically run this module at A/D conversion finish interrupt.
     * This implementation is an example. */
    // while (true)
    {
        /* Application work here. */
        /* Get angle/speed data */
        (void) RM_MOTOR_SENSE_HALL_AngleSpeedGet(&g_mtr_angle0_ctrl, &f_get_angle,
        &f_get_speed, &f_get_phase_err);
    }

    /* Reset the module */
    (void) RM_MOTOR_SENSE_HALL_Reset(&g_mtr_angle0_ctrl);

    /* Close the module */
    (void) RM_MOTOR_SENSE_HALL_Close(&g_mtr_angle0_ctrl);
}
```

Data Structures

```
struct motor_sense_hall_input_t
```

```
struct motor_sense_hall_extended_cfg_t
```

```
struct motor_sense_hall_instance_ctrl_t
```

Enumerations

```
enum motor_sense_hall_direction_t
```

```
enum motor_sense_hall_signal_status_t
```

Data Structure Documentation

| uint8_t | u1_last_hall_signal | Last hall signal pattern. |
| motor_sense_hall_direction_t | direction | Rotation direction. |
| motor_sense_hall_direction_t | last_direction | Last rotation direction. |
| uint16_t | u2_carrier_count | Carrier count. |
| uint16_t | u2_hall_period[MOTOR_SENSE_HALL_SPEED_COUNTS] | Array of carrier count to calculate 2PI. |
| uint8_t | u1_period_counter | Counter for above array. |
| float | f_angle | Rotor angle [radian]. |
| float | f_angle_per_count | Angle per 1 count. |
| float | f_calculated_speed | Calculated speed [radian/second]. |
| uint8_t | u1_hall_signal_memory | Memorized hall signal at startup. |
| motor_sense_hall_signal_status_t | hall_signal_status | Hall signal status. |
| uint8_t | u1_hall_signal_count | Rotation counter. |
| float | f4_pseudo_speed_rad | Pseudo speed used for startup [radian/second]. |
| float | f4_add_pseudo_speed_rad | Step of pseudo speed to update [radian/second]. |
| uint16_t | u2_startup_carrier_count | Counter of carrier interrupt for startup. |
| motor_sense_hall_input_t | st_input | Input parameter structure. |
| uint8_t | u1_startup_flag | Flag for startup. |
| motor_angle_cfg_t const * | p_cfg | |

Enumeration Type Documentation

◆ **motor_sense_hall_direction_t**

| enum motor_sense_hall_direction_t | |
|-----------------------------------|---------------------------------------|
| Enumerator | |
| MOTOR_SENSE_HALL_DIRECTION_CW | Rotation direction clockwise. |
| MOTOR_SENSE_HALL_DIRECTION_CCW | Rotation direction counter clockwise. |

◆ **motor_sense_hall_signal_status_t**

| enum motor_sense_hall_signal_status_t | |
|---|---------------------------------------|
| Enumerator | |
| MOTOR_SENSE_HALL_SIGNAL_STATUS_INITIAL | Hall signal isn't captured. (Initial) |
| MOTOR_SENSE_HALL_SIGNAL_STATUS_CAPTURED | Hall signal is captured. |

Function Documentation◆ **RM_MOTOR_SENSE_HALL_Open()**

`fsp_err_t RM_MOTOR_SENSE_HALL_Open (motor_angle_ctrl_t *const p_ctrl, motor_angle_cfg_t const *const p_cfg)`

Opens and configures the angle hall sensor module. Implements `motor_angle_api_t::open`.

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | MTR_ANGL_EST successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |

◆ **RM_MOTOR_SENSE_HALL_Close()**

```
fsp_err_t RM_MOTOR_SENSE_HALL_Close ( motor_angle_ctrl_t *const p_ctrl)
```

Disables specified Angle Estimation module. Implements `motor_angle_api_t::close`.

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_HALL_Reset()**

```
fsp_err_t RM_MOTOR_SENSE_HALL_Reset ( motor_angle_ctrl_t *const p_ctrl)
```

Reset variables of Angle Estimation module. Implements `motor_angle_api_t::reset`.

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_HALL_CurrentSet()**

```
fsp_err_t RM_MOTOR_SENSE_HALL_CurrentSet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_current_t *const p_st_current, motor_angle_voltage_reference_t *const p_st_voltage
)
```

Set d/q-axis Current Data & Voltage Reference. Implements `motor_angle_api_t::currentSet`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

◆ **RM_MOTOR_SENSE_HALL_SpeedSet()**

```
fsp_err_t RM_MOTOR_SENSE_HALL_SpeedSet ( motor_angle_ctrl_t *const p_ctrl, float const speed_ctrl, float const damp_speed )
```

Set Speed Information. Implements `motor_angle_api_t::speedSet`.

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Data get successfully. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_HALL_FlagPiCtrlSet()**

```
fsp_err_t RM_MOTOR_SENSE_HALL_FlagPiCtrlSet ( motor_angle_ctrl_t *const p_ctrl, uint32_t const flag_pi )
```

Set the flag of PI Control runs. Implements `motor_angle_api_t::flagPiCtrlSet`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

◆ **RM_MOTOR_SENSE_HALL_AngleSpeedGet()**

```
fsp_err_t RM_MOTOR_SENSE_HALL_AngleSpeedGet ( motor_angle_ctrl_t *const p_ctrl, float *const p_angle, float *const p_speed, float *const p_phase_err )
```

Gets the current rotor's angle and rotation speed. Implements `motor_angle_api_t::angleSpeedGet`.

Return values

| | |
|--------------------------|----------------------------|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is invalid. |

◆ **RM_MOTOR_SENSE_HALL_EstimatedComponentGet()**

```
fsp_err_t RM_MOTOR_SENSE_HALL_EstimatedComponentGet ( motor_angle_ctrl_t *const p_ctrl,
float *const p_ed, float *const p_eq )
```

Gets estimated d/q-axis component. Implements `motor_angle_api_t::estimatedComponentGet`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

◆ **RM_MOTOR_SENSE_HALL_ParameterUpdate()**

```
fsp_err_t RM_MOTOR_SENSE_HALL_ParameterUpdate ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_cfg_t const *const p_cfg )
```

Update the parameters of Angle&Speed Estimation. Implements `motor_angle_api_t::parameterUpdate`.

Return values

| | |
|-------------------|------------------------------|
| FSP_SUCCESS | Successfully data is update. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_HALL_InternalCalculate()**

```
fsp_err_t RM_MOTOR_SENSE_HALL_InternalCalculate ( motor_angle_ctrl_t *const p_ctrl)
```

Calculate internal parameters. Implements `motor_angle_api_t::internalCalculate`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

◆ **RM_MOTOR_SENSE_HALL_AngleAdjust()**

```
fsp_err_t RM_MOTOR_SENSE_HALL_AngleAdjust ( motor_angle_ctrl_t *const p_ctrl)
```

Angle Adjustment Process. Implements `motor_angle_api_t::angleAdjust`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

◆ RM_MOTOR_SENSE_HALL_EncoderCyclic()

```
fsp_err_t RM_MOTOR_SENSE_HALL_EncoderCyclic ( motor_angle_ctrl_t *const p_ctrl)
```

Encoder Cyclic Process (Call in cyclic timer). Implements [motor_angle_api_t::encoderCyclic](#).

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

◆ RM_MOTOR_SENSE_HALL_InfoGet()

```
fsp_err_t RM_MOTOR_SENSE_HALL_InfoGet ( motor_angle_ctrl_t *const p_ctrl,  
motor_angle_encoder_info_t *const p_info )
```

Gets information of Encoder Angle Module. Implements [motor_angle_api_t::infoGet](#).

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

Usage Notes

Limitations

Developers should be aware of the following limitations when using the motor angle and speed calculation with induction sensor: all configurations should be set as positive values.

Examples

Basic Example

This is a basic example of minimal use of the motor angle and speed calculation with induction sensor in an application.

```
void motor_sense_encoder_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the module. */
    err = RM_MOTOR_SENSE_INDUCTION_Open(&g_mtr_angle0_ctrl, &g_mtr_angle_set0_cfg);
    assert(FSP_SUCCESS == err);

    /* Basically run this module at A/D conversion finish interrupt.
     * This implementation is an example. */
    // while (true)
    {
        /* Application work here. */
        /* Initialize motor */
    }
}
```

```

        (void) RM_MOTOR_SENSE_INDUCTION_AngleAdjust(&g_mtr_angle0_ctrl);
/* Perform cyclic process*/
        (void) RM_MOTOR_SENSE_INDUCTION_CyclicProcess(&g_mtr_angle0_ctrl);
/* Calculate information with induction sensor signal input */
        (void) RM_MOTOR_SENSE_INDUCTION_InternalCalculate(&g_mtr_angle0_ctrl);
/* Get angle/speed data */
        (void) RM_MOTOR_SENSE_INDUCTION_AngleSpeedGet(&g_mtr_angle0_ctrl,
&f_get_angle, &f_get_speed, &f_get_phase_err);
    }
/* Reset the module */
    (void) RM_MOTOR_SENSE_INDUCTION_Reset(&g_mtr_angle0_ctrl);
/* Close the module */
    (void) RM_MOTOR_SENSE_INDUCTION_Close(&g_mtr_angle0_ctrl);
}

```

Function Documentation◆ **RM_MOTOR_SENSE_INDUCTION_Open()**

| fsp_err_t RM_MOTOR_SENSE_INDUCTION_Open (motor_angle_ctrl_t *const p_ctrl, motor_angle_cfg_t const *const p_cfg) | |
|--|--|
| Opens and configures the Angle module. Implements motor_angle_api_t::open . | |
| Return values | |
| FSP_SUCCESS | Angle Induction module successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

◆ **RM_MOTOR_SENSE_INDUCTION_Close()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_Close ( motor_angle_ctrl_t *const p_ctrl)
```

Disables specified Angle module. Implements `motor_angle_api_t::close`.

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_INDUCTION_Reset()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_Reset ( motor_angle_ctrl_t *const p_ctrl)
```

Reset variables of Angle module. Implements `motor_angle_api_t::reset`.

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_INDUCTION_InternalCalculate()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_InternalCalculate ( motor_angle_ctrl_t *const p_ctrl)
```

Calculate internal parameters. Implements `motor_angle_api_t::internalCalculate`.

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_INDUCTION_AngleSpeedGet()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_AngleSpeedGet ( motor_angle_ctrl_t *const p_ctrl, float
*const p_angle, float *const p_speed, float *const p_phase_err )
```

Gets the current rotor's angle and rotation speed. Implements `motor_angle_api_t::angleSpeedGet`.

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Successfully data calculated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_INDUCTION_AngleAdjust()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_AngleAdjust ( motor_angle_ctrl_t *const p_ctrl)
```

Angle Adjustment Process. Implements `motor_angle_api_t::angleAdjust`.

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Successfully data calculated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_INDUCTION_EncoderCyclic()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_EncoderCyclic ( motor_angle_ctrl_t *const p_ctrl)
```

Encoder Cyclic Process (Call in cyclic timer). Implements `motor_angle_api_t::encoderCyclic`.

Return values

| | |
|---------------------|--|
| FSP_ERR_UNSUPPORTED | Motor sense induction software encoderCyclic is not supported. |
|---------------------|--|

◆ **RM_MOTOR_SENSE_INDUCTION_CyclicProcess()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_CyclicProcess ( motor_angle_ctrl_t *const p_ctrl)
```

Induction sensor Cyclic Process (Call in cyclic timer). Implements `motor_angle_api_t::cyclicProcess`.

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Successfully data calculated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_INDUCTION_InfoGet()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_InfoGet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_encoder_info_t *const p_info )
```

Gets information of Angle Module. Implements `motor_angle_api_t::infoGet`.

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Successfully data calculated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_INDUCTION_CorrectReset()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_CorrectReset ( motor_angle_ctrl_t *const p_ctrl)
```

Reset to restart calibration Angle module.

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_INDUCTION_ErrorGet()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_ErrorGet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_error_t *const p_error )
```

Gets the error information about induction correction.

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Successfully data calculated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_INDUCTION_ParameterUpdate()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_ParameterUpdate ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_cfg_t const *const p_cfg )
```

Update the parameters of angle & speed calculation. Implements [motor_angle_api_t::parameterUpdate](#).

Return values

| | |
|-------------------|------------------------------|
| FSP_SUCCESS | Successfully data is update. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_INDUCTION_SensorDataSet()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_SensorDataSet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_ad_data_t *const p_ad_data )
```

Set A/D Converted Data. Implements [motor_angle_api_t::sensorDataSet](#).

Return values

| | |
|-------------------|------------------------------|
| FSP_SUCCESS | Successfully data is update. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SENSE_INDUCTION_CurrentSet()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_CurrentSet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_current_t *const p_st_current, motor_angle_voltage_reference_t *const p_st_voltage
)
```

Set d/q-axis Current Data & Voltage Reference. Implements `motor_angle_api_t::currentSet`.

Return values

| | |
|---------------------|---|
| FSP_ERR_UNSUPPORTED | Motor sense induction software currentSet is not supported. |
|---------------------|---|

◆ **RM_MOTOR_SENSE_INDUCTION_SpeedSet()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_SpeedSet ( motor_angle_ctrl_t *const p_ctrl, float const
speed_ctrl, float const damp_speed )
```

Set Speed Information. Implements `motor_angle_api_t::speedSet`.

Return values

| | |
|---------------------|---|
| FSP_ERR_UNSUPPORTED | Motor sense induction software speedSet is not supported. |
|---------------------|---|

◆ **RM_MOTOR_SENSE_INDUCTION_FlagPiCtrlSet()**

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_FlagPiCtrlSet ( motor_angle_ctrl_t *const p_ctrl, uint32_t
const flag_pi )
```

Set the flag of PI Control runs. Implements `motor_angle_api_t::flagPiCtrlSet`.

Return values

| | |
|---------------------|--|
| FSP_ERR_UNSUPPORTED | Motor sense induction software flagPiCtrlSet is not supported. |
|---------------------|--|

◆ RM_MOTOR_SENSE_INDUCTION_EstimatedComponentGet()

```
fsp_err_t RM_MOTOR_SENSE_INDUCTION_EstimatedComponentGet ( motor_angle_ctrl_t *const
p_ctrl, float *const p_ed, float *const p_eq )
```

Gets estimated d/q-axis component. Implements [motor_angle_api_t::estimatedComponentGet](#).

Return values

| | |
|---------------------|--|
| FSP_ERR_UNSUPPORTED | Motor sense induction software estimatedComponentGet is not supported. |
|---------------------|--|

Update the parameters of Current Control. Implements [motor_current_api_t::parameterUpdate](#). [More...](#)

void [rm_motor_current_encoder_cyclic](#) (motor_current_instance_t const *p_ctrl)

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor current Interface](#).

Overview

The motor current is used to control the electric current of motor rotation in an application. This module should be called cyclically after the A/D conversion of electric current of each phase in an application. This module calculates each phase voltage with input current reference, electric current and rotor angle.

Features

The Motor Current Module has below features.

- Calculate each phase(U/V/W) voltage.
- Decoupling Control.
- Voltage Error Compensation.

Configuration

Build Time Configurations for rm_motor_current

The following build time configurations are defined in fsp_cfg/rm_motor_current_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > Motor Current Controller (rm_motor_current)

This module can be added to the Stacks tab via New Stack > Motor > Motor Current Controller (rm_motor_current).

| Configuration | Options | Default | Description |
|-----------------------------|--|------------------|--------------------------------|
| General | | | |
| Name | Name must be a valid C symbol | g_motor_current0 | Module name. |
| Sensor type | <ul style="list-style-type: none"> • Sensorless • Encoder • Induction • Hall | Sensorless | Select sensor type |
| Shunt type | <ul style="list-style-type: none"> • 1 shunt • 2 shunt • 3 shunt | 2 shunt | Select shunt type |
| Current control decimation | Must be a valid non-negative value. | 0 | Decimation of current control. |
| PWM carrier frequency (kHz) | Must be a valid value | 20.0F | PWM carrier frequency. |

| | | | |
|---|---|--------|---|
| Input voltage (V) | Must be a valid value | 24.0F | Input voltage for limitation of current PI control. |
| Sample delay compensation | <ul style="list-style-type: none"> • Disable • Enable | Enable | Select enable/disable sample delay compensation. |
| Period magnification value | Must be a valid non-negative value. | 1.5 | Period magnification value for sampling delay compensation. |
| Voltage error compensation | <ul style="list-style-type: none"> • Disable • Enable | Enable | Select enable/disable voltage error compensation. |
| Voltage error compensation table of voltage 1 | Must be a valid value | 0.672F | Voltage error compensation table of voltage. |
| Voltage error compensation table of voltage 2 | Must be a valid value | 0.945F | Voltage error compensation table of voltage. |
| Voltage error compensation table of voltage 3 | Must be a valid value | 1.054F | Voltage error compensation table of voltage. |
| Voltage error compensation table of voltage 4 | Must be a valid value | 1.109F | Voltage error compensation table of voltage. |
| Voltage error compensation table of voltage 5 | Must be a valid value | 1.192F | Voltage error compensation table of voltage. |
| Voltage error compensation table of current 1 | Must be a valid value | 0.013F | Voltage error compensation table of current. |
| Voltage error compensation table of current 2 | Must be a valid value | 0.049F | Voltage error compensation table of current. |
| Voltage error compensation table of current 3 | Must be a valid value | 0.080F | Voltage error compensation table of current. |
| Voltage error compensation table of current 4 | Must be a valid value | 0.184F | Voltage error compensation table of current. |
| Voltage error compensation table of current 5 | Must be a valid value | 0.751F | Voltage error compensation table of current. |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | NULL | A user callback function. If this callback |

function is provided, it is called at A/D conversion finish interrupt.

Design Parameter

| | | | |
|---|-------------------------------------|------------|-------------------------|
| Current PI loop omega (Hz) | Must be a valid value | 300.0F | Current PI loop omega |
| Current PI loop zeta | Must be a valid value | 1.0F | Current PI loop zeta |
| Motor Parameter | | | |
| Pole pairs | Must be a valid non-negative value. | 2 | Pole pairs |
| Resistance (ohm) | Must be a valid value | 8.5F | Resistance |
| Inductance of d-axis (H) | Must be a valid value | 0.0045F | Inductance of d-axis |
| Inductance of q-axis (H) | Must be a valid value | 0.0045F | Inductance of q-axis |
| Permanent magnetic flux (Wb) | Must be a valid value | 0.02159F | Permanent magnetic flux |
| Motor Parameter > Rotor inertia (kgm ²) | Must be a valid value | 0.0000028F | Rotor inertia |

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

- Set the Period of Current Control with none-negative value.
- Set the Reference Voltage with none-negative value.

Examples

Basic Example

This is a basic example of minimal use of the Motor Current in an application.

```
void motor_current_basic_example (void)
{
    motor_current_input_current_t temp_input_current;
```

```
motor_current_input_voltage_t temp_input_voltage;
motor_current_get_voltage_t   temp_get_voltage;
fsp_err_t err = FSP_SUCCESS;

/* Initializes the module. */
err = RM_MOTOR_CURRENT_Open(g_test_motor_current.p_ctrl,
g_test_motor_current.p_cfg);
assert(FSP_SUCCESS == err);

/* Basically run this module at A/D conversion finish interrupt.
 * This implementation is an example. */
// while (true)
{
/* Application work here. */
/* Set current reference before get phase voltage */
(void) RM_MOTOR_CURRENT_CurrentReferenceSet(g_test_motor_current.p_ctrl, 1.0F,
1.0F);
/* Set speed and phase data before get phase voltage */
(void) RM_MOTOR_CURRENT_SpeedPhaseSet(g_test_motor_current.p_ctrl, 104.72F,
1.0F);

temp_input_current.iu   = 1.0F;
temp_input_current.iv   = 1.0F;
temp_input_current.iw   = 1.0F;
temp_input_voltage.vdc  = 24.0F;
temp_input_voltage.va_max = 24.0F;

/* Set electric current and voltage before get phase voltage */
(void) RM_MOTOR_CURRENT_CurrentSet(g_test_motor_current.p_ctrl,
temp_input_current, temp_input_voltage);

/* Activate the process. */
(void) RM_MOTOR_CURRENT_Run(g_test_motor_current.p_ctrl);

/* Get d/q-axis current*/
(void) RM_MOTOR_CURRENT_CurrentGet(g_test_motor_current.p_ctrl, &f_get_id,
&f_get_iq);

/* Get the flag of PI control */
(void) RM_MOTOR_CURRENT_PhaseVolageGet(g_test_motor_current.p_ctrl,
&temp_get_voltage);
```

```

/* Get Output Parameter */
    (void) RM_MOTOR_CURRENT_ParameterGet(g_test_motor_current.p_ctrl,
&test_output);

    (void) RM_MOTOR_CURRENT_ParameterUpdate(g_test_motor_current.p_ctrl,
g_test_motor_current.p_cfg);
}

/* Reset the process. */
(void) RM_MOTOR_CURRENT_Reset(g_test_motor_current.p_ctrl);

/* Close the module. */
(void) RM_MOTOR_CURRENT_Close(g_test_motor_current.p_ctrl);
}

```

Enumerations

```
enum motor_current_shunt_type_t
```

Enumeration Type Documentation

◆ motor_current_shunt_type_t

| enum motor_current_shunt_type_t | |
|----------------------------------|----------------------------|
| Selection of shunt type | |
| Enumerator | |
| MOTOR_CURRENT_SHUNT_TYPE_1_SHUNT | Only use U phase current. |
| MOTOR_CURRENT_SHUNT_TYPE_2_SHUNT | Use U and W phase current. |
| MOTOR_CURRENT_SHUNT_TYPE_3_SHUNT | Use all phase current. |

Function Documentation

◆ **RM_MOTOR_CURRENT_Open()**

```
fsp_err_t RM_MOTOR_CURRENT_Open ( motor_current_ctrl_t *const p_ctrl, motor_current_cfg_t
const *const p_cfg )
```

Opens and configures the Motor Current Module. Implements `motor_current_api_t::open`.

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Motor Current successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

◆ **RM_MOTOR_CURRENT_Close()**

```
fsp_err_t RM_MOTOR_CURRENT_Close ( motor_current_ctrl_t *const p_ctrl)
```

Disables specified Motor Current Module. Implements `motor_current_api_t::close`.

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_CURRENT_Reset()**

```
fsp_err_t RM_MOTOR_CURRENT_Reset ( motor_current_ctrl_t *const p_ctrl)
```

Reset variables of Motor Current Module. Implements `motor_current_api_t::reset`.

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_CURRENT_Run()**

```
fsp_err_t RM_MOTOR_CURRENT_Run ( motor_current_ctrl_t *const p_ctrl)
```

Run(Start) the Current Control. Implements `motor_current_api_t::run`.

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully run. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_CURRENT_ParameterSet()**

```
fsp_err_t RM_MOTOR_CURRENT_ParameterSet ( motor_current_ctrl_t *const p_ctrl,
motor_current_input_t const *const p_st_input )
```

Set (Input) Parameter Data. Implements `motor_current_api_t::parameterSet`.

Return values

| | |
|--------------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input argument error. |

◆ **RM_MOTOR_CURRENT_CurrentReferenceSet()**

```
fsp_err_t RM_MOTOR_CURRENT_CurrentReferenceSet ( motor_current_ctrl_t *const p_ctrl, float
const id_reference, float const iq_reference )
```

Set Current Reference Data. Implements `motor_current_api_t::currentReferenceSet`.

Return values

| | |
|-------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_CURRENT_SpeedPhaseSet()**

```
fsp_err_t RM_MOTOR_CURRENT_SpeedPhaseSet ( motor_current_ctrl_t *const p_ctrl, float const speed, float const phase )
```

Set Current Speed & rotor phase Data. Implements `motor_current_api_t::speedPhaseSet`.

Return values

| | |
|-------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_CURRENT_CurrentSet()**

```
fsp_err_t RM_MOTOR_CURRENT_CurrentSet ( motor_current_ctrl_t *const p_ctrl, motor_current_input_current_t const *const p_st_current, motor_current_input_voltage_t const *const p_st_voltage )
```

Set d/q-axis Current & Voltage Data. Implements `motor_current_api_t::currentSet`.

Return values

| | |
|--------------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ **RM_MOTOR_CURRENT_ParameterGet()**

```
fsp_err_t RM_MOTOR_CURRENT_ParameterGet ( motor_current_ctrl_t *const p_ctrl, motor_current_output_t *const p_st_output )
```

Get Output Parameters. Implements `motor_current_api_t::parameterGet`.

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ **RM_MOTOR_CURRENT_CurrentGet()**

```
fsp_err_t RM_MOTOR_CURRENT_CurrentGet ( motor_current_ctrl_t *const p_ctrl, float *const p_id, float *const p_iq )
```

Get d/q-axis Current. Implements `motor_current_api_t::currentGet`.

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successful data get. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ **RM_MOTOR_CURRENT_PhaseVoltageGet()**

```
fsp_err_t RM_MOTOR_CURRENT_PhaseVoltageGet ( motor_current_ctrl_t *const p_ctrl, motor_current_get_voltage_t *const p_voltage )
```

Gets the set phase voltage. Implements `motor_current_api_t::phaseVoltageGet`.

Return values

| | |
|--------------------------|------------------------------|
| FSP_SUCCESS | Successful data calculation. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ **RM_MOTOR_CURRENT_ParameterUpdate()**

```
fsp_err_t RM_MOTOR_CURRENT_ParameterUpdate ( motor_current_ctrl_t *const p_ctrl, motor_current_cfg_t const *const p_cfg )
```

Update the parameters of Current Control. Implements `motor_current_api_t::parameterUpdate`.

Return values

| | |
|-------------------|--------------------------------|
| FSP_SUCCESS | Successfully data was updated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **rm_motor_current_encoder_cyclic()**

```
void rm_motor_current_encoder_cyclic ( motor_current_instance_t const * p_ctrl)
```

```
(end addtogroup MOTOR_CURRENT)

Stop(Cancel) return origin function. [More...](#)

Detailed Description

Control a SPM motor on RA MCUs. This module implements the [Motor Encoder Vector Control \(rm_motor_encoder\)](#).

Overview

The motor encoder vector control is used to control motor rotation in an application. This module is meant to be used with Surface Permanent Magnet (SPM) motors and allows applications to start or stop motor rotation easily.

Features

The motor encoder module has below features.

- Start/stop motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

Target Hardware

The below figure shows an example of target hardware of this Motor Encoder Module.

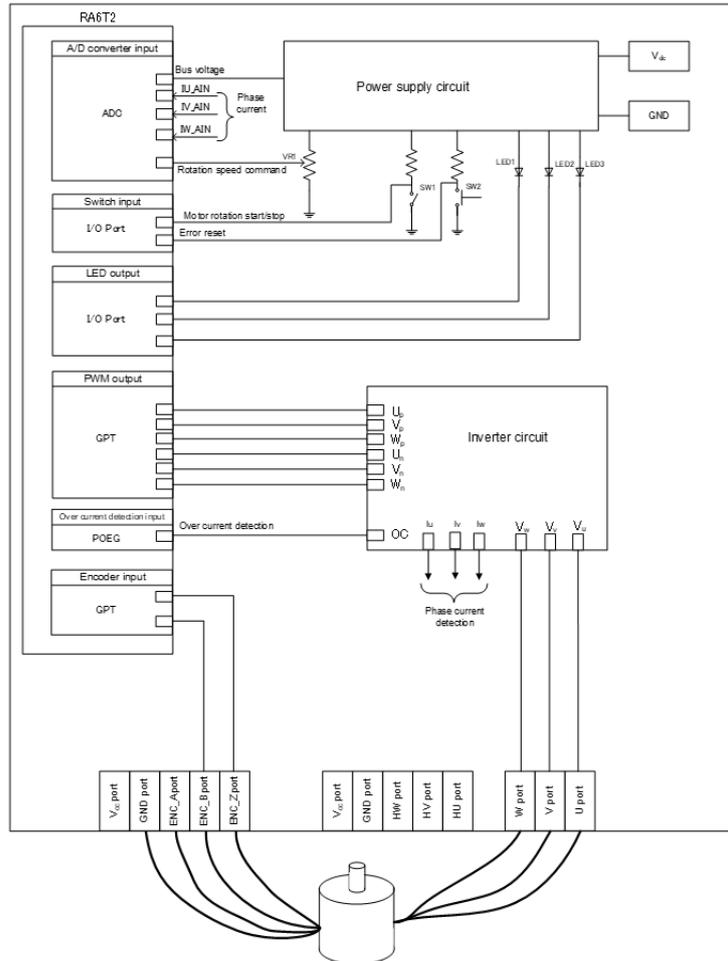

Figure 240: Example of target hardware of motor encoder module

Block Diagram

The below figure shows block diagram of encoder vector motor control.

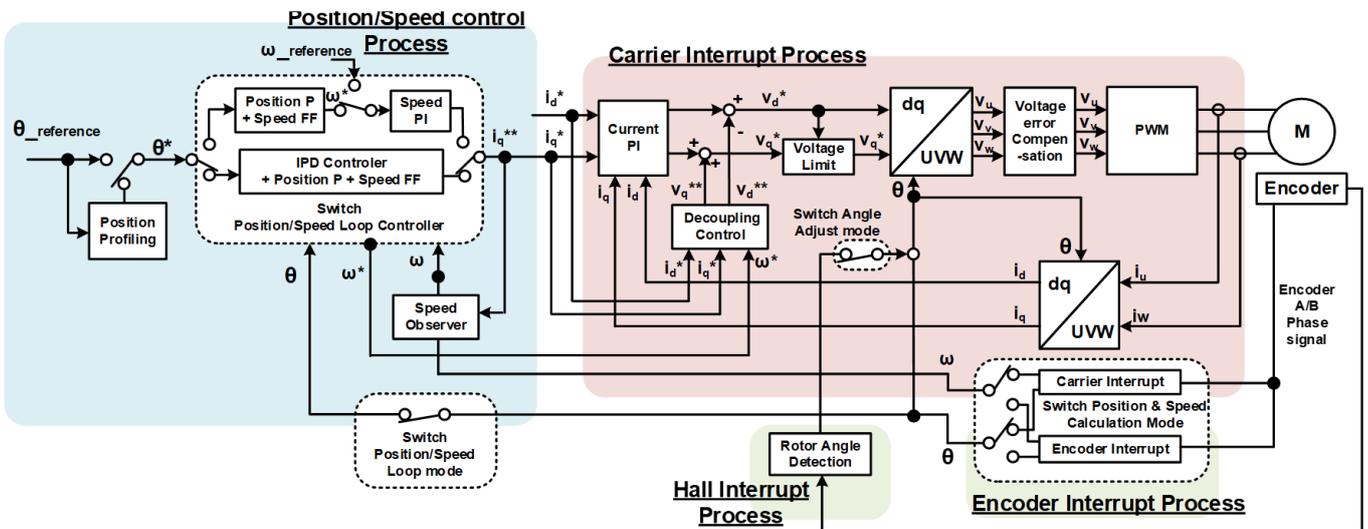

Figure 241: Block diagram of encoder vector control (PI feedback loop)

Modulation

- Sine wave modulation The modulation factor "m" is defined as follows.

$$m = \frac{V}{E}$$

m: Modulation ratio V: Reference voltage E: Inverter input voltage

Figure 242: Modulation factor

- Space vector modulation In vector control of a permanent magnet synchronous motor, generally, the desired voltage command value of each phase is generated sinusoidally. However, if the generated value is used as-is for the modulation wave for PWM generation, voltage utilization as applied to the motor (in terms of line voltage) is limited to a maximum of 86.7 percents with respect to inverter bus voltage. As such, as shown in the following expression, the average of the maximum and minimum values is calculated for the voltage command value of each phase, and the value obtained by subtracting the average from the voltage command value of each phase is used as the modulation wave. As a result, the maximum amplitude of the modulation wave is multiplied by (square root 3)/2, while voltage utilization becomes 100 percents and line voltage is unchanged.

$$\begin{pmatrix} V'_u \\ V'_v \\ V'_w \end{pmatrix} = \begin{pmatrix} V_u \\ V_v \\ V_w \end{pmatrix} + \Delta V \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$$

$$\therefore \Delta V = -\frac{V_{max} + V_{min}}{2}, \quad V_{max} = \max\{V_u, V_v, V_w\}, \quad V_{min} = \min\{V_u, V_v, V_w\}$$

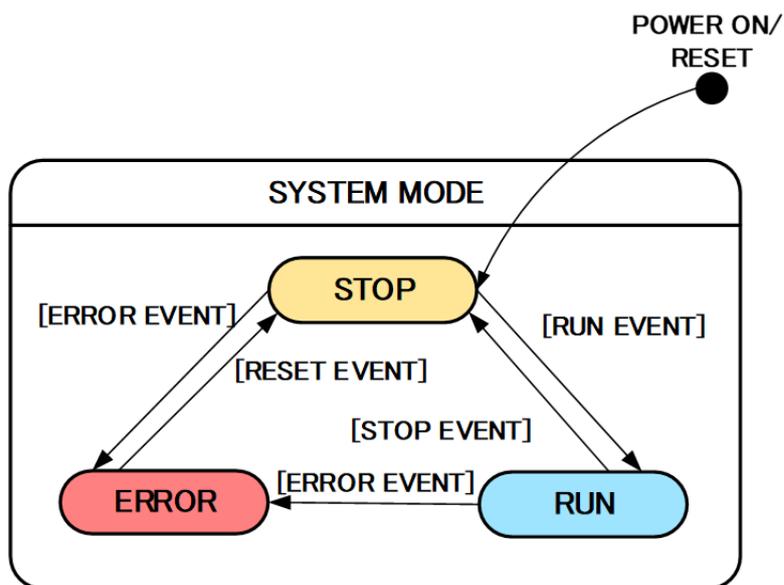

V_u, V_v, V_w : Command values of U-, V-, and W-phases

V'_u, V'_v, V'_w : Command values of U-, V-, and W-phases for PWM generation (modulation wave)

Figure 243: Space vector modulation

State transition

The below figure shows a state transition diagram. Internal state is managed by "SYSTEM MODE".

| | | MODE | | |
|-------|-------|-------|-------|-------|
| | | STOP | RUN | ERROR |
| EVENT | STOP | STOP | STOP | ERROR |
| | RUN | RUN | RUN | ERROR |
| | ERROR | ERROR | ERROR | ERROR |
| | RESET | STOP | RUN | STOP |

Figure 244: State transition diagram

(1) SYSTEM MODE "SYSTEM MODE" indicates the operating states of the system. The state transits on occurrence of each event (EVENT). "SYSTEM MODE" has 3 states that are motor drive stop (INACTIVE), motor drive (ACTIVE), and abnormal condition (ERROR).

(2) EVENT When "EVENT" occurs in each "SYSTEM MODE", "SYSTEM MODE" changes as shown the table in above figure, according to that "EVENT". The occurrence factors of each event are shown below.

| EVENT name | Occurrence factor |
|------------|----------------------------------|
| STOP | by user operation |
| RUN | by user operation |
| ERROR | when the system detects an error |
| RESET | by user operation |

Flowchart

The below figures show flowcharts of motor encoder module.

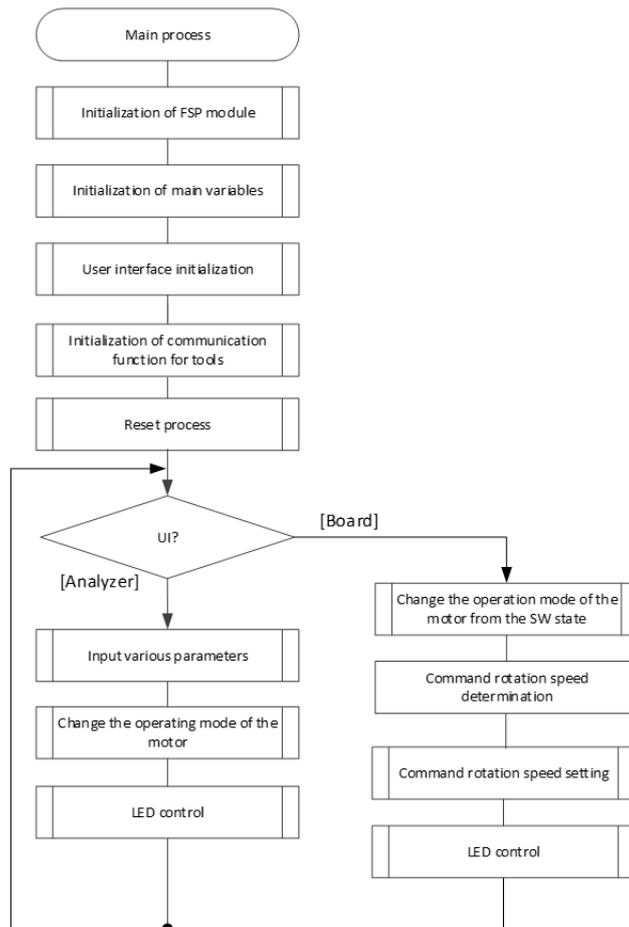

Figure 245: Main process

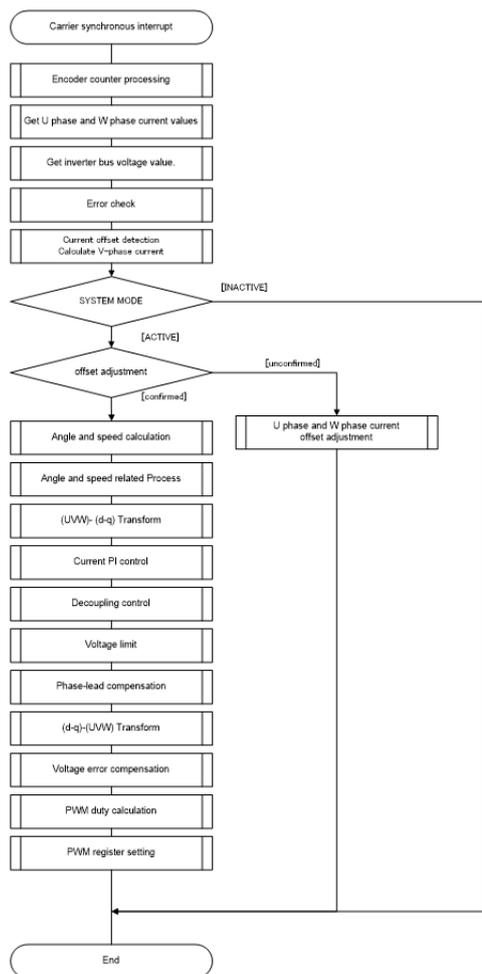

Figure 246: Current control process

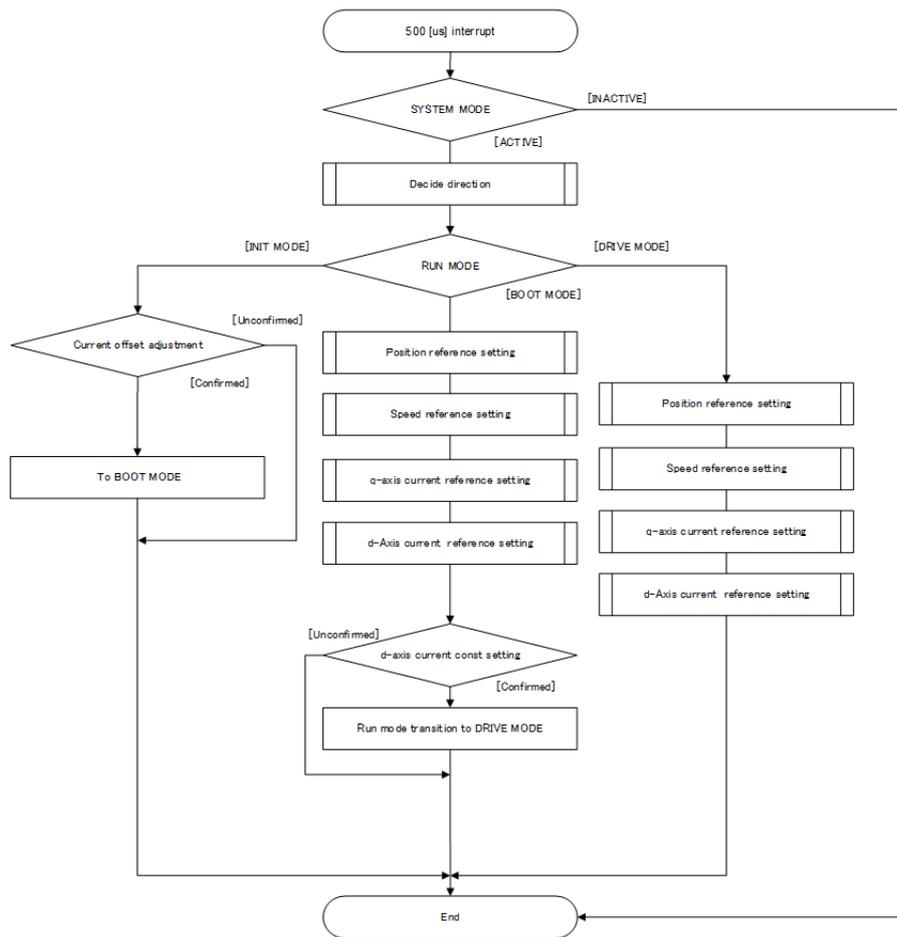

Figure 247: Speed control process

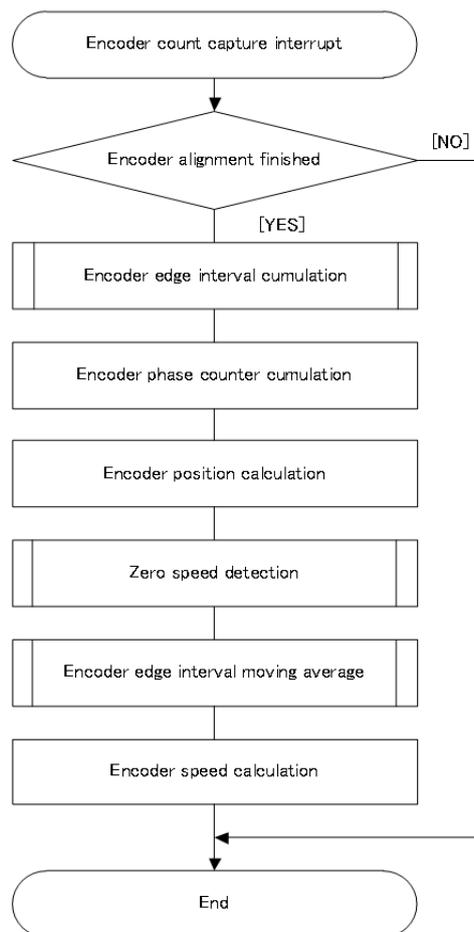

Figure 248: Encoder interrupt process

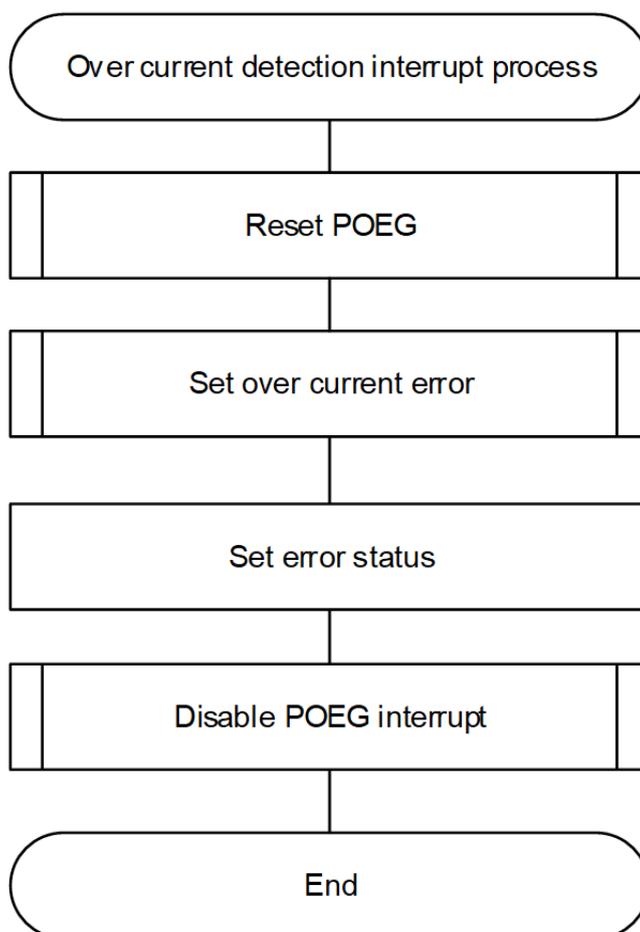

Figure 249: Over current detection interrupt process

Configuration

Build Time Configurations for rm_motor_encoder

The following build time configurations are defined in fsp_cfg/rm_motor_encoder_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> Default (BSP) Enabled Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > Motor Encoder Vector Control (rm_motor_encoder)

This module can be added to the Stacks tab via New Stack > Motor > Motor Encoder Vector Control (rm_motor_encoder).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

General

| | | | |
|---------------------------|-------------------------------|------------------|--|
| Name | Name must be a valid C symbol | g_motor_encoder0 | Module name. |
| Limit of over current (A) | Must be a valid value | 2.0F | Limit of over current.(Detection threshold) |
| Limit of over voltage (V) | Must be a valid value | 28.0F | Limit of over voltage.(Detection threshold) |
| Limit of over speed (rpm) | Must be a valid value | 2100.0F | Limit of over speed.(Detection threshold) |
| Limit of low voltage (V) | Must be a valid value | 18.0F | Limit of low voltage.(Detection threshold) |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | NULL | A user callback function. If this callback function is provided, it is called at speed control cyclic interrupt. |

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

Pin Configuration

This module does not use I/O pins. Please set used pins on configuration of each hardware modules.

Usage Notes

Limitations

Examples

Basic Example

This is a basic example of minimal use of the motor encoder module in an application.

```
void motor_encoder_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the module. */
    err = RM_MOTOR_ENCODER_Open(g_motor_encoder0.p_ctrl, g_motor_encoder0.p_cfg);
    handle_error(err);
}
```

```
/* Set speed reference before motor run */
    (void) RM_MOTOR_ENCODER_SpeedSet(g_motor_encoder0.p_ctrl,
RM_MOTOR_ENCODER_TEST_OVER_SPEED_LIMIT);
/* Set position reference before motor run */
    (void) RM_MOTOR_ENCODER_PositionSet(g_motor_encoder0.p_ctrl, &g_posref_sample1);
/* Start motor rotation */
    (void) RM_MOTOR_ENCODER_Run(g_motor_encoder0.p_ctrl);
/* Get current status */
    (void) RM_MOTOR_ENCODER_StatusGet(g_motor_encoder0.p_ctrl, &smpl_status);
/* Get current rotor angle */
    (void) RM_MOTOR_ENCODER_AngleGet(g_motor_encoder0.p_ctrl, &smpl_angle);
/* Get current motor speed */
    (void) RM_MOTOR_ENCODER_SpeedGet(g_motor_encoder0.p_ctrl, &smpl_speed);
/* Check error */
    (void) RM_MOTOR_ENCODER_ErrorCheck(g_motor_encoder0.p_ctrl, &smpl_error);
/* Stop motor rotation */
    (void) RM_MOTOR_ENCODER_Stop(g_motor_encoder0.p_ctrl);
/* Stop motor rotation */
    (void) RM_MOTOR_ENCODER_ErrorSet(g_motor_encoder0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
/* Reset Speed Control */
    (void) RM_MOTOR_ENCODER_Reset(g_motor_encoder0.p_ctrl);
/* Close Speed Control */
    (void) RM_MOTOR_ENCODER_Close(g_motor_encoder0.p_ctrl);
}
```

Enumerations

enum [motor_encoder_ctrl_t](#)

enum [motor_encoder_ctrl_event_t](#)

Enumeration Type Documentation

◆ **motor_encoder_ctrl_t**

| enum motor_encoder_ctrl_t | |
|---------------------------|-------------|
| Enumerator | |
| MOTOR_ENCODER_CTRL_STOP | Stop mode. |
| MOTOR_ENCODER_CTRL_RUN | Run mode. |
| MOTOR_ENCODER_CTRL_ERROR | Error mode. |

◆ **motor_encoder_ctrl_event_t**

| enum motor_encoder_ctrl_event_t | |
|---------------------------------|--------------|
| Enumerator | |
| MOTOR_ENCODER_CTRL_EVENT_STOP | Stop event. |
| MOTOR_ENCODER_CTRL_EVENT_RUN | Run event. |
| MOTOR_ENCODER_CTRL_EVENT_ERROR | Error event. |
| MOTOR_ENCODER_CTRL_EVENT_RESET | Reset event. |

Function Documentation

◆ **RM_MOTOR_ENCODER_Open()**

```
fsp_err_t RM_MOTOR_ENCODER_Open ( motor_ctrl_t *const p_ctrl, motor_cfg_t const *const p_cfg )
```

Configure the MOTOR in register start mode. Implements `motor_api_t::open`.

This function should only be called once as MOTOR configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
err = RM_MOTOR_ENCODER_Open(g_motor_encoder0.p_ctrl, g_motor_encoder0.p_cfg);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | MOTOR successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

Note

◆ **RM_MOTOR_ENCODER_Close()**

```
fsp_err_t RM_MOTOR_ENCODER_Close ( motor_ctrl_t *const p_ctrl)
```

Disables specified Motor Encoder Control block. Implements `motor_api_t::close`.

Example:

```
/* Close Speed Control */
(void) RM_MOTOR_ENCODER_Close(g_motor_encoder0.p_ctrl);
```

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ RM_MOTOR_ENCODER_Reset()

```
fsp_err_t RM_MOTOR_ENCODER_Reset ( motor_ctrl_t *const p_ctrl)
```

Reset Motor Encoder Control block. Implements [motor_api_t::reset](#).

Example:

```
/* Reset Speed Control */
(void) RM_MOTOR_ENCODER_Reset(g_motor_encoder0.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ RM_MOTOR_ENCODER_Run()

```
fsp_err_t RM_MOTOR_ENCODER_Run ( motor_ctrl_t *const p_ctrl)
```

Run Motor (Start motor rotation). Implements [motor_api_t::run](#).

Example:

```
/* Start motor rotation */
(void) RM_MOTOR_ENCODER_Run(g_motor_encoder0.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ RM_MOTOR_ENCODER_Stop()

```
fsp_err_t RM_MOTOR_ENCODER_Stop ( motor_ctrl_t *const p_ctrl)
```

Stop Motor (Stop motor rotation). Implements `motor_api_t::stop`.

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_ENCODER_Stop(g_motor_encoder0.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ RM_MOTOR_ENCODER_ErrorSet()

```
fsp_err_t RM_MOTOR_ENCODER_ErrorSet ( motor_ctrl_t *const p_ctrl, motor_error_t const error )
```

Set error information. Implements `motor_api_t::errorSet`.

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_ENCODER_ErrorSet(g_motor_encoder0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_ENCODER_SpeedSet()**

```
fsp_err_t RM_MOTOR_ENCODER_SpeedSet ( motor_ctrl_t *const p_ctrl, float const speed_rpm )
```

Set speed reference[rpm]. Implements `motor_api_t::speedSet`.

Example:

```
/* Set speed reference before motor run */
(void) RM_MOTOR_ENCODER_SpeedSet(g_motor_encoder0.p_ctrl,
RM_MOTOR_ENCODER_TEST_OVER_SPEED_LIMIT);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_ENCODER_PositionSet()**

```
fsp_err_t RM_MOTOR_ENCODER_PositionSet ( motor_ctrl_t *const p_ctrl,
motor_speed_position_data_t const *const p_position )
```

Set position reference[degree]. Implements `motor_api_t::positionSet`.

Example:

```
/* Set position reference before motor run */
(void) RM_MOTOR_ENCODER_PositionSet(g_motor_encoder0.p_ctrl, &g_posref_sample1);
```

Return values

| | |
|--------------------------|-------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data set pointer is invalid.. |

Note

◆ **RM_MOTOR_ENCODER_StatusGet()**

```
fsp_err_t RM_MOTOR_ENCODER_StatusGet ( motor_ctrl_t *const p_ctrl, uint8_t *const p_status )
```

Get current control status. Implements `motor_api_t::statusGet`.

Example:

```
/* Get current status */
(void) RM_MOTOR_ENCODER_StatusGet(g_motor_encoder0.p_ctrl, &smpl_status);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_ENCODER_AngleGet()**

```
fsp_err_t RM_MOTOR_ENCODER_AngleGet ( motor_ctrl_t *const p_ctrl, float *const p_angle_rad )
```

Get current rotor angle. Implements `motor_api_t::angleGet`.

Example:

```
/* Get current rotor angle */
(void) RM_MOTOR_ENCODER_AngleGet(g_motor_encoder0.p_ctrl, &smpl_angle);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_ENCODER_SpeedGet()**

```
fsp_err_t RM_MOTOR_ENCODER_SpeedGet ( motor_ctrl_t *const p_ctrl, float *const p_speed_rpm )
```

Get rotational speed. Implements `motor_api_t::speedGet`.

Example:

```
/* Get current motor speed */
(void) RM_MOTOR_ENCODER_SpeedGet(g_motor_encoder0.p_ctrl, &smpl_speed);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_ENCODER_ErrorCheck()**

```
fsp_err_t RM_MOTOR_ENCODER_ErrorCheck ( motor_ctrl_t *const p_ctrl, uint16_t *const p_error )
```

Check the occurrence of Error. Implements `motor_api_t::errorCheck`.

Example:

```
/* Check error */
(void) RM_MOTOR_ENCODER_ErrorCheck(g_motor_encoder0.p_ctrl, &smpl_error);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_ENCODER_WaitStopFlagGet()**

```
fsp_err_t RM_MOTOR_ENCODER_WaitStopFlagGet ( motor_ctrl_t *const p_ctrl,
motor_wait_stop_flag_t *const p_flag )
```

Get wait stop flag. Implements `motor_api_t::waitStopFlagGet`.

Example:

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

Note

◆ **RM_MOTOR_ENCODER_FunctionSelect()**

```
fsp_err_t RM_MOTOR_ENCODER_FunctionSelect ( motor_ctrl_t *const p_ctrl,
motor_function_select_t const function )
```

Select using function. Implements `motor_api_t::functionSelect`.

Return values

| | |
|----------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatched |

Note

◆ **RM_MOTOR_ENCODER_InertiaEstimateStart()**

```
fsp_err_t RM_MOTOR_ENCODER_InertiaEstimateStart ( motor_ctrl_t *const p_ctrl)
```

Start inertia estimation function.

Return values

| | |
|----------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatched |

Note

◆ **RM_MOTOR_ENCODER_InertiaEstimateStop()**

```
fsp_err_t RM_MOTOR_ENCODER_InertiaEstimateStop ( motor_ctrl_t *const p_ctrl)
```

Stop(Cancel) inertia estimation function.

Return values

| | |
|----------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatched |

Note

◆ **RM_MOTOR_ENCODER_ReturnOriginStart()**

```
fsp_err_t RM_MOTOR_ENCODER_ReturnOriginStart ( motor_ctrl_t *const p_ctrl)
```

Start return origin function.

Return values

| | |
|----------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatched |

Note

◆ RM_MOTOR_ENCODER_ReturnOriginStop()

`fsp_err_t RM_MOTOR_ENCODER_ReturnOriginStop (motor_ctrl_t *const p_ctrl)`

Stop(Cancel) return origin function.

Return values

| | |
|----------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatch |

Detailed Description

Measurement and calculation process for the motor control on RA MCUs. This module implements the [Motor Inertia Estimate Interface](#).

Overview

The motor inertia estimation module is used to measure and calculate rotor inertia in an application.

This module should be used with Renesas Motor Workbench (RMW) basically.

Features

The Motor Inertia Estimation Module has below features.

- Measurement process work automatically
- Calculate rotor inertia [kgm^2].

Configuration

Build Time Configurations for rm_motor_inertia_estimate

The following build time configurations are defined in fsp_cfg/rm_motor_inertia_estimate_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > Motor inertia estimation (rm_motor_inertia_estimate)

This module can be added to the Stacks tab via New Stack > Motor > Motor inertia estimation (rm_motor_inertia_estimate).

| Configuration | Options | Default | Description |
|---|--|---------------------------|---|
| General | | | |
| Name | Name must be a valid C symbol | g_motor_inertia_estimate0 | Module name. |
| Moved position distance to measure (degree) | Must be set -360 to -10 or 10 to 360. | 360 | Moved position distance to measure inertia (degree) |
| Maximum speed (rpm) | Must be set over 60. | 500 | Maximum rotation speed (rpm) |
| Acceleration time | Must be a valid non-negative value. | 0.3 | Acceleration time |
| Motor inertia | Manual Entry | 0.0000041 | Motor inertia |
| Low threshold to judge speed | Must be set 0.1 to 0.5 | 0.1 | Low threshold to judge speed reached |
| High threshold to judge speed | Must be set 0.5 to 0.9, and greater than low threshold | 0.9 | High threshold to judge speed reached |
| Time to wait moving stability (sec) | Must be a valid non-negative value. | 0.8 | Time to wait moving stability |
| Cyclic period of current control (sec) | Must be a valid non-negative value. | 0.00005 | Cyclic period of current control (sec) |

| | | | |
|--------------------------------------|-------------------------------------|---------|--|
| Cyclic period of speed control (sec) | Must be a valid non-negative value. | 0.0005 | Cyclic period of speed control (sec) |
| Motor pole pairs | Must be a valid non-negative value. | 4 | Motor pole pairs |
| Motor magnet flux (Wb) | Must be a valid non-negative value. | 0.00623 | Motor magnet flux (Wb) |
| Interval time | Must be a valid non-negative value. | 400.0 | Interval time. Please set same value as Position control |

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

Examples

Basic Example

This is a basic example of minimal use of the Motor Inertia Estimation in an application.

```
void motor_inertia_estimate_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = RM_MOTOR_INERTIA_ESTIMATE_Open(&g_mtr_inertia_estimate0_ctrl,
    &g_mtr_inertia_estimate0_cfg);
    assert(FSP_SUCCESS == err);
    /* Start process. */
    err = RM_MOTOR_INERTIA_ESTIMATE_Start(&g_mtr_inertia_estimate0_ctrl);
    temp_set_data.f_iq = 1.0F;
    temp_set_data.f_speed_radian_control = 1.04F;
    temp_set_data.s2_position_degree = 180;
    temp_set_data.ul_position_state = 0;
    /* Set data to the module. */
    err = RM_MOTOR_INERTIA_ESTIMATE_DataSet(&g_mtr_inertia_estimate0_ctrl,
```

```

&temp_set_data);

/* Get information from the module. */
err = RM_MOTOR_INERTIA_ESTIMATE_InfoGet(&g_mtr_inertia_estimate0_ctrl,
&temp_information);

/* Stop process. */
err = RM_MOTOR_INERTIA_ESTIMATE_Stop(&g_mtr_inertia_estimate0_ctrl);

/* Close the module. */
err = RM_MOTOR_INERTIA_ESTIMATE_Close(&g_mtr_inertia_estimate0_ctrl);
}

```

Function Documentation

◆ RM_MOTOR_INERTIA_ESTIMATE_Open()

```
fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_Open ( motor_inertia_estimate_ctrl_t *const p_ctrl,
motor_inertia_estimate_cfg_t const *const p_cfg )
```

Opens and configures the motor inertia estimate module. Implements `motor_inertia_estimate_api_t::open`.

Example:

```
/* Initializes the module. */
err = RM_MOTOR_INERTIA_ESTIMATE_Open(&g_mtr_inertia_estimate0_ctrl,
&g_mtr_inertia_estimate0_cfg);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Motor inertia estimate module successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ RM_MOTOR_INERTIA_ESTIMATE_Close()

`fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_Close (motor_inertia_estimate_ctrl_t *const p_ctrl)`

Disables specified motor inertia estimate module. Implements `motor_inertia_estimate_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MOTOR_INERTIA_ESTIMATE_Close(&g_mtr_inertia_estimate0_ctrl);
```

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_MOTOR_INERTIA_ESTIMATE_Start()

`fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_Start (motor_inertia_estimate_ctrl_t *const p_ctrl)`

Start inertia estimation. Implements `motor_inertia_estimate_api_t::start`.

Example:

```
/* Start process. */
err = RM_MOTOR_INERTIA_ESTIMATE_Start(&g_mtr_inertia_estimate0_ctrl);
```

Return values

| | |
|-------------------|-----------------------|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_INERTIA_ESTIMATE_Stop()**

```
fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_Stop ( motor_inertia_estimate_ctrl_t *const p_ctrl)
```

Stop (Cancel) inertia estimation. Implements `motor_inertia_estimate_api_t::stop`.

Example:

```
/* Stop process. */
err = RM_MOTOR_INERTIA_ESTIMATE_Stop(&g_mtr_inertia_estimate0_ctrl);
```

Return values

| | |
|-------------------|----------------------------------|
| FSP_SUCCESS | Successfully stopped (canceled). |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_INERTIA_ESTIMATE_Reset()**

```
fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_Reset ( motor_inertia_estimate_ctrl_t *const p_ctrl)
```

Reset variables of inertia estimate module. Implements `motor_inertia_estimate_api_t::reset`.

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_INERTIA_ESTIMATE_InfoGet()**

```
fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_InfoGet ( motor_inertia_estimate_ctrl_t *const p_ctrl,
motor_inertia_estimate_info_t *const p_info )
```

Get information of inertia estimation. Implements `motor_inertia_estimate_api_t::infoGet`.

Example:

```
/* Get information from the module. */
err = RM_MOTOR_INERTIA_ESTIMATE_InfoGet(&g_mtr_inertia_estimate0_ctrl,
&temp_information);
```

Return values

| | |
|--------------------------|------------------------------|
| FSP_SUCCESS | Successfully get data. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Argument pointer is invalid. |

◆ **RM_MOTOR_INERTIA_ESTIMATE_DataSet()**

```
fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_DataSet ( motor_inertia_estimate_ctrl_t *const p_ctrl,
motor_inertia_estimate_set_data_t *const p_set_data )
```

Set necessary data to inertia estimation. Implements `motor_inertia_estimate_api_t::dataSet`.

Example:

```
/* Set data to the module. */
err = RM_MOTOR_INERTIA_ESTIMATE_DataSet(&g_mtr_inertia_estimate0_ctrl,
&temp_set_data);
```

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successfully set data. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ **RM_MOTOR_INERTIA_ESTIMATE_SpeedCyclic()**

`fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_SpeedCyclic (motor_inertia_estimate_ctrl_t *const p_ctrl)`

Cyclic process of inertia estimation at speed control period. Implements `motor_inertia_estimate_api_t::speedCyclic`.

Return values

| | |
|-------------------|-----------------------------------|
| FSP_SUCCESS | Successfully perform the process. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_INERTIA_ESTIMATE_CurrentCyclic()**

`fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_CurrentCyclic (motor_inertia_estimate_ctrl_t *const p_ctrl)`

Cyclic process of inertia estimation at current control period (called at A/D conversion finish interrupt). Implements `motor_inertia_estimate_api_t::currentCyclic`.

Return values

| | |
|-------------------|-----------------------------------|
| FSP_SUCCESS | Successfully perform the process. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_INERTIA_ESTIMATE_ParameterUpdate()**

`fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_ParameterUpdate (motor_inertia_estimate_ctrl_t *const p_ctrl, motor_inertia_estimate_cfg_t const *const p_cfg)`

Update the parameters of inertia estimate. Implements `motor_inertia_estimate_api_t::parameterUpdate`.

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Successfully data was updated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

Modules » Motor

Functions

`fsp_err_t RM_MOTOR_POSITION_Open (motor_position_ctrl_t *const p_ctrl, motor_position_cfg_t const *const p_cfg)`

Opens and configures the Motor Position Module. Implements `motor_position_api_t::open`. [More...](#)

`fsp_err_t RM_MOTOR_POSITION_Close (motor_position_ctrl_t *const p_ctrl)`

Disables specified Motor Position Module. Implements `motor_position_api_t::close`. [More...](#)

`fsp_err_t RM_MOTOR_POSITION_Reset (motor_position_ctrl_t *const p_ctrl)`

Reset the variables of Motor Position Module. Implements `motor_position_api_t::reset`. [More...](#)

`fsp_err_t RM_MOTOR_POSITION_PositionGet (motor_position_ctrl_t *const p_ctrl, int16_t *const p_position)`

Get Rotor Position Data [degree]. Implements `motor_position_api_t::positionGet`. [More...](#)

`fsp_err_t RM_MOTOR_POSITION_PositionSet (motor_position_ctrl_t *const p_ctrl, float const position_rad)`

Set Position Data from Encoder [radian]. Implements `motor_position_api_t::positionSet`. [More...](#)

`fsp_err_t RM_MOTOR_POSITION_PositionReferenceSet (motor_position_ctrl_t *const p_ctrl, int16_t const position_reference_deg)`

Set Position Reference Data [degree]. Implements `motor_position_api_t::positionReferenceSet`. [More...](#)

`fsp_err_t RM_MOTOR_POSITION_ControlModeSet (motor_position_ctrl_t *const p_ctrl, motor_position_ctrl_mode_t const mode)`

Set Position Control Mode. Implements `motor_position_api_t::controlModeSet`. [More...](#)

`fsp_err_t RM_MOTOR_POSITION_PositionControl (motor_position_ctrl_t *const p_ctrl)`

Calculates internal position reference.(Main process of Position Control) Implements [motor_position_api_t::positionControl](#). [More...](#)

[fsp_err_t](#) [RM_MOTOR_POSITION_IpdSpeedPControl](#) ([motor_position_ctrl_t](#) *const p_ctrl, float const ref_speed_rad, float const speed_rad, float *const p_iq_ref)

Calculates the q-axis current reference by P control. Implements [motor_position_api_t::ipdSpeedPControl](#). [More...](#)

[fsp_err_t](#) [RM_MOTOR_POSITION_SpeedReferencePControlGet](#) ([motor_position_ctrl_t](#) *const p_ctrl, float *const p_speed_ref)

Get Speed Reference by P Control. Implements [motor_position_api_t::speedReferencePControlGet](#). [More...](#)

[fsp_err_t](#) [RM_MOTOR_POSITION_SpeedReferenceIpdControlGet](#) ([motor_position_ctrl_t](#) *const p_ctrl, float const max_speed_rad, float *const p_speed_ref)

Get Speed Reference by IPD Control. Implements [motor_position_api_t::speedReferenceIpdControlGet](#). [More...](#)

[fsp_err_t](#) [RM_MOTOR_POSITION_SpeedReferenceFeedforwardGet](#) ([motor_position_ctrl_t](#) *const p_ctrl, float *const p_speed_ref)

Get Speed Reference by Feedforward. Implements [motor_position_api_t::speedReferenceFeedforwardGet](#). [More...](#)

[fsp_err_t](#) [RM_MOTOR_POSITION_InfoGet](#) ([motor_position_ctrl_t](#) *const p_ctrl, [motor_position_info_t](#) *const p_info)

Get position information. [More...](#)

[fsp_err_t](#) [RM_MOTOR_POSITION_ParameterUpdate](#) ([motor_position_ctrl_t](#) *const p_ctrl, [motor_position_cfg_t](#) const *const p_cfg)

Update the parameters of Position Control Calculation. Implements [motor_position_api_t::parameterUpdate](#). [More...](#)

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor position Interface](#).

Overview

The motor position is used to control the position of motor rotor in an application. This module should be called cyclically in an application (e.g. in cyclic timer interrupt). This module calculates speed reference with inputted position reference and current rotational speed.

Features

The Motor Position Module has below features.

- Calculate speed reference.

Configuration

Build Time Configurations for rm_motor_position

The following build time configurations are defined in fsp_cfg/rm_motor_position_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > Motor Position Controller (rm_motor_position)

This module can be added to the Stacks tab via New Stack > Motor > Motor Position Controller (rm_motor_position).

| Configuration | Options | Default | Description |
|---------------------------------|---|-------------------|-----------------------------------|
| General | | | |
| Name | Name must be a valid C symbol | g_motor_position0 | Module name. |
| Position dead band | Manual Entry | 1U | Ignored area of position control. |
| Position band limit | Manual Entry | 3U | Ignored area of position control. |
| Speed feedforward ratio | Must be a valid value | 0.8F | Speed feedforward ratio. |
| Encoder counts per one rotation | Must be a valid value | 1200.0F | Encoder counts per one rotation. |
| Position omega | Must be a valid value | 10.0F | Position control omega. |
| Period of speed control (sec) | Must be a valid value | 0.0005F | Period of speed control. |
| IPD | | | |
| IPD LPF | <ul style="list-style-type: none"> • Disable • Enable | Disable | IPD LPF process enable or disable |
| Position Kp ratio | Must be a valid value | 0.3F | Position Kp ratio. |
| Position feedforward | Must be a valid value | 0.0F | Position feedforward |

| | | | |
|---|-----------------------|-------------|---------------------------------|
| ratio | | | ratio. |
| Speed K ratio | Must be a valid value | 2.0F | Speed K ratio |
| Error Limit #1 | Must be a valid value | 10.0F | Error limitation #1 |
| Error limit #2 | Must be a valid value | 0.2F | Error limitation #2 |
| LPF omega | Must be a valid value | 500.0F | LPF omega. |
| LPF zeta | Must be a valid value | 1.0F | LPF zeta. |
| Position Profiling | | | |
| Interval time | Manual Entry | 400U | Interval time. |
| Accel time | Must be a valid value | 0.3F | Accel time. |
| Maximum accel time (sec) | Must be a valid value | 8117.96F | Maximum acceleration time (sec) |
| Acceleration maximum speed | Must be a valid value | 2000.0F | Acceleration maximum speed. |
| Update step of timer | Must be a valid value | 0.0005F | Update step of timer. |
| Motor Parameter | | | |
| Pole pair | Manual Entry | 7 | Pole pair |
| Resistance (ohm) | Must be a valid value | 0.453F | Resistance |
| Inductance of d-axis (H) | Must be a valid value | 0.0009447F | Inductance of d-axis |
| Inductance of q-axis (H) | Must be a valid value | 0.0009447F | Inductance of q-axis |
| Permanent magnetic flux (Wb) | Must be a valid value | 0.006198F | Permanent magnetic flux |
| Motor Parameter > Motor inertia (kgm ²) | Must be a valid value | 0.00000962F | Motor inertia |

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

- Set the period of speed control with non-negative value.
- Set the limit of speed change step with non-negative value.
- Set the maximum speed with non-negative value.

Examples

Basic Example

This is a basic example of using the Motor Position module in an application.

```
void motor_position_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = RM_MOTOR_POSITION_Open(g_motor_position0.p_ctrl, g_motor_position0.p_cfg);
    handle_error(err);
    /* Set working mode */
    RM_MOTOR_POSITION_ModeSet(g_motor_position0.p_ctrl,
MOTOR_POSITION_CTRL_MODE_STEP);
    /* Set position reference */
    RM_MOTOR_POSITION_PositionReferenceSet(g_motor_position0.p_ctrl, 180U);
    /* Basically run this module at cyclic interrupt (e.g. AGT timer).
    * This implementation is an example. */
    // while (true)
    {
        /* Application work here. */
        /* Perform Position Control Process */
        RM_MOTOR_POSITION_PositionControl(g_motor_position0.p_ctrl);
        /* Perform Speed IPD Control Process */
        RM_MOTOR_POSITION_IpdSpeedPControl(g_motor_position0.p_ctrl, 0.0F, 0.0F,
&temp_iq_ref);
        /* Get Position */
        RM_MOTOR_POSITION_PositionGet(g_motor_position0.p_ctrl, &temp_position);
        /* Update parameters */
        RM_MOTOR_POSITION_ParameterUpdate(g_motor_position0.p_ctrl,
&g_motor_position0.p_cfg);
    }
    /* Reset Speed Control */
    RM_MOTOR_POSITION_Reset(g_motor_position0.p_ctrl);
    /* Close Speed Control */
```

```
RM_MOTOR_POSITION_Close(g_motor_position0.p_ctrl);
}
```

Enumerations

```
enum motor_position_ipd_lpf_t
```

Enumeration Type Documentation

◆ motor_position_ipd_lpf_t

```
enum motor_position_ipd_lpf_t
```

Enumerator

MOTOR_POSITION_IPD_LPF_DISABLE

ipd control is disabled

MOTOR_POSITION_IPD_LPF_ENABLE

ipd control is enabled

Function Documentation

◆ RM_MOTOR_POSITION_Open()

```
fsp_err_t RM_MOTOR_POSITION_Open ( motor_position_ctrl_t *const p_ctrl, motor_position_cfg_t
const *const p_cfg )
```

Opens and configures the Motor Position Module. Implements [motor_position_api_t::open](#).

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Motor Position Module successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Set parameter is invalid. |

◆ **RM_MOTOR_POSITION_Close()**

```
fsp_err_t RM_MOTOR_POSITION_Close ( motor_position_ctrl_t *const p_ctrl)
```

Disables specified Motor Position Module. Implements `motor_position_api_t::close`.

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_POSITION_Reset()**

```
fsp_err_t RM_MOTOR_POSITION_Reset ( motor_position_ctrl_t *const p_ctrl)
```

Reset the variables of Motor Position Module. Implements `motor_position_api_t::reset`.

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_POSITION_PositionGet()**

```
fsp_err_t RM_MOTOR_POSITION_PositionGet ( motor_position_ctrl_t *const p_ctrl, int16_t *const p_position )
```

Get Rotor Position Data [degree]. Implements `motor_position_api_t::positionGet`.

Return values

| | |
|--------------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is NULL. |

◆ **RM_MOTOR_POSITION_PositionSet()**

```
fsp_err_t RM_MOTOR_POSITION_PositionSet ( motor_position_ctrl_t *const p_ctrl, float const position_rad )
```

Set Position Data from Encoder [radian]. Implements [motor_position_api_t::positionSet](#).

Return values

| | |
|-------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_POSITION_PositionReferenceSet()**

```
fsp_err_t RM_MOTOR_POSITION_PositionReferenceSet ( motor_position_ctrl_t *const p_ctrl, int16_t const position_reference_deg )
```

Set Position Reference Data [degree]. Implements [motor_position_api_t::positionReferenceSet](#).

Return values

| | |
|-------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_POSITION_ControlModeSet()**

```
fsp_err_t RM_MOTOR_POSITION_ControlModeSet ( motor_position_ctrl_t *const p_ctrl, motor_position_ctrl_mode_t const mode )
```

Set Position Control Mode. Implements [motor_position_api_t::controlModeSet](#).

Return values

| | |
|-------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_POSITION_PositionControl()**

`fsp_err_t RM_MOTOR_POSITION_PositionControl (motor_position_ctrl_t *const p_ctrl)`

Calculates internal position reference.(Main process of Position Control) Implements `motor_position_api_t::positionControl`.

Return values

| | |
|-------------------|------------------------------|
| FSP_SUCCESS | Successful data calculation. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_POSITION_IpdSpeedPControl()**

`fsp_err_t RM_MOTOR_POSITION_IpdSpeedPControl (motor_position_ctrl_t *const p_ctrl, float const ref_speed_rad, float const speed_rad, float *const p_iq_ref)`

Calculates the q-axis current reference by P control. Implements `motor_position_api_t::ipdSpeedPControl`.

Return values

| | |
|--------------------------|------------------------------|
| FSP_SUCCESS | Successful data calculation. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is NULL. |

◆ **RM_MOTOR_POSITION_SpeedReferencePControlGet()**

`fsp_err_t RM_MOTOR_POSITION_SpeedReferencePControlGet (motor_position_ctrl_t *const p_ctrl, float *const p_speed_ref)`

Get Speed Reference by P Control. Implements `motor_position_api_t::speedReferencePControlGet`.

Return values

| | |
|--------------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is NULL. |

◆ **RM_MOTOR_POSITION_SpeedReferenceIpdControlGet()**

```
fsp_err_t RM_MOTOR_POSITION_SpeedReferenceIpdControlGet ( motor_position_ctrl_t *const p_ctrl,
float const max_speed_rad, float *const p_speed_ref )
```

Get Speed Reference by IPD Control. Implements [motor_position_api_t::speedReferenceIpdControlGet](#).

Return values

| | |
|--------------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is NULL. |

◆ **RM_MOTOR_POSITION_SpeedReferenceFeedforwardGet()**

```
fsp_err_t RM_MOTOR_POSITION_SpeedReferenceFeedforwardGet ( motor_position_ctrl_t *const
p_ctrl, float *const p_speed_ref )
```

Get Speed Reference by Feedforward. Implements [motor_position_api_t::speedReferenceFeedforwardGet](#).

Return values

| | |
|--------------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is NULL. |

◆ **RM_MOTOR_POSITION_InfoGet()**

```
fsp_err_t RM_MOTOR_POSITION_InfoGet ( motor_position_ctrl_t *const p_ctrl, motor_position_info_t
*const p_info )
```

Get position information.

Return values

| | |
|--------------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is NULL. |

◆ RM_MOTOR_POSITION_ParameterUpdate()

```
fsp_err_t RM_MOTOR_POSITION_ParameterUpdate ( motor_position_ctrl_t *const p_ctrl,
motor_position_cfg_t const *const p_cfg )
```

Update the parameters of Position Control Calculation. Implements [motor_position_api_t::parameterUpdate](#).

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Successfully data was updated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

Select function. Implements `motor_api_t::functionSelect`. [More...](#)

Detailed Description

Usual control of a SPM motor on RA MCUs. This module implements the [Motor Sensorless Vector Control \(rm_motor_sensorless\)](#).

Overview

The motor sensorless vector control is used to control a motor rotation in an application. This module is implemented with using SPM motor. User can start/stop motor rotation simply.

Features

The Motor Sensorless Module has below features.

- Start/Stop a motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

Target Hardware

The below figure shows an example of target hardware of this Motor Sensorless Module.

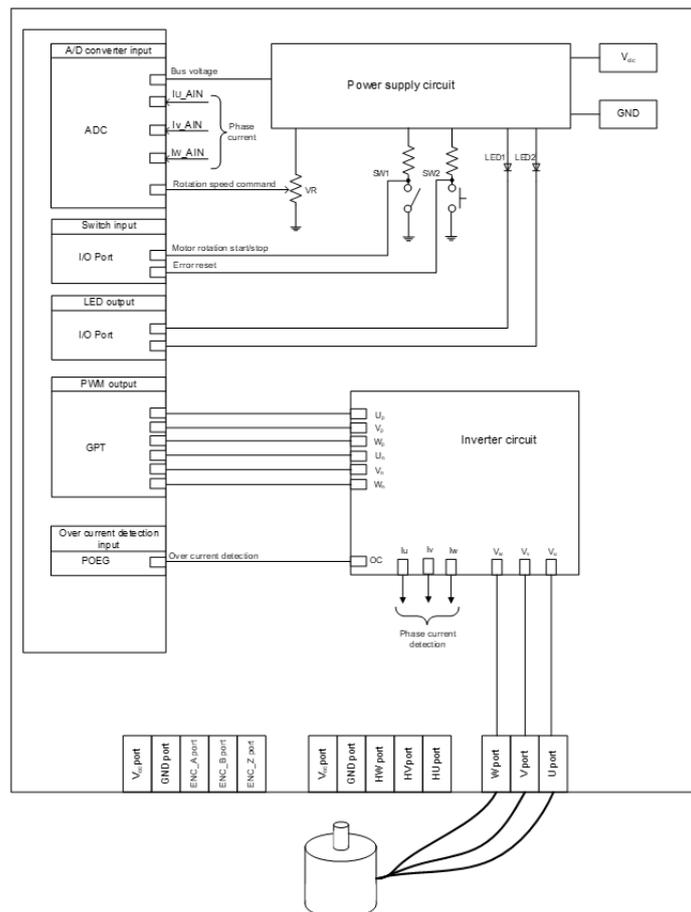

Figure 250: Example of target hardware of motor sensorless module

Block Diagram

The below figures show block diagram of sensorless vector motor control. The 1st shows as an open-loop state, 2nd as a PI feedback loop state.

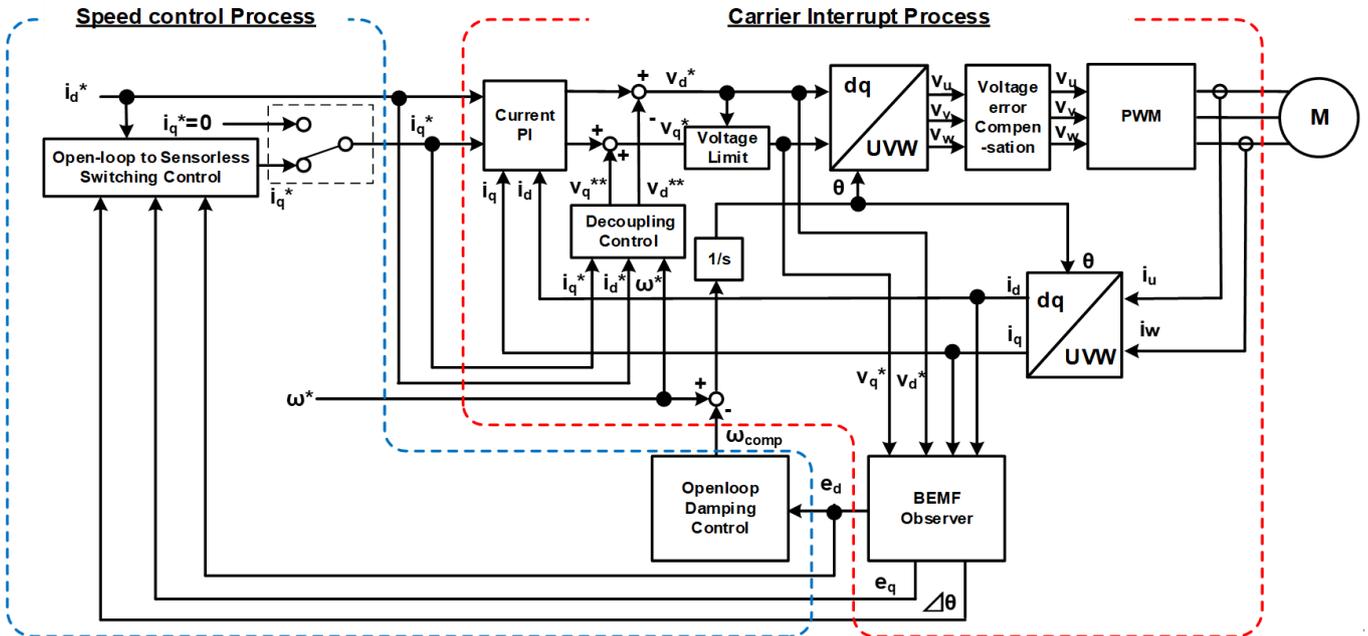

Figure 251: Block diagram of sensorless vector control (open-loop)

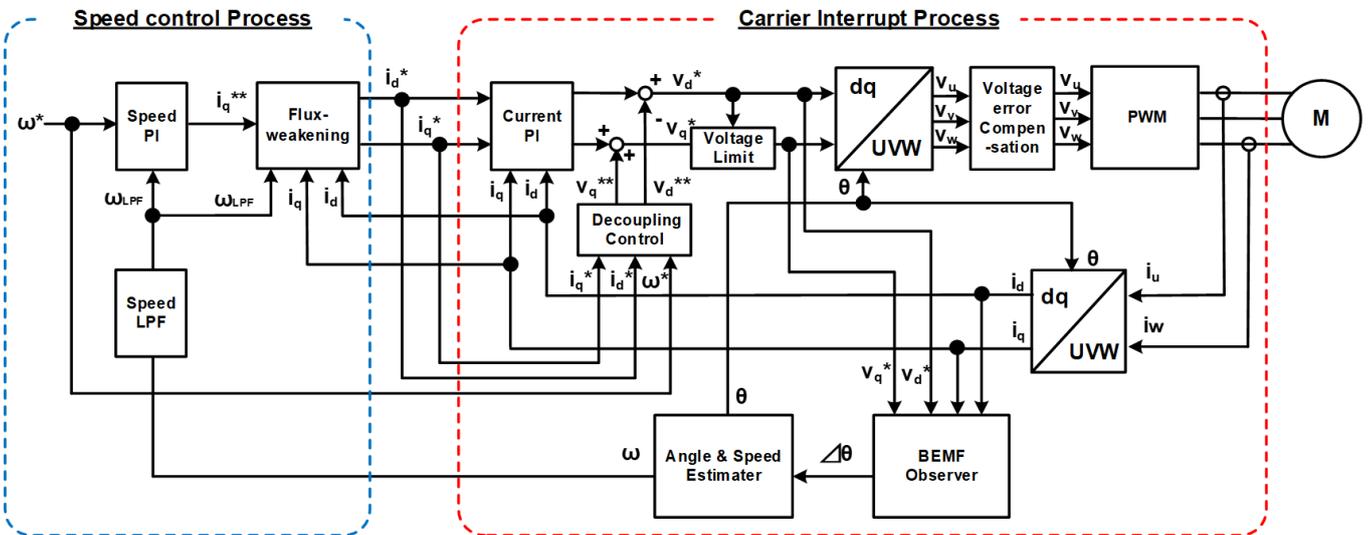

Figure 252: Block diagram of sensorless vector control (PI feedback loop)

Modulation

- Sine wave modulation The modulation factor "m" is defined as follows.

$$m = \frac{V}{E}$$

m: Modulation ratio V: Reference voltage E: Inverter input voltage

Figure 253: Modulation factor

- Space vector modulation In vector control of a permanent magnet synchronous motor, generally, the desired voltage command value of each phase is generated sinusoidally. However, if the generated value is used as-is for the modulation wave for PWM generation, voltage utilization as applied to the motor (in terms of line voltage) is limited to a maximum of 86.7 percents with respect to inverter bus voltage. As such, as shown in the following expression, the average of the maximum and minimum values is calculated for the voltage command value of each phase, and the value obtained by subtracting the average from the voltage command value of each phase is used as the modulation wave. As a result, the maximum amplitude of the modulation wave is multiplied by (square root 3)/2, while voltage utilization becomes 100 percents and line voltage is unchanged.

$$\begin{pmatrix} V'_u \\ V'_v \\ V'_w \end{pmatrix} = \begin{pmatrix} V_u \\ V_v \\ V_w \end{pmatrix} + \Delta V \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$$

$$\therefore \Delta V = -\frac{V_{max} + V_{min}}{2}, \quad V_{max} = \max\{V_u, V_v, V_w\}, \quad V_{min} = \min\{V_u, V_v, V_w\}$$

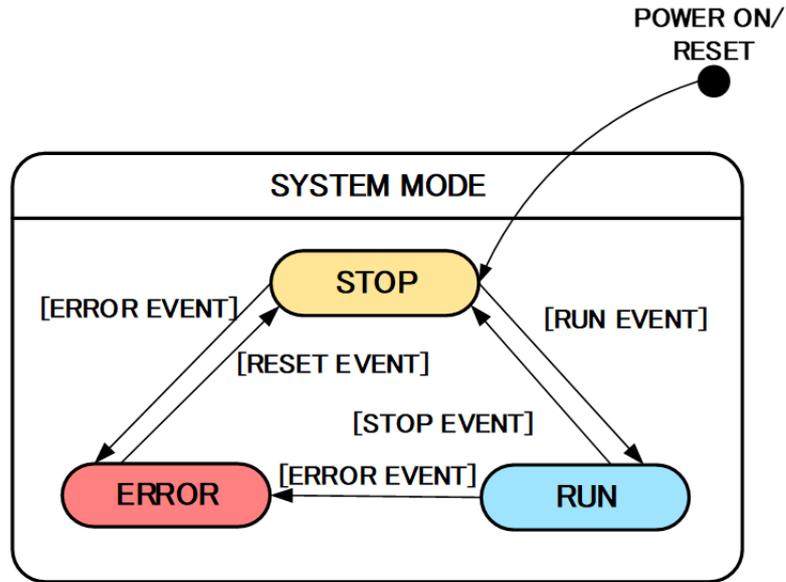

V_u, V_v, V_w : Command values of U-, V-, and W-phases

V'_u, V'_v, V'_w : Command values of U-, V-, and W-phases for PWM generation (modulation wave)

Figure 254: Space vector modulation

State transition

The below figure shows a state transition diagram. Internal state is managed by "SYSTEM MODE".

| | | MODE | | |
|-------|-------|-------|-------|-------|
| | | STOP | RUN | ERROR |
| EVENT | STOP | STOP | STOP | ERROR |
| | RUN | RUN | RUN | ERROR |
| | ERROR | ERROR | ERROR | ERROR |
| | RESET | STOP | RUN | STOP |

Figure 255: State transition diagram

(1) SYSTEM MODE "SYSTEM MODE" indicates the operating states of the system. The state transits on occurrence of each event (EVENT). "SYSTEM MODE" has 3 states that are motor drive stop (INACTIVE), motor drive (ACTIVE), and abnormal condition (ERROR).

(2) EVENT When "EVENT" occurs in each "SYSTEM MODE", "SYSTEM MODE" changes as shown the table in above figure, according to that "EVENT". The occurrence factors of each event are shown below.

| EVENT name | Occurrence factor |
|------------|----------------------------------|
| STOP | by user operation |
| RUN | by user operation |
| ERROR | when the system detects an error |
| RESET | by user operation |

Flowchart

The below figures show flowcharts of motor sensorless module.

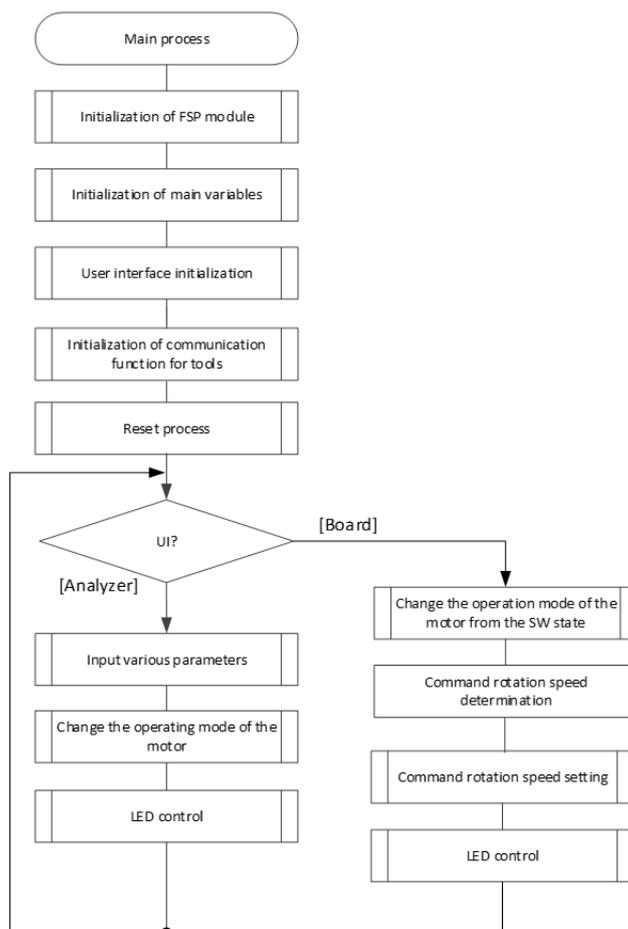

Figure 256: Main process

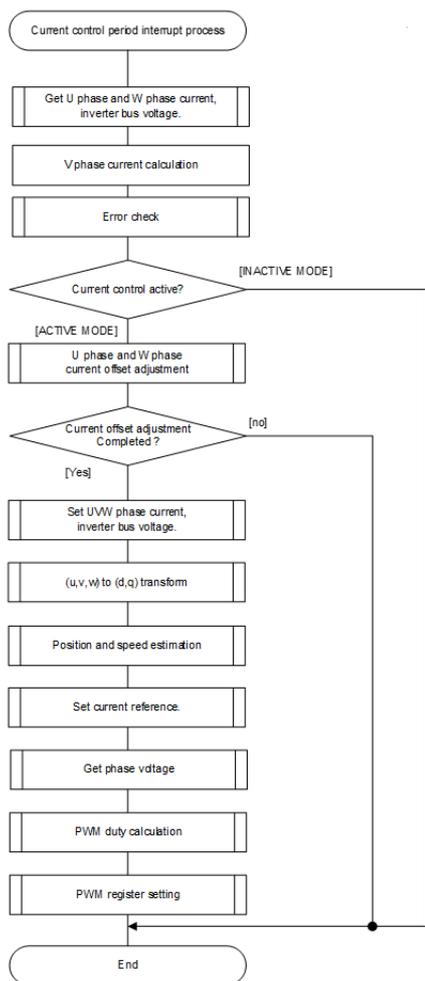

Figure 257: Current control process

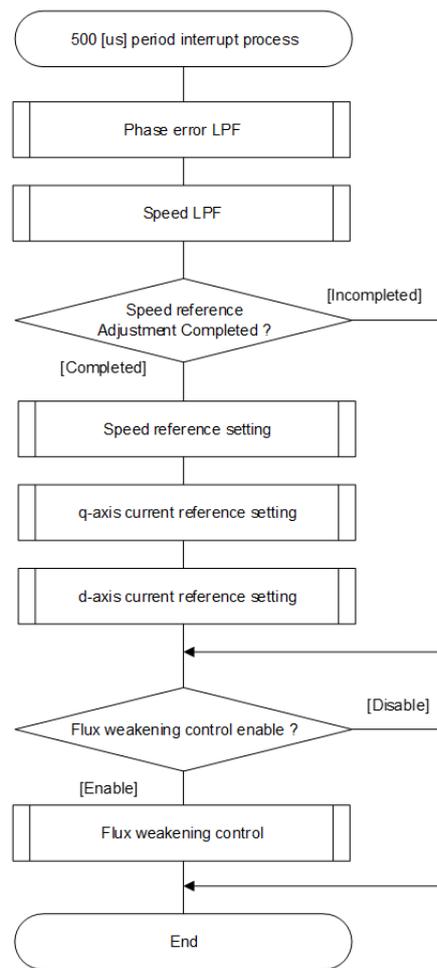

Figure 258: Speed control process

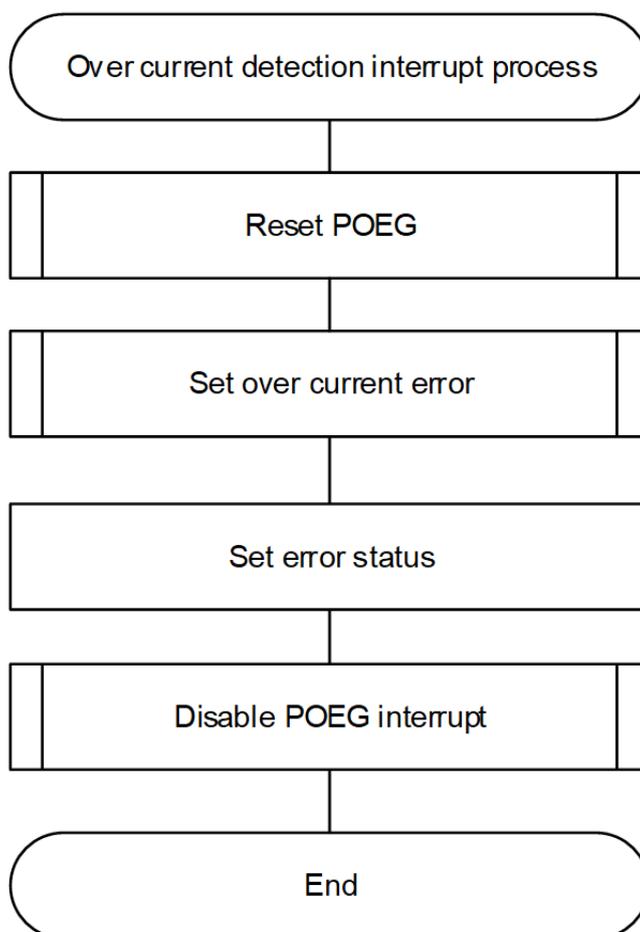

Figure 259: Over current detection interrupt process

Configuration

Build Time Configurations for rm_motor_sensorless

The following build time configurations are defined in fsp_cfg/rm_motor_sensorless_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter checking | <ul style="list-style-type: none"> Default (BSP) Enabled Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > Motor Sensorless Vector Control (rm_motor_sensorless)

This module can be added to the Stacks tab via New Stack > Motor > Motor Sensorless Vector Control (rm_motor_sensorless).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

General

| | | | |
|---------------------------|-------------------------------|---------------------|--|
| Name | Name must be a valid C symbol | g_motor_sensorless0 | Module name. |
| Limit of over current (A) | Must be a valid value | 0.42F | Limit of over current.(Detection threshold) |
| Limit of over voltage (V) | Must be a valid value | 28.0F | Limit of over voltage.(Detection threshold) |
| Limit of over speed (rpm) | Must be a valid value | 3000.0F | Limit of over speed.(Detection threshold) |
| Limit of low voltage (V) | Must be a valid value | 14.0F | Limit of low voltage.(Detection threshold) |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | NULL | A user callback function. If this callback function is provided, it is called at speed control cyclic interrupt. |

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

Pin Configuration

This module does not use I/O pins. Please set used pins on configuration of each hardware modules.

Usage Notes

Limitations

- Set the limit of electric current with non-negative value.
- Set the limit of input voltage with non-negative value.
- Set the limit of rotational speed with non-negative value.

Examples

Basic Example

This is a basic example of minimal use of the Motor Sensorless in an application.

```
void motor_sensorless_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the module. */
}
```

```
err = RM_MOTOR_SENSORLESS_Open(g_motor_sensorless0.p_ctrl,  
g_motor_sensorless0.p_cfg);  
assert(FSP_SUCCESS == err);  
/* Set speed reference before motor run */  
(void) RM_MOTOR_SENSORLESS_SpeedSet(g_motor_sensorless0.p_ctrl,  
DEF_SENSORLESS_TEST_OVSPD_LIM);  
/* Start motor rotation */  
(void) RM_MOTOR_SENSORLESS_Run(g_motor_sensorless0.p_ctrl);  
/* Get current status */  
(void) RM_MOTOR_SENSORLESS_StatusGet(g_motor_sensorless0.p_ctrl, &smpl_status);  
/* Get current rotor angle */  
(void) RM_MOTOR_SENSORLESS_AngleGet(g_motor_sensorless0.p_ctrl, &smpl_angle);  
/* Get current motor speed */  
(void) RM_MOTOR_SENSORLESS_SpeedGet(g_motor_sensorless0.p_ctrl, &smpl_speed);  
/* Check error */  
(void) RM_MOTOR_SENSORLESS_ErrorCheck(g_motor_sensorless0.p_ctrl, &smpl_error);  
/* Stop motor rotation */  
(void) RM_MOTOR_SENSORLESS_Stop(g_motor_sensorless0.p_ctrl);  
/* Stop motor rotation */  
(void) RM_MOTOR_SENSORLESS_ErrorSet(g_motor_sensorless0.p_ctrl,  
MOTOR_ERROR_OVER_CURRENT_HW);  
/* Reset Speed Control */  
(void) RM_MOTOR_SENSORLESS_Reset(g_motor_sensorless0.p_ctrl);  
/* Close Speed Control */  
(void) RM_MOTOR_SENSORLESS_Close(g_motor_sensorless0.p_ctrl);  
}
```

Function Documentation

◆ RM_MOTOR_SENSORLESS_Open()

```
fsp_err_t RM_MOTOR_SENSORLESS_Open ( motor_ctrl_t *const p_ctrl, motor_cfg_t const *const p_cfg )
```

Configure the MOTOR in register start mode. Implements [motor_api_t::open](#).

This function should only be called once as MOTOR configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
err = RM_MOTOR_SENSORLESS_Open(g_motor_sensorless0.p_ctrl,
g_motor_sensorless0.p_cfg);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | MOTOR successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

Note

◆ RM_MOTOR_SENSORLESS_Close()

```
fsp_err_t RM_MOTOR_SENSORLESS_Close ( motor_ctrl_t *const p_ctrl)
```

Disables specified Motor Sensorless Control block. Implements [motor_api_t::close](#).

Example:

```
/* Close Speed Control */
(void) RM_MOTOR_SENSORLESS_Close(g_motor_sensorless0.p_ctrl);
```

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ RM_MOTOR_SENSORLESS_Reset()

```
fsp_err_t RM_MOTOR_SENSORLESS_Reset ( motor_ctrl_t *const p_ctrl)
```

Reset Motor Sensorless Control block. Implements `motor_api_t::reset`.

Example:

```
/* Reset Speed Control */
(void) RM_MOTOR_SENSORLESS_Reset(g_motor_sensorless0.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ RM_MOTOR_SENSORLESS_Run()

```
fsp_err_t RM_MOTOR_SENSORLESS_Run ( motor_ctrl_t *const p_ctrl)
```

Run Motor (Start motor rotation). Implements `motor_api_t::run`.

Example:

```
/* Start motor rotation */
(void) RM_MOTOR_SENSORLESS_Run(g_motor_sensorless0.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ RM_MOTOR_SENSORLESS_Stop()

```
fsp_err_t RM_MOTOR_SENSORLESS_Stop ( motor_ctrl_t *const p_ctrl)
```

Stop Motor (Stop motor rotation). Implements `motor_api_t::stop`.

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_SENSORLESS_Stop(g_motor_sensorless0.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ RM_MOTOR_SENSORLESS_ErrorSet()

```
fsp_err_t RM_MOTOR_SENSORLESS_ErrorSet ( motor_ctrl_t *const p_ctrl, motor_error_t const error )
```

Set error information. Implements `motor_api_t::errorSet`.

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_SENSORLESS_ErrorSet(g_motor_sensorless0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ RM_MOTOR_SENSORLESS_SpeedSet()

```
fsp_err_t RM_MOTOR_SENSORLESS_SpeedSet ( motor_ctrl_t *const p_ctrl, float const speed_rpm )
```

Set speed reference[rpm]. Implements `motor_api_t::speedSet`.

Example:

```
/* Set speed reference before motor run */
(void) RM_MOTOR_SENSORLESS_SpeedSet(g_motor_sensorless0.p_ctrl,
DEF_SENSORLESS_TEST_OVSPD_LIM);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ RM_MOTOR_SENSORLESS_StatusGet()

```
fsp_err_t RM_MOTOR_SENSORLESS_StatusGet ( motor_ctrl_t *const p_ctrl, uint8_t *const p_status )
```

Get current control status. Implements `motor_api_t::statusGet`.

Example:

```
/* Get current status */
(void) RM_MOTOR_SENSORLESS_StatusGet(g_motor_sensorless0.p_ctrl, &smpl_status);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_SENSORLESS_AngleGet()**

```
fsp_err_t RM_MOTOR_SENSORLESS_AngleGet ( motor_ctrl_t *const p_ctrl, float *const p_angle_rad )
```

Get current rotor angle. Implements `motor_api_t::angleGet`.

Example:

```
/* Get current rotor angle */
(void) RM_MOTOR_SENSORLESS_AngleGet(g_motor_sensorless0.p_ctrl, &smpl_angle);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_SENSORLESS_SpeedGet()**

```
fsp_err_t RM_MOTOR_SENSORLESS_SpeedGet ( motor_ctrl_t *const p_ctrl, float *const p_speed_rpm )
```

Get rotational speed. Implements `motor_api_t::speedGet`.

Example:

```
/* Get current motor speed */
(void) RM_MOTOR_SENSORLESS_SpeedGet(g_motor_sensorless0.p_ctrl, &smpl_speed);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_SENSORLESS_ErrorCheck()**

```
fsp_err_t RM_MOTOR_SENSORLESS_ErrorCheck ( motor_ctrl_t *const p_ctrl, uint16_t *const p_error )
```

Check the occurrence of Error. Implements `motor_api_t::errorCheck`.

Example:

```
/* Check error */
(void) RM_MOTOR_SENSORLESS_ErrorCheck(g_motor_sensorless0.p_ctrl, &smpl_error);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_SENSORLESS_PositionSet()**

```
fsp_err_t RM_MOTOR_SENSORLESS_PositionSet ( motor_ctrl_t *const p_ctrl, motor_speed_position_data_t const *const p_position )
```

Set position reference. Implements `motor_api_t::positionSet`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

Note

◆ **RM_MOTOR_SENSORLESS_WaitStopFlagGet()**

```
fsp_err_t RM_MOTOR_SENSORLESS_WaitStopFlagGet ( motor_ctrl_t *const p_ctrl, motor_wait_stop_flag_t *const p_flag )
```

Get wait stop flag. Implements `motor_api_t::waitStopFlagGet`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

Note

◆ RM_MOTOR_SENSORLESS_FunctionSelect()

```
fsp_err_t RM_MOTOR_SENSORLESS_FunctionSelect ( motor_ctrl_t *const p_ctrl,
motor_function_select_t const function )
```

Select function. Implements `motor_api_t::functionSelect`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor speed Interface](#).

Overview

The motor speed is used to control the speed of motor rotation in an application. This module should be called cyclically in an application (e.g. in cyclic timer interrupt). This module calculates d/q-axis current reference with input speed reference, current rotational speed, and d/q-axis current.

Features

The motor speed module has below features.

- Calculate d/q-axis electric current reference.
- Flux weakening process at high speed rotation.
- Open loop damping control when using sensorless type.
- Low pass filter of input rotational speed.
- Speed observer function when using encoder type.

Configuration

Build Time Configurations for rm_motor_speed

The following build time configurations are defined in fsp_cfg/rm_motor_speed_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> Default (BSP) Enabled Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Position Support | <ul style="list-style-type: none"> Enabled Disabled | Disabled | Enable position algorithm support. |

Configurations for Motor > Motor Speed Controller (rm_motor_speed)

This module can be added to the Stacks tab via New Stack > Motor > Motor Speed Controller (rm_motor_speed).

| Configuration | Options | Default | Description |
|---|---|----------------|--|
| General | | | |
| Name | Name must be a valid C symbol | g_motor_speed0 | Module name. |
| Speed control period (sec) | Must be a valid value | 0.0005F | Period of speed control function. |
| Step of speed climbing (rpm) | Must be a valid value | 0.5F | Step of speed change at start of open-loop. |
| Maximum rotational speed (rpm) | Manual Entry | 2650 | Maximum rotational speed (Limit speed). |
| Speed LPF omega | Must be a valid value | 10.0F | Design parameter for speed LPF. |
| Limit of q-axis current (A) | Must be a valid value | 0.42F | Limit of q-axis current. |
| Step of speed feedback at open-loop | Must be a valid value | 0.20F | Step of speed feedback at open-loop. |
| Natural frequency | Must be a valid non-negative value. | 100.0 | Natural frequency for disturbance speed observer. |
| Open-loop damping | <ul style="list-style-type: none"> Disable Enable | Enable | Select enable/disable Open-loop damping control. |
| Flux weakening | <ul style="list-style-type: none"> Disable Enable | Disable | Select enable/disable flux weakening control. |
| Torque compensation for sensorless transition | <ul style="list-style-type: none"> Disable Enable | Enable | Select enable/disable torque compensation for sensorless |

| Output data | Name must be a valid C symbol | NULL | Structure for Speed control Output. If you set this content, Speed Control function write need data automatically. (No need to use Get API.) |

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

- Set the period of speed control with none-negative value.
- Set the limit of speed change step with none-negative value.
- Set the maximum speed with none-negative value.

Examples

Basic Example

This is a basic example of minimal use of the motor speed in an application.

```
void motor_speed_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = RM_MOTOR_SPEED_Open(g_motor_speed0.p_ctrl, g_motor_speed0.p_cfg);
    handle_error(err);
    /* Set speed reference before get current reference */
    (void) RM_MOTOR_SPEED_SpeedReferenceSet(g_motor_speed0.p_ctrl, 104.72F);
    /* Set position reference before get current reference
     * (Basically Exclusive to SpeedReferenceSet. This is only sample,) */
    (void) RM_MOTOR_SPEED_PositionReferenceSet(g_motor_speed0.p_ctrl,
    &g_posref_sample);
    /* Basically run this module at cyclic interrupt (e.g. AGT timer).
     * This implementation is an example. */
    // while (true)
    {
        /* Application work here. */
        /* Set input parameter data before get current reference */
        (void) RM_MOTOR_SPEED_ParameterSet(g_motor_speed0.p_ctrl,
    &g_test_speed_input);
        /* Activate Speed Process */
        (void) RM_MOTOR_SPEED_Run(g_motor_speed0.p_ctrl);
        /* Perform Speed Control Process */
        (void) RM_MOTOR_SPEED_SpeedControl(g_motor_speed0.p_ctrl);
        /* Get output parameters */
    }
```

```
(void) RM_MOTOR_SPEED_ParameterGet(g_motor_speed0.p_ctrl,  
&g_test_speed_output);  
//  
  
/* Update parameters */  
(void) RM_MOTOR_SPEED_ParameterUpdate(g_motor_speed0.p_ctrl,  
&g_motor_speed0.p_cfg);  
}  
  
/* Reset Speed Control */  
(void) RM_MOTOR_SPEED_Reset(g_motor_speed0.p_ctrl);  
  
/* Close Speed Control */  
(void) RM_MOTOR_SPEED_Close(g_motor_speed0.p_ctrl);  
}
```

|--------------------------------------|---------------------------|
| Enumerator | |
| MOTOR_SPEED_OPENLOOP_DAMPING_DISABLE | Disable openloop damping. |
| MOTOR_SPEED_OPENLOOP_DAMPING_ENABLE | Enable openloop damping. |

◆ **motor_speed_flux_weaken_t**

| enum motor_speed_flux_weaken_t | |
|---------------------------------|---------------------------------|
| Enumerator | |
| MOTOR_SPEED_FLUX_WEAKEN_DISABLE | Disable flux-weakening control. |
| MOTOR_SPEED_FLUX_WEAKEN_ENABLE | Enable flux-weakening control. |

◆ **motor_speed_less_switch_t**

| enum motor_speed_less_switch_t | |
|---------------------------------|---|
| Enumerator | |
| MOTOR_SPEED_LESS_SWITCH_DISABLE | Disable soft switching between open-loop mode and normal field oriented control mode. |
| MOTOR_SPEED_LESS_SWITCH_ENABLE | Enable soft switching between open-loop mode and normal field oriented control mode. |

◆ motor_speed_observer_switch_t

| enum motor_speed_observer_switch_t | |
|-------------------------------------|-------------------------|
| Enumerator | |
| MOTOR_SPEED_OBSERVER_SWITCH_DISABLE | Disable speed observer. |
| MOTOR_SPEED_OBSERVER_SWITCH_ENABLE | Enable speed observer. |

◆ motor_speed_observer_select_t

| enum motor_speed_observer_select_t | |
|---|-----------------------------|
| Enumerator | |
| MOTOR_SPEED_OBSERVER_SELECT_NORMAL | Normal speed observer. |
| MOTOR_SPEED_OBSERVER_SELECT_DISTURBAN CE | Disturbance speed observer. |

◆ motor_speed_ctrl_status_t

| enum motor_speed_ctrl_status_t | |
|--------------------------------|-------------------------------|
| Enumerator | |
| MOTOR_SPEED_CTRL_STATUS_INIT | Speed control status is INIT. |
| MOTOR_SPEED_CTRL_STATUS_BOOT | Speed control status is BOOT. |
| MOTOR_SPEED_CTRL_STATUS_RUN | Speed control status is RUN. |

Function Documentation

◆ **RM_MOTOR_SPEED_Open()**

```
fsp_err_t RM_MOTOR_SPEED_Open ( motor_speed_ctrl_t *const p_ctrl, motor_speed_cfg_t const *const p_cfg )
```

Opens and configures the Motor Speed Module. Implements `motor_speed_api_t::open`.

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Motor Speed Module successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

◆ **RM_MOTOR_SPEED_Close()**

```
fsp_err_t RM_MOTOR_SPEED_Close ( motor_speed_ctrl_t *const p_ctrl)
```

Disables specified Motor Speed Module. Implements `motor_speed_api_t::close`.

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SPEED_Reset()**

```
fsp_err_t RM_MOTOR_SPEED_Reset ( motor_speed_ctrl_t *const p_ctrl)
```

Reset the variables of Motor Speed Module. Implements `motor_speed_api_t::reset`.

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SPEED_Run()**

```
fsp_err_t RM_MOTOR_SPEED_Run ( motor_speed_ctrl_t *const p_ctrl)
```

Run(Start) the Motor Speed Control. Implements `motor_speed_api_t::run`.

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully start. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SPEED_SpeedReferenceSet()**

```
fsp_err_t RM_MOTOR_SPEED_SpeedReferenceSet ( motor_speed_ctrl_t *const p_ctrl, float const speed_reference_rpm )
```

Set Speed Reference Data. Implements `motor_speed_api_t::speedReferenceSet`.

Return values

| | |
|-------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SPEED_PositionReferenceSet()**

```
fsp_err_t RM_MOTOR_SPEED_PositionReferenceSet ( motor_speed_ctrl_t *const p_ctrl, motor_speed_position_data_t const *const p_position_data )
```

Set Position Reference Data. Implements `motor_speed_api_t::positionReferenceSet`.

Return values

| | |
|--------------------------|----------------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input structure pointer is NULL. |

◆ **RM_MOTOR_SPEED_ParameterSet()**

```
fsp_err_t RM_MOTOR_SPEED_ParameterSet ( motor_speed_ctrl_t *const p_ctrl,
motor_speed_input_t const *const p_st_input )
```

Set Input parameters. Implements [motor_speed_api_t::parameterSet](#).

Return values

| | |
|--------------------------|---------------------------|
| FSP_SUCCESS | Successfully data is set. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is NULL. |

◆ **RM_MOTOR_SPEED_SpeedControl()**

```
fsp_err_t RM_MOTOR_SPEED_SpeedControl ( motor_speed_ctrl_t *const p_ctrl)
```

Calculates the d/q-axis current reference.(Main process of Speed Control) Implements [motor_speed_api_t::speedControl](#).

Return values

| | |
|-------------------|------------------------------|
| FSP_SUCCESS | Successful data calculation. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_SPEED_ParameterGet()**

```
fsp_err_t RM_MOTOR_SPEED_ParameterGet ( motor_speed_ctrl_t *const p_ctrl,
motor_speed_output_t *const p_st_output )
```

Get Speed Control Parameters. Implements [motor_speed_api_t::parameterGet](#).

Return values

| | |
|--------------------------|----------------------------------|
| FSP_SUCCESS | Successfully the flag is gotten. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Output pointer is NULL. |

◆ RM_MOTOR_SPEED_ParameterUpdate()

```
fsp_err_t RM_MOTOR_SPEED_ParameterUpdate ( motor_speed_ctrl_t *const p_ctrl,
motor_speed_cfg_t const *const p_cfg )
```

Update the parameters of Speed Control Calculation. Implements [motor_speed_api_t::parameterUpdate](#).

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Successfully data was updated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

Select function. Implements [motor_api_t::functionSelect](#). [More...](#)

Detailed Description

Usual control of a SPM motor on RA MCUs. This module implements the [Motor Vector Control with hall sensors \(rm_motor_hall\)](#).

Overview

The motor vector control with hall sensors is used to control a motor rotation in an application. This module is meant to be used with Surface Permanent Magnet (SPM) motors and allows applications to start or stop motor rotation easily.

Features

The motor vector control with hall sensors has below features.

- Start/Stop a motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

Target Hardware

The below figure shows an example of target hardware of this Motor Hall Module.

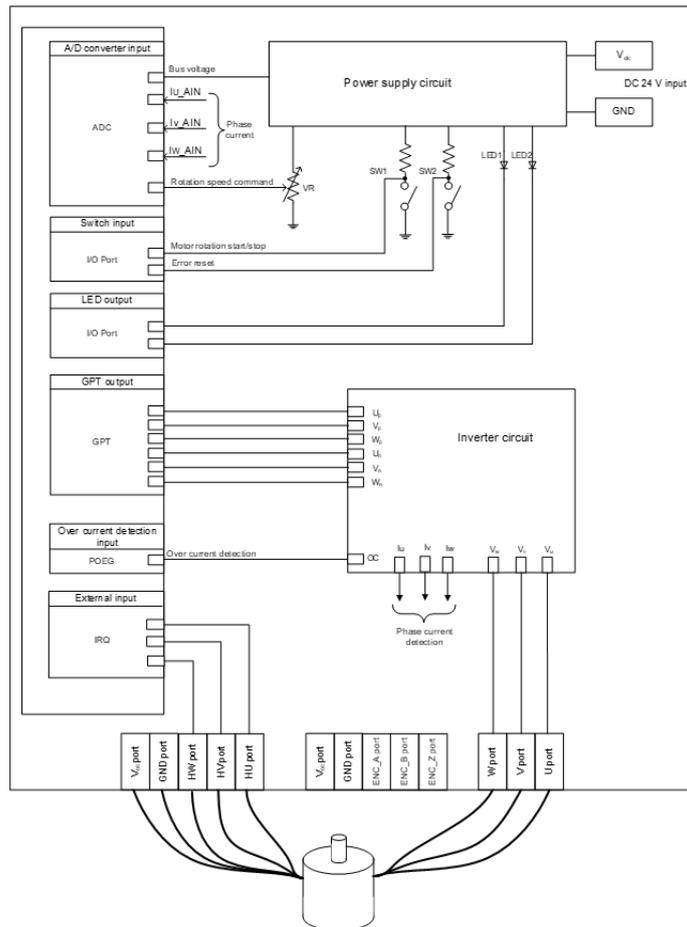

Figure 260: Example of target hardware of motor hall module

Block Diagram

The below figure shows block diagram of vector motor control with hall sensors.

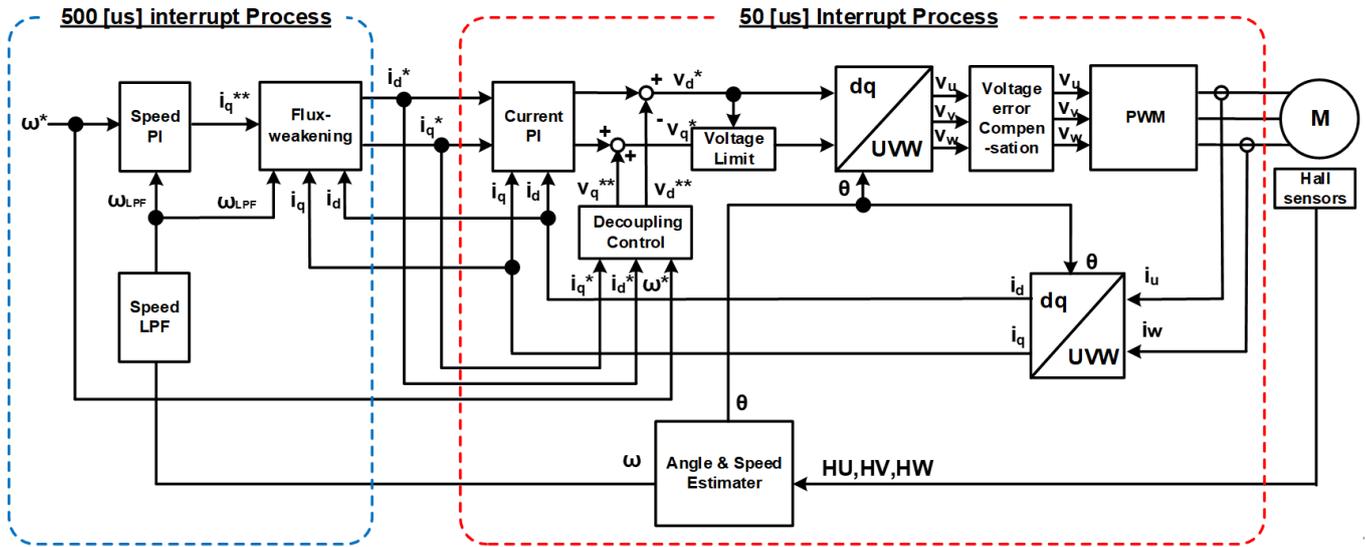

Figure 261: Block diagram of vector control with hall sensors

Modulation

- Sine wave modulation The modulation factor "m" is defined as follows.

$$m = \frac{V}{E}$$

m: Modulation ratio

V: Reference voltage

E: Inverter input voltage

Figure 262: Modulation factor

- Space vector modulation In vector control of a permanent magnet synchronous motor, generally, the desired voltage command value of each phase is generated sinusoidally. However, if the generated value is used as-is for the modulation wave for PWM generation, voltage utilization as applied to the motor (in terms of line voltage) is limited to a maximum of 86.7 percents with respect to inverter bus voltage. As such, as shown in the following expression, the average of the maximum and minimum values is calculated for the voltage command value of each phase, and the value obtained by subtracting the average from the voltage command value of each phase is used as the modulation wave. As a result, the maximum amplitude of the modulation wave is multiplied by (square root 3)/2, while voltage utilization becomes 100 percents and line voltage is unchanged.

$$\begin{pmatrix} V'_u \\ V'_v \\ V'_w \end{pmatrix} = \begin{pmatrix} V_u \\ V_v \\ V_w \end{pmatrix} + \Delta V \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$$

$$\therefore \Delta V = -\frac{V_{max}+V_{min}}{2}, V_{max} = \max\{V_u, V_v, V_w\}, V_{min} = \min\{V_u, V_v, V_w\}$$

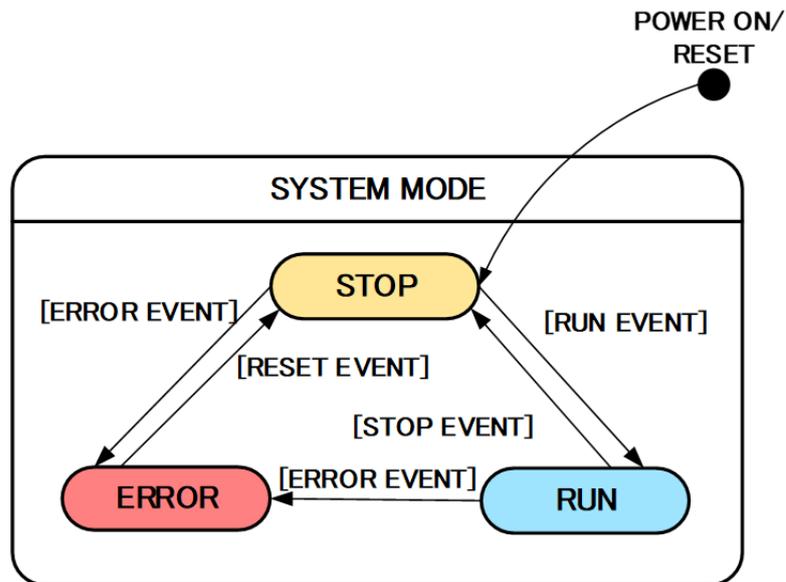

V_u, V_v, V_w : Command values of U-, V-, and W-phases

V'_u, V'_v, V'_w : Command values of U-, V-, and W-phases for PWM generation (modulation wave)

Figure 263: Space vector modulation

State transition

The below figure shows a state transition diagram. Internal state is managed by "SYSTEM MODE".

| | | MODE | | |
|-------|-------|-------|-------|-------|
| | | STOP | RUN | ERROR |
| EVENT | STOP | STOP | STOP | ERROR |
| | RUN | RUN | RUN | ERROR |
| | ERROR | ERROR | ERROR | ERROR |
| | RESET | STOP | RUN | STOP |

Figure 264: State transition diagram

(1) SYSTEM MODE "SYSTEM MODE" indicates the operating states of the system. The state transits on occurrence of each event (EVENT). "SYSTEM MODE" has 3 states that are motor drive stop (INACTIVE), motor drive (ACTIVE), and abnormal condition (ERROR).

(2) EVENT When "EVENT" occurs in each "SYSTEM MODE", "SYSTEM MODE" changes as shown the table in above figure, according to that "EVENT". The occurrence factors of each event are shown below.

| EVENT name | Occurrence factor |
|------------|----------------------------------|
| STOP | by user operation |
| RUN | by user operation |
| ERROR | when the system detects an error |
| RESET | by user operation |

Flowchart

The below figures show flowcharts of motor hall module.

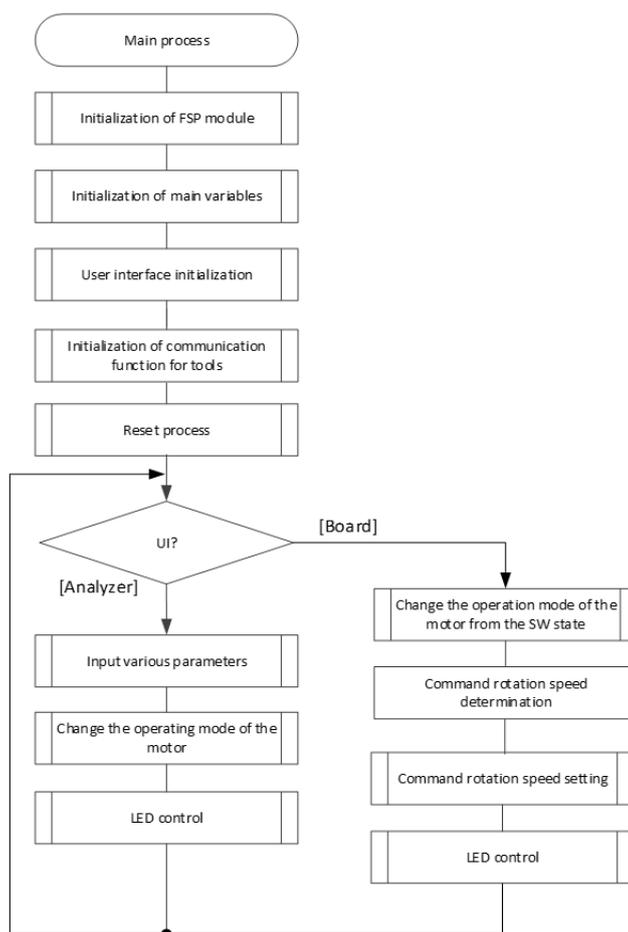

Figure 265: Main process

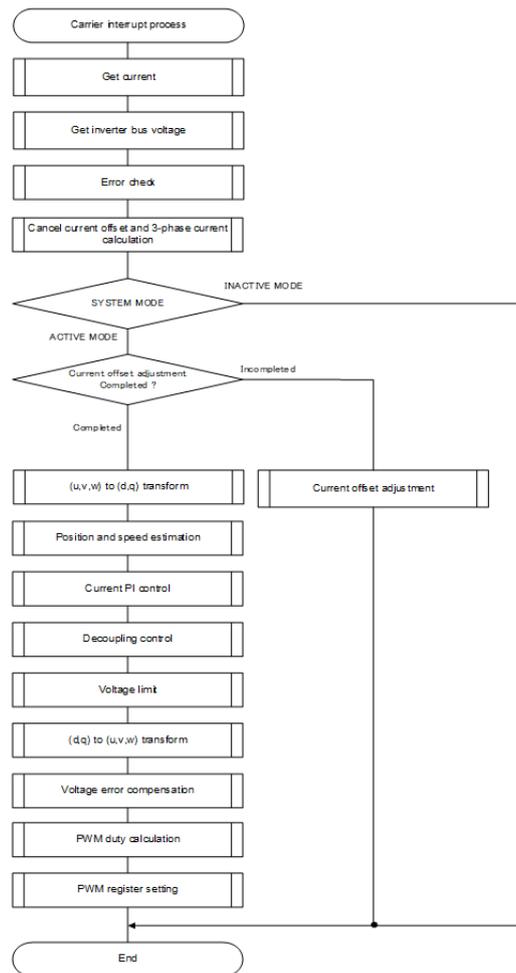

Figure 266: Current control process

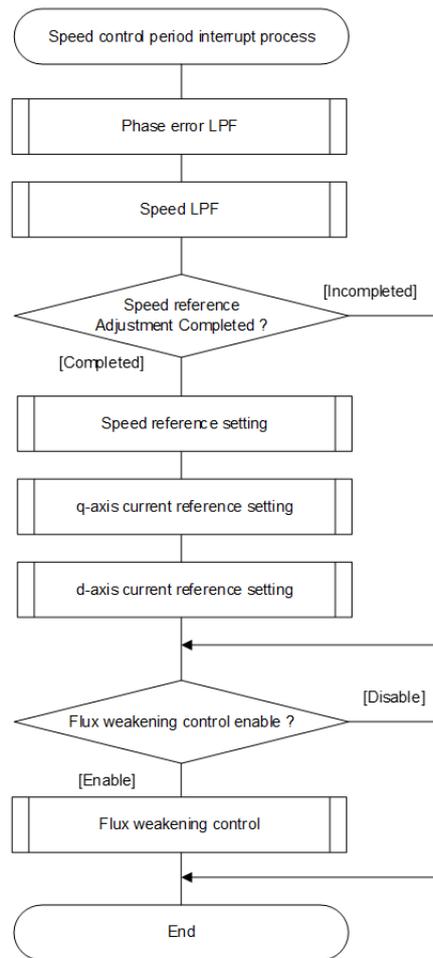

Figure 267: Speed control process

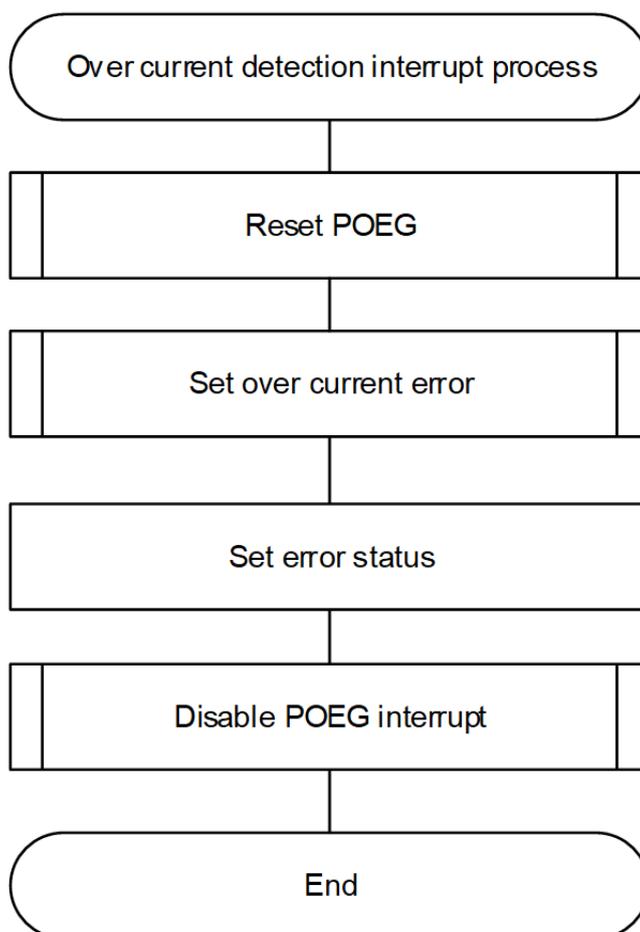

Figure 268: Over current detection interrupt process

Configuration

Build Time Configurations for rm_motor_hall

The following build time configurations are defined in fsp_cfg/rm_motor_hall_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > Motor Vector Control with hall sensors(rm_motor_hall)

This module can be added to the Stacks tab via New Stack > Motor > Motor Vector Control with hall sensors(rm_motor_hall).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

General

| | | | |
|---------------------------|-------------------------------|---------------|--|
| Name | Name must be a valid C symbol | g_motor_hall0 | Module name. |
| Limit of over current (A) | Must be a valid value | 0.42F | Limit of over current.(Detection threshold) |
| Limit of over voltage (V) | Must be a valid value | 28.0F | Limit of over voltage.(Detection threshold) |
| Limit of over speed (rpm) | Must be a valid value | 3000.0F | Limit of over speed.(Detection threshold) |
| Limit of low voltage (V) | Must be a valid value | 14.0F | Limit of low voltage.(Detection threshold) |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | NULL | A user callback function. If this callback function is provided, it is called at speed control cyclic interrupt. |

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

Pin Configuration

This module does not use I/O pins. Please set used pins on configuration of each hardware modules.

Usage Notes

Limitations

- Set the limit of electric current with non-negative value.
- Set the limit of input voltage with non-negative value.
- Set the limit of rotational speed with non-negative value.

Examples

Basic Example

This is a basic example of minimal use of the motor vector control with hall sensors in an application.

```
void motor_hall_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
}
```

```
err = RM_MOTOR_HALL_Open(g_motor_hall0_smpl.p_ctrl, g_motor_hall0_smpl.p_cfg);
assert(FSP_SUCCESS == err);

/* Set speed reference before motor run */
(void) RM_MOTOR_HALL_SpeedSet(g_motor_hall0_smpl.p_ctrl,
DEF_HALL_TEST_OVSPD_LIM);

/* Start motor rotation */
(void) RM_MOTOR_HALL_Run(g_motor_hall0_smpl.p_ctrl);

/* Get current status */
(void) RM_MOTOR_HALL_StatusGet(g_motor_hall0_smpl.p_ctrl, &smpl_status);

/* Get current rotor angle */
(void) RM_MOTOR_HALL_AngleGet(g_motor_hall0_smpl.p_ctrl, &smpl_angle);

/* Get current motor speed */
(void) RM_MOTOR_HALL_SpeedGet(g_motor_hall0_smpl.p_ctrl, &smpl_speed);

/* Check error */
(void) RM_MOTOR_HALL_ErrorCheck(g_motor_hall0_smpl.p_ctrl, &smpl_error);

/* Stop motor rotation */
(void) RM_MOTOR_HALL_Stop(g_motor_hall0_smpl.p_ctrl);

/* When error is detected with extra Hardware */
(void) RM_MOTOR_HALL_ErrorSet(g_motor_hall0_smpl.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);

/* Reset motor control (Clear error status) */
(void) RM_MOTOR_HALL_Reset(g_motor_hall0_smpl.p_ctrl);

/* Close motor control */
(void) RM_MOTOR_HALL_Close(g_motor_hall0_smpl.p_ctrl);
}
```

Function Documentation

◆ RM_MOTOR_HALL_Open()

```
fsp_err_t RM_MOTOR_HALL_Open ( motor_ctrl_t *const p_ctrl, motor_cfg_t const *const p_cfg )
```

Configure the MOTOR HALL in register start mode. Implements `motor_api_t::open`.

This function should only be called once as MOTOR configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
err = RM_MOTOR_HALL_Open(g_motor_hall0_smpl.p_ctrl, g_motor_hall0_smpl.p_cfg);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | MOTOR HALL successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

Note

◆ RM_MOTOR_HALL_Close()

```
fsp_err_t RM_MOTOR_HALL_Close ( motor_ctrl_t *const p_ctrl)
```

Disables specified Motor Hall Control block. Implements `motor_api_t::close`.

Example:

```
/* Close motor control */
(void) RM_MOTOR_HALL_Close(g_motor_hall0_smpl.p_ctrl);
```

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_HALL_Reset()**

```
fsp_err_t RM_MOTOR_HALL_Reset ( motor_ctrl_t *const p_ctrl)
```

Reset Motor Hall Control block. Implements [motor_api_t::reset](#).

Example:

```
/* Reset motor control (Clear error status) */
(void) RM_MOTOR_HALL_Reset(g_motor_hall0_smpl.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_HALL_Run()**

```
fsp_err_t RM_MOTOR_HALL_Run ( motor_ctrl_t *const p_ctrl)
```

Run Motor (Start motor rotation). Implements [motor_api_t::run](#).

Example:

```
/* Start motor rotation */
(void) RM_MOTOR_HALL_Run(g_motor_hall0_smpl.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ RM_MOTOR_HALL_Stop()

```
fsp_err_t RM_MOTOR_HALL_Stop ( motor_ctrl_t *const p_ctrl)
```

Stop Motor (Stop motor rotation). Implements `motor_api_t::stop`.

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_HALL_Stop(g_motor_hall0_smpl.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ RM_MOTOR_HALL_ErrorSet()

```
fsp_err_t RM_MOTOR_HALL_ErrorSet ( motor_ctrl_t *const p_ctrl, motor_error_t const error )
```

Set error information. Implements `motor_api_t::errorSet`.

Example:

```
/* When error is detected with extra Hardware */
(void) RM_MOTOR_HALL_ErrorSet(g_motor_hall0_smpl.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ RM_MOTOR_HALL_SpeedSet()

```
fsp_err_t RM_MOTOR_HALL_SpeedSet ( motor_ctrl_t *const p_ctrl, float const speed_rpm )
```

Set speed reference[rpm]. Implements `motor_api_t::speedSet`.

Example:

```
/* Set speed reference before motor run */
(void) RM_MOTOR_HALL_SpeedSet(g_motor_hall0_smpl.p_ctrl,
DEF_HALL_TEST_OVSPD_LIM);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ RM_MOTOR_HALL_StatusGet()

```
fsp_err_t RM_MOTOR_HALL_StatusGet ( motor_ctrl_t *const p_ctrl, uint8_t *const p_status )
```

Get current control status. Implements `motor_api_t::statusGet`.

Example:

```
/* Get current status */
(void) RM_MOTOR_HALL_StatusGet(g_motor_hall0_smpl.p_ctrl, &smpl_status);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_HALL_AngleGet()**

```
fsp_err_t RM_MOTOR_HALL_AngleGet ( motor_ctrl_t *const p_ctrl, float *const p_angle_rad )
```

Get current rotor angle. Implements `motor_api_t::angleGet`.

Example:

```
/* Get current rotor angle */
(void) RM_MOTOR_HALL_AngleGet(g_motor_hall0_smpl.p_ctrl, &smpl_angle);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_HALL_SpeedGet()**

```
fsp_err_t RM_MOTOR_HALL_SpeedGet ( motor_ctrl_t *const p_ctrl, float *const p_speed_rpm )
```

Get rotational speed. Implements `motor_api_t::speedGet`.

Example:

```
/* Get current motor speed */
(void) RM_MOTOR_HALL_SpeedGet(g_motor_hall0_smpl.p_ctrl, &smpl_speed);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_HALL_ErrorCheck()**

```
fsp_err_t RM_MOTOR_HALL_ErrorCheck ( motor_ctrl_t *const p_ctrl, uint16_t *const p_error )
```

Check the occurrence of Error. Implements `motor_api_t::errorCheck`.

Example:

```
/* Check error */
(void) RM_MOTOR_HALL_ErrorCheck(g_motor_hall0_smpl.p_ctrl, &smpl_error);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_HALL_PositionSet()**

```
fsp_err_t RM_MOTOR_HALL_PositionSet ( motor_ctrl_t *const p_ctrl, motor_speed_position_data_t
const *const p_position )
```

Set position reference. Implements `motor_api_t::positionSet`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

Note

◆ **RM_MOTOR_HALL_WaitStopFlagGet()**

```
fsp_err_t RM_MOTOR_HALL_WaitStopFlagGet ( motor_ctrl_t *const p_ctrl, motor_wait_stop_flag_t
*const p_flag )
```

Get wait stop flag. Implements `motor_api_t::waitStopFlagGet`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

Note

◆ RM_MOTOR_HALL_FunctionSelect()

```
fsp_err_t RM_MOTOR_HALL_FunctionSelect ( motor_ctrl_t *const p_ctrl, motor_function_select_t
const function )
```

Select function. Implements `motor_api_t::functionSelect`.

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

`fsp_err_t` [RM_MOTOR_RETURN_ORIGIN_SpeedCyclic](#) (`motor_return_origin_ctrl_t *const p_ctrl`)

Cyclic process of return origin function at speed control period. (Called at timer interrupt.) Implements [motor_return_origin_api_t::speedCyclic. More...](#)

`fsp_err_t` [RM_MOTOR_RETURN_ORIGIN_ParameterUpdate](#) (`motor_return_origin_ctrl_t *const p_ctrl, motor_return_origin_cfg_t const *const p_cfg`)

Update the parameters of return origin function. Implements [motor_return_origin_api_t::parameterUpdate. More...](#)

Detailed Description

Search origin position process for the motor control on RA MCUs. This module implements the [Motor Return Origin Function Interface](#).

Overview

The motor return origin module is used to search origin position in an application. This module should be used with Renesas Motor Workbench (RMW) basically.

Features

The Motor return origin module has below features.

- Search origin position automatically.

Configuration

Build Time Configurations for `rm_motor_return_origin`

The following build time configurations are defined in fsp_cfg/rm_motor_return_origin_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> Default (BSP) Enabled Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > Motor return origin function (rm_motor_return_origin)

This module can be added to the Stacks tab via New Stack > Motor > Motor return origin function (rm_motor_return_origin).

| Configuration | Options | Default | Description |
|--|-------------------------------------|------------------------|---|
| General | | | |
| Name | Name must be a valid C symbol | g_motor_return_origin0 | Module name. |
| Using mode | Search by pushing | Search by pushing | Select using mode |
| Search speed (rpm) | Must be a valid non-negative value. | 10.0 | Speed to search origin position (rpm) |
| Acceleration of speed (rpm/sec) | Must be set 1 to 10000. | 10000.0 | Acceleration of rotation speed at return moving (rpm/sec) |
| Cyclic period of speed control (sec) | Must be a valid non-negative value. | 0.0005 | Cyclic period of speed control (sec) |
| Maximum current (A) | Must be a valid non-negative value. | 1.8 | Maximum current (A). Please set to match used motor. |
| Percentage of current to judge pushing (%) | Must be a valid non-negative value. | 30.0 | Percentage of current to judge pushing (%) |
| Pushing time (sec) | Must be a valid non-negative value. | 1.0 | Time to push the stopper (sec) |
| Degree to judge none stopper | Must be set -360 to 360. | 360.0 | When the motor runs over this value, it is judged impossible to search the stopper. |
| Degree to return | Must be a valid non-negative value. | 3.0 | Degree to return from the stopper (degree) |
| Mechanical gear ratio | Must be a valid non-negative value. | 1.0 | Mechanical gear ratio |

Clock Configuration

This module doesn't depend on clock setting.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

Examples

Basic Example

This is a basic example of minimal use of the Motor Return origin in an application.

```
void motor_return_origin_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the module. */
    err = RM_MOTOR_RETURN_ORIGIN_Open(&g_mtr_return_origin0_ctrl,
&g_mtr_return_origin0_cfg);
    assert(FSP_SUCCESS == err);

    /* Start process. */
    err = RM_MOTOR_RETURN_ORIGIN_Start(&g_mtr_return_origin0_ctrl);
    temp_set_data.f_iq          = 1.0F;
    temp_set_data.f_position_degree = 180.0F;

    /* Set data to the module. */
    err = RM_MOTOR_RETURN_ORIGIN_DataSet(&g_mtr_return_origin0_ctrl, &temp_set_data);

    /* Get information from the module. */
    err = RM_MOTOR_RETURN_ORIGIN_InfoGet(&g_mtr_return_origin0_ctrl, &temp_info);

    /* Stop process. */
    err = RM_MOTOR_RETURN_ORIGIN_Stop(&g_mtr_return_origin0_ctrl);

    /* Close the module. */
    err = RM_MOTOR_RETURN_ORIGIN_Close(&g_mtr_return_origin0_ctrl);
}
```

Function Documentation

◆ RM_MOTOR_RETURN_ORIGIN_Open()

```
fsp_err_t RM_MOTOR_RETURN_ORIGIN_Open ( motor_return_origin_ctrl_t *const p_ctrl,
motor_return_origin_cfg_t const *const p_cfg )
```

Opens and configures the motor return origin module. Implements `motor_return_origin_api_t::open`.

Example:

```
/* Initializes the module. */
err = RM_MOTOR_RETURN_ORIGIN_Open(&g_mtr_return_origin0_ctrl,
&g_mtr_return_origin0_cfg);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Motor return origin module successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ RM_MOTOR_RETURN_ORIGIN_Close()

```
fsp_err_t RM_MOTOR_RETURN_ORIGIN_Close ( motor_return_origin_ctrl_t *const p_ctrl)
```

Disables specified motor return origin module. Implements `motor_return_origin_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MOTOR_RETURN_ORIGIN_Close(&g_mtr_return_origin0_ctrl);
```

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_RETURN_ORIGIN_Start()**

```
fsp_err_t RM_MOTOR_RETURN_ORIGIN_Start ( motor_return_origin_ctrl_t *const p_ctrl)
```

Start return origin function. Implements `motor_return_origin_api_t::start`.

Example:

```
/* Start process. */
err = RM_MOTOR_RETURN_ORIGIN_Start(&g_mtr_return_origin0_ctrl);
```

Return values

| | |
|-------------------|-----------------------|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_RETURN_ORIGIN_Stop()**

```
fsp_err_t RM_MOTOR_RETURN_ORIGIN_Stop ( motor_return_origin_ctrl_t *const p_ctrl)
```

Stop (Cancel) return origin function. Implements `motor_return_origin_api_t::stop`.

Example:

```
/* Stop process. */
err = RM_MOTOR_RETURN_ORIGIN_Stop(&g_mtr_return_origin0_ctrl);
```

Return values

| | |
|-------------------|----------------------------------|
| FSP_SUCCESS | Successfully stopped (canceled). |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_RETURN_ORIGIN_Reset()**

```
fsp_err_t RM_MOTOR_RETURN_ORIGIN_Reset ( motor_return_origin_ctrl_t *const p_ctrl)
```

Reset variables of return origin module. Implements `motor_return_origin_api_t::reset`.

Return values

| | |
|-------------------|---------------------|
| FSP_SUCCESS | Successfully reset. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MOTOR_RETURN_ORIGIN_InfoGet()**

```
fsp_err_t RM_MOTOR_RETURN_ORIGIN_InfoGet ( motor_return_origin_ctrl_t *const p_ctrl,
motor_return_origin_info_t *const p_info )
```

Get information of return origin. Implements `motor_return_origin_api_t::infoGet`.

Example:

```
/* Get information from the module. */
err = RM_MOTOR_RETURN_ORIGIN_InfoGet(&g_mtr_return_origin0_ctrl, &temp_info);
```

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successfully get data. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ **RM_MOTOR_RETURN_ORIGIN_DataSet()**

```
fsp_err_t RM_MOTOR_RETURN_ORIGIN_DataSet ( motor_return_origin_ctrl_t *const p_ctrl,
motor_return_origin_set_data_t *const p_set_data )
```

Set necessary data to return origin function. Implements `motor_return_origin_api_t::dataSet`.

Example:

```
/* Set data to the module. */
err = RM_MOTOR_RETURN_ORIGIN_DataSet(&g_mtr_return_origin0_ctrl, &temp_set_data);
```

Return values

| | |
|--------------------------|------------------------|
| FSP_SUCCESS | Successfully set data. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

◆ RM_MOTOR_RETURN_ORIGIN_SpeedCyclic()

`fsp_err_t RM_MOTOR_RETURN_ORIGIN_SpeedCyclic (motor_return_origin_ctrl_t *const p_ctrl)`

Cyclic process of return origin function at speed control period. (Called at timer interrupt.)
Implements `motor_return_origin_api_t::speedCyclic`.

Return values

| | |
|-------------------|-----------------------------------|
| FSP_SUCCESS | Successfully perform the process. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_MOTOR_RETURN_ORIGIN_ParameterUpdate()

`fsp_err_t RM_MOTOR_RETURN_ORIGIN_ParameterUpdate (motor_return_origin_ctrl_t *const p_ctrl, motor_return_origin_cfg_t const *const p_cfg)`

Update the parameters of return origin function. Implements `motor_return_origin_api_t::parameterUpdate`.

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Successfully data was updated. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter error. |

Detailed Description

Control a SPM motor on RA MCUs. This module implements the [Motor vector control with induction sensor \(rm_motor_induction\)](#).

Overview

The motor vector control with induction sensor is used to control motor rotation in an application. This module is meant to be used with Surface Permanent Magnet (SPM) motors and allows applications to start or stop motor rotation easily.

Features

The motor induction module has below features.

- Start/stop motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

Target Hardware

The below figure shows an example of target hardware of this Motor Induction Module.

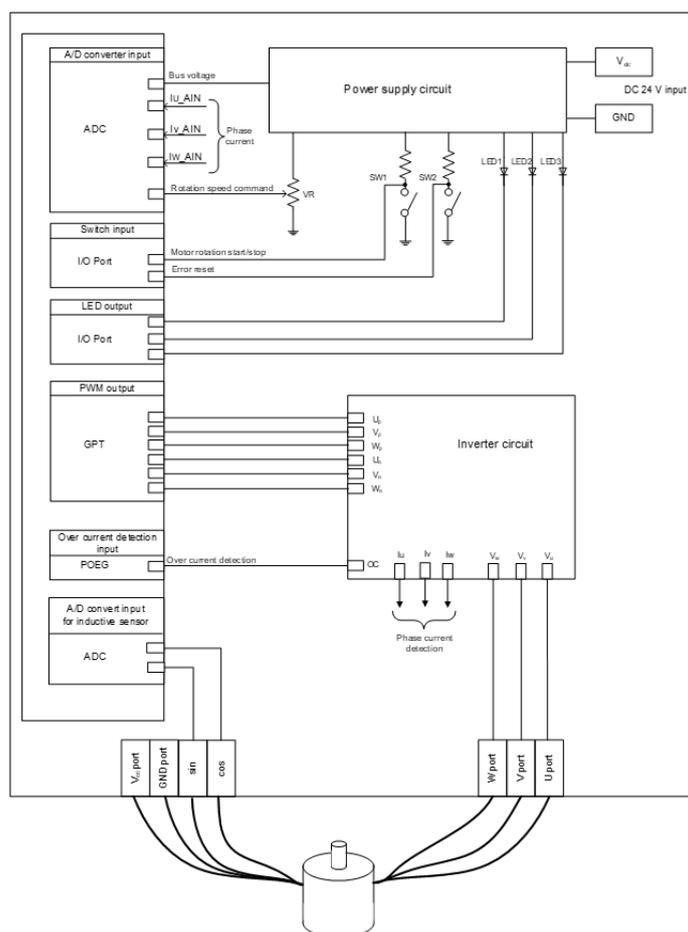

Figure 269: Example of target hardware of motor induction module

Block Diagram

The below figures show block diagram of vector motor control with using induction sensor.

$$\begin{pmatrix} V'_u \\ V'_v \\ V'_w \end{pmatrix} = \begin{pmatrix} V_u \\ V_v \\ V_w \end{pmatrix} + \Delta V \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$$

$$\therefore \Delta V = -\frac{V_{max}+V_{min}}{2}, V_{max} = \max\{V_u, V_v, V_w\}, V_{min} = \min\{V_u, V_v, V_w\}$$

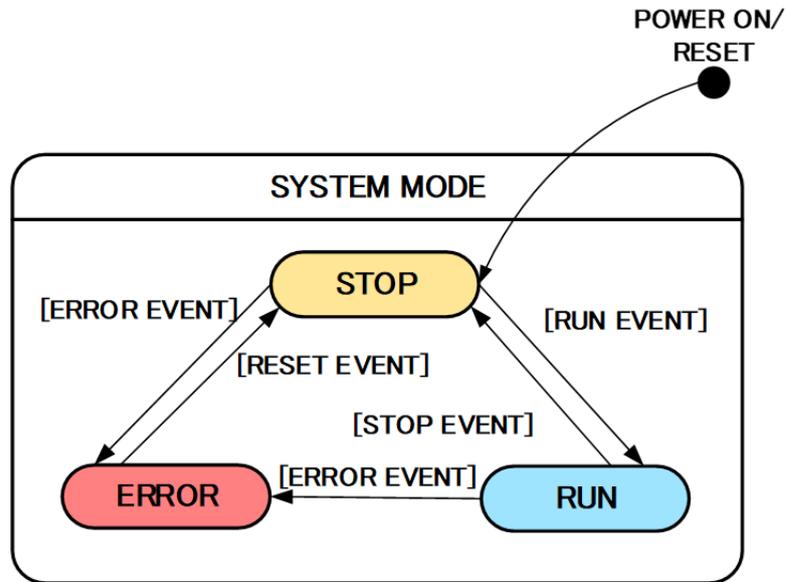

V_u, V_v, V_w : Command values of U-, V-, and W-phases

V'_u, V'_v, V'_w : Command values of U-, V-, and W-phases for PWM generation (modulation wave)

Figure 272: Space vector modulation

State transition

The below figure shows a state transition diagram. Internal state is managed by "SYSTEM MODE".

| | | MODE | | |
|-------|-------|-------|-------|-------|
| | | STOP | RUN | ERROR |
| EVENT | STOP | STOP | STOP | ERROR |
| | RUN | RUN | RUN | ERROR |
| | ERROR | ERROR | ERROR | ERROR |
| | RESET | STOP | RUN | STOP |

Figure 273: State transition diagram

(1) SYSTEM MODE "SYSTEM MODE" indicates the operating states of the system. The state transits on occurrence of each event (EVENT). "SYSTEM MODE" has 3 states that are motor drive stop (INACTIVE), motor drive (ACTIVE), and abnormal condition (ERROR).

(2) EVENT When "EVENT" occurs in each "SYSTEM MODE", "SYSTEM MODE" changes as shown the table in above figure, according to that "EVENT". The occurrence factors of each event are shown below.

| EVENT name | Occurrence factor |
|------------|----------------------------------|
| STOP | by user operation |
| RUN | by user operation |
| ERROR | when the system detects an error |
| RESET | by user operation |

Flowchart

The below figures show flowcharts of motor induction module.

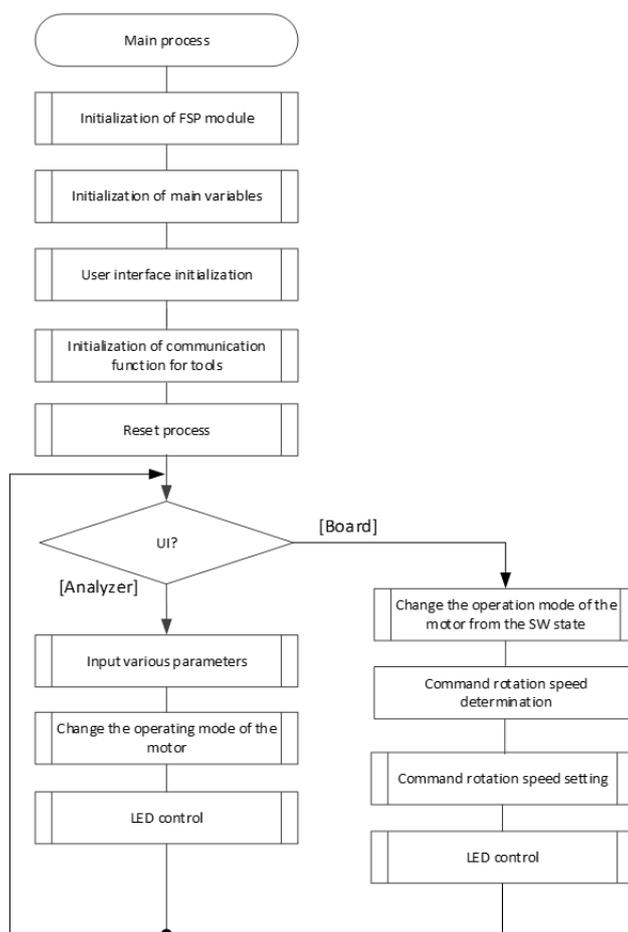

Figure 274: Main process

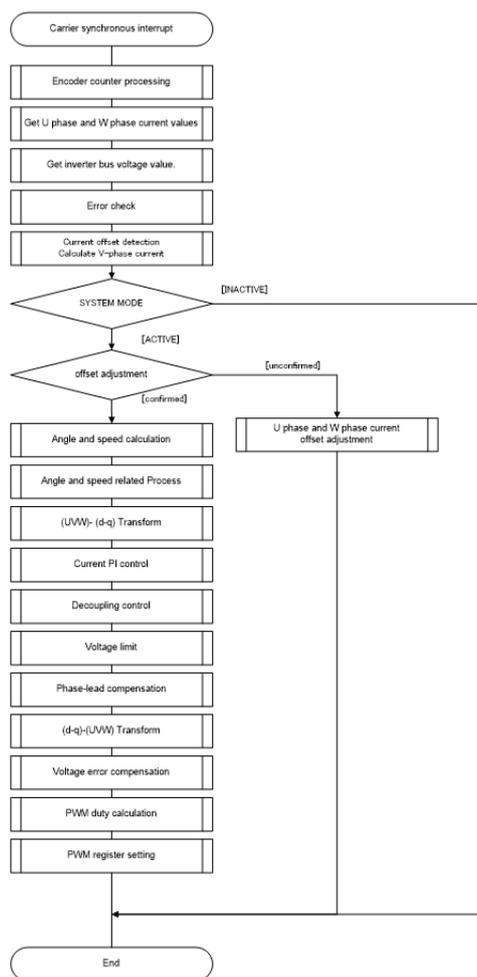

Figure 275: Current control process

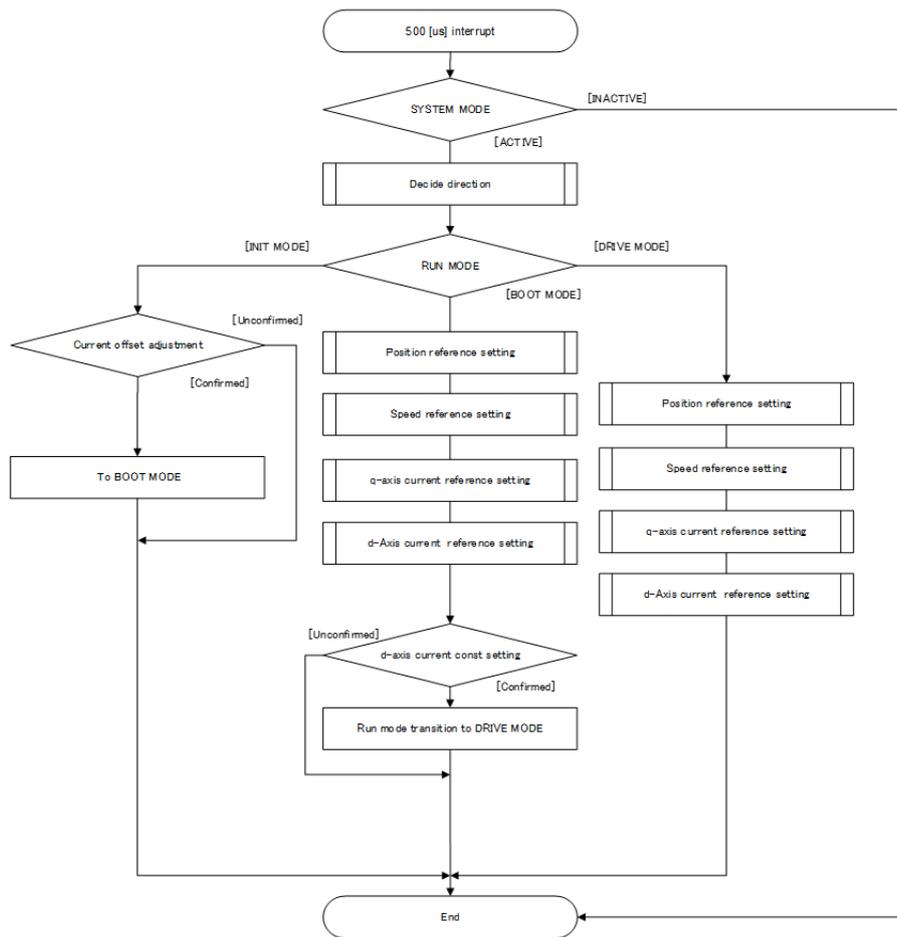

Figure 276: Speed control process

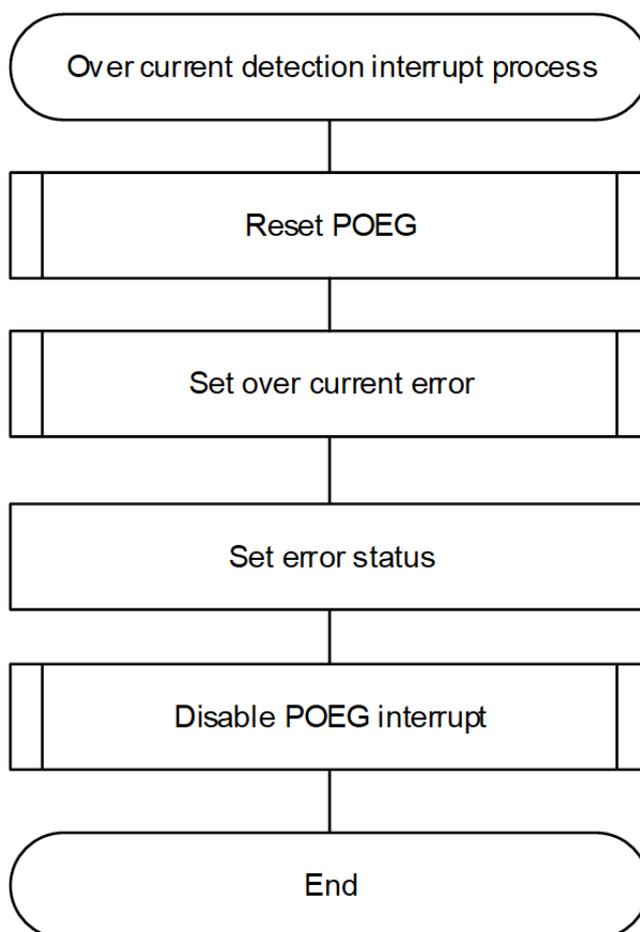

Figure 277: Over current detection interrupt process

Configuration

Build Time Configurations for rm_motor_induction

The following build time configurations are defined in fsp_cfg/rm_motor_induction_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Motor > Motor vector control with induction sensor (rm_motor_induction)

This module can be added to the Stacks tab via New Stack > Motor > Motor vector control with induction sensor (rm_motor_induction).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

General

| | | | |
|---------------------------|-------------------------------|--------------------|--|
| Name | Name must be a valid C symbol | g_motor_induction0 | Module name. |
| Limit of over current (A) | Must be a valid value | 2.0F | Limit of over current.(Detection threshold) |
| Limit of over voltage (V) | Must be a valid value | 28.0F | Limit of over voltage.(Detection threshold) |
| Limit of over speed (rpm) | Must be a valid value | 3000.0F | Limit of over speed.(Detection threshold) |
| Limit of low voltage (V) | Must be a valid value | 18.0F | Limit of low voltage.(Detection threshold) |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | NULL | A user callback function. If this callback function is provided, it is called at speed control cyclic interrupt. |

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

Pin Configuration

This module does not use I/O pins. Please set used pins on configuration of each hardware modules.

Usage Notes

Limitations

- Set the limit of electric current with non-negative value.
- Set the limit of input voltage with non-negative value.
- Set the limit of rotational speed with non-negative value.

Examples

Basic Example

This is a basic example of minimal use of the motor induction module in an application.

```
void motor_induction_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
}
```

```
err = RM_MOTOR_INDUCTION_Open(g_motor_induction0_smpl.p_ctrl,
g_motor_induction0_smpl.p_cfg);
handle_error(err);
/* Set speed reference before motor run */
(void) RM_MOTOR_INDUCTION_SpeedSet(g_motor_induction0_smpl.p_ctrl,
RM_MOTOR_INDUCTION_TEST_OVER_SPEED_LIMIT);
/* Set position reference before motor run */
(void) RM_MOTOR_INDUCTION_PositionSet(g_motor_induction0_smpl.p_ctrl,
&g_posref_sample1);
/* Start motor rotation */
(void) RM_MOTOR_INDUCTION_Run(g_motor_induction0_smpl.p_ctrl);
/* Get current status */
(void) RM_MOTOR_INDUCTION_StatusGet(g_motor_induction0_smpl.p_ctrl,
&smpl_status);
/* Get current rotor angle */
(void) RM_MOTOR_INDUCTION_AngleGet(g_motor_induction0_smpl.p_ctrl, &smpl_angle);
/* Get current motor rotational speed */
(void) RM_MOTOR_INDUCTION_SpeedGet(g_motor_induction0_smpl.p_ctrl, &smpl_speed);
/* Check error */
(void) RM_MOTOR_INDUCTION_ErrorCheck(g_motor_induction0_smpl.p_ctrl,
&smpl_error);
/* Stop motor rotation */
(void) RM_MOTOR_INDUCTION_Stop(g_motor_induction0_smpl.p_ctrl);
/* If need, set extra error status */
(void) RM_MOTOR_INDUCTION_ErrorSet(g_motor_induction0_smpl.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
/* Reset motor control */
(void) RM_MOTOR_INDUCTION_Reset(g_motor_induction0_smpl.p_ctrl);
/* Close motor control */
(void) RM_MOTOR_INDUCTION_Close(g_motor_induction0_smpl.p_ctrl);
}
```

Enumerations

enum [motor_induction_ctrl_t](#)

enum [motor_induction_ctrl_event_t](#)

Enumeration Type Documentation

◆ motor_induction_ctrl_t

| enum motor_induction_ctrl_t | |
|---|-------------|
| Enumerator | |
| MOTOR_INDUCTION_CTRL_STOP | Stop mode. |
| MOTOR_INDUCTION_CTRL_RUN | Run mode. |
| MOTOR_INDUCTION_CTRL_ERROR | Error mode. |

◆ motor_induction_ctrl_event_t

| enum motor_induction_ctrl_event_t | |
|---|--------------|
| Enumerator | |
| MOTOR_INDUCTION_CTRL_EVENT_STOP | Stop event. |
| MOTOR_INDUCTION_CTRL_EVENT_RUN | Run event. |
| MOTOR_INDUCTION_CTRL_EVENT_ERROR | Error event. |
| MOTOR_INDUCTION_CTRL_EVENT_RESET | Reset event. |

Function Documentation

◆ RM_MOTOR_INDUCTION_Open()

```
fsp_err_t RM_MOTOR_INDUCTION_Open ( motor_ctrl_t *const p_ctrl, motor_cfg_t const *const p_cfg )
```

Configure the MOTOR in register start mode. Implements `motor_api_t::open`.

This function should only be called once as MOTOR configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
err = RM_MOTOR_INDUCTION_Open(g_motor_induction0_smpl.p_ctrl,
g_motor_induction0_smpl.p_cfg);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | MOTOR successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

Note

◆ RM_MOTOR_INDUCTION_Close()

```
fsp_err_t RM_MOTOR_INDUCTION_Close ( motor_ctrl_t *const p_ctrl)
```

Disables specified Motor Induction Control block. Implements `motor_api_t::close`.

Example:

```
/* Close motor control */
(void) RM_MOTOR_INDUCTION_Close(g_motor_induction0_smpl.p_ctrl);
```

Return values

| | |
|-------------------|----------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ RM_MOTOR_INDUCTION_Reset()

```
fsp_err_t RM_MOTOR_INDUCTION_Reset ( motor_ctrl_t *const p_ctrl)
```

Reset Motor Induction Control block. Implements `motor_api_t::reset`.

Example:

```
/* Reset motor control */
(void) RM_MOTOR_INDUCTION_Reset(g_motor_induction0_smpl.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ RM_MOTOR_INDUCTION_Run()

```
fsp_err_t RM_MOTOR_INDUCTION_Run ( motor_ctrl_t *const p_ctrl)
```

Run Motor (Start motor rotation). Implements `motor_api_t::run`.

Example:

```
/* Start motor rotation */
(void) RM_MOTOR_INDUCTION_Run(g_motor_induction0_smpl.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ RM_MOTOR_INDUCTION_Stop()

`fsp_err_t RM_MOTOR_INDUCTION_Stop (motor_ctrl_t *const p_ctrl)`

Stop Motor (Stop motor rotation). Implements `motor_api_t::stop`.

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_INDUCTION_Stop(g_motor_induction0_smpl.p_ctrl);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ RM_MOTOR_INDUCTION_ErrorSet()

`fsp_err_t RM_MOTOR_INDUCTION_ErrorSet (motor_ctrl_t *const p_ctrl, motor_error_t const error)`

Set error information. Implements `motor_api_t::errorSet`.

Example:

```
/* If need, set extra error status */
(void) RM_MOTOR_INDUCTION_ErrorSet(g_motor_induction0_smpl.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_INDUCTION_SpeedSet()**

```
fsp_err_t RM_MOTOR_INDUCTION_SpeedSet ( motor_ctrl_t *const p_ctrl, float const speed_rpm )
```

Set speed reference[rpm]. Implements `motor_api_t::speedSet`.

Example:

```
/* Set speed reference before motor run */
(void) RM_MOTOR_INDUCTION_SpeedSet(g_motor_induction0_smpl.p_ctrl,
RM_MOTOR_INDUCTION_TEST_OVER_SPEED_LIMIT);
```

Return values

| | |
|-------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Note

◆ **RM_MOTOR_INDUCTION_PositionSet()**

```
fsp_err_t RM_MOTOR_INDUCTION_PositionSet ( motor_ctrl_t *const p_ctrl,
motor_speed_position_data_t const *const p_position )
```

Set position reference[degree]. Implements `motor_api_t::positionSet`.

Example:

```
/* Set position reference before motor run */
(void) RM_MOTOR_INDUCTION_PositionSet(g_motor_induction0_smpl.p_ctrl,
&g_posref_sample1);
```

Return values

| | |
|--------------------------|-------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data set pointer is invalid.. |

Note

◆ RM_MOTOR_INDUCTION_StatusGet()

```
fsp_err_t RM_MOTOR_INDUCTION_StatusGet ( motor_ctrl_t *const p_ctrl, uint8_t *const p_status )
```

Get current control status. Implements `motor_api_t::statusGet`.

Example:

```
/* Get current status */
(void) RM_MOTOR_INDUCTION_StatusGet(g_motor_induction0_smpl.p_ctrl,
&smpl_status);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ RM_MOTOR_INDUCTION_AngleGet()

```
fsp_err_t RM_MOTOR_INDUCTION_AngleGet ( motor_ctrl_t *const p_ctrl, float *const p_angle_rad )
```

Get current rotor angle. Implements `motor_api_t::angleGet`.

Example:

```
/* Get current rotor angle */
(void) RM_MOTOR_INDUCTION_AngleGet(g_motor_induction0_smpl.p_ctrl, &smpl_angle);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_INDUCTION_SpeedGet()**

```
fsp_err_t RM_MOTOR_INDUCTION_SpeedGet ( motor_ctrl_t *const p_ctrl, float *const p_speed_rpm )
```

Get rotational speed. Implements `motor_api_t::speedGet`.

Example:

```
/* Get current motor rotational speed */
(void) RM_MOTOR_INDUCTION_SpeedGet(g_motor_induction0_smpl.p_ctrl, &smpl_speed);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_INDUCTION_ErrorCheck()**

```
fsp_err_t RM_MOTOR_INDUCTION_ErrorCheck ( motor_ctrl_t *const p_ctrl, uint16_t *const p_error )
```

Check the occurrence of Error. Implements `motor_api_t::errorCheck`.

Example:

```
/* Check error */
(void) RM_MOTOR_INDUCTION_ErrorCheck(g_motor_induction0_smpl.p_ctrl,
&smpl_error);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Data received pointer is invalid.. |

Note

◆ **RM_MOTOR_INDUCTION_WaitStopFlagGet()**

```
fsp_err_t RM_MOTOR_INDUCTION_WaitStopFlagGet ( motor_ctrl_t *const p_ctrl,
motor_wait_stop_flag_t *const p_flag )
```

Get wait stop flag. Implements `motor_api_t::waitStopFlagGet`.

Example:

Return values

| | |
|---------------------|--------------|
| FSP_ERR_UNSUPPORTED | Unsupported. |
|---------------------|--------------|

Note

◆ **RM_MOTOR_INDUCTION_FunctionSelect()**

```
fsp_err_t RM_MOTOR_INDUCTION_FunctionSelect ( motor_ctrl_t *const p_ctrl,
motor_function_select_t const function )
```

Select using function. Implements `motor_api_t::functionSelect`.

Return values

| | |
|----------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatched |

Note

◆ **RM_MOTOR_INDUCTION_InertiaEstimateStart()**

```
fsp_err_t RM_MOTOR_INDUCTION_InertiaEstimateStart ( motor_ctrl_t *const p_ctrl)
```

Start inertia estimation function.

Return values

| | |
|----------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatched |

Note

◆ **RM_MOTOR_INDUCTION_InertiaEstimateStop()**

fsp_err_t RM_MOTOR_INDUCTION_InertiaEstimateStop (motor_ctrl_t *const p_ctrl)

Stop(Cancel) inertia estimation function.

Return values

| | |
|----------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatched |

Note◆ **RM_MOTOR_INDUCTION_ReturnOriginStart()**

fsp_err_t RM_MOTOR_INDUCTION_ReturnOriginStart (motor_ctrl_t *const p_ctrl)

Start return origin function.

Return values

| | |
|----------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatched |

Note

◆ RM_MOTOR_INDUCTION_ReturnOriginStop()

```
fsp_err_t RM_MOTOR_INDUCTION_ReturnOriginStop ( motor_ctrl_t *const p_ctrl)
```

Stop(Cancel) return origin function.

Return values

| | |
|----------------------|------------------------|
| FSP_SUCCESS | Successfully resetted. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Mode unmatch |

Note

5.2.12 Networking

Modules

Detailed Description

Networking Modules.

Modules

[AWS Cellular Interface on RYZ \(rm_cellular_ryz_aws\)](#)

Middleware implementing the AWS Cellular API for RYZ cellular modems.

[AWS MQTT](#)

This module provides the AWS MQTT integration documentation.

[AWS OTA PAL on MCUBoot \(rm_aws_ota_pal_mcuboot\)](#)

AWS OTA PAL layer implementation for downloading firmware updates.

[AWS PKCS11 PAL on LittleFS \(rm_aws_pkcs11_pal_littlefs\)](#)

PKCS#11 PAL LittleFS layer implementation for use by FreeRTOS TLS.

[AWS coreHTTP](#)

This module provides the AWS coreHTTP library.

[Azure Embedded Wireless Framework RYZ Port \(rm_azure_ewf_ryz\)](#)

[BLE Abstraction \(rm_ble_abs\)](#)

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the [BLE ABS Interface](#).

[BLE Driver \(r_ble_balance\)](#)

Driver for the Radio peripheral on RA MCUs. This module implements the [BLE Interface](#).

[BLE Driver \(r_ble_compact\)](#)

Driver for the Radio peripheral on RA MCUs. This module implements the [BLE Interface](#).

[BLE Driver \(r_ble_extended\)](#)

Driver for the Radio peripheral on RA MCUs. This module implements the [BLE Interface](#).

[BLE Mesh Network Modules](#)

BLE Mesh Network Modules.

[Cellular Comm Interface on UART \(rm_cellular_comm_uart_aws\)](#)

Middleware implementing the AWS Cellular Comm Interface for the FSP UART API.

[DA16XXX Transport Layer \(rm_at_transport_da16xxx_uart\)](#)

Transport layer implementation for linking DA16XXX Drivers with Communications layer.

[Ethernet \(r_ether\)](#)

Driver for the Ethernet peripheral on RA MCUs. This module implements the [Ethernet Interface](#).

[Ethernet \(r_ether_phy\)](#)

The Ethernet PHY module (`r_ether_phy`) provides an API for standard Ethernet PHY communications applications that use the ETHERC peripheral. It implements the [Ethernet PHY Interface](#).

[FreeRTOS+TCP Wrapper to r_ether \(rm_freertos_plus_tcp\)](#)

Middleware for using TCP on RA MCUs.

[GTL BLE Abstraction \(rm_ble_abs_gtl\)](#)

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the [BLE ABS Interface](#).

[NetX Duo Ethernet Driver \(rm_netxduo_ether\)](#)

[NetX Duo WiFi Driver \(rm_netxduo_wifi\)](#)

[On Chip HTTP Client on DA16XXX \(rm_http_onchip_da16xxx\)](#)

HTTP client implementation using the DA16XXX WiFi module on RA MCUs.

[On Chip MQTT Client on DA16XXX \(rm_mqtt_onchip_da16xxx\)](#)

MQTT client implementation using the DA16XXX WiFi module on RA MCUs.

[PTP \(r_ptp\)](#)

Driver for the PTP peripheral on RA MCUs. This module implements the [PTP Interface](#).

[SPP BLE Abstraction \(rm_ble_abs_spp\)](#)

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the [BLE ABS Interface](#).

[WiFi Onchip DA16XXX Framework Driver \(rm_wifi_da16xxx\)](#)

Wifi and Socket implementation using the da16xxx WiFi module on RA MCUs.

[WiFi Onchip Silex Driver using r_sci_uart \(rm_wifi_onchip_silex\)](#)

Wifi and Socket implementation using the Silex SX-ULPGN WiFi module on RA MCUs.

5.2.12.1 AWS Cellular Interface on RYZ (rm_cellular_ryz_aws)

[Modules](#) » [Networking](#)

Middleware implementing the AWS Cellular API for RYZ cellular modems.

Overview

See AWS documentation for how the Cellular API works: <https://www.freertos.org/Documentation/api-ref/cellular/index.html>

Features

The following RYZ modems are supported by this port:

- RYZ014A
(<https://www.renesas.com/us/en/products/interface-connectivity/wireless-communications/cellular-iot-modules/ryz014a-lte-cat-m1-cellular-iot-module>)
- RYZ024A
(<https://www.renesas.com/us/en/products/interface-connectivity/wireless-communications/cellular-iot-modules/ryz024a-lte-cat-m1-cellular-iot-module-global-deployment>)

Please see the data sheets for hardware configuration for modems. Some notable differences between the two are:

- RYZ014A default baud is 921600. RYZ024A default baud is 115200.
- RYZ014A reset pin has to be toggled high to reset the modem. RYZ024A is the opposite and has to be toggled low.
- RYZ024A doesn't support AT+CREG. AT+CEREG should be used instead.

All APIs are supported by the RYZ port with the exception of the following RAT APIs:

- Cellular_SetRatPriority
- Cellular_GetRatPriority

The following URCs are supported by the RYZ port:

- CEREG (Cellular_RegisterUrcNetworkRegistrationEventCallback)
- SYSSTART (Cellular_RegisterModemEventCallback)
- SHUTDOWN (Cellular_RegisterModemEventCallback)
- SQNSRING (Cellular_SocketRegisterDataReadyCallback)

Support for other RYZ URCs can be possibly added by request in future releases.

Limitations

- RYZ024A doesn't support AT+CREG. API implementations don't use AT+CREG and use AT+CEREG instead.
- This module does not handle the RYZ reset pin. The user should manually configure this pin

in order to reset the module.

- The RYZ can only be used in buffer reception mode, not transparent mode. When calling Cellular_SocketConnect only CELLULAR_ACCESSMODE_BUFFER is supported.
- The AWS Cellular APIs don't currently allow the local port to be set for UDP. It can be set by modifying the localPort field in CellularSocketHandle_t after calling Cellular_CreateSocket but before calling Cellular_SocketConnect.

Configuration

AWS Cellular Interface

Build Time Configurations for source

The following build time configurations are defined in aws/cellular_interface/cellular_config.h:

| Configuration | Options | Default | Description |
|---|----------------------------------|---------|--|
| Mobile Country Code Max Size | Value must be a positive integer | 3 | Mobile country code max size. |
| Mobile Network Node Max Size | Value must be a positive integer | 3 | Mobile network code max size. |
| Integrated Circuit Card Identity Max Size | Value must be a positive integer | 20 | Integrated circuit card identity max size. |
| International Mobile Subscriber Identity Max Size | Value must be a positive integer | 15 | International Mobile Subscriber Identity max size. |
| Firmware Version Max Size | Value must be a positive integer | 32 | Cellular module firmware version max size. |
| Hardware Version Max Size | Value must be a positive integer | 12 | Cellular module hardware version max size. |
| Serial Number Max Size | Value must be a positive integer | 12 | Cellular module serial number max size. |
| International Mobile Equipment Identity Max Size | Value must be a positive integer | 15 | International Mobile Equipment Identity number max size. |
| Registered Network operator Name Max Size | Value must be a positive integer | 32 | Registered network operator name max size. |
| Access Point Name Max Size | Value must be a positive integer | 64 | Access point name max size. |
| Packet Data Network Username Max Size | Value must be a positive integer | 32 | Packet data network username max size. |
| Packet Data Network Password Max Size | Value must be a positive integer | 32 | Packet data network password max size. |
| Data Network IP | Value must be a | 40 | Cellular data network |

| | | | |
|--|--|--------------------|--|
| Address Max Size | positive integer | | IP address max size. |
| AT Command Max Size | Value must be a positive integer | 200 | Cellular AT command max size. |
| Max Number of Sockets | Value must be a positive integer | 6 | Cellular module number of socket max size. |
| Manufacturer ID Max Size | Value must be a positive integer | 20 | Cellular module manufacturer ID max size. |
| Model ID Max Size | Value must be a positive integer | 10 | Model ID max size. |
| EDRX List Max Size | Value must be a positive integer | 4 | EDRX list max size. |
| PDN Context ID Min Value | Value must be a positive integer | 1 | PDN context ID min value. |
| PDN Context ID Max Value | Value must be a positive integer | 16 | PDN context ID max value. |
| RAT Priority Count | Value must be a positive integer | 3 | RAT (radio access technology) priority count. |
| Socket Max Send Data Length (bytes) | Value must be in the range 1 - 1500 | 1460 | Socket max send data length. |
| Socket Max Receive Data Length (bytes) | Value must be in the range 1 - 1500 | 1500 | Socket max receive data length. |
| GetHostByName Support | <ul style="list-style-type: none"> • Enabled (default) • Disabled | Enabled (default) | Enables/disable GetHostByName. |
| Comm Interface Send Timeout (ms) | Value must be a positive integer | 1000 | Cellular comm interface receive timeout in ms. |
| Comm Interface Receive Timeout (ms) | Value must be a positive integer | 50 | Cellular comm interface receive timeout in ms. |
| Static Allocation Context | <ul style="list-style-type: none"> • Enabled • Disabled (default) | Disabled (default) | Use statically allocated context. |
| Comm Interface Static Allocation Context | <ul style="list-style-type: none"> • Enabled • Disabled (default) | Disabled (default) | Use statically allocated context for comm interface. |
| Default RAT | <ul style="list-style-type: none"> • GSM • WCDMA • EDGE • HSDPA • HSUPA • HSDPAHSUPA | CATM1 | Default Radio Access Technology. |

| | | | |
|-----------------------------------|---|--------------------|---|
| | <ul style="list-style-type: none"> • LTE • CATM1 • NB1OT | | |
| GSM Support | <ul style="list-style-type: none"> • Enabled • Disabled (default) | Disabled (default) | This should be disabled when a modem doesn't support GSM or the AT+CGREG command. |
| Static Socket Context | <ul style="list-style-type: none"> • Enabled • Disabled (default) | Disabled (default) | Use statically allocated socket. |
| AT Command Timeout (ms) | Value must be a positive integer | 5000 | Cellular common AT command timeout. |
| AT Command Raw Timeout (ms) | Value must be a positive integer | 5000 | Cellular AT command raw timeout. |
| AT Command Response prefix length | Value must be a positive integer | 5000 | Cellular AT command response prefix string length. |

RYZ Cellular Interface Port

Configurations for Networking > AWS Cellular Interface on RYZ (rm_cellular_ryz_aws)

This module can be added to the Stacks tab via New Stack > Networking > AWS Cellular Interface on RYZ (rm_cellular_ryz_aws).

| Configuration | Options | Default | Description |
|--------------------------------|---|---------|---|
| Module Reset Pin (Port Number) | Refer to the RA Configuration tool for available options. | 00 | Specify the reset control port for the RYZ module. This property is only used in devassist. |
| Module Reset Pin (Pin Number) | Refer to the RA Configuration tool for available options. | 00 | Specify the reset control pin for the RYZ module. This property is only used in devassist. |

Examples

Basic Example

```
void rm_cellular_ryz_aws_basic_example (void)
{
    CellularHandle_t      cellular_handle = NULL;
    CellularSimCardStatus_t sim_card_status;

    /* Initialize Cellular Modem. */

    CellularError_t err = Cellular_Init(&cellular_handle,
```

```
&g_cellular_comm_interface_on_uart);
    assert(CELLULAR_SUCCESS == err);
    /* Get the SIM card status */
    err = Cellular_GetSimCardStatus(cellular_handle, &sim_card_status);
    assert(CELLULAR_SUCCESS == err);
    assert(CELLULAR_SIM_CARD_INSERTED == sim_card_status.simCardState);
}
```

Socket Example

```
#define SOCKET_EXAMPLE_BUFFER_SIZE (256)
#define SOCKET_EXAMPLE_TIMEOUT (UINT32_MAX)
#define SOCKET_EXAMPLE_IP ("255.255.255.255")
#define SOCKET_EXAMPLE_PORT (80)
uint32_t g_rcv_event_count = 0;
void socket_example_data_ready_callback (CellularSocketHandle_t socketHandle, void *
pCallbackContext)
{
    FSP_PARAMETER_NOT_USED(socketHandle);
    FSP_PARAMETER_NOT_USED(pCallbackContext);
    g_rcv_event_count++;
}
void rm_cellular_ryz_aws_socket_example (void)
{
    CellularHandle_t cellular_handle = NULL;
    char * p_data = "hello_world";
    char recv_buffer[SOCKET_EXAMPLE_BUFFER_SIZE] = "\0";
    uint32_t sent_data_length = 0;
    uint32_t received_data_length = 0;
    uint32_t timeout_ms = SOCKET_EXAMPLE_TIMEOUT;
    CellularSocketHandle_t socket_handle;
    CellularSocketAddress_t socket_address =
    {
        .ipAddress =
        {
```

```
        CELLULAR_IP_ADDRESS_V4,
        SOCKET_EXAMPLE_IP
    },
    .port      = SOCKET_EXAMPLE_PORT
};

/* Initialize Cellular Modem. */
CellularError_t err = Cellular_Init(&cellular_handle,
&g_cellular_comm_interface_on_uart);
assert(CELLULAR_SUCCESS == err);

/* Create a TCP socket */
err = Cellular_CreateSocket(cellular_handle,
                            1,
                            CELLULAR_SOCKET_DOMAIN_AF_INET,

                            &socket_handle);

assert(CELLULAR_SUCCESS == err);

/* Set the local port */
socket_handle->localPort = UDP_EXAMPLE_LOCAL_PORT;

/* Connect the UDP socket */
err = Cellular_SocketConnect(cellular_handle, socket_handle,
CELLULAR_ACCESSMODE_BUFFER, &socket_address);

assert(CELLULAR_SUCCESS == err);
}
```

5.2.12.2 AWS MQTT

[Modules](#) » [Networking](#)

This module provides the AWS MQTT integration documentation.

Overview

The AWS MQTT library can connect to either AWS or a third party MQTT broker such as [Mosquitto](#). The documentation for the library can be found at the following link: [coreMQTT](#).

Features

- MQTT connections over TLS to an AWS IoT Endpoint or Mosquitto server

Configuration

Memory Usage

The AWS CoreMQTT library relies heavily on dynamic memory allocation for thread/task creation as well as other uses. Depending on the configuration it may be required to provide as much as 110k heap. To decrease this it is recommended to tweak the thread stack configuration values based on usage. Notable values are:

FreeRTOS Thread

- General|Minimal Stack Size

FreeRTOS Plus TCP

- Stack size in words (not bytes)

Usage Notes

- A transport interface is required to use the CoreMQTT library (<https://www.freertos.org/network-interface.html>).
- For FSP, a transport interface over MbedTLS is provided. This transport interface can connect to RA ethernet, WiFi, and cellular modules via sockets wrappers for each module.
- TLS_FreeRTOS_Connect should be used before calling any CoreMQTT APIs. See the example for more information.

Limitations

- aws_clientcredential.h and aws_clientcredential_keys.h need to be added manually.
- MbedTLS must be initialized and key provisioning must be done before starting a secure connection.

Examples

Connection example using MbedTLS/PKCS11 Transport Interface

```
#define EXAMPLE_PDN_CONTEXT_NUMBER (1)
#define EXAMPLE_TIMEOUT_MS (5000)
#define EXAMPLE_DISABLE_SNI (false)
#define EXAMPLE_MQTT_HOST ("mqtt_host_server")
#define EXAMPLE_MQTT_HOST_PORT (8883)
#define EXAMPLE_MQTT_SEND_TIMEOUT (5000)
#define EXAMPLE_MQTT_RECEIVE_TIMEOUT (5000)
```

```

#define EXAMPLE_MQTT_TOPIC ("example_topic")
#define EXAMPLE_MQTT_CLIENT_IDENTIFIER ("client_id")
#define EXAMPLE_MQTT_KEEP_ALIVE_SECONDS (60)
#define EXAMPLE_MQTT_PAYLOAD ("helloworld")

5.2.12.3 AWS OTA PAL on MCUBoot (rm_aws_ota_pal_mcuboot)

Modules » Networking

AWS OTA PAL layer implementation for downloading firmware updates.

Overview

This module provides the hardware port layer for the AWS IoT Over-the-air Update Library. Refer to the AWS OTA documentation: <https://docs.aws.amazon.com/freertos/latest/userguide/integrate-ota-agent.html>.

Configuration

Build Time Configurations for rm_aws_ota_pal_mcuboot

The following build time configurations are defined in fsp_cfg/rm_aws_ota_pal_mcuboot_cfg.h:

| Configuration | Options | Default | Description |
|---------------------------------------|--|---------------|--|
| Parameter Checking | <ul style="list-style-type: none"> Default (BSP) Enabled Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Filepath to Slot ID Callback Function | Must be a valid C symbol | NULL | Callback function for determining which Slot ID the image should be downloaded to. |

| | | | |
|--------------------------------------|------------------|------------------|--|
| OTA code signing signature algorithm | sig-sha256-ecdsa | sig-sha256-ecdsa | Code signing algorithm used by AWS to sign the downloaded image. |
|--------------------------------------|------------------|------------------|--|

Configurations for Storage > AWS OTA PAL (rm_aws_ota_pal_mcuboot)

| Configuration | Options | Default | Description |
|---------------|-------------------------------|----------------------------|--------------|
| Name | Name must be a valid C symbol | g_rm_aws_ota_pal_mcu_boot0 | Module name. |

Common AWS Configuration

Build Time Configurations for source

The following build time configurations are defined in aws/ota_config.h:

| Configuration | Options | Default | Description |
|------------------------------|--------------------------------------|---------|--|
| Version | | | |
| Major | Value must be a non-negative integer | 0 | Major Version number used when updating. |
| Minor | Value must be a non-negative integer | 0 | Minor Version number used when updating. |
| Build | Value must be a non-negative integer | 1 | Build Version number used when updating. |
| Custom ota_config.h | Manual Entry | | Add a path to your custom ota_config.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations. |
| Log2 File Block Size | Value must be a non-negative integer | 11 | Log base 2 of the size of the file data block message (excluding the header). e.g. 11: $2^{11} = 2048$ bytes |
| Self Test Response Wait (ms) | Value must be a non-negative integer | 16000 | Milliseconds to wait for the self test phase to succeed before we force reset. |
| File Request Wait (ms) | Value must be a non-negative integer | 10000 | Milliseconds to wait before requesting data blocks from the OTA service if nothing is happening. |
| Max Thingname Length | Value must be a non-negative integer | 64 | The maximum allowed length of the thing name used by the OTA |

agent.

| | | | |
|----------------------------------|---|-----------------------|---|
| Max Num Blocks Request | Value must be a non-negative integer | 1 | The maximum number of data blocks requested from OTA streaming service. |
| Max Num Request Momentum | Value must be a non-negative integer | 32 | The maximum number of requests allowed to send without a response before we abort. |
| Ota Update Status Frequency | Value must be a non-negative integer | 64 | How frequently the device will report its OTA progress to the cloud. |
| Max Num OTA Data Buffers | Value must be a non-negative integer | 1 | The number of data buffers reserved by the OTA agent. |
| Allow Downgrade | <ul style="list-style-type: none"> Allowed Disallowed | Disallowed | Flag to enable booting into updates that have an identical or lower version than the current version. |
| Ota Firmware Update File Type ID | Value must be a non-negative integer | 0 | The file type id received in the job document. |
| Enabled Control Protocol | OTA Control Over MQTT | OTA Control Over MQTT | The protocol selected for OTA control operations. |
| Enabled Data Protcols | <ul style="list-style-type: none"> OTA Data Over MQTT OTA Data Over HTTP OTA Data Over MQTT and HTTP | OTA Data Over MQTT | The protocol selected for OTA data operations. |
| OTA Primary Data Protocol | <ul style="list-style-type: none"> OTA Data Over MQTT OTA Data Over HTTP | OTA Data Over MQTT | The preferred protocol selected for OTA data operations. |
| OTA Events Polling Timeout (ms) | Value must be a non-negative integer | 1000 | The polling timeout (milliseconds) to receive messages from event queue. |

Usage Notes

The current implementation utilizes [MCUboot Port \(rm_mcuboot_port\)](#) for switching images.

Limitations

- Currently only the only supported signature method is sig-sha256-ecdsa.

5.2.12.4 AWS PKCS11 PAL on LittleFS (rm_aws_pkcs11_pal_littlefs)

[Modules](#) » [Networking](#)

PKCS#11 PAL LittleFS layer implementation for use by FreeRTOS TLS.

Overview

Note

The PKCS#11 PAL LittleFS Interface does not provide any interfaces to the user. Consult the AWS documentation for more info: <https://docs.aws.amazon.com/freertos/latest/portingguide/afr-porting-pkcs.html>.

Configuration

There is no user configuration for this module

Usage Notes

The current implementation utilizes [LittleFS on Flash \(rm_littlefs_flash\)](#) for storage.

Limitations

- Credential access is not limited in any way.

5.2.12.5 AWS coreHTTP

[Modules](#) » [Networking](#)

This module provides the AWS coreHTTP library.

Overview

The AWS coreHTTP library can be used to send HTTP and HTTPS requests. The documentation for the library can be found at the following link: [coreHTTP](#).

Features

- Secure and Non-secure HTTP requests
- [Mutually authenticated connections](#)

Configuration

Memory Usage

The AWS coreHTTP stack relies on dynamic memory allocation for thread/task creation as well as other uses. It is recommended to tweak the thread stack configuration values based on usage. Notable values are:

FreeRTOS Thread

- General|Minimal Stack Size
- Memory Allocation|Total Heap Size

FreeRTOS Plus TCP

- Stack size in words (not bytes)

Usage Notes

- A transport interface is required to use the CoreHTTP library (<https://www.freertos.org/network-interface.html>).
- For FSP, a transport interface over MbedTLS is provided. This transport interface can connect to RA ethernet, WiFi, and cellular modules via sockets wrappers for each module.
- TLS_FreeRTOS_Connect should be used before calling any CoreHTTP APIs. See the example for more information.

Limitations

- MbedTLS must be initialized and key provisioning must be done before starting a secure connection.

Examples

HTTPS GET request

```
/* Certificate copied from https://www.amazontrust.com/repository/AmazonRootCA1.pem
*/

5.2.12.6 Azure Embedded Wireless Framework RYZ Port (rm_azure_ewf_ryz)

Modules » Networking

Note

The Azure Embedded Wireless Framework is still in beta and not all APIs may be fully implemented yet.

Overview

This documentation is for the RYZ014A/RYZ024A ports of the Azure Embedded Wireless Framework.

- For more information on the framework see the documentation:
<https://azure.github.io/embedded-wireless-framework/html/index.html>.
 - There are also various examples available for the RA6M4_EK:
<https://github.com/Azure/embedded-wireless-framework/tree/main/examples/EK-RA6M4>.
- For more RYZ014A hardware information including pin and baud rate info please see the RYZ014A page:
<https://www.renesas.com/us/en/products/interface-connectivity/wireless-communications/cellular-iot-modules/ryz014a-lte-cat-m1-cellular-iot-module>.
- For more RYZ024A hardware information including pin and baud rate info please see the RYZ024A page:
<https://www.renesas.com/us/en/products/interface-connectivity/wireless-communications/cellular-iot-modules/ryz024a-lte-cat-m1-cellular-iot-module-global-deployment>.

Features

- Various APIs to control/access RYZ modem features via AT commands.
- Raw AT command APIs
- IPv4 sockets using TCP/UDP
- The EWF framework is usable standalone with bare metal and ThreadX.
- The framework can also be used with NetX when coupled with a EWF NetX middleware layer.

Limitations

The following are the limitations of the Azure EWF Library:

- DTC is not supported. The lower level interface using R_UART relies on processing data one byte at a time via the interrupt callback and UART_EVENT_RX_CHAR.
- Server mode sockets should be supported but have not been fully tested due to APN limitations.
- There are potential issues when using the default (-Os) optimization or above with AC6. All files under embedded_wireless_framework should be set to compile with no optimization (-O0) when using AC6.
- nx_ip_status_check does not currently work for the EWF middleware.
- When using socket send functions (ewf_adapter_tcp_send and ewf_adapter_udp_send) the RYZ port is limited to sending only 1460 bytes at a time. Data sent using these functions should be broken into 1460 byte chunks or less.
 - When using NetX the packet size for the driver packet pool should be set to 1460 bytes or less. Using larger packet sizes will work but the NetX Middleware Driver will potentially break up the packets inefficiently.

Unsupported NetX Duo Features

These features are handled directly on the RYZ hardware or are not supported yet in the EWF library. NetX APIs for these features should not be used:

- IPv6 functionality (the EWF library doesn't yet support IPv6)
- ARP is handled directly by the cellular modem
- DHCP is handled directly by the cellular modem.

Configuration

The RYZ014A port for the Embedded Wireless Framework can be added to the Stacks tab via New Stack > Networking > Azure EWF Adapter on RYZ014A.

The RYZ024A port for the Embedded Wireless Framework can be added to the Stacks tab via New Stack > Networking > Azure EWF Adapter on RYZ024A.

Build Time Configurations for Common

The following build time configurations are defined in `fsp_cfg/azure/ewf/ewf.config.h`:

| Configuration | Options | Default | Description |
|------------------------|---|----------------------------------|--|
| Parameter Checking | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | This enables checking of function parameters. When this is disabled, parameter checking code is not present and the footprint is reduced |
| Enable Logging | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | This enables logging and the compilation of debug code. When disabled, logging and debug code is not present and the footprint is reduced. |
| Verbose Logging | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | This enables verbose logging. Verbose logging will only work if a EWF Log Function is set and logging is enabled. |
| EWF Log Function | Manual Entry | <code>printf(__VA_ARGS__)</code> | Function the library uses for standard log messages when logging is enabled. |
| EWF Log Error Function | Manual Entry | <code>printf(__VA_ARGS__)</code> | Function the library uses for error log messages when logging is enabled. |

Usage Notes

The basic setup for the library is as follows:

Note

The message allocator (EWF_ALLOCATOR_THREADX_STATIC_DECLARE) should be at least 1500 bytes for RYZ

1. Declare an allocator, interface, and adapter using appropriate macros (EWF_ALLOCATOR_THREADX_STATIC_DECLARE/EWF_ALLOCATOR_MEMORY_POOL_STATIC_DECLARE/EWF_ALLOCATOR_C_HEAP_STATIC_DECLARE, EWF_INTERFACE_RA_UART_STATIC_DECLARE, EWF_ADAPTER_RENESAS_RYZ014_STATIC_DECLARE/EWF_ADAPTER_RENESAS_RYZ024A_STATIC_DECLARE).
2. Start the adapter with `ewf_adapter_start`.
3. Setup modem service if necessary with functions from `ewf_adapter_api_modem.h` and other included `api_modem_*` files.
4. Set functionality with `ewf_adapter_modem_functionality_set`.
5. Wait for network registration (can use `ewf_adapter_modem_network_registration_check` to wait).
6. Do a service activate to set desired PDP context with `ewf_adapter_modem_packet_service_activate`. This should be called regardless of whether context is already activated as it sets an internal library context number for functions like `ewf_adapter_get_ipv4_address`.
7. Call other network functions as needed from desired headers (i.e. TCP functions are in `ewf_adapter_api_tcp.h`).

When using NetX Duo the following must be done:

- Before creating an IP instance make sure that the modem adapter is started and connected to a network.
- After creating an IP instance the adapter pointer has to be stored manually to the IP instance: `g_ip.nx_ip_interface->nx_interface_additional_link_info = adapter_ptr;`
- After creating an IP instance the gateway address should be set to the IP of the modem in order to satisfy NetX Duo's internal routing algorithms (packets are actually routed by the modem hardware): `nx_ip_gateway_address_set(&g_ip, RM_NETXDUE_TESTS_IP_ADDR);`

Examples

Basic TCP Socket Example

Note

The user should choose the relevant EWF_ALLOCATOR and EWF_ADAPTER macros from this example to use based on the hardware and RTOS being used

```
#define EWF_LOG_BUFFER_SIZE (256)

#define EWF_MODEM_NETWORK_WAIT_TIME_SECONDS (30)

#define EWF_HTTP_GET_SERVER "www.microsoft.com"

#define EWF_HTTP_GET "GET / HTTP/1.1\r\nHost:www.microsoft.com\r\n\r\n"

#define EWF_HTTP_PORT (80)

ewf_allocator * message_allocator_ptr = NULL;
ewf_interface * interface_ptr = NULL;
ewf_adapter * adapter_ptr = NULL;
```

```
char ewf_log_buffer[EWF_LOG_BUFFER_SIZE];
void rm_azure_ewf_ryz_example ()
{
    static uint8_t buffer[2048];          // NOLINT
        uint32_t      buffer_length = sizeof(buffer);
    /* Azure library has macros to declare/allocate structs and pointers.
     * Different ones should be used depending on Adapter and whether the library is
being used on bare metal or ThreadX */
    /* This is for the memory allocator using ThreadX block pools */
        EWF_ALLOCATOR_THREADX_STATIC_DECLARE(message_allocator_ptr, message_allocator,
12, 2048);
    /* This is for the memory allocator using static memory on bare metal */
        EWF_ALLOCATOR_MEMORY_POOL_STATIC_DECLARE(message_allocator_ptr,
message_allocator, 12, 2048);
    /* This is for the memory allocator using the heap on bare metal */
        EWF_ALLOCATOR_C_HEAP_STATIC_DECLARE(message_allocator_ptr, message_allocator, 12,
2048);
    /* This is for the communications interface using R_UART */
        EWF_INTERFACE_RA_UART_STATIC_DECLARE(interface_ptr, sci_uart);
    /* If using RYZ014A */
        EWF_ADAPTER_RENESAS_RYZ014_STATIC_DECLARE(adapter_ptr, renesas_ryz014,
message_allocator_ptr, NULL, interface_ptr);
    /* If using RYZ024A */
        EWF_ADAPTER_RENESAS_RYZ024A_STATIC_DECLARE(adapter_ptr, renesas_ryz024,
message_allocator_ptr, NULL, interface_ptr);
    /* Start the adapter */
        assert(EWF_RESULT_OK == ewf_adapter_start(adapter_ptr));
    /* Set the ME functionality */
        assert(EWF_RESULT_OK == ewf_adapter_modem_functionality_set(adapter_ptr, "1"));
    /* Wait for the modem functionality to be up */
        assert(EWF_RESULT_OK ==
            ewf_adapter_modem_network_registration_check(adapter_ptr,
EWF_ADAPTER_MODEM_CMD_QUERY_EPS_NETWORK_REG,
```

```
EWf_MoDem_NetWork_Wait_Time_Seconds));

/* Do a service activate to set context num correctly */
ewf_adapter_modem_packet_service_activate(adapter_ptr, 1);

ewf_socket_tcp socket_tcp = {0};

/* Open TCP Socket */
assert(EWF_RESULT_OK == ewf_adapter_tcp_open(adapter_ptr, &socket_tcp));

/* Connect to server */
assert(EWF_RESULT_OK == ewf_adapter_tcp_connect(&socket_tcp, EWF_HTTP_GET_SERVER,
EWf_Http_Port));

/* Send HTTP GET */
assert(EWF_RESULT_OK == ewf_adapter_tcp_send(&socket_tcp, (const uint8_t *)
EWf_Http_Get, strlen(EWf_Http_Get)));

/* Receive HTTP GET response */
assert(EWF_RESULT_OK == ewf_adapter_tcp_receive(&socket_tcp, buffer,
&buffer_length, true));

/* Shutdown socket connection to server */
assert(EWF_RESULT_OK == ewf_adapter_tcp_shutdown(&socket_tcp));

/* Close/destroy socket */
assert(EWF_RESULT_OK == ewf_adapter_tcp_close(&socket_tcp));
}
```

NetX Duo Example

```
#define NETXDuo_Example_Packet_Size (1568U)
#define NETXDuo_Example_Packet_Num (100U)

Detailed Description

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the [BLE ABS Interface](#).

Overview

This module provides BLE GAP functionality that complies with the Bluetooth Core Specification version 5.0 specified by the Bluetooth SIG. This module is configured via the [QE for BLE](#). QE for BLE provides standard services defined by standardization organization and custom services defined by user. [Bluetooth LE Profile API Document User's Manual](#) describes the APIs for standard services.

Features

The Bluetooth Low Energy (BLE) Abstraction module supports the following features:

- following GAP Role support
 - Central: The device that sends a connection request to the Peripheral device.
 - Peripheral: The device that accepts a connection request from Central and establishes a connection.
 - Observer : The device that scans for advertising.
 - Broadcaster : The device that sends advertising.
- LE 2M PHY
 - BLE communication is supported on the 2 Msym/s PHY.
- LE Coded PHY -Supports BLE communication on the Coded PHY. This enables communication over longer distances than 1M PHY and 2M PHY.
- LE Advertising Extensions
 - Up to four independent adverts can be executed simultaneously.
 - The size of Advertising Data/Scan Response Data has been expanded to a maximum of 1650 bytes.
 - Periodic Advertising is available.
- LE Channel Selection Algorithm #2
 - With the hopping channel selection algorithm added in Version 5.0, the machine that selects the channel It is possible.
- High Duty Cycle Non-Connectable Advertising
 - The ability to support non-connectable advertising with a minimum interval of up to 20 msec.
- LE Secure Connections
 - Elliptic curve Diffie-Hellman key sharing (ECDH) for pairing with passive eavesdropping support.
- Link Layer privacy
 - This feature avoids being tracked by other BLE devices by periodically changing the Bluetooth device address.
- Link Layer Extended Scanner Filter policies
 - Scan Filter support for Resolvable private addresses.
- LE Data Packet Length Extension
 - This function expands the packet size of BLE data communications. It is possible to scale up to 251 bytes.
- LE L2CAP Connection Oriented Channel Support
 - The ability to support communication using the L2CAP credit based flow control channel.
- Low Duty Cycle Directed Advertising
 - The ability to support the advertising of the Low Duty Cycle for reconnecting to a known device.
- LE Link Layer Topology
 - It supports both Master and Slave roles and can operate as Master when connected to one remote device and as Slave when connected to another remote device.
- LE Ping
 - This function checks whether the link is maintained or not by requesting the transmission of packets containing MIC after link encryption.

BLE Library Configuration

There are three types of BLE Protocol Stacks, and the functions provided are different depending on the type of BLE Protocol Stack you select.

| BLE library feature | Extended | Balance | Compact |
|--|--|--|------------------------|
| GAP Role | Central Peripheral Observer Broadcaster | Central Peripheral Observer Broadcaster | Peripheral Broadcaster |
| LE 2M PHY | Yes | Yes | No |
| LE Coded PHY | Yes | Yes | No |
| LE Advertising Extensions | Yes | No | No |
| LE Channel Selection Algorithm #2 | Yes | Yes | No |
| High Duty Cycle Non- Connectable Advertising | Yes | Yes | Yes |
| LE Secure Connections | Yes | Yes | Yes |
| Link Layer privacy | Yes | Yes | Yes |
| Link Layer Extended Scanner Filter policies | Yes | Yes | No |
| LE Data Packet Length Extension | Yes | Yes | Yes |
| LE L2CAP Connection Oriented Channel Support | Yes | No | No |
| Low Duty Cycle Directed Advertising | Yes | Yes | Yes |
| LE Link Layer Topology | Yes | Yes | No |
| LE Ping | Yes | Yes | Yes |
| 32-bit UUID Support in LE | Yes | Yes | Yes |

Target Devices

The BLE Abstraction module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_abs

The following build time configurations are defined in fsp_cfg/rm_ble_abs_cfg.h:

| Configuration | Options | Default | Description |
|------------------------------------|--|-------------------|---|
| Parameter Checking | <ul style="list-style-type: none"> Default (BSP) Enable Disable | Default (BSP) | Specify whether to include code for API parameter checking. Valid settings include. |
| Debug Public Address | Must be a valid device address | FF:FF:FF:50:90:74 | Public Address of firmware initial value. |
| Debug Random Address | Must be a valid device address | FF:FF:FF:FF:FF:FF | Random Address of firmware initial value. |
| Maximum number of connections | Value must be an integer between 1 and 7, and lower than the value defined in ble module. | 7 | Maximum number of connections. |
| Maximum connection data length | Value must be an integer between 27 and 251, and lower than the value defined in ble module. | 251 | Maximum connection data length. |
| Maximum advertising data length | Value must be an integer between 31 and 1650, and lower than the value defined in ble module. | 1650 | Maximum advertising data length. |
| Maximum advertising set number | Value must be an integer between 1 and 4, and lower than the value defined in ble module. | 4 | Maximum advertising set number. |
| Maximum periodic sync set number. | Value must be an integer between 1 and 2, and lower than the value defined in ble module. | 2 | Maximum periodic sync set number. |
| Store Security Data | <ul style="list-style-type: none"> Disable Enable | Disable | Store Security Data in DataFlash. |
| Data Flash Block for Security Data | Value must be an integer between 0 and 7, and lower than the value defined in ble module. | 0 | Data Flash Block for Security Data Management. |
| Remote Device Bonding Number | Value must be an integer between 1 and 7, and lower than the value defined in ble module. | 7 | Number of remote device bonding information. |
| Connection Event Start | <ul style="list-style-type: none"> Disable | Disable | Set Connection event |

| | | | |
|--------------------------------|---|--------------------------------|---|
| Notify | <ul style="list-style-type: none"> • Enable | | start notify enable/disable. |
| Connection Event Close Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set Connection event close notify enable/disable. |
| Advertising Event Start Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set Advertising event start notify enable/disable. |
| Advertising Event Close Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set Advertising event close notify enable/disable. |
| Scanning Event Start Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set Scanning event start notify enable/disable. |
| Scanning Event Close Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set Scanning event close notify enable/disable. |
| Initiating Event Start Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set Initiating event start notify enable/disable. |
| Initiating Event Close Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set Initiating event close notify enable/disable. |
| RF Deep Sleep Start Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set RF_DEEP_SLEEP start notify enable/disable. |
| RF Deep Sleep Wakeup Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set RF_DEEP_SLEEP wakeup notify enable/disable. |
| Bluetooth dedicated clock | Value must be an integer between 0 and 15, and lower than the value defined in ble module. | 6 | Load capacitance adjustment. |
| DC-DC converter | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set DC-DC converter for RF part. |
| Slow Clock Source | <ul style="list-style-type: none"> • Use RF_LOCO • Use External 32.768kHz | Use RF_LOCO | Set slow clock source for RF part. |
| MCU CLKOUT Port | <ul style="list-style-type: none"> • P109 • P205 | P109 | When BLE_ABS_CFG_RF_EXTERNAL_32K_ENAB LE = 1, Set port of MCU CLKOUT. |
| MCU CLKOUT Frequency Output | <ul style="list-style-type: none"> • MCU CLKOUT frequency 32.768kHz | MCU CLKOUT frequency 32.768kHz | When BLE_ABS_CFG_RF_EXTERNAL_32K_ENAB LE = 1, set frequency |

| | | | |
|----------------------------------|---|---|--|
| | <ul style="list-style-type: none"> MCU CLKOUT frequency 16.384kHz | | output from CLKOUT of MCU part. |
| Sleep Clock Accuracy(SCA) | Value must be an integer between 0 and 500, and lower than the value defined in ble module. | 250 | When BLE_ABS_CFG_RF_EXTERNAL_32K_ENABLE = 1, set Sleep Clock Accuracy(SCA) for RF slow clock. |
| Transmission Power Maximum Value | <ul style="list-style-type: none"> max +0dBm max +4dBm | max +4dBm | Set transmission power maximum value. |
| Transmission Power Default Value | <ul style="list-style-type: none"> High 0dBm(Transmission Power Maximum Value = +0dBm) / +4dBm(Transmission Power Maximum Value = +4dBm) Mid 0dBm(Transmission Power Maximum Value = +0dBm) / 0dBm(Transmission Power Maximum Value = +4dBm) Low -18dBm(Transmission Power Maximum Value = +0dBm) / -20dBm(Transmission Power Maximum Value = +4dBm) | High 0dBm(Transmission Power Maximum Value = +0dBm) / +4dBm(Transmission Power Maximum Value = +4dBm) | Set default transmit power. Default transmit power is dependent on the configuration of Maximum transmission power(BLE_ABS_CFG_RF_DEF_TX_POW). |
| CLKOUT_RF Output | <ul style="list-style-type: none"> No output 4MHz output 2MHz output 1MHz output | No output | Set CLKOUT_RF output setting. |
| RF_DEEP_SLEEP Transition | <ul style="list-style-type: none"> Disable Enable | Enable | Set RF_DEEP_SLEEP transition. |
| MCU Main Clock Frequency | Value must be an integer between 1000 and 20000, and lower than the value defined in ble module. | 8000 | Set MCU Main Clock Frequency (kHz). Set clock source according to your board environment. HOCO: don't care. / Main Clock: 1000 to 20000 kHz / PLL Circuit: 4000 to 12500 kHz |

| | | | |
|--------------------------------------|--|-----|---|
| Code Flash(ROM) Device Data Block | Value must be an integer between -1 and 255, and lower than the value defined in ble module. | 255 | Device specific data block on Code Flash (ROM). |
| Device Specific Data Flash Block | Value must be an integer between -1 and 7, and lower than the value defined in ble module. | -1 | Device specific data block on E2 Data Flash. |
| MTU Size Configured | Value must be an integer between 23 and 247, and lower than the value defined in ble module. | 247 | MTU Size configured by GATT MTU exchange procedure. |
| Timer Slot Maximum Number | Value must be an integer between 1 and 10, and lower than the value defined in ble module. | 10 | The maximum number of timer slot. |

Configurations for Networking > BLE Abstraction (rm_ble_abs)

This module can be added to the Stacks tab via New Stack > Networking > BLE Abstraction (rm_ble_abs).

| Configuration | Options | Default | Description |
|--------------------------------|-------------------------------|-----------------------|---|
| General | | | |
| Name | Name must be a valid C symbol | g_ble_abs0 | Module name. |
| Gap callback | Name must be a valid C symbol | gap_cb | A user callback function must be provided if the BLE_ABS is configured to generate a GAP. If QE is used, set to NULL. |
| Vendor specific callback | Name must be a valid C symbol | vs_cb | A user callback function must be provided if the BLE_ABS is configured to generate a Vendor Specific. If QE is used, set to NULL. |
| GATT server callback parameter | Name must be a valid C symbol | gs_abs_gatts_cb_param | Set GATT server callback parameter. If QE is used, set to NULL. |
| GATT server callback | Must be a valid number | 2 | The number of GATT |

| | | | |
|---|--|--------------------------------|---|
| number | | | Server callback functions. |
| GATT client callback parameter | Name must be a valid C symbol | gs_abs_gattc_cb_param | Set GATT client callback parameter. If QE is used, set to NULL. |
| GATT client callback number | Must be a valid number | 2 | The number of GATT Server callback functions. |
| Security | | | |
| Pairing parameters | Name must be a valid C symbol | gs_abs_pairing_param | Set pairing parameters. |
| IO capabilities of local device. | <ul style="list-style-type: none"> • BLE_GAP_IOCAP_DISPLAY_ONLY • BLE_GAP_IOCAP_DISPLAY_YESNO • BLE_GAP_IOCAP_KEYBOARD_ONLY • BLE_GAP_IOCAP_NOINPUT_NOOUTPUT • BLE_GAP_IOCAP_KEYBOARD_DISPLAY | BLE_GAP_IOCAP_NOINPUT_NOOUTPUT | Select IO capabilities of local device. |
| MITM protection policy. | <ul style="list-style-type: none"> • BLE_GAP_SEC_MITM_BEST Effort • BLE_GAP_SEC_MITM_STRICT | BLE_GAP_SEC_MITM_BEST Effort | Select MITM protection policy. |
| Determine whether to accept only Secure Connections or not. | <ul style="list-style-type: none"> • BLE_GAP_SC_BEST Effort • BLE_GAP_SC_STRICT | BLE_GAP_SC_BEST Effort | Select determine whether to accept only Secure Connections or not. |
| Type of keys to be distributed from local device. | <ul style="list-style-type: none"> • BLE_GAP_KEY_DIST_ENCKEY • BLE_GAP_KEY_DIST_IDKEY • BLE_GAP_KEY_DIST_SIGNKEY | | Select type of keys to be distributed from local device. |
| Type of keys which local device requests a remote device to distribute. | <ul style="list-style-type: none"> • BLE_GAP_KEY_DIST_ENCKEY • BLE_GAP_KEY_DIST_IDKEY • BLE_GAP_KEY_DIST_SIGNKEY | | Set type of keys which local device requests a remote device to distribute. |
| Maximum LTK size. | Valid range is 7 - 16 | 16 | Set Maximum LTK size. |

Interrupts

| | | | |
|--------------------------------------|-------------------------------|------|---|
| Callback provided when an ISR occurs | Name must be a valid C symbol | NULL | Callback provided when BLE ABS ISR occurs |
|--------------------------------------|-------------------------------|------|---|

Clock Configuration

Note

System clock (ICLK): 8 MHz or more

Peripheral module clock A (PCLKA): 8MHz or more

The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.

It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.

Pin Configuration

This module does not use I/O pins.

Stack Size Configuration

Note

When you use BLE on RTOS environment, make sure that thread stack size must be 0x1000 or more which call [R_BLE_Execute](#).

Usage Notes

Limitations

Developers should be aware of the following limitations when using the BLE_ABS:

Examples

BLE_ABS Basic Example

This is a basic example of minimal use of the BLE_ABS in an application.

```
#define BLE_ABS_EVENT_FLAG_STACK_ON (0x01 << 0)
#define BLE_ABS_EVENT_FLAG_CONN_IND (0x01 << 1)
#define BLE_ABS_EVENT_FLAG_ADV_ON (0x01 << 2)
#define BLE_ABS_EVENT_FLAG_ADV_OFF (0x01 << 3)
#define BLE_ABS_EVENT_FLAG_DISCONN_IND (0x01 << 4)
#define BLE_ABS_EVENT_FLAG_RSLV_LIST_CONF_COMP (0x01 << 5)
#define BLE_ABS_EXAMPLE_SHORTENED_LOCAL_NAME 'E', 'x', 'a', 'm', 'p', 'l', 'e'
#define BLE_ABS_EXAMPLE_COMPLETE_LOCAL_NAME 'T', 'E', 'S', 'T', '_', 'E', 'x', 'a', 'm', 'p', 'l', 'e'
#define BLE_ABS_EXAMPLE_SLOW_ADVERTISING_INTERVAL (0x00000640)

| uint32_t | current_timeout_ms | Current timeout. |
| uint32_t | elapsed_timeout_ms | Elapsed timeout. |
| ble_abs_cfg_t const * | p_cfg | Pointer to the BLE ABS configuration block. |

Typedef Documentation

◆ [ble_abs_timer_cb_t](#)

```
typedef void(* ble_abs_timer_cb_t) (uint32_t timer_hdl)
```

The timer callback invoked when the timer expired.

Enumeration Type Documentation

◆ **e_ble_timer_type_t**

| | |
|-------------------------|---------------------|
| enum e_ble_timer_type_t | |
| The timer type. | |
| Enumerator | |
| BLE_TIMER_ONE_SHOT | One shot timer type |
| BLE_TIMER_PERIODIC | Periodic timer type |

Function Documentation◆ **RM_BLE_ABS_Open()**

```
fsp_err_t RM_BLE_ABS_Open ( ble_abs_ctrl_t *const p_ctrl, ble_abs_cfg_t const *const p_cfg )
```

Host stack is initialized with this function. Before using All the R_BLE APIs, it's necessary to call this function. A callback functions are registered with this function. In order to receive the GAP, GATT, Vendor specific event, it's necessary to register a callback function. The result of this API call is notified in BLE_GAP_EVENT_STACK_ON event. Implements [ble_abs_api_t::open](#).

Example:

```
/* Open the module. */
err = RM_BLE_ABS_Open(&g_ble_abs0_ctrl, &g_ble_abs0_cfg);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Null pointer presented. |
| FSP_ERR_ALREADY_OPEN | Requested channel is already open in a different configuration. |
| FSP_ERR_INVALID_ARGUMENT | Invalid input parameter. |
| FSP_ERR_INVALID_MODE | Invalid mode during open call |

Host stack is initialized with this function. Before using All the R_BLE APIs, it's necessary to call this function. A callback functions are registered with this function. In order to receive the GAP, GATT, Vendor specific event, it's necessary to register a callback function. The result of this API call is notified in BLE_GAP_EVENT_STACK_ON event. Implements [ble_abs_api_t::open](#).

Example:

```
/* Open the module. */
err = RM_BLE_ABS_Open(&g_ble_abs0_ctrl, &g_ble_abs0_cfg);
```

Return values

| | |
|-------------------|------------------------------|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Null pointer presented. |

| | |
|--------------------------|---|
| FSP_ERR_ALREADY_OPEN | Requested channel is already open in a different configuration. |
| FSP_ERR_INVALID_ARGUMENT | Invalid input parameter. |
| FSP_ERR_INVALID_MODE | Invalid mode during open call |

Host stack is initialized with this function. Before using All the R_BLE APIs, it's necessary to call this function. A callback functions are registered with this function. In order to receive the GAP, GATT, Vendor specific event, it's necessary to register a callback function. The result of this API call is notified in BLE_GAP_EVENT_STACK_ON event. Implements [ble_abs_api_t::open](#).

Example:

```
/* Open the module. */
err = RM_BLE_ABS_Open(&g_ble_abs0_ctrl, &g_ble_abs0_cfg);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Null pointer presented. |
| FSP_ERR_INVALID_CHANNEL | The channel number is invalid. |
| FSP_ERR_ALREADY_OPEN | Requested channel is already open in a different configuration. |
| FSP_ERR_INVALID_ARGUMENT | Invalid input parameter. |

◆ **RM_BLE_ABS_Close()**

```
fsp_err_t RM_BLE_ABS_Close ( ble_abs_ctrl_t *const p_ctrl)
```

Close the BLE channel. Implements `ble_abs_api_t::close`.

Example:

```
/* Close BLE driver */
err = RM_BLE_ABS_Close(&g_ble_abs0_ctrl);
```

Return values

| | |
|-------------------|------------------------------|
| FSP_SUCCESS | Channel closed successfully. |
| FSP_ERR_ASSERTION | Null pointer presented. |
| FSP_ERR_NOT_OPEN | Control block not open. |

Example:

```
/* Close BLE driver */
err = RM_BLE_ABS_Close(&g_ble_abs0_ctrl);
```

Return values

| | |
|-------------------|------------------------------|
| FSP_SUCCESS | Channel closed successfully. |
| FSP_ERR_ASSERTION | Null pointer presented. |
| FSP_ERR_NOT_OPEN | Control block not open. |

Example:

```
/* Close BLE driver */
err = RM_BLE_ABS_Close(&g_ble_abs0_ctrl);
```

Return values

| | |
|-------------------|------------------------------|
| FSP_SUCCESS | Channel closed successfully. |
| FSP_ERR_ASSERTION | Null pointer presented. |
| FSP_ERR_NOT_OPEN | Control block not open. |

◆ **RM_BLE_ABS_Reset()**

```
fsp_err_t RM_BLE_ABS_Reset ( ble_abs_ctrl_t *const p_ctrl, ble_event_cb_t init_callback )
```

This function is not implemented. To perform this function call R_BLE_Close followed by R_BLE_Open. Implements `ble_abs_api_t::reset`.

Return values

| | |
|---------------------|---------------------------|
| FSP_ERR_UNSUPPORTED | Function is not supported |
|---------------------|---------------------------|

BLE is reset with this function. The process is carried out in the following order. `R_BLE_Close()` -> `R_BLE_GAP_Terminate()` -> `R_BLE_Open()` -> `R_BLE_SetEvent()`. The `init_cb` callback initializes the others (Host Stack, timer, etc...). Implements `ble_abs_api_t::reset`.

Return values

| | |
|-------------------|------------------------------|
| FSP_SUCCESS | Channel closed successfully. |
| FSP_ERR_ASSERTION | Null pointer presented. |
| FSP_ERR_NOT_OPEN | Control block not open. |

◆ RM_BLE_ABS_StartLegacyAdvertising()

```
fsp_err_t RM_BLE_ABS_StartLegacyAdvertising ( ble_abs_ctrl_t *const p_ctrl,
ble_abs_legacy_advertising_parameter_t const *const p_advertising_parameter )
```

Start Legacy Advertising after setting advertising parameters, advertising data and scan response data. The legacy advertising uses the advertising set whose advertising handle is 0. The advertising type is connectable and scannable(ADV_IND). The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements [ble_abs_api_t::startLegacyAdvertising](#)

Example:

```
/* Start advertising. */
err = RM_BLE_ABS_StartLegacyAdvertising(&g_ble_abs0_ctrl,
&legacy_advertising_parameter);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_STATE | Host stack hasn't been initialized. |
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_INVALID_ARGUMENT | The advertising parameter is out of range. |

Start Legacy Advertising after setting advertising parameters, advertising data and scan response data. The legacy advertising uses the advertising set whose advertising handle is 0. The advertising type is connectable and scannable(ADV_IND). The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements [ble_abs_api_t::startLegacyAdvertising](#)

Example:

```
/* Start advertising. */
err = RM_BLE_ABS_StartLegacyAdvertising(&g_ble_abs0_ctrl,
&legacy_advertising_parameter);
```

Return values

| | |
|-----------------------|---------------------------------------|
| FSP_SUCCESS | Operation succeeded |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_STATE | Host stack hasn't been initialized. |
| | |

| | |
|--------------------------|---|
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_INVALID_ARGUMENT | The advertising parameter is out of range. |

Start Legacy Advertising after setting advertising parameters, advertising data and scan response data. The legacy advertising uses the advertising set whose advertising handle is 0. The advertising type is connectable and scannable(ADV_IND). The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements [ble_abs_api_t::startLegacyAdvertising](#)

Example:

```
/* Start advertising. */
err = RM_BLE_ABS_StartLegacyAdvertising(&g_ble_abs0_ctrl,
&legacy_advertising_parameter);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_STATE | Host stack hasn't been initialized. |
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_INVALID_ARGUMENT | The advertising parameter is out of range. |

◆ RM_BLE_ABS_StartExtendedAdvertising()

```
fsp_err_t RM_BLE_ABS_StartExtendedAdvertising ( ble_abs_ctrl_t *const p_ctrl,
ble_abs_extend_advertising_parameter_t const *const p_advertising_parameter )
```

Start Extended Advertising after setting advertising parameters, advertising data. The extended advertising uses the advertising set whose advertising handle is 1. The advertising type is connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements [ble_abs_api_t::startExtendedAdvertising](#)

Return values

| | |
|-------------------------|--|
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_UNSUPPORTED | Subordinate modules do not support this feature. |

Start Extended Advertising after setting advertising parameters, advertising data. The extended advertising uses the advertising set whose advertising handle is 1. The advertising type is connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements [ble_abs_api_t::startExtendedAdvertising](#)

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_INVALID_STATE | Host stack hasn't been initialized. |
| FSP_ERR_INVALID_ARGUMENT | The advertising parameter is out of range. |
| FSP_ERR_UNSUPPORTED | Subordinate modules do not support this feature. |

◆ RM_BLE_ABS_StartNonConnectableAdvertising()

```
fsp_err_t RM_BLE_ABS_StartNonConnectableAdvertising ( ble_abs_ctrl_t *const p_ctrl,
ble_abs_non_connectable_advertising_parameter_t const *const p_advertising_parameter )
```

Start Non-Connectable Advertising after setting advertising parameters, advertising data. The non-connectable advertising uses the advertising set whose advertising handle is 2. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements [ble_abs_api_t::startNonConnectableAdvertising](#).

Return values

| | |
|-------------------------|---|
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_UNSUPPORTED | Feature not yet supported. |

Start Non-Connectable Advertising after setting advertising parameters, advertising data. The non-connectable advertising uses the advertising set whose advertising handle is 2. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements [ble_abs_api_t::startNonConnectableAdvertising](#).

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_INVALID_STATE | Host stack hasn't been initialized. |
| FSP_ERR_INVALID_ARGUMENT | The advertising parameter is out of range. |

◆ RM_BLE_ABS_StartPeriodicAdvertising()

```
fsp_err_t RM_BLE_ABS_StartPeriodicAdvertising ( ble_abs_ctrl_t *const p_ctrl,
ble_abs_periodic_advertising_parameter_t const *const p_advertising_parameter )
```

Start Periodic Advertising after setting advertising parameters, periodic advertising parameters, advertising data and periodic advertising data. The periodic advertising uses the advertising set whose advertising handle is 3. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements [ble_abs_api_t::startPeriodicAdvertising](#)

Return values

| | |
|-------------------------|--|
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_UNSUPPORTED | Subordinate modules do not support this feature. |

Start Periodic Advertising after setting advertising parameters, periodic advertising parameters, advertising data and periodic advertising data. The periodic advertising uses the advertising set whose advertising handle is 3. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements [ble_abs_api_t::startPeriodicAdvertising](#)

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_advertising_parameter is specified as NULL. |
| FSP_ERR_INVALID_ARGUMENT | The advertising parameter is out of range. |
| FSP_ERR_UNSUPPORTED | This feature is not supported in this configuration. |

◆ RM_BLE_ABS_StartScanning()

```
fsp_err_t RM_BLE_ABS_StartScanning ( ble_abs_ctrl_t *const p_ctrl, ble_abs_scan_parameter_t
const *const p_scan_parameter )
```

Start scanning after setting scan parameters. The scanner address type is Public Identity Address. Fast scan is followed by slow scan. The end of fast scan or slow scan is notified with BLE_GAP_EVENT_SCAN_TO event. If fast_period is 0, only slow scan is carried out. If scan_period is 0, slow scan continues. Implements [ble_abs_api_t::startScanning](#).

Example:

```
/* Start scanning. */
err = RM_BLE_ABS_StartScanning(&g_ble_abs0_ctrl, &scan_parameter);
```

Return values

| | |
|-------------------------|--|
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_scan_parameter is specified as NULL. |
| FSP_ERR_UNSUPPORTED | Function is not supported |

Start scanning after setting scan parameters. The scanner address type is Public Identity Address. Fast scan is followed by slow scan. The end of fast scan or slow scan is notified with BLE_GAP_EVENT_SCAN_TO event. If fast_period is 0, only slow scan is carried out. If scan_period is 0, slow scan continues. Implements [ble_abs_api_t::startScanning](#).

Example:

```
/* Start scanning. */
err = RM_BLE_ABS_StartScanning(&g_ble_abs0_ctrl, &scan_parameter);
```

Return values

| | |
|-------------------------|--|
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_scan_parameter is specified as NULL. |
| FSP_ERR_UNSUPPORTED | Function is not supported |

Start scanning after setting scan parameters. The scanner address type is Public Identity Address. Fast scan is followed by slow scan. The end of fast scan or slow scan is notified with BLE_GAP_EVENT_SCAN_TO event. If fast_period is 0, only slow scan is carried out. If scan_period is 0, slow scan continues. Implements [ble_abs_api_t::startScanning](#).

Example:

```
/* Start scanning. */
err = RM_BLE_ABS_StartScanning(&g_ble_abs0_ctrl, &scan_parameter);
```

Return values

| | |
|---------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_scan_parameter is specified as NULL. |
| FSP_ERR_INVALID_ARGUMENT | The scan parameter is out of range. |
| FSP_ERR_IN_USE | This API is called in scanning. |
| FSP_ERR_BLE_ABS_NOT_FOUND | Usable timer slot not found. |
| FSP_ERR_UNSUPPORTED | This feature is not supported in this configuration. |

◆ RM_BLE_ABS_CreateConnection()

```
fsp_err_t RM_BLE_ABS_CreateConnection ( ble_abs_ctrl_t*const p_ctrl,
ble_abs_connection_parameter_t const *const p_connection_parameter )
```

Request create connection. The initiator address type is Public Identity Address. The scan interval is 60ms and the scan window is 30ms in case of 1M PHY or 2M PHY. The scan interval is 180ms and the scan window is 90ms in case of coded PHY. The Minimum CE Length and the Maximum CE Length are 0xFFFF. When the request for a connection has been received by the Controller, BLE_GAP_EVENT_CREATE_CONN_COMP event is notified. When a link has been established, BLE_GAP_EVENT_CONN_IND event is notified. Implements [ble_abs_api_t::createConnection](#).

Example:

```
/* Create connection with remote device. */
err = RM_BLE_ABS_CreateConnection(&g_ble_abs0_ctrl, &g_connection_parameter);
```

Return values

| | |
|--------------------------|--|
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_connection_parameter is specified as NULL. |
| FSP_ERR_INVALID_ARGUMENT | The create connection parameter is out of range. |
| FSP_ERR_UNSUPPORTED | Function is not supported |

Request create connection. The initiator address type is Public Identity Address. The scan interval is 60ms and the scan window is 30ms in case of 1M PHY or 2M PHY. The scan interval is 180ms and the scan window is 90ms in case of coded PHY. The Minimum CE Length and the Maximum CE Length are 0xFFFF. When the request for a connection has been received by the Controller, BLE_GAP_EVENT_CREATE_CONN_COMP event is notified. When a link has been established, BLE_GAP_EVENT_CONN_IND event is notified. Implements [ble_abs_api_t::createConnection](#).

Example:

```
/* Create connection with remote device. */
err = RM_BLE_ABS_CreateConnection(&g_ble_abs0_ctrl, &g_connection_parameter);
```

Return values

| | |
|--------------------------|--|
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_connection_parameter is specified as NULL. |
| FSP_ERR_INVALID_ARGUMENT | The create connection parameter is out of range. |
| FSP_ERR_UNSUPPORTED | Function is not supported |

Request create connection. The initiator address type is Public Identity Address. The scan interval is 60ms and the scan window is 30ms in case of 1M PHY or 2M PHY. The scan interval is 180ms and the scan window is 90ms in case of coded PHY. The Minimum CE Length and the Maximum CE Length are 0xFFFF. When the request for a connection has been received by the Controller, BLE_GAP_EVENT_CREATE_CONN_COMP event is notified. When a link has been established, BLE_GAP_EVENT_CONN_IND event is notified. Implements [ble_abs_api_t::createConnection](#).

Example:

```
/* Create connection with remote device. */
err = RM_BLE_ABS_CreateConnection(&g_ble_abs0_ctrl, &g_connection_parameter);
```

Return values

| | |
|---------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_POINTER | p_connection_parameter is specified as NULL. |
| FSP_ERR_INVALID_ARGUMENT | The create connection parameter is out of range. |
| FSP_ERR_IN_USE | This API is called while creating a link by previous API call. |
| FSP_ERR_BLE_ABS_NOT_FOUND | Couldn't find a valid timer. |
| FSP_ERR_UNSUPPORTED | This feature is not supported in this configuration. |

◆ RM_BLE_ABS_SetLocalPrivacy()

```
fsp_err_t RM_BLE_ABS_SetLocalPrivacy ( ble_abs_ctrl_t *const p_ctrl, uint8_t const *const p_lc_irk,
uint8_t privacy_mode )
```

Generate a IRK, add it to the resolving list, set privacy mode and enable RPA function. Register vendor specific callback function, if IRK is generated by this function. After configuring local device privacy, BLE_GAP_ADDR_RPA_ID_PUBLIC is specified as own device address in the advertising/scan/create connection API. Implements [ble_abs_api_t::setLocalPrivacy](#)

Return values

| | |
|--------------------------|---|
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_ARGUMENT | The privacy_mode parameter is out of range. |
| FSP_ERR_UNSUPPORTED | Function is not supported |

Generate a IRK, add it to the resolving list, set privacy mode and enable RPA function. Register vendor specific callback function, if IRK is generated by this function. After configuring local device privacy, BLE_GAP_ADDR_RPA_ID_PUBLIC is specified as own device address in the advertising/scan/create connection API. Implements [ble_abs_api_t::setLocalPrivacy](#)

Example:

```
/* Set local privacy. */
err = RM_BLE_ABS_SetLocalPrivacy(&g_ble_abs0_ctrl, p_local_irk, privacy_mode);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | p_instance_ctrl is specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_ARGUMENT | The privacy_mode parameter is out of range. |

◆ RM_BLE_ABS_StartAuthentication()

```
fsp_err_t RM_BLE_ABS_StartAuthentication ( ble_abs_ctrl_t *const p_ctrl, uint16_t
connection_handle )
```

Start pairing or encryption. If pairing has been done, start encryption. The pairing parameters are configured by [RM_BLE_ABS_Open\(\)](#) or [R_BLE_GAP_SetPairingParams\(\)](#). If the pairing parameters are configure by [RM_BLE_ABS_Open\(\)](#),

- bonding policy is that bonding information is stored.
- Key press notification is not supported. Implements [ble_abs_api_t::startAuthentication](#).

Example:

```
/* Start authentication with remote device. */
err = RM_BLE_ABS_StartAuthentication(&g_ble_abs0_ctrl, g_connection_handle);
```

Return values

| | |
|---------------------|---|
| FSP_ERR_ASSERTION | p_instance_ctrl or connection_handle are specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_UNSUPPORTED | Function is not supported |

Start pairing or encryption. If pairing has been done, start encryption. The pairing parameters are configured by [RM_BLE_ABS_Open\(\)](#) or [R_BLE_GAP_SetPairingParams\(\)](#). If the pairing parameters are configure by [RM_BLE_ABS_Open\(\)](#),

- bonding policy is that bonding information is stored.
- Key press notification is not supported. Implements [ble_abs_api_t::startAuthentication](#).

Example:

```
/* Start authentication with remote device. */
err = RM_BLE_ABS_StartAuthentication(&g_ble_abs0_ctrl, g_connection_handle);
```

Return values

| | |
|---------------------|---|
| FSP_ERR_ASSERTION | p_instance_ctrl or connection_handle are specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_UNSUPPORTED | Function is not supported |

Start pairing or encryption. If pairing has been done, start encryption. The pairing parameters are configured by [RM_BLE_ABS_Open\(\)](#) or [R_BLE_GAP_SetPairingParams\(\)](#). If the pairing parameters are configure by [RM_BLE_ABS_Open\(\)](#),

- bonding policy is that bonding information is stored.
- Key press notification is not supported. Implements [ble_abs_api_t::startAuthentication](#).

Example:

```
/* Start authentication with remote device. */
err = RM_BLE_ABS_StartAuthentication(&g_ble_abs0_ctrl, g_connection_handle);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | p_instance_ctrl or connection_handle are specified as NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_ARGUMENT | The connection handle parameter is out of range. |

◆ RM_BLE_ABS_DeleteBondInformation()

```
fsp_err_t RM_BLE_ABS_DeleteBondInformation ( ble_abs_ctrl_t *const p_ctrl,
ble_abs_bond_information_parameter_t const *const p_bond_information_parameter )
```

Delete bonding information from BLE stack and storage. Implements [ble_abs_api_t::deleteBondInformation](#).

Example:

```
/* Delete bonding information. */
err = RM_BLE_ABS_DeleteBondInformation(&g_ble_abs0_ctrl,
&g_bond_information_parameter);
```

Return values

| | |
|-------------------------|---|
| FSP_SUCCESS | Operation was successful |
| FSP_ERR_ASSERTION | The parameter p_instance_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_bond_information_parameter is NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |

Delete bonding information from BLE stack and storage. Implements [ble_abs_api_t::deleteBondInformation](#).

Example:

```
/* Delete bonding information. */
err = RM_BLE_ABS_DeleteBondInformation(&g_ble_abs0_ctrl,
&g_bond_information_parameter);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Operation was successful |
| FSP_ERR_ASSERTION | The parameter p_instance_ctrl is NULL. |

| | |
|-------------------------|--|
| FSP_ERR_INVALID_POINTER | The parameter <code>p_bond_information_parameter</code> is NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |

Delete bonding information from BLE stack and storage. Implements [ble_abs_api_t::deleteBondInformation](#).

Example:

```
/* Delete bonding information. */
err = RM_BLE_ABS_DeleteBondInformation(&g_ble_abs0_ctrl,
&g_bond_information_parameter);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter <code>p_instance_ctrl</code> is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter <code>p_bond_information_parameter</code> is NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |

◆ RM_BLE_ABS_ImportKeyInformation()

```
fsp_err_t RM_BLE_ABS_ImportKeyInformation ( ble_abs_ctrl_t*const p_ctrl, ble_device_address_t*
p_local_identity_address, uint8_t* p_local_irk, uint8_t* p_local_csrk )
```

Import key information to BLE stack and storage. Implements [ble_abs_api_t::importKeyInformation](#).

Example:

```
/* Import local key information. */
err = RM_BLE_ABS_ImportKeyInformation(&g_ble_abs0_ctrl, &local_identity_address,
local_irk, local_csrk);
```

Return values

| | |
|------------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter <code>p_instance_ctrl</code> is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter <code>p_local_identity_address</code> , <code>p_local_irk</code> or <code>p_local_csrk</code> is NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_HW_CONDITION | Failure to access internal storage. |
| FSP_ERR_UNSUPPORTED | Not supported in this configuration. |

◆ RM_BLE_ABS_ExportKeyInformation()

```
fsp_err_t RM_BLE_ABS_ExportKeyInformation ( ble_abs_ctrl_t *const p_ctrl, ble_device_address_t *
p_local_identity_address, uint8_t * p_local_irk, uint8_t * p_local_csrk )
```

Export key information to BLE stack and storage. Implements `ble_abs_api_t::exportKeyInformation`.

Example:

```
/* Export local key information. */
err = RM_BLE_ABS_ExportKeyInformation(&g_ble_abs0_ctrl, &local_identity_address,
local_irk, local_csrk);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_instance_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_local_identity_address, p_local_irk or p_local_csrk is NULL. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_BUFFER_EMPTY | Dynamic memory allocation failed. |
| FSP_ERR_OUT_OF_MEMORY | Failure to access internal storage. |
| FSP_ERR_NOT_INITIALIZED | Not initialized internal storage. |
| FSP_ERR_UNSUPPORTED | Not supported in this configuration. |

5.2.12.8 BLE Driver (r_ble_balance)

Modules » [Networking](#)

Driver for the Radio peripheral on RA MCUs. This module implements the [BLE Interface](#).

Overview

The Bluetooth Low Energy (BLE) library in Balance configuration (r_ble) provides an API to control the Radio peripheral. This module is configured via the [QE for BLE](#). QE for BLE provides standard services defined by standardization organization and custom services defined by user. [Bluetooth LE Profile API Document User's Manual](#) describes the APIs for standard services.

Features

- Common
 - Open/Close the BLE protocol stack.
 - Execute the BLE job.

- Add an event in the BLE protocol stack internal queue.
- **GAP**
 - Initialization of the Host stack.
 - Start/Stop Advertising.
 - Start/Stop Scan.
 - Connect/Disconnect a link.
 - Initiate/Respond a pairing request.
- **GATT Common**
 - Get MTU size.
- **GATT Server**
 - Initialization of GATT Server.
 - Notification/Indication.
- **GATT Client**
 - Discovery services, characteristics.
 - Read/Write characteristic.
- **Vendor Specific**
 - DTM.
 - Set/Get transmit power.
 - Set/Get BD_ADDR.

Supported functions

The supported functions are listed in the table below. Choose the configuration that best suits the functions that target system requires.

| BLE library feature | Extended | Balance | Compact |
|---------------------|------------|----------------------|---------------|
| Common API | Supported | Supported | Supported |
| GAP API | Supported | *1 Limited | *1 *2 Limited |
| GATT Common API | Supported | Supported | Supported |
| GATT Client API | Supported | Supported | Supported |
| GATT Client API | Supported | Supported | Supported |
| L2CAP API | Supported | Not Supported | Not supported |
| Vendor Specific API | *3 Limited | *3 Limited | *3 Limited |

Note

1. This configuration dose not support LE Advertising Extensions functionality APIs.
2. This configuration dose not support Central and Observer functionality APIs.
3. This configuration dose not support vender specific firmware update functionality APIs.

Target Devices

The Renesas BLE Library supports the following devices.

- RA4W1

Configuration

Clock Configuration

Note

System clock (ICLK): 8 MHz or more

Peripheral module clock A (PCLKA): 8MHz or more

The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.

It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Figure shows the software structure of the BLE FSP module.

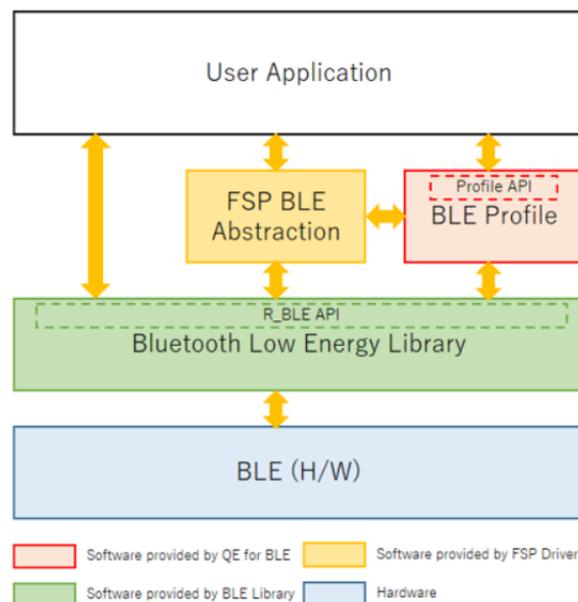

Figure 278: BLE software structure

The BLE FSP module consists of the BLE library.

The BLE Application uses the BLE functions via the [R_BLE API](#) provided by the BLE Library.

The QE for BLE generates the source codes (BLE base skeleton program) as a base for the BLE Application and the BLE Profile codes including the Profile API.

Initialize the BLE protocol stack*Note*

It takes around 250msec to initialize BLE protocol stack.

[R_BLE_Open](#) API will be occupied MCU resources during the initialization.

Limitations

Developers should be aware of the following limitations when using the ble:

Note

- This configuration dose not support LE Advertising Extensions functionality APIs.

If those functionalities need your system, select *BLE Driver (r_ble_extended)* configuration.

- This configuration dose not support L2CAP functionality APIs.

If those functionalities need your system, select *BLE Driver (r_ble_extended)* configuration.

- This configuration dose not support vender specific firmware update functionality APIs.

Those APIs are only supported by *SPP BLE Abstraction (rm_ble_abs_spp)* module.

Limitations on FreeRTOS environment

Developers should be aware of the following limitations when using the ble on FreeRTOS environment: When use deep sleep, sleep mode or standby mode, there is following two wake up option from RF module.

- Using Semaphore
- Using Event Groups

Note

Event Groups is processing as a delay handler by timer task.

Therefore, if blocked by interrupts or if the timer task is blocked by another high-priority task, the existing connection will be broken.

5.2.12.9 BLE Driver (r_ble_compact)

[Modules](#) » [Networking](#)

Driver for the Radio peripheral on RA MCUs. This module implements the [BLE Interface](#).

Overview

The Bluetooth Low Energy (BLE) library in Compact configuration (r_ble) provides an API to control the Radio peripheral. This module is configured via the [QE for BLE](#). QE for BLE provides standard services defined by standardization organization and custom services defined by user. [Bluetooth LE Profile API Document User's Manual](#) describes the APIs for standard services.

Features

- Common
 - Open/Close the BLE protocol stack.
 - Execute the BLE job.
 - Add an event in the BLE protocol stack internal queue.
- [GAP](#)
 - Initialization of the Host stack.
 - Start/Stop Advertising.
 - Initiate/Respond a pairing request.
- [GATT Common](#)
 - Get MTU size.
- [GATT Server](#)
 - Initialization of GATT Server.
 - Notification/Indication.
- [GATT Client](#)
 - Discovery services, characteristics.

- Read/Write characteristic.
- **Vendor Specific**
 - DTM.
 - Set/Get transmit power.
 - Set/Get BD_ADDR.

Supported functions

The supported functions are listed in the table below. Choose the configuration that best suits the functions that target system requires.

| BLE library feature | Extended | Balance | Compact |
|---------------------|------------|---------------|----------------------|
| Common API | Supported | Supported | Supported |
| GATT Common API | Supported | *1 Limited | *1 *2 Limited |
| GATT Common API | Supported | Supported | Supported |
| GATT Server API | Supported | Supported | Supported |
| GATT Client API | Supported | Supported | Supported |
| L2CAP API | Supported | Not supported | Not supported |
| Vendor Specific API | *3 Limited | *3 Limited | *3 Limited |

Note

1. This configuration dose not support LE Advertising Extensions functionality APIs.
2. This configuration dose not support Central and Observer functionality APIs.
3. This configuration dose not support vender specific firmware update functionality APIs.

Target Devices

The Renesas BLE Library supports the following devices.

- RA4W1

Configuration

Clock Configuration

Note

System clock (ICLK): 8 MHz or more

Peripheral module clock A (PCLKA): 8MHz or more

The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.

It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Figure shows the software structure of the BLE FSP module.

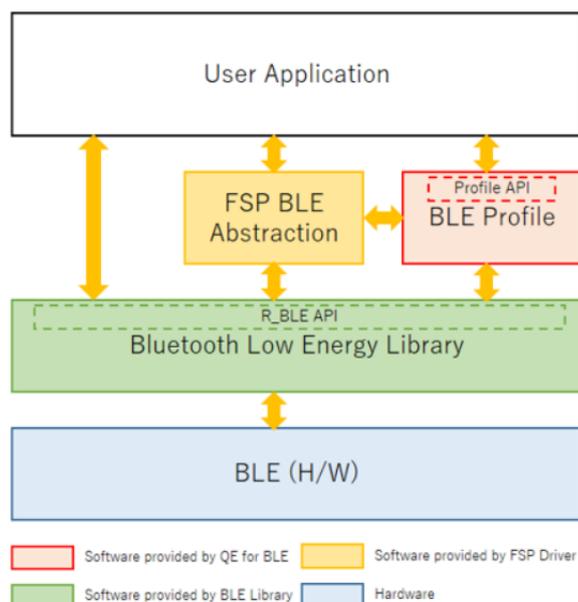

Figure 279: BLE software structure

The BLE FSP module consists of the BLE library. The BLE Application uses the BLE functions via the `R_BLE API` provided by the BLE Library. The QE for BLE generates the source codes (BLE base skeleton program) as a base for the BLE Application and the BLE Profile codes including the Profile API.

Initialize the BLE protocol stack

Note

*It takes around 250msec to initialize BLE protocol stack.
`R_BLE_Open` API will be occupied MCU resources during the initialization.*

Limitations

Developers should be aware of the following limitations when using the ble:

Note

- This configuration dose not supports LE Advertising Extensions functionality APIs.
 If those functionalities need your system, select `BLE Driver (r_ble_extended)` configuration.
- This configuration dose not supports Central and Observer functionality APIs.
 If those functionalities need your system, select `BLE Driver (r_ble_extended)` or `BLE Driver (r_ble_balance)` configuration.
- This configuration dose not supports L2CAP functionality APIs.
 If those functionalities need your system, select `BLE Driver (r_ble_extended)` configuration.
- This configuration dose not supports vender specific firmware update functionality APIs.
 Those APIs are only supported by `SPP BLE Abstraction (rm_ble_abs_spp)` module.

Limitations on FreeRTOS environment

Developers should be aware of the following limitations when using the ble on FreeRTOS environment: When use deep sleep, sleep mode or standby mode, there is following two wake up option from RF module.

- Using Semaphore
- Using Event Groups

Note

*Event Groups is processing as a delay handler by timer task.
Therefore, if blocked by interrupts or if the timer task is blocked by another high-priority task,
the existing connection will be broken.*

5.2.12.10 BLE Driver (r_ble_extended)

[Modules](#) » [Networking](#)

Driver for the Radio peripheral on RA MCUs. This module implements the [BLE Interface](#).

Overview

The Bluetooth Low Energy (BLE) library in Extended configuration (r_ble) provides an API to control the Radio peripheral. This module is configured via the [QE for BLE](#). QE for BLE provides standard services defined by standardization organization and custom services defined by user. [Bluetooth LE Profile API Document User's Manual](#) describes the APIs for standard services.

Features

- Common
 - Open/Close the BLE protocol stack.
 - Execute the BLE job.
 - Add an event in the BLE protocol stack internal queue.
- [GAP](#)
 - Initialization of the Host stack.
 - Start/Stop Advertising (Support LE Advertising Extensions).
 - Start/Stop Scan.
 - Connect/Disconnect a link.
 - Initiate/Respond a pairing request.
- [GATT Common](#)
 - Get MTU size.
- [GATT Server](#)
 - Initialization of GATT Server.
 - Notification/Indication.
- [GATT Client](#)
 - Discovery services, characteristics.
 - Read/Write characteristic.
- [L2CAP](#)
 - Credit-based flow control transaction.
- [Vendor Specific](#)
 - DTM.
 - Set/Get transmit power.
 - Set/Get BD_ADDR.

Supported functions

The supported functions are listed in the table below. Choose the configuration that best suits the functions that target system requires.

| BLE library feature | Extended | Balance | Compact |
|---------------------|-------------------|---------------|---------------|
| Common API | Supported | Supported | Supported |
| GAP API | Supported | *1 Limited | *1 *2 Limited |
| GATT Common API | Supported | Supported | Supported |
| GATT Server API | Supported | Supported | Supported |
| GATT Client API | Supported | Supported | Supported |
| L2CAP API | Supported | Not supported | Not supported |
| Vendor Specific API | *3 Limited | *3 Limited | *3 Limited |

Note

1. This configuration dose not support LE Advertising Extensions functionality APIs.
2. This configuration dose not support Central and Observer functionality APIs.
3. This configuration dose not support vender specific firmware update functionality APIs.

Target Devices

The Renesas BLE Library supports the following devices.

- RA4W1

Configuration

Clock Configuration

Note

System clock (ICLK): 8 MHz or more

Peripheral module clock A (PCLKA): 8MHz or more

The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.

It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Figure shows the software structure of the BLE FSP module.

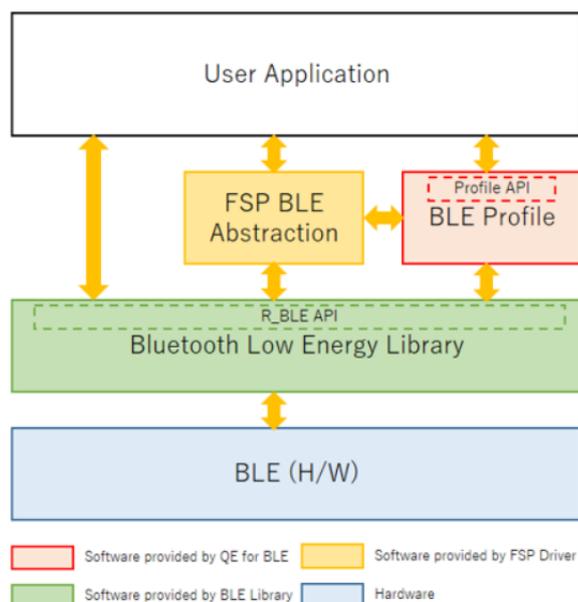

Figure 280: BLE software structure

The BLE FSP module consists of the BLE library. The BLE Application uses the BLE functions via the `R_BLE API` provided by the BLE Library. The QE for BLE generates the source codes (BLE base skeleton program) as a base for the BLE Application and the BLE Profile codes including the Profile API.

Initialize the BLE protocol stack

Note

*It takes around 250msec to initialize BLE protocol stack.
`R_BLE_Open` API will be occupied MCU resources during the initialization.*

Limitations

Developers should be aware of the following limitations when using the ble:

Note

*- This configuration dose not support vender specific firmware update functionality APIs.
 Those APIs are only supported by `SPP BLE Abstraction (rm_ble_abs_spp)` module.*

Limitations on FreeRTOS environment

Developers should be aware of the following limitations when using the ble on FreeRTOS environment: When use deep sleep, sleep mode or standby mode, there is following two wake up option from RF module.

- Using Semaphore
- Using Event Groups

Note

*Event Groups is processing as a delay handler by timer task.
 Therefore, if blocked by interrupts or if the timer task is blocked by another high-priority task, the existing connection will be broken.*

5.2.12.11 BLE Mesh Network Modules

[Modules](#) » [Networking](#)

Detailed Description

BLE Mesh Network Modules.

Modules

BLE Mesh Network (rm_ble_mesh)

BLE Mesh Network Access (rm_ble_mesh_access)

BLE Mesh Network Bearer (rm_ble_mesh_bearer)

BLE Mesh Network Bearer Platform (rm_mesh_bearer_platform)

BLE Mesh Network Config Client (rm_mesh_config_clt)

BLE Mesh Network Config Server (rm_mesh_config_srv)

BLE Mesh Network Generic Admin Property Server
(rm_mesh_generic_admin_prop_srv)

BLE Mesh Network Generic Battery Client
(rm_mesh_generic_battery_clt)

BLE Mesh Network Generic Battery Server
(rm_mesh_generic_battery_srv)

Detailed Description

Overview

Bluetooth Mesh defines a managed-flood-based mesh network. Any device in the network can send a message at any time as long as there is a sufficient density of devices that are listening and relaying messages. See [sample application document](#) and [start up guide](#) for information on how to create a BLE MESH application.

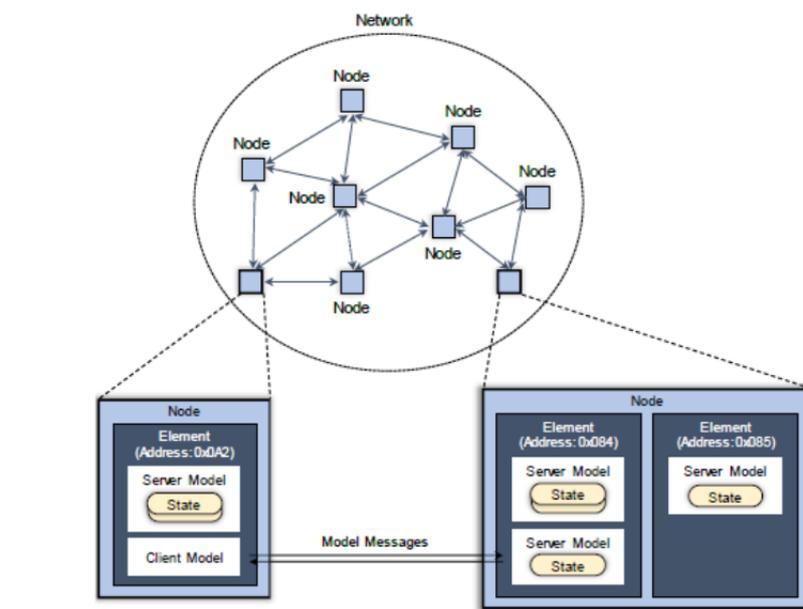

Figure 281: Overview Of Bluetooth Mesh

Features

The BLE Mesh middleware has the following features:

- Supports one-to-one and one-to-many message transmission
- Supports relay messages to other nodes
- Supports secure message transmission against the following attack
 - Wiretap attack
 - Man-in-the-middle attack
 - Replay attack
 - Trash-can attack
 - Brute Force Key attack
- Supports following optional features
 - Supports Relay feature
 - Supports Proxy feature
 - Supports Friend feature
 - Supports Low Power feature

Target Devices

The BLE Mesh Network module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enable • Disable | Default (BSP) | Specify whether to include code for API parameter checking. Valid settings include. |

Configurations for Networking > BLE Mesh Network modules > BLE Mesh (rm_ble_mesh)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh (rm_ble_mesh).

| Configuration | Options | Default | Description |
|--------------------------|----------------------------------|----------------|---|
| General | | | |
| Name | Name Must Be a Valid C Symbol | g_rm_ble_mesh0 | Module name. |
| Channel Number | Invalid Channel Number | 0 | Select channel corresponding to the channel number of the hardware. |
| Bearer | | | |
| Network Interface Number | Invalid Network Interface Number | 2 | Network interfaces number. |
| Provisioning Interface | Invalid Provisioning | 2 | Provisioning interfaces |

| Number | Interface Number | | number. |
|---|---|------|--|
| Provisioning | | | |
| Unprovisioned Device Beacon Timeout in Milliseconds | Invalid Unprovisioned Device Beacon Timeout in Milliseconds | 200 | Unprovisioned device beacon timeout in milliseconds. |
| Network | | | |
| Network Cache Size | Invalid Network Cache Size | 10 | Network cache size. |
| Network Sequence Number Cache Size | Invalid Network Sequence Number Cache Size | 32 | Network sequence number cache size. |
| Maximum Number of Subnet | Invalid Maximum Number of Subnets | 4 | Maximum number of subnets |
| Maximum Number of Device Key | Invalid Maximum Number of Device Keys | 4 | Maximum number of device keys. |
| Proxy Filter List Size | Invalid Proxy Filter List Size | 2 | Maximum number of addresses present in each proxy filter list. |
| Network Sequence Number Block Size | Invalid Network Sequence Number Block Size | 2048 | The distance between the network sequence numbers, for every persistent storage write. |
| Network Transmit Count for Network Packets | Invalid Network Transmit Count for Network Packets | 1 | Network transmit count for network packets. |
| Network Interval Steps for Network Packets | Invalid Network Interval Steps for Network Packets | 4 | Network interval steps for network packets. |
| Network Transmit Count for Relayed Packets | Invalid Network Transmit Count for Relayed Packets | 0 | Network transmit count for relayed packets. |
| Network Interval Steps for Relayed Packets | Invalid Network Interval Steps for Relayed Packets | 9 | Network interval steps for relayed packets. |
| Proxy ADV Network ID Timeout for Each Subnet in Milliseconds. | Invalid Proxy ADV Network ID Timeout | 100 | Proxy ADV network ID timeout for each subnet in milliseconds. |
| Proxy ADV Node Identity Timeout for Each Subnet in Milliseconds | Invalid Proxy ADV Node Identity Timeout for Each Subnet in Milliseconds | 300 | Proxy ADV node identity timeout for each subnet in milliseconds. |
| Proxy ADV Node Identity Overall Time Period in Seconds | Invalid Proxy ADV Node Identity Overall Time Period in Seconds | 60 | Proxy ADV node identity overall time period in seconds. |

| | | | |
|--|--|------|---|
| Maximum Number of Queued Messages for Transmission | Invalid Maximum Number of Queued Messages for Transmission | 64 | Maximum number of queued messages for transmission. |
| Transport | | | |
| Maximum Number of LPN | Invalid Maximum Number of LPNs | 1 | Maximum number of LPNs. |
| Replay Protection Cache Size | Invalid Replay Protection Cache Size | 10 | Replay protection cache size. |
| Reassembled Cache Size | Invalid Reassembled Cache Size | 8 | Reassembled cach size. |
| Friend Poll Retry Count | Invalid Friend Poll Retry Count | 10 | Friend poll retry count. |
| Maximum Number of Segmentation and Reassembly Context | Invalid Maximum Number of Segmentation and Reassembly Context | 8 | Number of segmentation and reassembly contexts. |
| Lower Transport Segment Transmission Timeout in Milliseconds | Invalid Lower Transport Segment Transmission Timeout in Milliseconds | 300 | Lower transport segment transmission timeout in milliseconds. |
| Lower Transport Segment Re-Transmission Count | Invalid Lower Transport Segment Re-Transmission Count | 2 | Lower transport segment re-transmission count. |
| Lower Transport Acknowledgement Timeout in Milliseconds | Invalid Lower Transport Acknowledgement Timeout in Milliseconds | 200 | Lower transport acknowledgement timeout in milliseconds. |
| Lower Transport Incomplete Timeout in Seconds | Invalid Lower Transport Incomplete Timeout in Seconds | 20 | Lower transport incomplete timeout in seconds. |
| Friendship Receive Window | Invalid Friendship Receive Window | 100 | Friendship receive window. |
| Maximum Number of Friend Message Queue | Invalid Maximum Number of Friend Messages Queue | 15 | Maximum number of messages that the friend is capabale to queue for a single Low Power Node. |
| Maximum Number of Friend Subscription List | Invalid Maximum Number of Friend Subscription List | 8 | Maximum number of subscription addresses that the friend is capable to store for a single Low Power Node. |
| Friend Clear Confirmation Timeout in Milliseconds | Invalid Friend Clear Confirmation Timeout in Milliseconds | 1000 | Friend clear confirmation timeout in milliseconds. |
| Friend Clear Retry | Invalid Friend Clear | 5 | Friend clear retry |

| Count | Retry Count | | count. |
|--|--|--------|---|
| Friendship Retry Timeout in Milliseconds | Invalid Friendship Retry Timeout in Milliseconds | 1200 | Friendship retry timeout in milliseconds. |
| Access | | | |
| Maximum Number of Element | Invalid Maximum Number of Element | 4 | Maximum number of elements. |
| Maximum Number of Model | Invalid Maximum Number of Model | 60 | Maximum number of models. |
| Maximum Number of Application | Invalid Maximum Number of Application | 8 | Maximum number of applications (keys) the device can store information about. |
| Maximum Number of Virtual Address | Invalid Maximum Number of Virtual Address | 8 | Maximum number of virtual addresses the device can store information about. |
| Maximum Number of Non-Virtual Address | Invalid Maximum Number of Non-Virtual Address | 8 | Maximum number of non-virtual addresses the device can store information about. |
| Maximum Number of Transition Timers | Invalid Maximum Number of Transition Timers | 5 | Maximum number of transition timers. |
| Maximum Number of Periodic Step Timers | Invalid Maximum Number of Periodic Step Timers | 5 | Maximum number of periodic step timers. |
| Foundation | | | |
| Config Server Secure Network Beacon Interval | Invalid Config Server Secure Network Beacon Interval | 10 | Config server secure network beacon interval. |
| Maximum Number of Health Server Instance | Invalid Maximum Number of Health Server Instance | 2 | Maximum number of health server instances. |
| Model | | | |
| Maximum Number of Light Lightness Controller Server Instance | Invalid Maximum Number of Light Lightness Controller Server Instance | 1 | Maximum number of light lightness controller server instances. |
| ID | | | |
| Company ID | Invalid Company ID | 0x0036 | Company ID. |
| Product ID | Invalid Product ID | 0x0001 | Product ID. |
| Vendor ID | Invalid Vendor ID | 0x0100 | Vendor ID. |
| Platform | | | |

Platform > Storage

| | | | |
|--------------|----------------------|---|---------------|
| Block Number | Invalid Block Number | 5 | Block number. |
|--------------|----------------------|---|---------------|

Platform > Memory Pool

| | | | |
|------------------|--------------------------|--------|-------------------|
| Memory Pool Size | Invalid Memory Pool Size | 0x4000 | Memory pool size. |
|------------------|--------------------------|--------|-------------------|

Platform > Logging

| | | |
|-----------------|---|--|
| Packet Bitfield | <ul style="list-style-type: none"> • Network • Lower Trans • Upper Trans • Access | Specifies if this is included in the packet_bitfield mask. |
|-----------------|---|--|

| | | |

| Module Info Bitfield | <ul style="list-style-type: none"> • Network • Lower Trans • Upper Trans • Access | Specifies if this is included in the module information bitfield mask. |
|----------------------|---|--|

| | | |
|----------------------|---|---|
| Generic Log Bitfield | <ul style="list-style-type: none"> • Network • Lower Trans • Upper Trans • Access | Specifies if this is included in the generic log bitfield mask. |
|----------------------|---|---|

| | | |
|----------|-------------------------------|------|
| function | Name Must Be a Valid C Symbol | NULL |
|----------|-------------------------------|------|

Clock Configuration*Note**System clock (ICLK): 8 MHz or more**Peripheral module clock A (PCLKA): 8MHz or more**The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.**It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.***Pin Configuration**

This module does not use I/O pins.

Usage Notes**Mesh System Architecture**

Purpose of each layer is,

Model layer

Model is a standardized typical functionality so that nodes perform operations in accordance with application scenario.

Foundation Model layer

Foundation Models are models to configure and manage operations of elements.

Access layer

The access layer defines how higher layer applications can use the upper transport layer.

Upper transport layer

The upper transport layer encrypts, decrypts, and authenticates application data and is designed to provide confidentiality of access messages.

Lower transport layer

The lower transport layer defines how upper transport layer messages are segmented and reassembled into multiple Lower Transport PDUs to deliver large upper transport layer messages to other nodes.

Network layer

The network layer defines how transport messages are addressed towards one or more elements.

Bearer layer

The bearer layer defines how network messages are transported between nodes.

Device Life Cycle

The device not joined in the mesh network is an Unprovisioned Device and the device joined in the mesh network is called a Node.

- **Unprovisioned Device**
Unprovisioned device cannot send or receive mesh messages. However, it will advertise its presence to the provisioner. By the provisioner, Unprovisioned Devices are invited to join the mesh network and become nodes(Provisioning).
- **Node**
Nodes can send and receive mesh messages. It is managed by the configuration client through the mesh network, which configures how the nodes communicate. The configuration client can also remove a Node from the mesh network, which will return the node to an Unprovisioned Device.

To communicate with other nodes by using Models, each node needs Configuration. By Configuration process, information required for Model operation such as Application Keys, Publish Address, Subscription Address is configured. Following shows a typical lifecycle of a node.

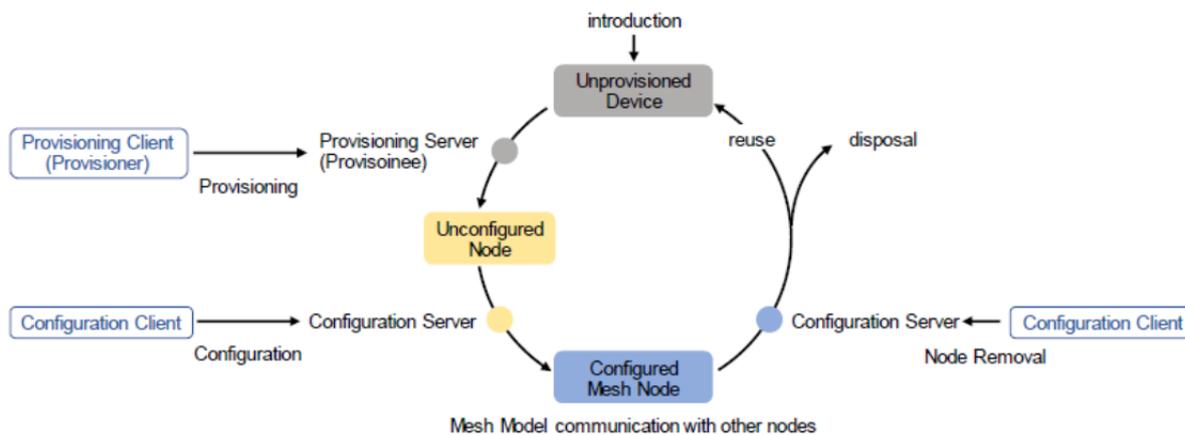

Figure 282: Device Life Cycle Image

Newly introduced device is provisioned by Provisioner and joins a network. Furthermore, this device is configured by Configuration Client and becomes to be able to communicate with other nodes with Mesh Model. Generally, Configuration Client is a smart phone or other mobile computing device. Configuration Client removes a node from a network by sending Config Node Reset message. Besides, Configuration Client updates encryption keys used in the network, and the removed node becomes unable to communicate with other nodes.

Examples

BLE_MESH Basic Example

This is a basic example of minimal use of the BLE_MESH in an application.

Data Structures

```
struct rm_ble_mesh_instance_ctrl_t
```

Data Structure Documentation

◆ rm_ble_mesh_instance_ctrl_t

```
struct rm_ble_mesh_instance_ctrl_t
```

RM_BLE_MESH_BEARER private control block. DO NOT MODIFY. Initialization occurs when [RM_BLE_MESH_BEARER_Open\(\)](#) is called.

Function Documentation

◆ RM_BLE_MESH_Open()

```
fsp_err_t RM_BLE_MESH_Open ( rm_ble_mesh_ctrl_t *const p_ctrl, rm_ble_mesh_cfg_t const *const p_cfg )
```

Open ble mesh middleware. API to initialize Mesh Stack. This is the first API that the application should call before any other API. This function initializes all the internal stack modules and data structures.

Implements [rm_ble_mesh_api_t::open](#).

Example:

```
/* Open the module. */
err = RM_BLE_MESH_Open(&g_ble_mesh0_ctrl, &g_ble_mesh0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |

◆ RM_BLE_MESH_Close()

```
fsp_err_t RM_BLE_MESH_Close ( rm_ble_mesh_ctrl_t *const p_ctrl)
```

Close ble mesh middleware. API to turn off Bluetooth Hardware. This API should be called after [RM_BLE_MESH_Open](#).

Implements [rm_ble_mesh_api_t::close](#).

Example:

```
/* Close the module. */
err = RM_BLE_MESH_Close(&g_ble_mesh0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_StartTransitionTimer()

```
fsp_err_t RM_BLE_MESH_StartTransitionTimer ( rm_ble_mesh_ctrl_t *const p_ctrl,
rm_ble_mesh_access_state_transition_t const *const p_transition, uint16_t *const
p_transition_time_handle )
```

To start transition timer. API to start a transition timer.

Implements [rm_ble_mesh_api_t::startTransitionTimer](#).

Example:

```
/* Start transition timer. */
err = RM_BLE_MESH_StartTransitionTimer(&g_ble_mesh0_ctrl, &transition,
&transition_time_handle);
```

Return values

| | |
|-------------------------|-------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_transition is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |

◆ RM_BLE_MESH_StopTransitionTimer()

```
fsp_err_t RM_BLE_MESH_StopTransitionTimer ( rm_ble_mesh_ctrl_t*const p_ctrl, uint16_t
transition_time_handle )
```

To stop transition timer. API to stop a transition timer.

Implements `rm_ble_mesh_api_t::stopTransitionTimer`.

Example:

```
/* Stop transition timer. */
err = RM_BLE_MESH_StopTransitionTimer(&g_ble_mesh0_ctrl, transition_time_handle);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_GetRemainingTransitionTime()

```
fsp_err_t RM_BLE_MESH_GetRemainingTransitionTime ( rm_ble_mesh_ctrl_t*const p_ctrl, uint16_t
transition_time_handle, uint8_t*const p_remaining_transition_time )
```

To get remaining Transition Time. API to get remaining Transition Time.

Implements `rm_ble_mesh_api_t::getRemainingTransitionTime`.

Example:

```
/* Get remaining transition time. */
err = RM_BLE_MESH_GetRemainingTransitionTime(&g_ble_mesh0_ctrl,
transition_time_handle, &remaining_transition_time);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_remaining_transition_time is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_GetRemainingTransitionTimeWithOffset()

```
fsp_err_t RM_BLE_MESH_GetRemainingTransitionTimeWithOffset ( rm_ble_mesh_ctrl_t *const
p_ctrl, uint16_t transition_time_handle, uint32_t offset_in_ms, uint8_t *const
p_remaining_transition_time )
```

To get remaining Transition Time, with offset. API to get remaining Transition Time with offset in ms.

Implements `rm_ble_mesh_api_t::getRemainingTransitionTimeWithOffset`.

Example:

```
/* Get remaining transition time with offset. */
err = RM_BLE_MESH_GetRemainingTransitionTimeWithOffset(&g_ble_mesh0_ctrl,
                                                    transition_time_handle,
                                                    offset_in_ms,
&remaining_transition_time);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_remaining_transition_time is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ConvertTransitionTimeFromMs()

```
fsp_err_t RM_BLE_MESH_ConvertTransitionTimeFromMs ( rm_ble_mesh_ctrl_t *const p_ctrl,
uint32_t transition_time_in_ms, uint8_t *const p_transition_time )
```

To convert transition time from milisecond. API to convert transition timer in milisecond to Generic Default Transition Time state format.

Implements `rm_ble_mesh_api_t::convertTransitionTimeFromMs`.

Example:

```
/* Convert transition time from milliseconds. */
err = RM_BLE_MESH_ConvertTransitionTimeFromMs(&g_ble_mesh0_ctrl,
transition_time_in_ms, &transition_time);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_transition_time is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ConvertTransitionTimeToMs()

```
fsp_err_t RM_BLE_MESH_ConvertTransitionTimeToMs ( rm_ble_mesh_ctrl_t *const p_ctrl, uint8_t
transition_time, uint32_t *const p_transition_time_in_ms )
```

To convert transition time to milisecond. API to convert Generic Default Transition Time state format to required transition time value in milliseconds.

Implements `rm_ble_mesh_api_t::convertTransitionTimeToMs`.

Example:

```
/* Convert transition time to milliseconds. */
err = RM_BLE_MESH_ConvertTransitionTimeToMs(&g_ble_mesh0_ctrl, transition_time,
&transition_time_in_ms);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_transition_time_in_ms is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Detailed Description

Overview

Target Devices

The BLE Mesh Network Access module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh_access

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_access_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Access (rm_ble_mesh_access)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Access (rm_ble_mesh_access).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

General

| | | | |
|---------------------|-------------------------------|---------------------------|---|
| Name | Name Must Be a Valid C Symbol | g_rm_ble_mesh_access 0 | Module name. |
| Channel Number | Invalid Channel Number | 0 | Select channel corresponding to the channel number of the hardware. |
| Location Descriptor | Invalid Descriptor | 0 | Location descriptor. |
| Element Number | Invalid Descriptor | 0 | Element number to register the model. |

Data Structures

```
struct rm_ble_mesh_access_instance_ctrl_t
```

Data Structure Documentation

◆ rm_ble_mesh_access_instance_ctrl_t

```
struct rm_ble_mesh_access_instance_ctrl_t
```

RM_BLE_MESH_ACCESS private control block. DO NOT MODIFY. Initialization occurs when [RM_BLE_MESH_ACCESS_Open\(\)](#) is called.

Function Documentation

◆ RM_BLE_MESH_ACCESS_Open()

```
fsp_err_t RM_BLE_MESH_ACCESS_Open ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_cfg_t const *const p_cfg )
```

Open access middleware. This routine creates a new node in the device. This can be used by the application to create extra nodes if required in addition to the default primary node. And this routine registers an element that can be populated with the models information to a specific node in the device identified by the node id.

Implements `rm_ble_mesh_access_api_t::open`.

Example:

```
/* Open the module. */
err = RM_BLE_MESH_ACCESS_Open(&g_ble_mesh_access0_ctrl, &g_ble_mesh_access0_cfg);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_Close()

```
fsp_err_t RM_BLE_MESH_ACCESS_Close ( rm_ble_mesh_access_ctrl_t *const p_ctrl)
```

Close access middleware. Implements `rm_ble_mesh_access_api_t::close`.

Example:

```
/* Close the module. */
err = RM_BLE_MESH_ACCESS_Close(&g_ble_mesh_access0_ctrl);
```

Return values

| | |
|-----------------------|-------------------------------|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_ACCESS_RegisterModel()

```
fsp_err_t RM_BLE_MESH_ACCESS_RegisterModel ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_t const *const p_model, rm_ble_mesh_access_model_handle_t *const
p_model_handle )
```

Register a model with the access layer. This routine registers a model associated with an element with the access layer.

Implements `rm_ble_mesh_access_api_t::registerModel`.

Example:

```
/* Register a model with the access layer. */
err = RM_BLE_MESH_ACCESS_RegisterModel(&g_ble_mesh_access0_ctrl, &model,
&model_handle);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_model and p_model_handle are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_BLE_MESH_ACCESS_GetElementHandle()**

```
fsp_err_t RM_BLE_MESH_ACCESS_GetElementHandle ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_address_t elem_addr, rm_ble_mesh_access_element_handle_t *const
p_handle )
```

Get element handle. This routine searches for the element handle associated with specific element address.

Implements `rm_ble_mesh_access_api_t::getElementHandle`.

Example:

```
/* Get element handle. */
err = RM_BLE_MESH_ACCESS_GetElementHandle(&g_ble_mesh_access0_ctrl, elem_addr,
&elem_handle);
```

Return values

| | |
|-------------------------|---------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |

◆ RM_BLE_MESH_ACCESS_GetElementHandleForModelHandle()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetElementHandleForModelHandle ( rm_ble_mesh_access_ctrl_t
*const p_ctrl, rm_ble_mesh_access_model_handle_t model_handle,
rm_ble_mesh_access_element_handle_t *const p_elem_handle )
```

Get element handle for a given model handle. This routine searches for the element handle associated with specific model handle.

Implements `rm_ble_mesh_access_api_t::getElementHandleForModelHandle`.

Example:

```
/* Get element handle for a given model handle. */
err = RM_BLE_MESH_ACCESS_GetElementHandleForModelHandle(&g_ble_mesh_access0_ctrl,
model_handle, &elem_handle);
```

Return values

| | |
|-------------------------|--------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_elem_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_GetModelHandle()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetModelHandle ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_element_handle_t elem_handle, rm_ble_mesh_access_model_id_t model_id,
rm_ble_mesh_access_model_handle_t *const p_handle )
```

Get model handle. This routine searches for the model handle associated with specific model ID.

Implements `rm_ble_mesh_access_api_t::getModelHandle`.

Example:

```
/* Get model handle. */
err = RM_BLE_MESH_ACCESS_GetModelHandle(&g_ble_mesh_access0_ctrl, elem_handle,
model_id, &model_handle);
```

Return values

| | |
|--------------------------|---------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_Publish()

```
fsp_err_t RM_BLE_MESH_ACCESS_Publish ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t const *const p_handle, rm_ble_mesh_access_req_msg_raw_t
const *const p_publish_message, uint8_t reliable )
```

API to publish access layer message. This routine publishes Access Layer message to the publish address associated with the model.

Implements `rm_ble_mesh_access_api_t::publish`.

Example:

```
/* Publish access layer message. */
err = RM_BLE_MESH_ACCESS_Publish(&g_ble_mesh_access0_ctrl, &model_handle,
&publish_message, reliable);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle and p_publish_message are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_ACCESS_ReliablePublish()

```
fsp_err_t RM_BLE_MESH_ACCESS_ReliablePublish ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t const *const p_handle, rm_ble_mesh_access_req_msg_raw_t
const *const p_publish_message, uint32_t rsp_opcode )
```

API to reliably publish Access layer message. This routine reliably publishes Access Layer message to the publish address associated with the model.

Implements `rm_ble_mesh_access_api_t::reliablePublish`.

Example:

```
/* Reliably publish access layer message. */
err = RM_BLE_MESH_ACCESS_ReliablePublish(&g_ble_mesh_access0_ctrl, &model_handle,
&req_msg_raw, rsp_opcode);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle and p_publish_message are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_ACCESS_Reply()

```
fsp_err_t RM_BLE_MESH_ACCESS_Reply ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_req_msg_context_t const *const p_req_msg_context, uint8_t ttl,
rm_ble_mesh_access_req_msg_raw_t const *const p_req_msg_raw )
```

API to reply to Access Layer message. This routine replies to Access Layer message.

Implements `rm_ble_mesh_access_api_t::reply`.

Example:

```
/* Reply to access layer message. */
err = RM_BLE_MESH_ACCESS_Reply(&g_ble_mesh_access0_ctrl, &req_msg_context, ttl,
&req_msg_raw);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_req_msg_context and p_req_msg_raw are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_ACCESS_ReplyAndPublish()

```
fsp_err_t RM_BLE_MESH_ACCESS_ReplyAndPublish ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_req_msg_context_t const *const p_req_msg_context,
rm_ble_mesh_access_req_msg_raw_t const *const p_req_msg_raw,
rm_ble_mesh_access_publish_setting_t const *const p_publish_setting )
```

API to reply to Access Layer message and optionally also to publish. This routine replies to Access Layer message and also publish if requested by application.

Implements `rm_ble_mesh_access_api_t::replyAndPublish`.

Example:

```
/* Reply to access layer message. */
err =
RM_BLE_MESH_ACCESS_ReplyAndPublish(&g_ble_mesh_access0_ctrl, &req_msg_context,
&req_msg_raw, &publish_setting);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_req_msg_context and p_req_msg_raw are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ **RM_BLE_MESH_ACCESS_SendPdu()**

```
fsp_err_t RM_BLE_MESH_ACCESS_SendPdu ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_pdu_t const *const p_pdu, uint8_t reliable )
```

API to send access PDUs. This routine sends transport PDUs to peer device.

Implements `rm_ble_mesh_access_api_t::sendPdu`.

Example:

```
/* Send Access PDUs. */
err = RM_BLE_MESH_ACCESS_SendPdu(&g_ble_mesh_access0_ctrl, &pdu, reliable);
```

Return values

| | |
|--------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_pdu is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ **RM_BLE_MESH_ACCESS_GetCompositionData()**

```
fsp_err_t RM_BLE_MESH_ACCESS_GetCompositionData ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_buffer_t *const p_buffer )
```

Get composition data.

Implements `rm_ble_mesh_access_api_t::getCompositionData`.

Example:

```
/* Get composition data. */
err = RM_BLE_MESH_ACCESS_GetCompositionData(&g_ble_mesh_access0_ctrl, &buffer);
```

Return values

| | |
|--------------------------|---------------------------------|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_buffer is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ **RM_BLE_MESH_ACCESS_Reset()**

```
fsp_err_t RM_BLE_MESH_ACCESS_Reset ( rm_ble_mesh_access_ctrl_t *const p_ctrl)
```

To reset a node. This routine resets a node (other than a Provisioner) and removes it from the network.

Implements `rm_ble_mesh_access_api_t::reset`.

Example:

```
/* Reset a node. */
err = RM_BLE_MESH_ACCESS_Reset(&g_ble_mesh_access0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_GetElementCount()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetElementCount ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint8_t *const p_count )
```

To get the number of elements in local node. This routine retrieves the number of elements in local node.

Implements `rm_ble_mesh_access_api_t::getElementCount`.

Example:

```
/* Get the number of elements in local node. */
err = RM_BLE_MESH_ACCESS_GetElementCount(&g_ble_mesh_access0_ctrl, &count);
```

Return values

| | |
|-------------------------|--------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_count is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_SetPrimaryUnicastAddress()

```
fsp_err_t RM_BLE_MESH_ACCESS_SetPrimaryUnicastAddress ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_network_address_t addr )
```

To set primary unicast address. This routine sets primary unicast address.

Implements `rm_ble_mesh_access_api_t::setPrimaryUnicastAddress`.

Example:

```
/* Set primary unicast address. */
err = RM_BLE_MESH_ACCESS_SetPrimaryUnicastAddress(&g_ble_mesh_access0_ctrl,
addr);
```

Return values

| | |
|-------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |

◆ **RM_BLE_MESH_ACCESS_GetPrimaryUnicastAddress()**

```
fsp_err_t RM_BLE_MESH_ACCESS_GetPrimaryUnicastAddress ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_network_address_t *const p_addr )
```

To get primary unicast address. This routine gets primary unicast address.

Implements `rm_ble_mesh_access_api_t::getPrimaryUnicastAddress`.

Example:

```
/* Get primary unicast address. */
err = RM_BLE_MESH_ACCESS_GetPrimaryUnicastAddress(&g_ble_mesh_access0_ctrl,
&addr);
```

Return values

| | |
|--------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_addr is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ **RM_BLE_MESH_ACCESS_SetDefaultTtl()**

```
fsp_err_t RM_BLE_MESH_ACCESS_SetDefaultTtl ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint8_t
ttl )
```

To set default TTL. This routine sets default TTL.

Implements `rm_ble_mesh_access_api_t::setDefaultTtl`.

Example:

```
/* Set default TTL. */
err = RM_BLE_MESH_ACCESS_SetDefaultTtl(&g_ble_mesh_access0_ctrl, ttl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_GetDefaultTtl()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetDefaultTtl ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint8_t
const *const p_ttl )
```

To get default TTL. This routine gets default TTL.

Implements `rm_ble_mesh_access_api_t::getDefaultTtl`.

Example:

```
/* Get default TTL. */
err = RM_BLE_MESH_ACCESS_GetDefaultTtl(&g_ble_mesh_access0_ctrl, &t1);
```

Return values

| | |
|--------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_ttl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_SetIvIndex()

```
fsp_err_t RM_BLE_MESH_ACCESS_SetIvIndex ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint32_t
iv_index, uint8_t iv_update_flag )
```

To set IV Index. This routine sets IV Index.

Implements `rm_ble_mesh_access_api_t::setIvIndex`.

Example:

```
/* Set IV Index. */
err = RM_BLE_MESH_ACCESS_SetIvIndex(&g_ble_mesh_access0_ctrl, iv_index,
iv_update_flag);
```

Return values

| | |
|-----------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |
| FSP_ERR_IN_USE | Resource is busy. |

◆ RM_BLE_MESH_ACCESS_GetIvIndex()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetIvIndex ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint32_t
*const p_iv_index, uint8_t *const p_iv_update_flag )
```

To get IV Index. This routine gets IV Index.

Implements `rm_ble_mesh_access_api_t::getIvIndex`.

Example:

```
/* Get IV Index. */
err = RM_BLE_MESH_ACCESS_GetIvIndex(&g_ble_mesh_access0_ctrl, &iv_index,
&iv_update_flag);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_iv_index and p_iv_update_flag are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_GetIvIndexByIvi()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetIvIndexByIvi ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint8_t ivi, uint32_t *const p_iv_index )
```

To get IV Index by IVI. This routine gets IV Index based on the IVI in the received packet.

Implements `rm_ble_mesh_access_api_t::getIvIndexByIvi`.

Example:

```
/* Get IV Index by IVI. */
err = RM_BLE_MESH_ACCESS_GetIvIndexByIvi(&g_ble_mesh_access0_ctrl, ivi,
&iv_index);
```

Return values

| | |
|--------------------------|-----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_iv_index is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ **RM_BLE_MESH_ACCESS_SetFeaturesField()**

```
fsp_err_t RM_BLE_MESH_ACCESS_SetFeaturesField ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint8_t enable, uint8_t feature )
```

To enable/disable a feature. This routine enables/disables a feature field.

Implements `rm_ble_mesh_access_api_t::setFeaturesField`.

Example:

```
/* Enable/Disable a feature. */
err = RM_BLE_MESH_ACCESS_SetFeaturesField(&g_ble_mesh_access0_ctrl, enable,
features);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_BLE_MESH_ACCESS_GetFeaturesField()**

```
fsp_err_t RM_BLE_MESH_ACCESS_GetFeaturesField ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint8_t *const p_enable, uint8_t feature )
```

To get state of a feature. This routine gets the state of a feature field.

Implements `rm_ble_mesh_access_api_t::getFeaturesField`.

Example:

```
/* Get state of a feature. */
err = RM_BLE_MESH_ACCESS_GetFeaturesField(&g_ble_mesh_access0_ctrl, &enable,
features);
```

Return values

| | |
|-------------------------|---------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_enable is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_GetFeatures()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetFeatures ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint8_t *const p_features )
```

To get state of all features. This routine gets the state of all features.

Implements `rm_ble_mesh_access_api_t::getFeatures`.

Example:

```
/* Get state of all features. */
err = RM_BLE_MESH_ACCESS_GetFeatures(&g_ble_mesh_access0_ctrl, &features);
```

Return values

| | |
|-------------------------|-----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_features is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_GetFriendshipRole()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetFriendshipRole ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint8_t *const p_friend_role )
```

To get friendship role of the node. This routine gets the current friendship role of the node.

Implements `rm_ble_mesh_access_api_t::getFriendshipRole`.

Example:

```
/* Get friendship role of the node. */
err = RM_BLE_MESH_ACCESS_GetFriendshipRole(&g_ble_mesh_access0_ctrl,
&friend_role);
```

Return values

| | |
|-------------------------|--------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_friend_role is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_SetFriendshipRole()

```
fsp_err_t RM_BLE_MESH_ACCESS_SetFriendshipRole ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint8_t friend_role )
```

To set friendship role of the node. This routine sets the current friendship role of the node.

Implements `rm_ble_mesh_access_api_t::setFriendshipRole`.

Example:

```
/* Set friendship role of the node. */
err = RM_BLE_MESH_ACCESS_SetFriendshipRole(&g_ble_mesh_access0_ctrl,
friend_role);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_AddDeviceKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_AddDeviceKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint8_t
const *const p_dev_key, rm_ble_mesh_network_address_t uaddr, uint8_t num_elements )
```

To add Device Key. This routine adds Device Key entry, along with corresponding Primary Device Address and Number of elements.

Implements `rm_ble_mesh_access_api_t::addDeviceKey`.

Example:

```
/* Add Device Key. */
err = RM_BLE_MESH_ACCESS_AddDeviceKey(&g_ble_mesh_access0_ctrl, &dev_key, uaddr,
num_elements);
```

Return values

| | |
|-------------------------|----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_dev_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OVERFLOW | Device key table is full. |

◆ RM_BLE_MESH_ACCESS_GetDeviceKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetDeviceKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint8_t dev_key_index, uint8_t **const p_dev_key )
```

To get Device Key. This routine gets Device Key entry.

Implements `rm_ble_mesh_access_api_t::getDeviceKey`.

Example:

```
/* Get Device Key. */
err = RM_BLE_MESH_ACCESS_GetDeviceKey(&g_ble_mesh_access0_ctrl, dev_key_index,
p_dev_key);
```

Return values

| | |
|--------------------------|----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_dev_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_RemoveAllDeviceKeys()

```
fsp_err_t RM_BLE_MESH_ACCESS_RemoveAllDeviceKeys ( rm_ble_mesh_access_ctrl_t *const p_ctrl)
```

To remove all Device Keys. This routine removes all Device Keys from table.

Implements `rm_ble_mesh_access_api_t::removeAllDeviceKeys`.

Example:

```
/* Remove all Device Keys. */
err = RM_BLE_MESH_ACCESS_RemoveAllDeviceKeys(&g_ble_mesh_access0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_GetProvisionedDeviceList()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetProvisionedDeviceList ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_access_provisioned_device_entry_t const *const p_prov_dev_list, uint16_t
*const p_num_entries )
```

To get list of Provisioned Device List. This routine returns list of Provisioned Devices from the Device Key Table.

Implements `rm_ble_mesh_access_api_t::getProvisionedDeviceList`.

Example:

```
/* Get list of provisioned device list. */
err = RM_BLE_MESH_ACCESS_GetProvisionedDeviceList(&g_ble_mesh_access0_ctrl,
&prov_dev_list, &num_entries);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_prov_dev_list and p_num_entries are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_GetDeviceKeyHandle()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetDeviceKeyHandle ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_address_t prim_elem_uaddr, rm_ble_mesh_access_device_key_handle_t
*const p_handle )
```

To get device key handle. This routine returns Device Key Handle for a given Primary Element Address entry in Device Key Table.

Implements `rm_ble_mesh_access_api_t::getDeviceKeyHandle`.

Example:

```
/* Get Device Key handle. */
err = RM_BLE_MESH_ACCESS_GetDeviceKeyHandle(&g_ble_mesh_access0_ctrl,
prim_elem_uaddr, &handle);
```

Return values

| | |
|--------------------------|---------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ **RM_BLE_MESH_ACCESS_GetAppKey()**

```
fsp_err_t RM_BLE_MESH_ACCESS_GetAppKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_appkey_handle_t appkey_handle, uint8_t **const p_app_key, uint8_t
*const p_aid )
```

To get AppKey. This routine gets AppKey along with AID entry.

Implements `rm_ble_mesh_access_api_t::getAppKey`.

Example:

```
/* Get AppKey. */
err = RM_BLE_MESH_ACCESS_GetAppKey(&g_ble_mesh_access0_ctrl, appkey_handle,
p_app_key, &aid);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_app_key and p_aid are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_AddUpdateNetkey()

```
fsp_err_t RM_BLE_MESH_ACCESS_AddUpdateNetkey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint16_t netkey_index, uint32_t opcode, uint8_t const *const p_net_key )
```

To add/update NetKey. This routine adds/updates NetKey entry. Each NetKey is associated with a subnet.

Implements `rm_ble_mesh_access_api_t::addUpdateNetkey`.

Example:

```
/* Add/Update NetKey. */
err = RM_BLE_MESH_ACCESS_AddUpdateNetkey(&g_ble_mesh_access0_ctrl, netkey_index,
opcode, &net_key);
```

Return values

| | |
|--------------------------|----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_net_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_AddFriendSecurityCredential()

```
fsp_err_t RM_BLE_MESH_ACCESS_AddFriendSecurityCredential ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_network_subnet_handle_t subnet_handle, uint16_t friend_index,
rm_ble_mesh_access_friend_security_credential_info_t info )
```

To add Security Credential of a LPN or the Friend. This routine adds NID, privacy and encryption keys associated with a friendship.

Implements `rm_ble_mesh_access_api_t::addFriendSecurityCredential`.

Example:

```
/* Add security credential of a LPN or the friend. */
err =
RM_BLE_MESH_ACCESS_AddFriendSecurityCredential(&g_ble_mesh_access0_ctrl,
subnet_handle, friend_index, info);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_DeleteFriendSecurityCredential()

```
fsp_err_t RM_BLE_MESH_ACCESS_DeleteFriendSecurityCredential ( rm_ble_mesh_access_ctrl_t
*const p_ctrl, rm_ble_mesh_network_subnet_handle_t subnet_handle, uint16_t friend_index )
```

To delete the Security Credential of a LPN or the Friend. This routine deletes NID, privacy and encryption keys associated with a friendship.

Implements `rm_ble_mesh_access_api_t::deleteFriendSecurityCredential`.

Example:

```
/* Delete the security credential of a LPN or the Friend. */
err = RM_BLE_MESH_ACCESS_DeleteFriendSecurityCredential(&g_ble_mesh_access0_ctrl,
subnet_handle, friend_index);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_FindSubnet()

```
fsp_err_t RM_BLE_MESH_ACCESS_FindSubnet ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint16_t
netkey_index, rm_ble_mesh_network_subnet_handle_t *const p_subnet_handle )
```

To find a Subnet associated with the NetKey. This routine finds a Subnet based on the NetKey entry. Each NetKey is associated with a subnet.

Implements `rm_ble_mesh_access_api_t::findSubnet`.

Example:

```
/* Find a subnet associated with the NetKey. */
err = RM_BLE_MESH_ACCESS_FindSubnet(&g_ble_mesh_access0_ctrl, netkey_index,
&subnet_handle);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_subnet_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_FindMasterSubnet()

```
fsp_err_t RM_BLE_MESH_ACCESS_FindMasterSubnet ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t friend_subnet_handle,
rm_ble_mesh_network_subnet_handle_t *const p_master_subnet_handle )
```

To find the Master Subnet associated with the friend security credential, identified by Friend Subnet Handle. This routine finds the Master Subnet based on the friend security credential, identified by Friend Subnet Handle.

Implements `rm_ble_mesh_access_api_t::findMasterSubnet`.

Example:

```
/* Close the module. */
err =
RM_BLE_MESH_ACCESS_FindMasterSubnet(&g_ble_mesh_access0_ctrl, friend_subnet_handle,
&master_subnet_handle);
```

Return values

| | |
|-------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_master_subnet_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_DeleteNetKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_DeleteNetKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle )
```

To delete NetKey. This routine deletes a NetKey entry. Each NetKey is associated with a subnet.

Implements `rm_ble_mesh_access_api_t::deleteNetKey`.

Example:

```
/* Delete NetKey. */
err = RM_BLE_MESH_ACCESS_DeleteNetKey(&g_ble_mesh_access0_ctrl, subnet_handle);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_GetNetKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetNetKey ( rm_ble_mesh_access_ctrl_t*const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint8_t*const p_net_key )
```

To get NetKey. This routine fetches a NetKey entry. Each NetKey is associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getNetKey`.

Example:

```
/* Close the module. */
err = RM_BLE_MESH_ACCESS_GetNetKey(&g_ble_mesh_access0_ctrl, subnet_handle,
&net_key);
```

Return values

| | |
|-------------------------|----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_net_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_GetNetKeyIndexList()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetNetKeyIndexList ( rm_ble_mesh_access_ctrl_t*const p_ctrl,
uint16_t*const p_netkey_count, uint16_t*const p_netkey_index_list )
```

To get list of all known NetKeys. This routine returns a list of known NetKey Indices.

Implements `rm_ble_mesh_access_api_t::getNetKeyIndexList`.

Example:

```
/* Get list of all known NetKeys. */
err = RM_BLE_MESH_ACCESS_GetNetKeyIndexList(&g_ble_mesh_access0_ctrl,
&netkey_count, &netkey_index_list);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_netkey_count and p_netkey_index_list are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_LookUpNid()

```
fsp_err_t RM_BLE_MESH_ACCESS_LookUpNid ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint8_t
nid, rm_ble_mesh_network_subnet_handle_t *const p_subnet_handle,
rm_ble_mesh_access_associated_keys_t *const p_key_set )
```

To search for NID. This routine searches for matching NID in subnet table.

Implements `rm_ble_mesh_access_api_t::lookUpNid`.

Example:

```
/* Search for NID. */
err = RM_BLE_MESH_ACCESS_LookUpNid(&g_ble_mesh_access0_ctrl, nid, &subnet_handle,
&key_set);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_subnet_handle and p_key_set are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_LookUpNetworkId()

```
fsp_err_t RM_BLE_MESH_ACCESS_LookUpNetworkId ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint8_t const *const p_network_id, rm_ble_mesh_network_subnet_handle_t *const
p_subnet_handle, rm_ble_mesh_access_associated_keys_t *const p_key_set )
```

To search for Network ID. This routine searches for matching Network ID in subnet table.

Implements `rm_ble_mesh_access_api_t::lookUpNetworkId`.

Example:

```
/* Search for NID. */
err = RM_BLE_MESH_ACCESS_LookUpNid(&g_ble_mesh_access0_ctrl, nid, &subnet_handle,
&key_set);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_network_id, p_subnet_handle and p_key_set are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_LookUpAid()

```
fsp_err_t RM_BLE_MESH_ACCESS_LookUpAid ( rm_ble_mesh_access_ctrl_t *const p_ctrl, uint8_t
aid, rm_ble_mesh_network_appkey_handle_t *const p_appkey_handle, uint8_t *const p_app_key )
```

To search for AID. This routine searches for matching NID in subnet table.

Implements `rm_ble_mesh_access_api_t::lookUpAid`.

Example:

```
/* Search for AID. */
err = RM_BLE_MESH_ACCESS_LookUpAid(&g_ble_mesh_access0_ctrl, aid, &appkey_handle,
&app_key);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter <code>p_ctrl</code> is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter <code>p_appkey_handle</code> and <code>p_app_key</code> are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_SetProvisioningData()

```
fsp_err_t RM_BLE_MESH_ACCESS_SetProvisioningData ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_provision_data_t const *const p_prov_data )
```

Set Provisioning Data. This routine configures the provisioning data with Access Layer.

Implements `rm_ble_mesh_access_api_t::setProvisioningData`.

Example:

```
/* Set provisioning data. */
err = RM_BLE_MESH_ACCESS_SetProvisioningData(&g_ble_mesh_access0_ctrl,
&prov_data);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_prov_data is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_GetSubnetNid()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetNid ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t handle, uint8_t *const p_nid )
```

To get NID associated with a subnet. This routine fetches the NID associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getSubnetNid`.

Example:

```
/* Get NID associated with a subnet. */
err = RM_BLE_MESH_ACCESS_GetSubnetNid(&g_ble_mesh_access0_ctrl, subnet_handle,
&nid);
```

Return values

| | |
|--------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_nid is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_GetSubnetPrivacyKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetPrivacyKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t handle, uint8_t *const p_privacy_key )
```

To get Privacy Key associated with a subnet. This routine fetches the Privacy Key associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getSubnetPrivacyKey`.

Example:

```
/* Get Privacy Key associated with a subnet. */
err = RM_BLE_MESH_ACCESS_GetSubnetPrivacyKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &privacy_key);
```

Return values

| | |
|--------------------------|--------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_privacy_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_GetSubnetNetworkId()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetNetworkId ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t handle, uint8_t *const p_network_id )
```

To get Network ID associated with a subnet. This routine fetches the Network ID associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getSubnetNetworkId`.

Example:

```
/* Get Network ID associated with a subnet. */
err = RM_BLE_MESH_ACCESS_GetSubnetNetworkId(&g_ble_mesh_access0_ctrl,
subnet_handle, &network_id);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_network_id is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_GetSubnetBeaconKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetBeaconKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t handle, uint8_t *const p_beacon_key )
```

To get Beacon Key associated with a subnet. This routine fetches the Beacon Key associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getSubnetBeaconKey`.

Example:

```
/* Get Beacon Key associated with a subnet. */
err = RM_BLE_MESH_ACCESS_GetSubnetBeaconKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &beacon_key);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_beacon_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_GetSubnetIdentityKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetIdentityKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t handle, uint8_t *const p_identity_key )
```

To get Identity Key associated with a subnet. This routine fetches the Identity Key associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getSubnetIdentityKey`.

Example:

```
/* Get Identity Key associated with a subnet. */
err = RM_BLE_MESH_ACCESS_GetSubnetIdentityKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &identity_key);
```

Return values

| | |
|--------------------------|---------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_identity_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_GetSubnetEncryptionKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetEncryptionKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t handle, uint8_t *const p_encrypt_key )
```

To get Encryption Key associated with a subnet. This routine fetches the Encryption Key associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getSubnetEncryptionKey`.

Example:

```
/* Get Encryption Key associated with a subnet. */
err = RM_BLE_MESH_ACCESS_GetSubnetEncryptionKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &encrypt_key);
```

Return values

| | |
|--------------------------|--------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_encrypt_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_GetNodeIdentity()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetNodeIdentity ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint8_t *const p_id_state )
```

To get Node Identity. This routine gets Node Identity State of a node

Implements `rm_ble_mesh_access_api_t::getNodeIdentity`.

Example:

```
/* Get node identity. */
err = RM_BLE_MESH_ACCESS_GetNodeIdentity(&g_ble_mesh_access0_ctrl, subnet_handle,
&id_state);
```

Return values

| | |
|-------------------------|-----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_id_state is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_SetNodeIdentity()

```
fsp_err_t RM_BLE_MESH_ACCESS_SetNodeIdentity ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint8_t *const p_id_state )
```

To set Node Identity. This routine sets Node Identity State of a node.

Implements `rm_ble_mesh_access_api_t::setNodeIdentity`.

Example:

```
/* Set node identity. */
err = RM_BLE_MESH_ACCESS_SetNodeIdentity(&g_ble_mesh_access0_ctrl, subnet_handle,
&id_state);
```

Return values

| | |
|-------------------------|-----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_id_state is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_GetKeyRefreshPhase()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetKeyRefreshPhase ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint8_t *const p_key_refresh_state )
```

To get Key Refresh Phase. This routine gets Key Refresh Phase State of a node

Implements `rm_ble_mesh_access_api_t::getKeyRefreshPhase`.

Example:

```
/* Get key refresh phase. */
err = RM_BLE_MESH_ACCESS_GetKeyRefreshPhase(&g_ble_mesh_access0_ctrl,
subnet_handle, &key_refresh_state);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_key_refresh_state is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_SetKeyRefreshPhase()

```
fsp_err_t RM_BLE_MESH_ACCESS_SetKeyRefreshPhase ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint8_t const *const p_key_refresh_state
)
```

To set Key Refresh Phase. This routine sets Key Refresh Phase State of a node.

Implements `rm_ble_mesh_access_api_t::setKeyRefreshPhase`.

Example:

```
/* Set key refresh phase. */
err = RM_BLE_MESH_ACCESS_SetKeyRefreshPhase(&g_ble_mesh_access0_ctrl,
subnet_handle, &key_refresh_state);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_key_refresh_state is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_SetTransmitState()

```
fsp_err_t RM_BLE_MESH_ACCESS_SetTransmitState ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint8_t tx_state_type, uint8_t tx_state )
```

To set Network/Relay Transmit state. This routine sets Network/Relay Transmit state.

Implements `rm_ble_mesh_access_api_t::setTransmitState`.

Example:

```
/* Set network/relay transmit state. */
err = RM_BLE_MESH_ACCESS_SetTransmitState(&g_ble_mesh_access0_ctrl,
tx_state_type, tx_state);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_GetTransmitState()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetTransmitState ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
uint8_t tx_state_type, uint8_t *const p_tx_state )
```

To get Network/Relay Transmit state. This routine gets Network/Relay Transmit state.

Implements `rm_ble_mesh_access_api_t::getTransmitState`.

Example:

```
/* Get network/relay transmit state. */
err = RM_BLE_MESH_ACCESS_GetTransmitState(&g_ble_mesh_access0_ctrl,
tx_state_type, &tx_state);
```

Return values

| | |
|-------------------------|-----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_tx_state is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_AddAppKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_AddAppKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint16_t appkey_index, uint8_t const
*const p_app_key )
```

To add AppKey. This routine adds AppKey entry. Each AppKey is associated with a subnet.

Implements `rm_ble_mesh_access_api_t::addAppKey`.

Example:

```
/* Add AppKey. */
err = RM_BLE_MESH_ACCESS_AddAppKey(&g_ble_mesh_access0_ctrl, subnet_handle,
appkey_index, &app_key);
```

Return values

| | |
|--------------------------|----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_app_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_UpdateAppKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_UpdateAppKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint16_t appkey_index, uint8_t const
*const p_app_key )
```

To update AppKey. This routine updates AppKey entry. Each AppKey is associated with a subnet. Implements `rm_ble_mesh_access_api_t::updateAppKey`.

Example:

```
/* Update AppKey. */
err = RM_BLE_MESH_ACCESS_UpdateAppKey(&g_ble_mesh_access0_ctrl, subnet_handle,
appkey_index, &app_key);
```

Return values

| | |
|--------------------------|----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_app_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_DeleteAppKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_DeleteAppKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint16_t appkey_index, uint8_t const
*const p_app_key )
```

To delete AppKey. This routine deletes AppKey entry. Each AppKey is associated with a subnet. Implements `rm_ble_mesh_access_api_t::deleteAppKey`.

Example:

```
/* Delete AppKey. */
err = RM_BLE_MESH_ACCESS_DeleteAppKey(&g_ble_mesh_access0_ctrl, subnet_handle,
appkey_index, &app_key);
```

Return values

| | |
|--------------------------|----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_app_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_GetAppKeyHandle()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetAppKeyHandle ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint16_t appkey_index, uint8_t const
*const p_app_key, rm_ble_mesh_network_appkey_handle_t *const p_appkey_handle )
```

To get AppKey Handle for a given AppKey Index. This routine gets AppKey Handle for a given AppKey Index. Each AppKey is associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getAppKeyHandle`.

Example:

```
/* Get AppKey handle for a given AppKey index. */
err = RM_BLE_MESH_ACCESS_GetAppKeyHandle(&g_ble_mesh_access0_ctrl,
                                         subnet_handle,
                                         appkey_index,
                                         &app_key,
                                         &appkey_handle);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_appkey_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_GetAppKeyIndexList()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetAppKeyIndexList ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_network_subnet_handle_t subnet_handle, uint16_t *const p_appkey_count, uint16_t
*const p_appkey_index_list )
```

To get list of all known AppKeys. This routine returns a list of known AppKey Indices associated with a subnet.

Implements `rm_ble_mesh_access_api_t::getAppKeyIndexList`.

Example:

```
/* Get list of all known AppKeys. */
err = RM_BLE_MESH_ACCESS_GetAppKeyIndexList(&g_ble_mesh_access0_ctrl,
                                             subnet_handle,
                                             &appkey_count,
                                             &appkey_index_list);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_appkey_count and p_appkey_index_list are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_BindModelWithAppKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_BindModelWithAppKey ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t model_handle, uint16_t appkey_index )
```

To bind a model with an AppKey. This routine binds a model with an AppKey.

Implements `rm_ble_mesh_access_api_t::bindModelWithAppKey`.

Example:

```
/* Bind a model with an AppKey. */
err = RM_BLE_MESH_ACCESS_BindModelWithAppKey(&g_ble_mesh_access0_ctrl,
model_handle, appkey_index);
```

Return values

| | |
|--------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_UnbindModelWithAppKey()

```
fsp_err_t RM_BLE_MESH_ACCESS_UnbindModelWithAppKey ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle, uint16_t appkey_index )
```

To unbind a model with an AppKey. This routine unbinds a model with an AppKey.

Implements `rm_ble_mesh_access_api_t::unbindModelWithAppKey`.

Example:

```
/* Unbind a model with an AppKey. */
err = RM_BLE_MESH_ACCESS_UnbindModelWithAppKey(&g_ble_mesh_access0_ctrl,
model_handle, appkey_index);
```

Return values

| | |
|--------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_GetModelAppKeyList()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetModelAppKeyList ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t model_handle, uint16_t *const p_appkey_count, uint16_t
*const p_appkey_index_list )
```

To get list of all AppKeys associated with a model. This routine returns a list of known AppKey Indices associated with a model.

Implements `rm_ble_mesh_access_api_t::getModelAppKeyList`.

Example:

```
/* Get list of all AppKeys associated with a model. */
err = RM_BLE_MESH_ACCESS_GetModelAppKeyList(&g_ble_mesh_access0_ctrl,
                                             model_handle,
                                             &appkey_count,
                                             &appkey_index_list);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_appkey_count and p_appkey_index_list are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_SetModelPublication()

```
fsp_err_t RM_BLE_MESH_ACCESS_SetModelPublication ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t model_handle, rm_ble_mesh_access_publish_info_t *const
p_publish_info )
```

To set Publication information associated with a model. This routine sets Publication information associated with a model.

Implements `rm_ble_mesh_access_api_t::setModelPublication`.

Example:

```
/* Set publication information associated with a model. */
err = RM_BLE_MESH_ACCESS_SetModelPublication(&g_ble_mesh_access0_ctrl,
model_handle, &publish_info);
```

Return values

| | |
|--------------------------|---------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_publish_info is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_SetModelPublicationPeriodDivisor()

```
fsp_err_t RM_BLE_MESH_ACCESS_SetModelPublicationPeriodDivisor ( rm_ble_mesh_access_ctrl_t
*const p_ctrl, rm_ble_mesh_access_model_handle_t model_handle, uint8_t period_divisor )
```

To set Publication Fast Period Divisor information associated with a model. This routine sets Publication Fast Period Divisor information associated with a model.

Implements `rm_ble_mesh_access_api_t::setModelPublicationPeriodDivisor`.

Example:

```
/* Set publication fast period divisor information associated with a model. */
err =
RM_BLE_MESH_ACCESS_SetModelPublicationPeriodDivisor(&g_ble_mesh_access0_ctrl,
model_handle, period_divisor);
```

Return values

| | |
|--------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ **RM_BLE_MESH_ACCESS_GetModelPublication()**

```
fsp_err_t RM_BLE_MESH_ACCESS_GetModelPublication ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t model_handle, rm_ble_mesh_access_publish_info_t *const
p_publish_info )
```

To get Publication information associated with a model. This routine returns Publication information associated with a model.

Implements `rm_ble_mesh_access_api_t::getModelPublication`.

Example:

```
/* Get publication information associated with a model. */
err = RM_BLE_MESH_ACCESS_GetModelPublication(&g_ble_mesh_access0_ctrl,
model_handle, &publish_info);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_publish_info is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_AddModelSubscription()

```
fsp_err_t RM_BLE_MESH_ACCESS_AddModelSubscription ( rm_ble_mesh_access_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t model_handle, rm_ble_mesh_access_address_t const *const
p_sub_addr )
```

To add an address to a model subscription list. This routine adds an address to a subscription list of a model.

Implements `rm_ble_mesh_access_api_t::addModelSubscription`.

Example:

```
/* Add an address to a model subscription list. */
err = RM_BLE_MESH_ACCESS_AddModelSubscription(&g_ble_mesh_access0_ctrl,
model_handle, &sub_addr);
```

Return values

| | |
|-------------------------|-----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_sub_addr is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_DeleteModelSubscription()

```
fsp_err_t RM_BLE_MESH_ACCESS_DeleteModelSubscription ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle, rm_ble_mesh_access_address_t const
*const p_sub_addr )
```

To delete an address to a model subscription list. This routine deletes an address to a subscription list of a model.

Implements `rm_ble_mesh_access_api_t::deleteModelSubscription`.

Example:

```
/* Delete an address to a model subscription list. */
err = RM_BLE_MESH_ACCESS_DeleteModelSubscription(&g_ble_mesh_access0_ctrl,
model_handle, &sub_addr);
```

Return values

| | |
|--------------------------|-----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_sub_addr is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_DeleteAllModelSubscription()

```
fsp_err_t RM_BLE_MESH_ACCESS_DeleteAllModelSubscription ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle )
```

To discard a model subscription list. This routine discards a subscription list of a model.

Implements `rm_ble_mesh_access_api_t::deleteAllModelSubscription`.

Example:

```
/* Discard a model subscription list. */
err = RM_BLE_MESH_ACCESS_DeleteAllModelSubscription(&g_ble_mesh_access0_ctrl,
model_handle);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_GetModelSubscriptionList()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetModelSubscriptionList ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t model_handle, uint16_t *const p_sub_addr_count,
uint16_t *const p_sub_addr_list )
```

To get list of subscription addresses of a model. This routine returns a list of subscription addresses of a model.

Implements `rm_ble_mesh_access_api_t::getModelSubscriptionList`.

Example:

```
/* Get list of subscription addresses of a model. */
err = RM_BLE_MESH_ACCESS_GetModelSubscriptionList(&g_ble_mesh_access0_ctrl,
                                                model_handle,
                                                &sub_addr_count,
                                                &sub_addr_list);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter <code>p_ctrl</code> is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter <code>p_sub_addr_count</code> and <code>p_sub_addr_list</code> are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_GetAllModelSubscriptionList()

```
fsp_err_t RM_BLE_MESH_ACCESS_GetAllModelSubscriptionList ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, uint16_t *const p_sub_addr_count, uint16_t *const p_sub_addr_list )
```

To get list of subscription addresses of all the models. This routine returns a consolidated list of subscription addresses of all the models.

Implements `rm_ble_mesh_access_api_t::getAllModelSubscriptionList`.

Example:

```
/* Get list of subscription addresses of all the models. */
err = RM_BLE_MESH_ACCESS_GetAllModelSubscriptionList(&g_ble_mesh_access0_ctrl,
&sub_addr_count, &sub_addr_list);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_sub_addr_count and p_sub_addr_list are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_ACCESS_IsValidElementAddress()

```
fsp_err_t RM_BLE_MESH_ACCESS_IsValidElementAddress ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_network_address_t addr )
```

To check if valid element address to receive a packet. This routine checks if destination address in a received packet matches with any of the known element address of local or friend device.

Implements `rm_ble_mesh_access_api_t::isValidElementAddress`.

Example:

```
/* Check if valid element address to receive a packet. */
err = RM_BLE_MESH_ACCESS_IsValidElementAddress(&g_ble_mesh_access0_ctrl, addr);
```

Return values

| | |
|-------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |

◆ RM_BLE_MESH_ACCESS_IsFixedGroupAddressToBeProcessed()

```
fsp_err_t RM_BLE_MESH_ACCESS_IsFixedGroupAddressToBeProcessed ( rm_ble_mesh_access_ctrl_t
*const p_ctrl, rm_ble_mesh_network_address_t addr )
```

To check if Fixed Group Address in receive packet to be processed. This routine checks if destination address in a received packet as a Fixed Group Address to be processed.

Implements `rm_ble_mesh_access_api_t::isFixedGroupAddressToBeProcessed`.

Example:

```
/* Check if fixed group address in receive packet to be processed. */
err =
RM_BLE_MESH_ACCESS_IsFixedGroupAddressToBeProcessed(&g_ble_mesh_access0_ctrl, addr);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_ACCESS_IsValidSubscriptionAddress()

```
fsp_err_t RM_BLE_MESH_ACCESS_IsValidSubscriptionAddress ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_network_address_t addr )
```

To check if valid subscription address to receive a packet. This routine checks if destination address in a received packet matches with any of the known subscription address of local or friend device.

Implements `rm_ble_mesh_access_api_t::isValidSubscriptionAddress`.

Example:

```
/* Check if valid subscription address to receive a packet. */
err = RM_BLE_MESH_ACCESS_IsValidSubscriptionAddress(&g_ble_mesh_access0_ctrl,
addr);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_ACCESS_EnableIvUpdateTestMode()

```
fsp_err_t RM_BLE_MESH_ACCESS_EnableIvUpdateTestMode ( rm_ble_mesh_access_ctrl_t *const
p_ctrl, rm_ble_mesh_access_iv_update_test_mode_t mode )
```

To set the IV Update Test Mode feature. This routine is used to set the IV Update Test Mode flag.

Implements `rm_ble_mesh_access_api_t::enableIvUpdateTestMode`.

Example:

```
/* Set the IV update test mode feature. */
err = RM_BLE_MESH_ACCESS_EnableIvUpdateTestMode(&g_ble_mesh_access0_ctrl, mode);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

BLE Mesh Network Bearer (rm_ble_mesh_bearer)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Bearer module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh_bearer

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_bearer_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Bearer (rm_ble_mesh_bearer)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Bearer (rm_ble_mesh_bearer).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

General

| | | | |
|----------------|-------------------------------|---------------------------|---|
| Name | Name Must Be a Valid C Symbol | g_rm_ble_mesh_bearer 0 | Module name. |
| Channel Number | Invalid Channel Number | 0 | Select channel corresponding to the channel number of the hardware. |

Data Structures

```
struct rm_ble_mesh_bearer_instance_ctrl_t
```

Data Structure Documentation

◆ rm_ble_mesh_bearer_instance_ctrl_t

```
struct rm_ble_mesh_bearer_instance_ctrl_t
```

RM_BLE_MESH_BEARER private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_BEARER_Open() is called.

Function Documentation

◆ RM_BLE_MESH_BEARER_Open()

```
fsp_err_t RM_BLE_MESH_BEARER_Open ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl,
rm_ble_mesh_bearer_cfg_t const *const p_cfg )
```

Open bearer middleware.

Implements `rm_ble_mesh_bearer_api_t::open`.

Example:

```
/* Open the module. */
err = RM_BLE_MESH_BEARER_Open(&g_ble_mesh_bearer0_ctrl, &g_ble_mesh_bearer0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |

◆ RM_BLE_MESH_BEARER_Close()

```
fsp_err_t RM_BLE_MESH_BEARER_Close ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl)
```

Close bearer middleware. Implements `rm_ble_mesh_bearer_api_t::close`.

Example:

```
/* Open the module. */
err = RM_BLE_MESH_BEARER_Close(&g_ble_mesh_bearer0_ctrl);
```

Return values

| | |
|-----------------------|--|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_BEARER_RegisterInterface()

```
fsp_err_t RM_BLE_MESH_BEARER_RegisterInterface ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl,
rm_ble_mesh_bearer_type_t brr_type, rm_ble_mesh_bearer_ntf_callback_result_t(*) (
rm_ble_mesh_bearer_ntf_callback_args_t *p_args) p_callback )
```

Register interface with Bearer Layer. This routine registers interface with the Bearer Layer. Bearer Layer supports single Application, hence this routine shall be called once.

Implements `rm_ble_mesh_bearer_api_t::registerInterface`.

Example:

```
/* Register Bearer interface. */
err = RM_BLE_MESH_BEARER_RegisterInterface(&g_ble_mesh_bearer0_ctrl, brr_type,
rm_ble_mesh_bearer_ntf_callback);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_BEARER_RegisterBeaconHandler()

```
fsp_err_t RM_BLE_MESH_BEARER_RegisterBeaconHandler ( rm_ble_mesh_bearer_ctrl_t *const
p_ctrl, rm_ble_mesh_bearer_beacon_type_t bcon_type,
void(*) (rm_ble_mesh_bearer_beacon_callback_args_t *p_args) p_handler )
```

Register beacon interface with Bearer Layer. This routine registers interface with the Bearer Layer to process Beacons. Bearer Layer supports single Application, hence this routine shall be called once.

Implements `rm_ble_mesh_bearer_api_t::registerBeaconHandler`.

Example:

```
/* Register beacon handler. */
err = RM_BLE_MESH_BEARER_RegisterBeaconHandler(&g_ble_mesh_bearer0_ctrl,
RM_BLE_MESH_BEARER_TYPE_BCON,
rm_ble_mesh_bearer_beacon_callback
);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_BEARER_AddBearer()

```
fsp_err_t RM_BLE_MESH_BEARER_AddBearer ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl,
rm_ble_mesh_bearer_type_t brr_type, rm_ble_mesh_bearer_info_t const *const p_brr_info,
rm_ble_mesh_bearer_handle_t *const p_brr_handle )
```

Add a bearer to Bearer Layer. This routine adds a bearer that is setup by the application for use by the Mesh Stack. Bearer Layer supports single Application, hence this routine shall be called once.

Implements `rm_ble_mesh_bearer_api_t::addBearer`.

Example:

```
/* Add Bearer. */
err = RM_BLE_MESH_BEARER_AddBearer(&g_ble_mesh_bearer0_ctrl,
RM_BLE_MESH_BEARER_TYPE_BCON, &brr_info, &brr_handle);
```

Return values

| | |
|-------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter <code>p_brr_info</code> and <code>p_brr_handle</code> are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_BEARER_RemoveBearer()

```
fsp_err_t RM_BLE_MESH_BEARER_RemoveBearer ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl,
rm_ble_mesh_bearer_type_t brr_type, rm_ble_mesh_bearer_handle_t const *const p_brr_handle )
```

Remove a bearer from Bearer Layer. This routine removes a bearer from the Mesh Stack. Bearer Layer supports single Application, hence this routine shall be called once.

Implements `rm_ble_mesh_bearer_api_t::removeBearer`.

Example:

```
/* Remove Bearer. */
err = RM_BLE_MESH_BEARER_RemoveBearer(&g_ble_mesh_bearer0_ctrl,
RM_BLE_MESH_BEARER_TYPE_BCON, &brr_handle);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter <code>p_brr_handle</code> is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_BEARER_ObserveBeacon()

```
fsp_err_t RM_BLE_MESH_BEARER_ObserveBeacon ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl,
uint8_t bcon_type, uint8_t enable )
```

Observe on/off for the beacon type. This routine sends enables/disables the observation procedure for the given beacon type.

Implements `rm_ble_mesh_bearer_api_t::observeBeacon`.

Example:

```
/* Observe beacon. */
err = RM_BLE_MESH_BEARER_ObserveBeacon(&g_ble_mesh_bearer0_ctrl, bcon_type,
enable);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_BEARER_BcastUnprovisionedBeacon()

```
fsp_err_t RM_BLE_MESH_BEARER_BcastUnprovisionedBeacon ( rm_ble_mesh_bearer_ctrl_t *const
p_ctrl, uint8_t type, uint8_t const *const p_dev_uuid, uint16_t oob_info, rm_ble_mesh_buffer_t
const *const p_uri )
```

API to send unprovisioned device beacon. This routine sends Unprovisioned Device Beacon.

Implements `rm_ble_mesh_bearer_api_t::bcastUnprovisionedBeacon`.

Example:

```
/* Broadcast unprovisioned beacon. */
err = RM_BLE_MESH_BEARER_BcastUnprovisionedBeacon(&g_ble_mesh_bearer0_ctrl, type,
&dev_uuid, oob_info, &uri);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_dev_uuid and p_uri are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_BEARER_BroadcastBeacon()

```
fsp_err_t RM_BLE_MESH_BEARER_BroadcastBeacon ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl,
uint8_t type, uint8_t const *const p_packet, uint16_t length )
```

API to broadcast a beacon. This routine sends the beacon of given type on Adv and GATT bearers.

Implements `rm_ble_mesh_bearer_api_t::broadcastBeacon`.

Example:

```
/* Broadcast beacon. */
err = RM_BLE_MESH_BEARER_BroadcastBeacon(&g_ble_mesh_bearer0_ctrl, type, &packet,
length);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_packet is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ **RM_BLE_MESH_BEARER_StartProxyAdv()**

```
fsp_err_t RM_BLE_MESH_BEARER_StartProxyAdv ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl, uint8_t
type, uint8_t const *const p_data, uint16_t datalen )
```

API to send proxy device ADV. This routine sends Proxy Device ADV.

Implements `rm_ble_mesh_bearer_api_t::startProxyAdv`.

Example:

```
/* Start proxy advertising. */
err = RM_BLE_MESH_BEARER_StartProxyAdv(&g_ble_mesh_bearer0_ctrl, type, &data,
length);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_data is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_BEARER_SendPdu()

```
fsp_err_t RM_BLE_MESH_BEARER_SendPdu ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl,
rm_ble_mesh_bearer_handle_t const *const p_brr_handle, rm_ble_mesh_bearer_type_t brr_type,
rm_ble_mesh_buffer_t const *const p_buffer )
```

Send a bearer PDU. This routine sends a PDU from the Mesh stack to over the bearer indicated by the bearer handle.

Implements `rm_ble_mesh_bearer_api_t::sendPdu`.

Example:

```
/* Send common Bearer PDUs. */
err = RM_BLE_MESH_BEARER_SendPdu(&g_ble_mesh_bearer0_ctrl, &brr_handle,
RM_BLE_MESH_BEARER_TYPE_BCON, &buffer);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_brr_handle and p_buffer are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_BEARER_GetPacketRssi()

```
fsp_err_t RM_BLE_MESH_BEARER_GetPacketRssi ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl, uint8_t * p_rssi_value )
```

Get the RSSI of current received packet being processed. This routine returns the RSSI value of the received packet in its context when called from the Mesh stack.

Implements `rm_ble_mesh_bearer_api_t::getPacketRssi`.

Example:

```
/* Get the RSSI of current received packet being processed. */
err = RM_BLE_MESH_BEARER_GetPacketRssi(&g_ble_mesh_bearer0_ctrl, &rssi_value);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_rssi_value is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_BEARER_Sleep()

```
fsp_err_t RM_BLE_MESH_BEARER_Sleep ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl)
```

Put the bearer to sleep. This routine requests the underlying bearer interface to sleep. Default bearer interface is that of advertising bearer.

Implements `rm_ble_mesh_bearer_api_t::sleep`.

Example:

```
/* Put the bearer to sleep. */
err = RM_BLE_MESH_BEARER_Sleep(&g_ble_mesh_bearer0_ctrl);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_BEARER_Wakeup()

```
fsp_err_t RM_BLE_MESH_BEARER_Wakeup ( rm_ble_mesh_bearer_ctrl_t *const p_ctrl, uint8_t mode )
```

Wakeup the bearer. This routine requests the underlying bearer interface to wakeup. Default bearer interface is that of advertising bearer.

Implements `rm_ble_mesh_bearer_api_t::wakeup`.

Example:

```
/* Wakeup the bearer. */
err = RM_BLE_MESH_BEARER_Wakeup(&g_ble_mesh_bearer0_ctrl, mode);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

BLE Mesh Network Bearer Platform (rm_mesh_bearer_platform)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Bearer Platform module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_bearer_platform

The following build time configurations are defined in fsp_cfg/rm_mesh_bearer_platform_cfg.h:

| Configuration | Options | Default | Description |
|----------------------|--------------------------------|-------------------|---|
| Debug Public Address | Must be a valid device address | FF:FF:FF:50:90:74 | Public Address of firmware initial value. |
| Debug Random Address | Must be a valid device address | FF:FF:FF:FF:FF:FF | Random Address of firmware initial value. |
| Maximum number of | Value must be an | 7 | Maximum number of |

| | | | |
|------------------------------------|---|---------|--|
| connections | integer between 1 and 7, and lower than the value defined in ble module. | | connections. |
| Maximum connection data length | Value must be an integer between 27 and 251, and lower than the value defined in ble module. | 251 | Maximum connection data length. |
| Maximum advertising data length | Value must be an integer between 31 and 1650, and lower than the value defined in ble module. | 1650 | Maximum advertising data length. |
| Maximum advertising set number | Value must be an integer between 1 and 4, and lower than the value defined in ble module. | 4 | Maximum advertising set number. |
| Maximum periodic sync set number. | Value must be an integer between 1 and 2, and lower than the value defined in ble module. | 2 | Maximum periodic sync set number. |
| Store Security Data | <ul style="list-style-type: none"> • Disable • Enable | Disable | Store Security Data in DataFlash. |
| Data Flash Block for Security Data | Value must be an integer between 0 and 7, and lower than the value defined in ble module. | 0 | Data Flash Block for Security Data Management. |
| Remote Device Bonding Number | Value must be an integer between 1 and 7, and lower than the value defined in ble module. | 7 | Number of remote device bonding information. |
| Connection Event Start Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set Connection event start notify enable/disable. |
| Connection Event Close Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set Connection event close notify enable/disable. |
| Advertising Event Start Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set Advertising event start notify enable/disable. |
| Advertising Event Close Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set Advertising event close notify enable/disable. |

| | | | |
|----------------------------------|--|--------------------------------|--|
| Scanning Event Start Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set Scanning event start notify enable/disable. |
| Scanning Event Close Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set Scanning event close notify enable/disable. |
| Initiating Event Start Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set Initiating event start notify enable/disable. |
| Initiating Event Close Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set Initiating event close notify enable/disable. |
| RF Deep Sleep Start Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set RF_DEEP_SLEEP start notify enable/disable. |
| RF Deep Sleep Wakeup Notify | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set RF_DEEP_SLEEP wakeup notify enable/disable. |
| Bluetooth dedicated clock | Value must be an integer between 0 and 15, and lower than the value defined in ble module. | 6 | Load capacitance adjustment. |
| DC-DC converter | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set DC-DC converter for RF part. |
| Slow Clock Source | <ul style="list-style-type: none"> • Use RF_LOCO • Use External 32.768kHz | Use RF_LOCO | Set slow clock source for RF part. |
| MCU CLKOUT Port | <ul style="list-style-type: none"> • P109 • P205 | P109 | When MESH_BEARER_PLATFORM_CFG_RF_EXTERNAL_32K_ENABLE = 1, Set port of MCU CLKOUT. |
| MCU CLKOUT Frequency Output | <ul style="list-style-type: none"> • MCU CLKOUT frequency 32.768kHz • MCU CLKOUT frequency 16.384kHz | MCU CLKOUT frequency 32.768kHz | When MESH_BEARER_PLATFORM_CFG_RF_EXTERNAL_32K_ENABLE = 1, set frequency output from CLKOUT of MCU part. |
| Sleep Clock Accuracy(SCA) | Value must be an integer between 0 and 500, and lower than the value defined in ble module. | 250 | When MESH_BEARER_PLATFORM_CFG_RF_EXTERNAL_32K_ENABLE = 1, set Sleep Clock Accuracy(SCA) for RF slow clock. |
| Transmission Power Maximum Value | <ul style="list-style-type: none"> • max +0dBm • max +4dBm | max +4dBm | Set transmission power maximum value. |

| | | | |
|-----------------------------------|---|---|--|
| Transmission Power Default Value | <ul style="list-style-type: none"> • High 0dBm(Transmission Power Maximum Value = +0dBm) / +4 dBm(Transmission Power Maximum Value = +4dBm) • Mid 0dBm(Transmission Power Maximum Value = +0dBm) / 0dBm(Transmission Power Maximum Value = +4dBm) • Low -18dBm(Transmission Power Maximum Value = +0dBm) / -20 dBm(Transmission Power Maximum Value = +4dBm) | High 0dBm(Transmission Power Maximum Value = +0dBm) / +4dBm(Transmission Power Maximum Value = +4dBm) | Set default transmit power. Default transmit power is dependent on the configuration of Maximum transmission power(MESH_BEARER_PLATFORM_CFG_RF_MAX_TX_POW). |
| CLKOUT_RF Output | <ul style="list-style-type: none"> • No output • 4MHz output • 2MHz output • 1MHz output | No output | Set CLKOUT_RF output setting. |
| RF_DEEP_SLEEP Transition | <ul style="list-style-type: none"> • Disable • Enable | Enable | Set RF_DEEP_SLEEP transition. |
| MCU Main Clock Frequency | Value must be an integer between 1000 and 20000, and lower than the value defined in ble module. | 8000 | Set MCU Main Clock Frequency (kHz). Set clock source according to your board environment. HOCO: don't care. / Main Clock: 1000 to 20000 kHz / PLL Circuit: 4000 to 12500 kHz |
| Code Flash(ROM) Device Data Block | Value must be an integer between -1 and 255, and lower than the value defined in ble module. | 255 | Device specific data block on Code Flash (ROM). |
| Device Specific Data Flash Block | Value must be an integer between -1 and 7, and lower than the value defined in ble module. | -1 | Device specific data block on E2 Data Flash. |

| | | | |
|---------------------------|--|-----|---|
| MTU Size Configured | Value must be an integer between 23 and 247, and lower than the value defined in ble module. | 247 | MTU Size configured by GATT MTU exchange procedure. |
| Timer Slot Maximum Number | Value must be an integer between 1 and 10, and lower than the value defined in ble module. | 10 | The maximum number of timer slot. |

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Bearer Platform (rm_mesh_bearer_platform)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Bearer Platform (rm_mesh_bearer_platform).

| Configuration | Options | Default | Description |
|-----------------------------|--------------------------------|----------------------------|---|
| General | | | |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_bearer_platform0 | Module name. |
| Channel Number | Invalid Channel Number | 0 | Select channel corresponding to the channel number of the hardware. |
| Device Address Type | Invalid Device Address Type | 0 | Select device address type (public : 0, random : 1). |
| GATT Server Callback Number | Invalid Callback Number | 1 | Number of GATT server callback. |
| GATT Client Callback Number | Invalid Callback Number | 1 | Number of GATT client callback. |
| Vender Specific Callback | Name Must Be a Valid C Symbol. | NULL | Vendor specific callback function name. |

Data Structures

```
struct rm_mesh_bearer_platform_instance_ctrl_t
```

```
struct rm_mesh_bearer_platform_extended_cfg_t
```

Typedefs

```
typedef void(* rm_mesh_bearer_platform_gatt_iface_cb_t) (uint8_t event_name, uint8_t event_param, uint16_t conn_hdl, st_ble_dev_addr_t *peer_addr)
```

Callback function for GATT interface event. [More...](#)

Enumerations

enum [rm_mesh_bearer_platform_interface_event_t](#)

Data Structure Documentation

◆ rm_mesh_bearer_platform_instance_ctrl_t

struct [rm_mesh_bearer_platform_instance_ctrl_t](#)

RM_BLE_MESH_BEARER private control block. DO NOT MODIFY. Initialization occurs when [RM_BLE_MESH_BEARER_Open\(\)](#) is called.

◆ rm_mesh_bearer_platform_extended_cfg_t

struct [rm_mesh_bearer_platform_extended_cfg_t](#)

Bearer port extension for renesas BLE stack.

Typedef Documentation

◆ rm_mesh_bearer_platform_gatt_iface_cb_t

typedef void(* [rm_mesh_bearer_platform_gatt_iface_cb_t](#)) (uint8_t event_name, uint8_t event_param, uint16_t conn_hdl, [st_ble_dev_addr_t](#) *peer_addr)

Callback function for GATT interface event.

Parameters

| | |
|-------------|---|
| event_name | The event defined by rm_mesh_bearer_platform_interface_event_t |
| event_param | The mode of GATT connection rm_mesh_bearer_platform_gatt_mode_t |
| conn_hdl | The connection handle |
| peer_addr | Pointer to the connected device address |

Enumeration Type Documentation

◆ **rm_mesh_bearer_platform_interface_event_t**

| enum <code>rm_mesh_bearer_platform_interface_event_t</code> | |
|--|---|
| GATT Interface Events | |
| Enumerator | |
| <code>RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_UP</code> | The event GATT Bearer BLE Link Layer connected |
| <code>RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_DOWN</code> | The event GATT Bearer BLE Link Layer disconnected |
| <code>RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_ENABLE</code> | The event GATT Bearer service enabled for communication |
| <code>RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_DISABLE</code> | The event GATT Bearer service disabled for communication |
| <code>RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_NOT_FOUND</code> | The event discovery process is not completed |
| <code>RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_SCAN</code> | The event that connectable device having Mesh GATT Service is found |
| <code>RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_CANCEL</code> | The Event GATT/BLE link layer connection creation is canceled |

Function Documentation

◆ RM_MESH_BEARER_PLATFORM_Open()

```
fsp_err_t RM_MESH_BEARER_PLATFORM_Open ( rm_mesh_bearer_platform_ctrl_t *const p_ctrl,
rm_mesh_bearer_platform_cfg_t const *const p_cfg )
```

Open Bearer Platform middleware. Initialize underlying BLE Protocol Stack to use as a Mesh Bearer. API to initialize underlying BLE Protocol Stack to use as a Mesh Bearer. Completion of the initialization is notified by the callback function.

Implements `rm_mesh_bearer_platform_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_BEARER_PLATFORM_Open(&g_mesh_bearer_platform0_ctrl,
&g_mesh_bearer_platform0_cfg);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_MESH_BEARER_PLATFORM_Close()

```
fsp_err_t RM_MESH_BEARER_PLATFORM_Close ( rm_mesh_bearer_platform_ctrl_t *const p_ctrl)
```

Close Bearer Platform middleware. Terminate BLE stack.

Implements `rm_mesh_bearer_platform_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_BEARER_PLATFORM_Close(&g_mesh_bearer_platform0_ctrl);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MESH_BEARER_PLATFORM_Setup()**

```
fsp_err_t RM_MESH_BEARER_PLATFORM_Setup ( rm_mesh_bearer_platform_ctrl_t *const p_ctrl)
```

Register ADV bearer with Mesh stack and start scan. API to register ADV bearer with Mesh stack. After registering, this routine starts Scan.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | rm_mesh_bearer_platform control block. |
|------|--------|--|

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ **RM_MESH_BEARER_PLATFORM_CallbackSet()**

```
fsp_err_t RM_MESH_BEARER_PLATFORM_CallbackSet ( rm_mesh_bearer_platform_ctrl_t *const p_ctrl, rm_mesh_bearer_platform_gatt_iface_cb_t callback )
```

Register callback function to receive GATT interface events. API to register callback function to receive GATT interface events.

Parameters

| | | |
|------|----------|--|
| [in] | p_ctrl | rm_mesh_bearer_platform control block. |
| [in] | callback | Callback function. |

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ **RM_MESH_BEARER_PLATFORM_SetGattMode()**

```
fsp_err_t RM_MESH_BEARER_PLATFORM_SetGattMode ( rm_mesh_bearer_platform_ctrl_t *const
p_ctrl, rm_mesh_bearer_platform_gatt_mode_t mode )
```

Set GATT Bearer mode.

Parameters

| | | |
|------|--------|---|
| [in] | p_ctrl | rm_mesh_bearer_platform control block. |
| [in] | mode | GATT interface mode, either RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION or RM_MESH_BEARER_PLATFORM_GATT_MODE_PROXY. |

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ **RM_MESH_BEARER_PLATFORM_GetGattMode()**

```
fsp_err_t RM_MESH_BEARER_PLATFORM_GetGattMode ( rm_mesh_bearer_platform_ctrl_t *const
p_ctrl, rm_mesh_bearer_platform_gatt_mode_t * p_mode )
```

Get current GATT Bearer mode.

Parameters

| | | |
|------|--------|---|
| [in] | p_ctrl | rm_mesh_bearer_platform control block. |
| [in] | p_mode | GATT interface mode, either RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION or RM_MESH_BEARER_PLATFORM_GATT_MODE_PROXY. |

Return values

| | |
|-------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_mode is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_BEARER_PLATFORM_SetScanResponseData()

```
fsp_err_t RM_MESH_BEARER_PLATFORM_SetScanResponseData ( rm_mesh_bearer_platform_ctrl_t
*const p_ctrl, uint8_t* p_data, uint8_t len )
```

Set scan response data in connectable and scannable undirected advertising event. API to Set Scan Response Data in Connectable and scannable undirected Advertising event. Scan Response Data can be used for indicating additional information such as << Complete Local Name>>.

Implements `rm_mesh_bearer_platform_api_t::setScanResponseData`.

Example:

```
/* Set scan response data in connectable and scannable undirected advertising
event.. */
err = RM_MESH_BEARER_PLATFORM_SetScanResponseData(&g_mesh_bearer_platform0_ctrl,
&data, length);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_data is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MESH_BEARER_PLATFORM_ScanGattBearer()**

```
fsp_err_t RM_MESH_BEARER_PLATFORM_ScanGattBearer ( rm_mesh_bearer_platform_ctrl_t *const
p_ctrl, rm_mesh_bearer_platform_state_t state, rm_mesh_bearer_platform_gatt_mode_t mode )
```

Manage reporting connectable device having Mesh GATT service. API to manage reporting connectable device having Mesh GATT service.

Parameters

| | | |
|------|--------|---|
| [in] | p_ctrl | rm_mesh_bearer_platform control block. |
| [in] | state | Notification configuration flag; enable if RM_MESH_BEARER_PLATFORM_STATE_ENABLE, or disable if RM_MESH_BEARER_PLATFORM_STATE_DISABLE. |
| [in] | mode | GATT interface mode, either RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION or RM_MESH_BEARER_PLATFORM_GATT_MODE_PROXY. |

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_BEARER_PLATFORM_Connect()

```
fsp_err_t RM_MESH_BEARER_PLATFORM_Connect ( rm_mesh_bearer_platform_ctrl_t *const p_ctrl,
uint8_t * p_remote_address, uint8_t address_type, rm_mesh_bearer_platform_gatt_mode_t mode
)
```

Request to create connection. API to request to Create Connection. Completion of the establishing a connection is notified by RM_BLE_MESH_BEARER_IFACE_UP. After establishing a connection, RM_MESH_BEARER_PLATFORM_DiscoverService() is invoked automatically.

Implements `rm_mesh_bearer_platform_api_t::connect`.

Example:

```
/* Request to create connection. */
err = RM_MESH_BEARER_PLATFORM_Connect (&g_mesh_bearer_platform0_ctrl,
                                         &remote_address,
                                         bearer_address_type,
                                         RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_remote_address is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_MESH_BEARER_PLATFORM_DiscoverService()**

```
fsp_err_t RM_MESH_BEARER_PLATFORM_DiscoverService ( rm_mesh_bearer_platform_ctrl_t *const
p_ctrl, uint16_t handle, rm_mesh_bearer_platform_gatt_mode_t mode )
```

Start service discovery for Mesh GATT service. API to start Service Discovery for Mesh GATT Service. If Mesh GATT Service specified by the "mode" argument, this routine enables Notification of the Mesh GATT Service by invoking [RM_MESH_BEARER_PLATFORM_ConfigureNotification\(\)](#).

Implements [rm_mesh_bearer_platform_api_t::discoverService](#).

Example:

```
/* Start service discovery for Mesh GATT service. */
err = RM_MESH_BEARER_PLATFORM_DiscoverService(&g_mesh_bearer_platform0_ctrl,
                                             handle,
RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_MESH_BEARER_PLATFORM_ConfigureNotification()

```
fsp_err_t RM_MESH_BEARER_PLATFORM_ConfigureNotification ( rm_mesh_bearer_platform_ctrl_t
*const p_ctrl, uint16_t handle, rm_mesh_bearer_platform_state_t state,
rm_mesh_bearer_platform_gatt_mode_t mode )
```

Configure GATT notification of Mesh GATT service. API to configure GATT Notification of Mesh GATT Service.

Implements `rm_mesh_bearer_platform_api_t::configureNotification`.

Example:

```
/* Configure GATT notification of Mesh GATT service. */
err =
RM_MESH_BEARER_PLATFORM_ConfigureNotification(&g_mesh_bearer_platform0_ctrl,
                                             handle,
RM_MESH_BEARER_PLATFORM_STATE_ENABLE,
RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_MESH_BEARER_PLATFORM_Disconnect()

```
fsp_err_t RM_MESH_BEARER_PLATFORM_Disconnect ( rm_mesh_bearer_platform_ctrl_t *const
p_ctrl, uint16_t handle )
```

Terminate Connection. API to terminate connection.

Implements `rm_mesh_bearer_platform_api_t::disconnect`.

Example:

```
/* Terminate Connection. */
err = RM_MESH_BEARER_PLATFORM_Disconnect(&g_mesh_bearer_platform0_ctrl, handle);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Detailed Description

Overview

Target Devices

The BLE Mesh Network Config Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_config_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_config_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Config Client (rm_mesh_config_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Config Client (rm_mesh_config_clt).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|---------------------------------------|-------------------------------|-----------------------|--|
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh config client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_config_clt0 | Module name. |

Data Structures

```
struct rm\_mesh\_config\_clt\_instance\_ctrl\_t
```

Data Structure Documentation

◆ rm_mesh_config_clt_instance_ctrl_t

```
struct rm_mesh_config_clt_instance_ctrl_t
```

BLE mesh config instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_CONFIG_CLT_Open\(\)](#) is called.

Function Documentation

◆ RM_MESH_CONFIG_CLT_Open()

```
fsp_err_t RM_MESH_CONFIG_CLT_Open ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
rm_ble_mesh_config_client_cfg_t const *const p_cfg )
```

Open Configuration Client middleware. This is to initialize Configuration Client model and to register with Access layer.

Implements `rm_ble_mesh_config_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_CONFIG_CLT_Open(&g_mesh_config_clt0_ctrl, &g_mesh_config_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_CONFIG_CLT_Close()

```
fsp_err_t RM_MESH_CONFIG_CLT_Close ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

Close Configuration Client middleware.

Implements `rm_ble_mesh_config_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_CONFIG_CLT_Close(&g_mesh_config_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_CONFIG_CLT_SetServer()

```
fsp_err_t RM_MESH_CONFIG_CLT_SetServer ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
rm_ble_mesh_network_address_t server_addr, uint8_t * p_dev_key )
```

This is to sets the information about server which is to be configured.

Implements `rm_ble_mesh_config_client_api_t::setServer`.

Example:

```
/* Sets the information about server which is to be configured. */
err = RM_MESH_CONFIG_CLT_SetServer(&g_mesh_config_clt0_ctrl, server_addr,
&dev_key);
```

Return values

| | |
|--------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |

◆ RM_MESH_CONFIG_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_CONFIG_CLT_SendReliablePdu ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_config_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_CONFIG_CLT_SendReliablePdu(&g_mesh_config_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_BeaconGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_BeaconGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

The Config Beacon Get is an acknowledged message used to get the current Secure Network Beacon state of a node.

Parameters

| | | |
|------|--------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
|------|--------|-----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_BeaconSet()

```
fsp_err_t RM_MESH_CONFIG_CLT_BeaconSet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Config Beacon Set is an acknowledged message used to set the current Secure Network Beacon state of a node.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_beacon_set_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_CompositionDataGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_CompositionDataGet ( rm_ble_mesh_config_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Config Composition Data Get is an acknowledged message used to read one page of the Composition Data.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_composition_data_get_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_DefaultTtlGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_DefaultTtlGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

Config Default TTL Get is an acknowledged message used to get the current Default TTL state of a node.

Parameters

| | | |
|------|--------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
|------|--------|-----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_DefaultTtlSet()

```
fsp_err_t RM_MESH_CONFIG_CLT_DefaultTtlSet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config Default TTL Set is an acknowledged message used to set the Default TTL state of a node.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_default_ttl_set_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_GattProxyGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_GattProxyGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

The Config GATT Proxy Get is an acknowledged message used to get the GATT Proxy state of a node.

Parameters

| | | |
|------|--------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
|------|--------|-----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_GattProxySet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_GattProxySet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config GATT Proxy Set is an acknowledged message used to set the GATT Proxy state of a node.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_gatt_proxy_set_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_RelayGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_RelayGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

The Config Relay Get is an acknowledged message used to get the current Relay and Relay Retransmit states of a node.

Parameters

| | | |
|------|--------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
|------|--------|-----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_RelaySet()

```
fsp_err_t RM_MESH_CONFIG_CLT_RelaySet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Config Relay Set is an acknowledged message used to set the current Relay and Relay Retransmit states of a node.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_relay_set_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_ModelPublicationGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelPublicationGet ( rm_ble_mesh_config_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Config Model Publication Get is an acknowledged message used to get the publish address and parameters of an outgoing message that originates from a model.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_publication_get_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_ModelPublicationSet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelPublicationSet ( rm_ble_mesh_config_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Config Model Publication Set is an acknowledged message used to set the Model Publication state of an outgoing message that originates from a model.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_publication_set_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_ModelPublicationVaddrSet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelPublicationVaddrSet ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config Model Publication Set is an acknowledged message used to set the Model Publication state of an outgoing message that originates from a model.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_publication_virtual_address_set_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_ModelSubscriptionAdd()**

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionAdd ( rm_ble_mesh_config_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Config Model Subscription Add is an acknowledged message used to add an address to a Subscription List of a model.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_add_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrAdd()**

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrAdd ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config Model Subscription Add is an acknowledged message used to add an address to a Subscription List of a model.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_virtual_address_add_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_ModelSubscriptionDelete()**

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionDelete ( rm\_ble\_mesh\_config\_client\_ctrl\_t
*const p_ctrl, void const *const p_parameter )
```

The Config Model Subscription Delete is an acknowledged message used to delete a subscription address from the Subscription List of a model.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_delete_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrDelete()

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrDelete ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config Model Subscription Delete is an acknowledged message used to delete a subscription address from the Subscription List of a model.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_virtual_address_delete_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_ModelSubscriptionOverwrite()**

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionOverwrite ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config Model Subscription Overwrite is an acknowledged message used to discard the Subscription List and add an address to the cleared Subscription List of a model.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_overwrite_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrOverwrite()**

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrOverwrite (
rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Config Model Subscription Overwrite is an acknowledged message used to discard the Subscription List and add an address to the cleared Subscription List of a model.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_virtual_address_overwrite_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_ModelSubscriptionDeleteAll()**

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionDeleteAll ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config Model Subscription Delete All is an acknowledged message used to discard the Subscription List of a model.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_delete_all_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_SigModelSubscriptionGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_SigModelSubscriptionGet ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config SIG Model Subscription Get is an acknowledged message used to get the list of subscription addresses of a model within the element. This message is only for SIG Models.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_sig_model_subscription_get_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_VendorModelSubscriptionGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_VendorModelSubscriptionGet ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config SIG Model Subscription Get is an acknowledged message used to get the list of subscription addresses of a model within the element. This message is only for Vendor Models.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_vendor_model_subscription_get_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_NetkeyAdd()

```
fsp_err_t RM_MESH_CONFIG_CLT_NetkeyAdd ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Config NetKey Add is an acknowledged message used to add a NetKey to a NetKey List on a node. The added NetKey is then used by the node to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_netkey_add_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_NetkeyUpdate()

```
fsp_err_t RM_MESH_CONFIG_CLT_NetkeyUpdate ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config NetKey Update is an acknowledged message used to update a NetKey on a node. The updated NetKey is then used by the node to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends, as defined by the Key Refresh procedure.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_netkey_update_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_NetkeyDelete()

```
fsp_err_t RM_MESH_CONFIG_CLT_NetkeyDelete ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config NetKey Delete is an acknowledged message used to delete a NetKey on a NetKey List from a node.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_netkey_delete_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_NetkeyGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_NetkeyGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

The Config NetKey Get is an acknowledged message used to report all NetKeys known to the node.

Parameters

| | | |
|------|--------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
|------|--------|-----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_AppkeyAdd()

```
fsp_err_t RM_MESH_CONFIG_CLT_AppkeyAdd ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Config AppKey Add is an acknowledged message used to add an AppKey to the AppKey List on a node and bind it to the NetKey identified by NetKeyIndex. The added AppKey can be used by the node only as a pair with the specified NetKey. The AppKey is used to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_appkey_add_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_AppkeyUpdate()

```
fsp_err_t RM_MESH_CONFIG_CLT_AppkeyUpdate ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config AppKey Update is an acknowledged message used to update an AppKey value on the AppKey List on a node. The updated AppKey is used by the node to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends, as defined by the Key Refresh procedure.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_appkey_update_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_AppkeyDelete()

```
fsp_err_t RM_MESH_CONFIG_CLT_AppkeyDelete ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config AppKey Delete is an acknowledged message used to delete an AppKey from the AppKey List on a node

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_appkey_delete_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_AppkeyGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_AppkeyGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The AppKey Get is an acknowledged message used to report all AppKeys bound to the NetKey.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_appkey_get_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_NodeIdentityGet()

```
fsp_err_t RM_MESH_CONFIG_CLT_NodeIdentityGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config Node Identity Get is an acknowledged message used to get the current Node Identity state for a subnet.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_node_id_get_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_NodeIdentitySet()

```
fsp_err_t RM_MESH_CONFIG_CLT_NodeIdentitySet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config Node Identity Set is an acknowledged message used to set the current Node Identity state for a subnet.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_node_id_set_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_ModelAppBind()

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelAppBind ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config Model App Bind is an acknowledged message used to bind an AppKey to a model.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_app_bind_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_ModelAppUnbind()

```
fsp_err_t RM_MESH_CONFIG_CLT_ModelAppUnbind ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config Model App Unbind is an acknowledged message used to remove the binding between an AppKey and a model.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_model_app_unbind_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_SigModelAppGet()

```
fsp_err_t RM_MESH_CONFIG_CLT_SigModelAppGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Config SIG Model App Get is an acknowledged message used to request report of all AppKeys bound to the SIG Model.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_sig_model_app_get_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_VendorModelAppGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_VendorModelAppGet ( rm_ble_mesh_config_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Config Vendor Model App Get is an acknowledged message used to request report of all AppKeys bound to the Vendor Model.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_vendor_model_app_get_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_NodeReset()**

```
fsp_err_t RM_MESH_CONFIG_CLT_NodeReset ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

The Config Node Reset is an acknowledged message used to reset a node (other than a Provisioner) and remove it from the network.

Parameters

| | | |
|------|--------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
|------|--------|-----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_FriendGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_FriendGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

The Config Friend Get is an acknowledged message used to get the current Friend state of a node.

Parameters

| | | |
|------|--------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
|------|--------|-----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_FriendSet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_FriendSet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Config Friend Set is an acknowledged message used to set the Friend state of a node.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_friend_set_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_KeyrefreshPhaseGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_KeyrefreshPhaseGet ( rm_ble_mesh_config_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Config Key Refresh Phase Get is an acknowledged message used to get the current Key Refresh Phase state of the identified network key.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_key_refresh_phase_get_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_KeyrefreshPhaseSet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_KeyrefreshPhaseSet ( rm_ble_mesh_config_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Config Key Refresh Phase Set is an acknowledged message used to set the current Key Refresh Phase state of the identified network key.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_key_refresh_phase_set_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_HeartbeatPublicationGet()

```
fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatPublicationGet ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl)
```

The Config Heartbeat Publication Get is an acknowledged message used to get the current Heartbeat Publication state of an element.

Parameters

| | | |
|------|--------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
|------|--------|-----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_HeartbeatPublicationSet()

```
fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatPublicationSet ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config Heartbeat Publication Set is an acknowledged message used to set the current Heartbeat Publication state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_heartbeat_publication_set_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_HeartbeatSubscriptionGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatSubscriptionGet ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl)
```

The Config Heartbeat Subscription Get is an acknowledged message used to get the current Heartbeat Subscription state of an element.

Parameters

| | | |
|------|--------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
|------|--------|-----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_HeartbeatSubscriptionSet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatSubscriptionSet ( rm_ble_mesh_config_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Config Heartbeat Publication Set is an acknowledged message used to set the current Heartbeat Subscription state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_heartbeat_subscription_set_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_LpnPolltimeoutGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_LpnPolltimeoutGet ( rm_ble_mesh_config_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Config Low Power Node PollTimeout Get is an acknowledged message used to get the current value of PollTimeout timer of the Low Power node within a Friend node. The message is sent to a Friend node that has claimed to be handling messages by sending ACKs On Behalf Of (OBO) the indicated Low Power node. This message should only be sent to a node that has the Friend feature supported and enabled.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_low_power_node_polling_timeout_get_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_CONFIG_CLT_NetworkTransmitGet()**

```
fsp_err_t RM_MESH_CONFIG_CLT_NetworkTransmitGet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
```

The Config Network Transmit Get is an acknowledged message used to get the current Network Transmit state of a node.

Parameters

| | | |
|------|--------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
|------|--------|-----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_CONFIG_CLT_NetworkTransmitSet()

```
fsp_err_t RM_MESH_CONFIG_CLT_NetworkTransmitSet ( rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Config Network Transmit Set is an acknowledged message used to set the current Network Transmit state of a node.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_config_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_config_clt_network_transmit_set_parameter_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

BLE Mesh Network Config Server (rm_mesh_config_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_CONFIG_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_CONFIG_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

```
fsp_err_t RM_MESH_CONFIG_SRV_StateUpdate
          (rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
           rm_ble_mesh_access_server_state_t const *const p_state)
```

Detailed Description

Overview

Target Devices

The BLE Mesh Network Config Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_config_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_config_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Config Server (rm_mesh_config_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Config Server (rm_mesh_config_srv).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|--|-------------------------------|---------------------------|--|
| Callback | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh config client ISR occurs |
| Callback Provided When an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic admin property server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_config_srv 0 | Module name. |

Data Structures

```
struct rm_mesh_config_srv_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_config_srv_instance_ctrl_t

```
struct rm_mesh_config_srv_instance_ctrl_t
```

BLE mesh config instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_CONFIG_SRV_Open()` is called.

Function Documentation

◆ `RM_MESH_CONFIG_SRV_Open()`

```
fsp_err_t RM_MESH_CONFIG_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize configuration server model. This is to initialize configuration server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_CONFIG_SRV_Open(&g_mesh_config_srv0_ctrl, &g_mesh_config_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_CONFIG_SRV_Close()

```
fsp_err_t RM_MESH_CONFIG_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate configuration server model. This is to terminate configuration server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_CONFIG_SRV_Close(&g_mesh_config_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_CONFIG_SRV_StateUpdate()

```
fsp_err_t RM_MESH_CONFIG_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_CONFIG_SRV_StateUpdate(&g_mesh_config_srv0_ctrl, &state);
```

Return values

| | |
|---------------------|-------------------------------|
| FSP_ERR_UNSUPPORTED | This function is unsupported. |
|---------------------|-------------------------------|

BLE Mesh Network Generic Admin Property Server (rm_mesh_generic_admin_prop_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_Open
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_Close
          (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

```
fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_StateUpdate
          (rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
           rm_ble_mesh_access_server_state_t const *const p_state)
```

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Admin Property Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_admin_prop_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_admin_prop_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Admin Property Server (rm_mesh_generic_admin_prop_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Admin Property Server (rm_mesh_generic_admin_prop_srv).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|--|-------------------------------|-----------------------------------|--|
| Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic admin property server ISR occurs |
| Callback Provided When an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic admin property server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_admin_prop_srv0 | Module name. |

Data Structures

```
struct rm_mesh_generic_admin_prop_srv_info_t
```

```
struct rm\_mesh\_generic\_admin\_prop\_srv\_instance\_ctrl\_t
```

Data Structure Documentation

◆ [rm_mesh_generic_admin_prop_srv_info_t](#)

| Data Fields | | |
|-------------|--------------------|--|
| uint16_t | property_id | Admin Property ID field is a 2-octet Assigned Number value referencing a device property |
| uint8_t | user_access | Admin User Access field is an enumeration indicating whether the device property can be read or written as a Generic User Property |
| uint8_t * | property_value | Admin Property Value field is a conditional field |
| uint16_t | property_value_len | |

◆ [rm_mesh_generic_admin_prop_srv_instance_ctrl_t](#)

| struct rm_mesh_generic_admin_prop_srv_instance_ctrl_t |
|--|
| BLE mesh generic admin prop instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_ADMIN_PROP_SRV_Open() is called. |

Function Documentation

◆ RM_MESH_GENERIC_ADMIN_PROP_SRV_Open()

```
fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic_Admin_Property Server model. This is to initialize Generic_Admin_Property Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err =
RM_MESH_GENERIC_ADMIN_PROP_SRV_Open(&g_mesh_generic_admin_prop_srv0_ctrl,
&g_mesh_generic_admin_prop_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_ADMIN_PROP_SRV_Close()

```
fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl)
```

API to terminate Generic_Admin_Property Server model. This is to terminate Generic_Admin_Property Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_ADMIN_PROP_SRV_Close(&g_mesh_generic_admin_prop_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_ADMIN_PROP_SRV_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err =
RM_MESH_GENERIC_ADMIN_PROP_SRV_StateUpdate(&g_mesh_generic_admin_prop_srv0_ctrl,
&state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

BLE Mesh Network Generic Battery Client (rm_mesh_generic_battery_clt)

(rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Battery Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_battery_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_battery_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Battery Client (rm_mesh_generic_battery_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Battery Client (rm_mesh_generic_battery_clt).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|---------------------------------------|-------------------------------|--------------------------------|---|
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic battery client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_battery_clt0 | Module name. |

Data Structures

```
struct rm_mesh_generic_battery_clt_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_battery_clt_instance_ctrl_t

```
struct rm_mesh_generic_battery_clt_instance_ctrl_t
```

BLE mesh generic battery instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_GENERIC_BATTERY_CLT_Open()` is called.

Function Documentation

◆ RM_MESH_GENERIC_BATTERY_CLT_Open()

```
fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Generic Battery Client middleware. This is to initialize Generic_Battery Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_BATTERY_CLT_Open(&g_mesh_generic_battery_clt0_ctrl,
&g_mesh_generic_battery_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_BATTERY_CLT_Close()

```
fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Generic Battery Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_BATTERY_CLT_Close(&g_mesh_generic_battery_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_BATTERY_CLT_GetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Generic_Battery client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of generic battery client model. */
err =
RM_MESH_GENERIC_BATTERY_CLT_GetModelHandle(&g_mesh_generic_battery_clt0_ctrl,
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_GENERIC_BATTERY_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err =
RM_MESH_GENERIC_BATTERY_CLT_SendReliablePdu(&g_mesh_generic_battery_clt0_ctrl,
                                             req_opcode,
                                             p_parameter,
                                             rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_BATTERY_CLT_Get()

`fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)`

Generic Battery Get message is an acknowledged message used to get the Generic Battery state of an element. The response to the Generic Battery Get message is a Generic Battery Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | rm_mesh_generic_battery_clt control block. |
|------|--------|--|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

BLE Mesh Network Generic Battery Server (rm_mesh_generic_battery_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

`fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)`

`fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)`

`fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)`

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Battery Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_battery_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_battery_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Battery Server (rm_mesh_generic_battery_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Battery Server (rm_mesh_generic_battery_srv).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|--|-------------------------------|--------------------------------|---|
| Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic battery server ISR occurs |
| Callback Provided When an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic battery server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_battery_srv0 | Module name. |

Data Structures

```
struct rm_mesh_generic_battery_srv_info_t
```

```
struct rm_mesh_generic_battery_srv_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_battery_srv_info_t

```
struct rm_mesh_generic_battery_srv_info_t
```

| Generic Battery state is a set of four values representing the state of a battery | | |
|---|-----------------------------------|--|
| Data Fields | | |
| uint8_t | generic_battery_level | Generic Battery Level state is a value ranging from 0 percent through 100 percent |
| uint32_t | generic_battery_time_to_discharge | Generic Battery Time to Discharge state is a 24-bit unsigned value ranging from 0 through 0xFFFFFFFF |
| uint32_t | generic_battery_time_to_charge | Generic Battery Time to Charge state is a 24-bit unsigned value ranging from 0 through 0xFFFFFFFF |
| uint8_t | generic_battery_flags | Generic Battery Flags state is a concatenation of four 2-bit bit fields: Presence, Indicator, Charging, and Serviceability |

◆ rm_mesh_generic_battery_srv_instance_ctrl_t

| |
|--|
| struct rm_mesh_generic_battery_srv_instance_ctrl_t |
| BLE mesh generic_battery instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_BATTERY_SRV_Open() is called. |

Function Documentation

◆ RM_MESH_GENERIC_BATTERY_SRV_Open()

```
fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic_Battery Server model. This is to initialize Generic_Battery Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_BATTERY_SRV_Open(&g_mesh_generic_battery_srv0_ctrl,
&g_mesh_generic_battery_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_BATTERY_SRV_Close()

```
fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl)
```

API to terminate Generic_Battery Server model. This is to terminate Generic_Battery Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_BATTERY_SRV_Close(&g_mesh_generic_battery_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_BATTERY_SRV_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_GENERIC_BATTERY_SRV_StateUpdate(&g_mesh_generic_battery_srv0_ctrl,
&state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

BLE Mesh Network Generic Client Property Server (rm_mesh_generic_client_prop_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_Open
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_Close
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

```
fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state)
```

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Client Property Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_client_prop_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_client_prop_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Client Property Server (rm_mesh_generic_client_prop_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Client Property Server (rm_mesh_generic_client_prop_srv).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|--|-------------------------------|------------------------------------|---|
| Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic client property server ISR occurs |
| Callback Provided When an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic client property server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_client_prop_srv0 | Module name. |

Data Structures

```
struct rm_mesh_generic_client_prop_srv_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_client_prop_srv_instance_ctrl_t

```
struct rm_mesh_generic_client_prop_srv_instance_ctrl_t
```

BLE mesh generic client prop instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_GENERIC_CLIENT_PROP_SRV_Open\(\)](#) is called.

Function Documentation

◆ [RM_MESH_GENERIC_CLIENT_PROP_SRV_Open\(\)](#)

```
fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic_Client_Property Server model. This is to initialize Generic_Client_Property Server model and to register with Access layer.

Implements [rm_ble_mesh_model_server_api_t::open](#).

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_CLIENT_PROP_SRV_Open(&g_mesh_generic_client_prop_srv0_ctrl,
                                           &g_mesh_generic_client_prop_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_CLIENT_PROP_SRV_Close()

```
fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const  
p_ctrl)
```

API to terminate Generic_Client_Property Server model. This is to terminate Generic_Client_Property Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */  
err =  
RM_MESH_GENERIC_CLIENT_PROP_SRV_Close(&g_mesh_generic_client_prop_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err =
RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate(&g_mesh_generic_client_prop_srv0_ctrl,
&state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

BLE Mesh Network Generic Default Transition Time Client (rm_mesh_generic_dtt_clt)

Modules » Networking » BLE Mesh Network Modules

Functions

(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const
p_parameter)
```

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Default Transition Time Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_dtt_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_dtt_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Default Transition Time Client (rm_mesh_generic_dtt_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Default Transition Time Client (rm_mesh_generic_dtt_clt).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|---------------------------------------|-------------------------------|------|---|
| Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic default transition time |
|---------------------------------------|-------------------------------|------|---|

client ISR occurs

| | | | |
|------|-------------------------------|----------------------------|--------------|
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_dtt_clt0 | Module name. |
|------|-------------------------------|----------------------------|--------------|

Data Structures

```
struct rm_mesh_generic_dtt_clt_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_dtt_clt_instance_ctrl_t

```
struct rm_mesh_generic_dtt_clt_instance_ctrl_t
```

BLE mesh generic dtt instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_GENERIC_DTT_CLT_Open()` is called.

Function Documentation

◆ RM_MESH_GENERIC_DTT_CLT_Open()

```
fsp_err_t RM_MESH_GENERIC_DTT_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Generic Default Transition Time Client middleware. This is to initialize Generic_Default_Transition_Time Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_DTT_CLT_Open(&g_mesh_generic_dtt_clt0_ctrl,
&g_mesh_generic_dtt_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_DTT_CLT_Close()

```
fsp_err_t RM_MESH_GENERIC_DTT_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Generic Default Transition Time Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_DTT_CLT_Close(&g_mesh_generic_dtt_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_DTT_CLT_GetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_DTT_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Generic_Default_Transition_Time client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of generic default transition time client model. */
err = RM_MESH_GENERIC_DTT_CLT_GetModelHandle(&g_mesh_generic_dtt_clt0_ctrl,
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_GENERIC_DTT_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_GENERIC_DTT_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands */
err = RM_MESH_GENERIC_DTT_CLT_SendReliablePdu(&g_mesh_generic_dtt_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_DTT_CLT_Get()**

```
fsp_err_t RM_MESH_GENERIC_DTT_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Generic Default Transition Time Get is an acknowledged message used to get the Generic Default Transition Time state of an element. The response to the Generic Default Transition Time Get message is a Generic Default Transition Time Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | rm_mesh_generic_dtt_clt control block. |
|------|--------|--|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_DTT_CLT_Set()

```
fsp_err_t RM_MESH_GENERIC_DTT_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

Generic Default Transition Time Set is an acknowledged message used to set the Generic Default Transition Time state of an element. The response to the Generic Default Transition Time Set message is a Generic Default Transition Time Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_dtt_clt control block. |
| [in] | p_parameter | Pointer to transition time. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_DTT_CLT_SetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_DTT_CLT_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic Default Transition Time Set Unacknowledged is an unacknowledged message used to set the Generic Default Transition Time state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_dtt_clt control block. |
| [in] | p_parameter | Pointer to transition time. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

BLE Mesh Network Generic Default Transition Time Server (rm_mesh_generic_dtt_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_GENERIC_DTT_SRV_Open
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_GENERIC_DTT_SRV_Close
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

```
fsp_err_t RM_MESH_GENERIC_DTT_SRV_GetTime
```

```
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_mesh_generic_dtt_srv_transntion_time_info_t *const p_info)
```

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Default Transition Time Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_dtt_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_dtt_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Default Transition Time Server (rm_mesh_generic_dtt_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Default Transition Time Server (rm_mesh_generic_dtt_srv).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|--|-------------------------------|----------------------------|---|
| Callback Provided When Tmeout Occurs | Name must Be a Valid C Symbol | NULL | Callback provided when mesh generic default transition time server ISR occurs |
| Callback Provided When an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic default transition time server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_dtt_srv0 | Module name. |

Data Structures

```
struct rm_mesh_generic_dtt_srv_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_dtt_srv_instance_ctrl_t

```
struct rm_mesh_generic_dtt_srv_instance_ctrl_t
```

BLE mesh generic dtt instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_GENERIC_DTT_SRV_Open()` is called.

Function Documentation

◆ RM_MESH_GENERIC_DTT_SRV_Open()

```
fsp_err_t RM_MESH_GENERIC_DTT_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic_Default_Transition_Time Server model. This is to initialize Generic_Default_Transition_Time Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_DTT_SRV_Open(&g_mesh_generic_dtt_srv0_ctrl,
&g_mesh_generic_dtt_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_DTT_SRV_Close()

```
fsp_err_t RM_MESH_GENERIC_DTT_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Generic_Default_Transition_Time Server model. This is to terminate Generic_Default_Transition_Time Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_DTT_SRV_Close(&g_mesh_generic_dtt_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_DTT_SRV_GetTime()

```
fsp_err_t RM_MESH_GENERIC_DTT_SRV_GetTime ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_mesh_generic_dtt_srv_transtion_time_info_t *const p_info )
```

API to get default transition time. This is to get default transition time.

Parameters

| | | |
|------|--------|---|
| [in] | p_ctrl | rm_mesh_generic_dtt_srv control block. |
| [in] | p_info | rm_mesh_generic_dtt_srv status information. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |

BLE Mesh Network Generic Level Client (rm_mesh_generic_level_clt)

Modules » Networking » BLE Mesh Network Modules

Functions

| | |
|-----------|--|
| fsp_err_t | RM_MESH_GENERIC_LEVEL_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg) |
| fsp_err_t | RM_MESH_GENERIC_LEVEL_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_GENERIC_LEVEL_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle) |
| fsp_err_t | RM_MESH_GENERIC_LEVEL_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode) |
| fsp_err_t | RM_MESH_GENERIC_LEVEL_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_MESH_GENERIC_LEVEL_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_GENERIC_LEVEL_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_GENERIC_LEVEL_CLT_DeltaSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_GENERIC_LEVEL_CLT_DeltaSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_GENERIC_LEVEL_CLT_MoveSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_GENERIC_LEVEL_CLT_MoveSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Level Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_level_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_level_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Level Client (rm_mesh_generic_level_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Level Client (rm_mesh_generic_level_clt).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|---------------------------------------|-------------------------------|------------------------------|---|
| Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic level client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_level_clt0 | Module name. |

Data Structures

```
struct rm_mesh_generic_level_clt_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_level_clt_instance_ctrl_t

```
struct rm_mesh_generic_level_clt_instance_ctrl_t
```

BLE mesh generic level instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_GENERIC_LEVEL_CLT_Open\(\)](#) is called.

Function Documentation

◆ **RM_MESH_GENERIC_LEVEL_CLT_Open()**

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Generic_Level Client middleware. This is to initialize Generic_Level Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_LEVEL_CLT_Open(&g_mesh_generic_level_clt0_ctrl,
&g_mesh_generic_level_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ **RM_MESH_GENERIC_LEVEL_CLT_Close()**

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Generic_Level Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_LEVEL_CLT_Close(&g_mesh_generic_level_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_LEVEL_CLT_GetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Generic_Level client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle()`.

Example:

```
/* Get the handle of generic level client model. */
err = RM_MESH_GENERIC_LEVEL_CLT_GetModelHandle(&g_mesh_generic_level_clt0_ctrl,
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_GENERIC_LEVEL_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err =
RM_MESH_GENERIC_LEVEL_CLT_SendReliablePdu(&g_mesh_generic_level_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_LEVEL_CLT_Get()**

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Generic Level Get is an acknowledged message used to get the Generic Level state of an element. The response to the Generic Level Get message is a Generic Level Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | rm_mesh_generic_level_clt control block. |
|------|--------|--|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_LEVEL_CLT_Set()**

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

Generic Level Set is an acknowledged message used to set the Generic Level state of an element to a new absolute value. The response to the Generic Level Set message is a Generic Level Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_level_clt control block. |
| [in] | p_parameter | Pointer to Generic Level Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_LEVEL_CLT_SetUnacknowledged()**

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic Level Set Unacknowledged is an unacknowledged message used to set the Generic Level state of an element to a new absolute value.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_level_clt control block. |
| [in] | p_parameter | Pointer to Generic Level Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_LEVEL_CLT_DeltaSet()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_DeltaSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Generic Delta Set is an acknowledged message used to set the Generic Level state of an element by a relative value. The message is transactional, it supports changing the state by a cumulative value with a sequence of messages that are part of a transaction. The response to the Generic Delta Set message is a Generic Level Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_level_clt control block. |
| [in] | p_parameter | Pointer to Generic Level Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_LEVEL_CLT_DeltaSetUnacknowledged()**

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_DeltaSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic Delta Set Unacknowledged is an unacknowledged message used to set the Generic Level state of an element by a relative value.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_level_clt control block. |
| [in] | p_parameter | Pointer to Generic Level Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_LEVEL_CLT_MoveSet()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_MoveSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Generic Move Set is an acknowledged message used to start a process of changing the Generic Level state of an element with a defined transition speed. The response to the Generic Move Set message is a Generic Level Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_level_clt control block. |
| [in] | p_parameter | Pointer to Generic Level Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_LEVEL_CLT_MoveSetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_MoveSetUnacknowledged (
  rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic Move Set Unacknowledged is an unacknowledged message used to start a process of changing the Generic Level state of an element with a defined transition speed.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_level_clt control block. |
| [in] | p_parameter | Pointer to Generic Level Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

BLE Mesh Network Generic Level Server (rm_mesh_generic_level_srv)

rm_ble_mesh_access_server_state_t const *const p_state)
```

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Level Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_level_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_level_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Level Server (rm_mesh_generic_level_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Level Server (rm_mesh_generic_level_srv).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|--|-------------------------------|------------------------------|---|
| Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic level server ISR occurs |
| Callback Provided When an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic level server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_level_srv0 | Module name. |

Data Structures

```
struct rm_mesh_generic_level_srv_info_t
```

```
struct rm_mesh_generic_level_srv_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_level_srv_info_t

struct rm_mesh_generic_level_srv_info_t

Generic Level state is a 16-bit signed integer (2-s complement) representing the state of an element

Data Fields

| | | |
|----------|-----------------|---------------|
| uint16_t | level | Generic Level |
| uint32_t | delta_level | Delta Level |
| uint16_t | move_level | Move Level |
| uint8_t | tid | |
| uint8_t | transition_time | |
| uint8_t | delay | |
| uint16_t | target_level | Target Level |

◆ **rm_mesh_generic_level_srv_instance_ctrl_t****struct rm_mesh_generic_level_srv_instance_ctrl_t**

BLE mesh generic level instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_GENERIC_LEVEL_SRV_Open\(\)](#) is called.

Function Documentation

◆ RM_MESH_GENERIC_LEVEL_SRV_Open()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic_Level Server model. This is to initialize Generic_Level Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_LEVEL_SRV_Open(&g_mesh_generic_level_srv0_ctrl,
&g_mesh_generic_level_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_LEVEL_SRV_Close()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Generic_Level Server model. This is to terminate Generic_Level Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_LEVEL_SRV_Close(&g_mesh_generic_level_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_LEVEL_SRV_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_LEVEL_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_GENERIC_BATTERY_SRV_StateUpdate(&g_mesh_generic_battery_srv0_ctrl,
&state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

BLE Mesh Network Generic Location Client (rm_mesh_generic_loc_clt)

          (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const
           p_parameter)
```

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Location Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_loc_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_loc_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic

Location Client (rm_mesh_generic_loc_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Location Client (rm_mesh_generic_loc_clt).

| Configuration | Options | Default | Description |
|---------------------------------------|-------------------------------|----------------------------|--|
| Interrupts | | | |
| Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic location client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_loc_clt0 | Module name. |

Data Structures

```
struct rm_mesh_generic_loc_clt_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_loc_clt_instance_ctrl_t

```
struct rm_mesh_generic_loc_clt_instance_ctrl_t
```

BLE mesh generic loc instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_GENERIC_LOC_CLT_Open\(\)](#) is called.

Function Documentation

◆ RM_MESH_GENERIC_LOC_CLT_Open()

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Generic_Location Client middleware. This is to initialize Generic_Location Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_LOC_CLT_Open(&g_mesh_generic_loc_clt0_ctrl,
&g_mesh_generic_loc_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_LOC_CLT_Close()

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Generic_Location Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_LOC_CLT_Close(&g_mesh_generic_loc_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_LOC_CLT_GetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Generic_Location client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of generic_location client model. */
err = RM_MESH_GENERIC_LOC_CLT_GetModelHandle(&g_mesh_generic_loc_clt0_ctrl,
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_GENERIC_LOC_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands */
err = RM_MESH_GENERIC_LOC_CLT_SendReliablePdu(&g_mesh_generic_loc_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_LOC_CTL_LocationGlobalGet()**

```
fsp_err_t RM_MESH_GENERIC_LOC_CTL_LocationGlobalGet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl)
```

Generic Location Global Get message is an acknowledged message used to get the selected fields of the Generic Location state of an element. The response to the Generic Location Global Get message is a Generic Location Global Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | rm_mesh_generic_loc_ctl control block. |
|------|--------|--|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_LOC_CLT_LocationGlobalSet()**

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationGlobalSet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic Location Global Set is an acknowledged message used to set the selected fields of the Generic Location state of an element. The response to the Generic Location Global Set message is a Generic Location Global Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_loc_clt control block. |
| [in] | p_parameter | Pointer to Generic Location Global Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_LOC_CLT_LocationGlobalSetUnacknowledged()**

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationGlobalSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic Location Global Set Unacknowledged is an unacknowledged message used to set the selected fields of the Generic Location state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_loc_clt control block. |
| [in] | p_parameter | Pointer to Generic Location Global Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_LOC_CLT_LocationLocalGet()

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationLocalGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Generic Location Local Get message is an acknowledged message used to get the selected fields of the Generic Location state of an element. The response to the Generic Location Local Get message is a Generic Location Local Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | rm_mesh_generic_loc_clt control block. |
|------|--------|--|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_LOC_CLT_LocationLocalSet()

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationLocalSet ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

Generic Location Local Set is an acknowledged message used to set the selected fields of the Generic Location state of an element. The response to the Generic Location Local Set message is a Generic Location Local Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_loc_clt control block. |
| [in] | p_parameter | Pointer to Generic Location Local Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_LOC_CLT_LocationLocalSetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationLocalSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic Location Local Set Unacknowledged is an unacknowledged message used to set the selected fields of the Generic Location state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_loc_clt control block. |
| [in] | p_parameter | Pointer to Generic Location Local Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ rm_mesh_generic_loc_srv_state_info_t

| | | |
|--|-----------------|-----------------|
| struct rm_mesh_generic_loc_srv_state_info_t | | |
| Generic Location state is a composite state that includes a Generic Location Global state and a Generic Location Local state | | |
| Data Fields | | |
| rm_mesh_generic_loc_srv_global_info_t | global_location | Global Location |
| rm_mesh_generic_loc_srv_local_info_t | local_location | Local Location |

◆ rm_mesh_generic_loc_srv_instance_ctrl_t

| | | |
|---|--|--|
| struct rm_mesh_generic_loc_srv_instance_ctrl_t | | |
| BLE mesh generic loc instance control block. DO NOT INITIALIZE. Initialization occurs when <code>RM_MESH_GENERIC_LOC_SRV_Open()</code> is called. | | |

Function Documentation

◆ RM_MESH_GENERIC_LOC_SRV_Open()

```
fsp_err_t RM_MESH_GENERIC_LOC_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic_Location Server model and to initialize Generic_Location_Setup Server model. This is to initialize Generic_Location Server model and to register with Access layer. And this is to initialize Generic_Location_Setup Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_LOC_SRV_Open(&g_mesh_generic_loc_srv0_ctrl,
&g_mesh_generic_loc_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_LOC_SRV_Close()

```
fsp_err_t RM_MESH_GENERIC_LOC_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Generic_Location Server model. This is to terminate Generic_Location Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_LOC_SRV_Close(&g_mesh_generic_loc_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_LOC_SRV_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_LOC_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_GENERIC_LOC_SRV_StateUpdate(&g_mesh_generic_loc_srv0_ctrl, &state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_LOC_SRV_SetupServerStateUpdate()

```
fsp_err_t RM_MESH_GENERIC_LOC_SRV_SetupServerStateUpdate (
  rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const
  p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

| | | |
|------|---------|---|
| [in] | p_ctrl | rm_mesh_generic_loc_srv control block. |
| [in] | p_state | To send reply for a request or to inform change in state. |

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

BLE Mesh Network Generic Manufacturer Property Server (rm_mesh_generic_mfr_prop_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_GENERIC_MFR_PROP_SRV_Open
  (rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
  rm_ble_mesh_model_server_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_GENERIC_MFR_PROP_SRV_Close
```

```
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

```
fsp_err_t RM_MESH_GENERIC_MFR_PROP_SRV_StateUpdate
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state)
```

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Manufacturer Property Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_mfr_prop_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_mfr_prop_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Manufacturer Property Server (rm_mesh_generic_mfr_prop_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Manufacturer Property Server (rm_mesh_generic_mfr_prop_srv).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|--|-------------------------------|---------------------------------|---|
| Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic manufacturer property server ISR occurs |
| Callback Provided When an Timeout ISR Occurs | Name Must be a Valid C Symbol | NULL | Callback provided when mesh generic manufacturer property server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_mfr_prop_srv0 | Module name. |

Data Structures

```
struct rm_mesh_generic_mfr_prop_srv_info_t
```

```
struct rm_mesh_generic_mfr_prop_srv_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_mfr_prop_srv_info_t

| struct rm_mesh_generic_mfr_prop_srv_info_t | | |
|--|--------------------|---|
| Generic Manufacturer Property is a state representing a device property of an element that is programmed by a manufacturer and can be read | | |
| Data Fields | | |
| uint16_t | property_id | Manufacturer Property ID field is a 2-octet Assigned Number value that references a device property |
| uint8_t | user_access | Manufacturer User Access field is an enumeration indicating whether or not the device property can be read as a Generic User Property |
| uint8_t * | property_value | Manufacturer Property Value field is a conditional field |
| uint16_t | property_value_len | |

◆ rm_mesh_generic_mfr_prop_srv_instance_ctrl_t

| struct rm_mesh_generic_mfr_prop_srv_instance_ctrl_t |
|--|
| BLE mesh generic mfr prop instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_MFR_PROP_SRV_Open() is called. |

Function Documentation

◆ **RM_MESH_GENERIC_MFR_PROP_SRV_Open()**

```
fsp_err_t RM_MESH_GENERIC_MFR_PROP_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic_Manufacturer_Property Server model. This is to initialize Generic_Manufacturer_Property Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_MFR_PROP_SRV_Open(&g_mesh_generic_mfr_prop_srv0_ctrl,
&g_mesh_generic_mfr_prop_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ **RM_MESH_GENERIC_MFR_PROP_SRV_Close()**

```
fsp_err_t RM_MESH_GENERIC_MFR_PROP_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl)
```

API to terminate Generic_Manufacturer_Property Server model. This is to terminate Generic_Manufacturer_Property Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_MFR_PROP_SRV_Close(&g_mesh_generic_mfr_prop_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_MFR_PROP_SRV_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_MFR_PROP_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err =
RM_MESH_GENERIC_MFR_PROP_SRV_StateUpdate(&g_mesh_generic_mfr_prop_srv0_ctrl, &state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

```

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic On Off Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_on_off_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_on_off_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic On Off Client (rm_mesh_generic_on_off_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic On Off Client (rm_mesh_generic_on_off_clt).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|---------------------------------------|-------------------------------|------|--|
| Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic on off client ISR occurs |
|---------------------------------------|-------------------------------|------|--|

| | | | |
|------|-------------------------------|-------------------------------|--------------|
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_on_off_clt0 | Module name. |
|------|-------------------------------|-------------------------------|--------------|

Data Structures

```
struct rm_mesh_generic_on_off_clt_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_on_off_clt_instance_ctrl_t

```
struct rm_mesh_generic_on_off_clt_instance_ctrl_t
```

BLE mesh generic on off instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_GENERIC_ON_OFF_CLT_Open()` is called.

Function Documentation

◆ RM_MESH_GENERIC_ON_OFF_CLT_Open()

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Generic_Onoff Client middleware. This is to initialize Generic_Onoff Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_ON_OFF_CLT_Open(&g_mesh_generic_on_off_clt0_ctrl,
&g_mesh_generic_on_off_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_ON_OFF_CLT_Close()

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Generic_Onoff Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_ON_OFF_CLT_Close(&g_mesh_generic_on_off_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_ON_OFF_CLT_GetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Generic_Onoff client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of generic on_off client model. */
err = RM_MESH_GENERIC_ON_OFF_CLT_GetModelHandle(&g_mesh_generic_on_off_clt0_ctrl,
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_GENERIC_ON_OFF_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err =
RM_MESH_GENERIC_ON_OFF_CLT_SendReliablePdu(&g_mesh_generic_on_off_clt0_ctrl,
                                           req_opcode,
                                           p_parameter,
                                           rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_ON_OFF_CLT_Get()**

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Generic OnOff Get is an acknowledged message used to get the Generic OnOff state of an element.

Parameters

| | | |
|------|--------|---|
| [in] | p_ctrl | rm_mesh_generic_on_off_clt control block. |
|------|--------|---|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_ON_OFF_CLT_Set()**

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Generic OnOff Set is an acknowledged message used to get the Generic OnOff state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_on_off_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_generic_on_off_set_info_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_ON_OFF_CLT_SetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Generic OnOff Set is an unacknowledged message used to get the Generic OnOff state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_on_off_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_generic_on_off_set_info_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

| Callback Provided When an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic on off server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_on_off_srv0 | Module name. |

Data Structures

```
struct rm_mesh_generic_on_off_srv_info_t
```

```
struct rm_mesh_generic_on_off_srv_instance_ctrl_t
```

Data Structure Documentation

◆ **rm_mesh_generic_on_off_srv_info_t**

| | | |
|--|------------------------|--|
| struct rm_mesh_generic_on_off_srv_info_t | | |
| Generic OnOff state is a Boolean value that represents the state of an element | | |
| Data Fields | | |
| uint8_t | onoff | Generic On/Off |
| uint8_t | target_onoff | Target On/Off - Used in response path |
| uint8_t | last_onoff | Last On/Off |
| uint8_t | tid | TID - Used in request path |
| uint8_t | transition_time | Transition Time - Used in request path. Used as remaining time in response path. |
| uint8_t | delay | Delay - Used in request path |
| uint16_t | transition_time_handle | Transition Timer Handle |

◆ **rm_mesh_generic_on_off_srv_instance_ctrl_t**

| | |
|--|--|
| struct rm_mesh_generic_on_off_srv_instance_ctrl_t | |
| BLE mesh generic on off instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_ON_OFF_SRV_Open() is called. | |

Function Documentation

◆ RM_MESH_GENERIC_ON_OFF_SRV_Open()

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic_Onoff Server model. This is to initialize Generic_Onoff Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_ON_OFF_SRV_Open(&g_mesh_generic_on_off_srv0_ctrl,
&g_mesh_generic_on_off_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_ON_OFF_SRV_Close()

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Generic_Onoff Server model. This is to terminate Generic_Onoff Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_ON_OFF_SRV_Close(&g_mesh_generic_on_off_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_ON_OFF_SRV_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_GENERIC_ON_OFF_SRV_StateUpdate(&g_mesh_generic_on_off_srv0_ctrl,
&state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

BLE Mesh Network Generic Power Level Client (rm_mesh_generic_pl_clt)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Power Level Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_pl_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_pl_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Power Level Client (rm_mesh_generic_pl_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Power Level Client (rm_mesh_generic_pl_clt).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|---------------------------------------|-------------------------------|---------------------------|---|
| Callback Provided When Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic power level client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_pl_clt0 | Module name. |

Data Structures

```
struct rm\_mesh\_generic\_pl\_clt\_instance\_ctrl\_t
```

Data Structure Documentation

◆ rm_mesh_generic_pl_clt_instance_ctrl_t

```
struct rm_mesh_generic_pl_clt_instance_ctrl_t
```

BLE mesh generic pl instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_GENERIC_PL_CLT_Open\(\)](#) is called.

Function Documentation

◆ RM_MESH_GENERIC_PL_CLT_Open()

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Generic_Power_Level Client middleware. This is to initialize Generic_Power_Level Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_PL_CLT_Open(&g_mesh_generic_pl_clt0_ctrl,
&g_mesh_generic_pl_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_PL_CLT_Close()

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Generic_Power_Level Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_PL_CLT_Close(&g_mesh_generic_pl_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_PL_CLT_GetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const  
p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Generic_Power_Level client model. Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of generic power level client model. */  
err = RM_MESH_GENERIC_PL_CLT_GetModelHandle(&g_mesh_generic_pl_clt0_ctrl,  
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_GENERIC_PL_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands. Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_GENERIC_PL_CLT_SendReliablePdu(&g_mesh_generic_pl_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_PL_CLT_LevelGet()**

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_LevelGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Generic Power Level Get message is an acknowledged message used to get the Generic Power Actual state of an element. The response to the Generic Power Level Get message is a Generic Power Level Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|---------------------------------------|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |
|------|--------|---------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_PL_CLT_LevelSet()**

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_LevelSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Generic Power Level Set is an acknowledged message used to set the Generic Power Actual state of an element. The response to the Generic Power Level Set message is a Generic Power Level Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |
| [in] | p_parameter | Pointer to Generic Power Level Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_PL_CLT_LevelSetUnacknowledged()**

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_LevelSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic Power Level Set Unacknowledged is an unacknowledged message used to set the Generic Power Actual state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |
| [in] | p_parameter | Pointer to Generic Power Level Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_PL_CLT_LastGet()**

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_LastGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Generic Power Last Get is an acknowledged message used to get the Generic Power Last state of an element. The response to a Generic Power Last Get message is a Generic Power Last Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|---------------------------------------|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |
|------|--------|---------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_PL_CLT_DefaultGet()**

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_DefaultGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Generic Power Default Get is an acknowledged message used to get the Generic Power Default state of an element. The response to a Generic Power Default Get message is a Generic Power Default Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|---------------------------------------|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |
|------|--------|---------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_PL_CLT_DefaultSet()**

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_DefaultSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Generic Power Default Set is an acknowledged message used to set the Generic Power Default state of an element. The response to the Generic Power Default Set message is a Generic Power Default Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |
| [in] | p_parameter | Pointer to Generic Power Default Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_PL_CLT_DefaultSetUnacknowledged()**

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_DefaultSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic Power Default Set Unacknowledged is an unacknowledged message used to set the Generic Power Default state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |
| [in] | p_parameter | Pointer to Generic Power Default Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PL_CLT_RangeGet()

`fsp_err_t RM_MESH_GENERIC_PL_CLT_RangeGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)`

Generic Power Range Get is an acknowledged message used to get the Generic Power Range state of an element. The response to the Generic Power Range Get message is a Generic Power Range Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|---------------------------------------|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |
|------|--------|---------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_PL_CLT_RangeSet()**

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_RangeSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Generic Power Range Set is an acknowledged message used to set the Generic Power Range state of an element. The response to the Generic Power Range Set message is a Generic Power Range Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |
| [in] | p_parameter | Pointer to Generic Power Range Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PL_CLT_RangeSetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_PL_CLT_RangeSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic Power Range Set Unacknowledged is an unacknowledged message used to set the Generic Power Range state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_pl_clt control block. |
| [in] | p_parameter | Pointer to Generic Power Range Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

| rm_mesh_generic_pl_srv_range_state_info_t | generic_power_range | Generic Power Range |

◆ rm_mesh_generic_pl_srv_instance_ctrl_t

| | | |
|---|--|--|
| struct rm_mesh_generic_pl_srv_instance_ctrl_t | | |
| BLE mesh generic pl instance control block. DO NOT INITIALIZE. Initialization occurs when <code>RM_MESH_GENERIC_PL_SRV_Open()</code> is called. | | |

Function Documentation

◆ RM_MESH_GENERIC_PL_SRV_Open()

```
fsp_err_t RM_MESH_GENERIC_PL_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic_Power_Level Server model and to initialize Generic_Power_Level_Setup Server model. This is to initialize Generic_Power_Level Server model and to register with Access layer. And this is to initialize Generic_Power_Level_Setup Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_PL_SRV_Open(&g_mesh_generic_pl_srv0_ctrl,
&g_mesh_generic_pl_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_PL_SRV_Close()

```
fsp_err_t RM_MESH_GENERIC_PL_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Generic_Power_Level Server model. This is to terminate Generic_Power_Level Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_PL_SRV_Close(&g_mesh_generic_pl_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_PL_SRV_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_PL_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_GENERIC_PL_SRV_StateUpdate(&g_mesh_generic_pl_srv0_ctrl, &state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PL_SRV_SetupServerStateUpdate()

```
fsp_err_t RM_MESH_GENERIC_PL_SRV_SetupServerStateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

| | | |
|------|---------|---|
| [in] | p_ctrl | rm_mesh_generic_pl_srv control block. |
| [in] | p_state | To send reply for a request or to inform change in state. |

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Power On Off Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_poo_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_poo_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Power On Off Client (rm_mesh_generic_poo_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Power On Off Client (rm_mesh_generic_poo_clt).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|---------------------------------------|-------------------------------|------|--|
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic power on off client ISR occurs |
|---------------------------------------|-------------------------------|------|--|

| | | | |
|------|-------------------------------|----------------------------|--------------|
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_poo_clt0 | Module name. |
|------|-------------------------------|----------------------------|--------------|

Data Structures

```
struct rm_mesh_generic_poo_clt_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_poo_clt_instance_ctrl_t

```
struct rm_mesh_generic_poo_clt_instance_ctrl_t
```

BLE mesh generic poo instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_GENERIC_POO_CLT_Open()` is called.

Function Documentation

◆ RM_MESH_GENERIC_POO_CLT_Open()

```
fsp_err_t RM_MESH_GENERIC_POO_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Generic_Power_Onoff Client middleware. This is to initialize Generic_Power_Onoff Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_POO_CLT_Open(&g_mesh_generic_poo_clt0_ctrl,
&g_mesh_generic_poo_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ **RM_MESH_GENERIC_POO_CLT_Close()**

```
fsp_err_t RM_MESH_GENERIC_POO_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Generic_Power_Onoff Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_POO_CLT_Close(&g_mesh_generic_poo_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ **RM_MESH_GENERIC_POO_CLT_GetModelHandle()**

```
fsp_err_t RM_MESH_GENERIC_POO_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Generic_Power_Onoff client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of generic power on off client model. */
err = RM_MESH_GENERIC_POO_CLT_GetModelHandle(&g_mesh_generic_poo_clt0_ctrl,
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_GENERIC_POO_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_GENERIC_POO_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_GENERIC_POO_CLT_SendReliablePdu(&g_mesh_generic_poo_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_POO_CLT_OnpowerupGet()**

```
fsp_err_t RM_MESH_GENERIC_POO_CLT_OnpowerupGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Generic OnPowerUp Get is an acknowledged message used to get the Generic OnPowerUp state of an element. The response to the Generic OnPowerUp Get message is a Generic OnPowerUp Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | rm_mesh_generic_poo_clt control block. |
|------|--------|--|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_POO_CLT_OnpowerupSet()**

```
fsp_err_t RM_MESH_GENERIC_POO_CLT_OnpowerupSet ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

Generic OnPowerUp Set is an acknowledged message used to set the Generic OnPowerUp state of an element. The response to the Generic OnPowerUp Set message is a Generic OnPowerUp Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_poo_clt control block. |
| [in] | p_parameter | Pointer to Generic OnPowerUp Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_POO_CLT_OnpowerupSetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_POO_CLT_OnpowerupSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic OnPowerUp Set Unacknowledged is an unacknowledged message used to set the Generic OnPowerUp state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_poo_clt control block. |
| [in] | p_parameter | Pointer to Generic OnPowerUp Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

| Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic power on off server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_poo_srv0 | Module name. |

Data Structures

```
struct rm_mesh_generic_poo_srv_on_power_up_state_info_t
```

```
struct rm_mesh_generic_poo_srv_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_poo_srv_on_power_up_state_info_t

| | | |
|---|-----------|-------------------|
| struct rm_mesh_generic_poo_srv_on_power_up_state_info_t | | |
| Generic OnPowerUp state is an enumeration representing the behavior of an element when powered up | | |
| Data Fields | | |
| uint8_t | onpowerup | Generic OnPowerUp |

◆ rm_mesh_generic_poo_srv_instance_ctrl_t

| |
|---|
| struct rm_mesh_generic_poo_srv_instance_ctrl_t |
| BLE mesh generic poo instance control block. DO NOT INITIALIZE. Initialization occurs when <code>RM_MESH_GENERIC_POO_SRV_Open()</code> is called. |

Function Documentation

◆ RM_MESH_GENERIC_POO_SRV_Open()

| | |
|--|--|
| fsp_err_t RM_MESH_GENERIC_POO_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg) | |
| API to initialize Generic_Power_Onoff Server model and to initialize Generic_Power_Onoff_Setup Server model. This is to initialize Generic_Power_Onoff Server model and to register with Access layer. And this is to initialize Generic_Power_Onoff_Setup Server model and to register with Access layer. | |
| Implements <code>rm_ble_mesh_model_server_api_t::open</code> . | |
| Example: | |
| <pre>/* Open the module. */ err = RM_MESH_GENERIC_POO_SRV_Open(&g_mesh_generic_poo_srv0_ctrl, &g_mesh_generic_poo_srv0_cfg);</pre> | |
| Return values | |
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_POO_SRV_Close()

```
fsp_err_t RM_MESH_GENERIC_POO_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Generic_Power_Onoff Server model. This is to terminate Generic_Power_Onoff Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */  
err = RM_MESH_GENERIC_POO_SRV_Close(&g_mesh_generic_poo_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_POO_SRV_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_POO_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_GENERIC_POO_SRV_StateUpdate(&g_mesh_generic_poo_srv0_ctrl, &state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_POO_SRV_SetupServerStateUpdate()

```
fsp_err_t RM_MESH_GENERIC_POO_SRV_SetupServerStateUpdate (
rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const
p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

| | | |
|------|---------|---|
| [in] | p_ctrl | rm_mesh_generic_poo_srv control block. |
| [in] | p_state | To send reply for a request or to inform change in state. |

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Property Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_prop_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_prop_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Property Client (rm_mesh_generic_prop_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Property Client (rm_mesh_generic_prop_clt).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|---------------------------------------|-------------------------------|-----------------------------|--|
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic property client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_prop_clt0 | Module name. |

Data Structures

```
struct rm_mesh_generic_prop_clt_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_generic_prop_clt_instance_ctrl_t

```
struct rm_mesh_generic_prop_clt_instance_ctrl_t
```

BLE mesh generic prop instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_GENERIC_PROP_CLT_Open()` is called.

Function Documentation

◆ `RM_MESH_GENERIC_PROP_CLT_Open()`

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Generic_Property Client middleware. This is to initialize Generic_Property Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_PROP_CLT_Open(&g_mesh_generic_prop_clt0_ctrl,
&g_mesh_generic_prop_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ `RM_MESH_GENERIC_PROP_CLT_Close()`

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Generic_Property Client middleware. Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_PROP_CLT_Close(&g_mesh_generic_prop_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_PROP_CLT_GetModelHandle()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Generic_Property client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of generic property client model. */
err = RM_MESH_GENERIC_PROP_CLT_GetModelHandle(&g_mesh_generic_prop_clt0_ctrl,
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_GENERIC_PROP_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_GENERIC_PROP_CLT_SendReliablePdu(&g_mesh_generic_prop_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_PROP_CLT_UserPropertiesGet()**

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertiesGet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl)
```

Generic User Properties Get is an acknowledged message used to get the list of Generic User Property states of an element. The response to the Generic User Properties Get message is a Generic User Properties Status message. The message has no parameters.

Parameters

| | | |
|------|--------|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
|------|--------|---|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PROP_CLT_UserPropertyGet()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertyGet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic User Property Get is an acknowledged message used to get the Generic User Property state of an element. The response to the Generic User Property Get message is a Generic User Property Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic User Property Get message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PROP_CLT_UserPropertySet()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertySet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic User Property Set is an acknowledged message used to set the Generic User Property state of an element. The response to the Generic User Property Set message is a Generic User Property Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic User Property Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_PROP_CLT_UserPropertySetUnacknowledged()**

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertySetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic User Property Set Unacknowledged is an unacknowledged message used to set the Generic User Property state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic User Property Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_PROP_CLT_AdminPropertiesGet()**

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertiesGet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl)
```

Generic Admin Properties Get is an acknowledged message used to get the list of Generic Admin Property states of an element. The response to the Generic Admin Properties Get message is a Generic Admin Properties Status message. The message has no parameters.

Parameters

| | | |
|------|--------|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
|------|--------|---|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_PROP_CLT_AdminPropertyGet()**

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertyGet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic Admin Property Get is an acknowledged message used to get the Generic Admin Property state of an element. The response to the Generic Admin Property Get message is a Generic Admin Property Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic Admin Property Get message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PROP_CLT_AdminPropertySet()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertySet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic Admin Property Set is an acknowledged message used to set the Generic Admin Property state of an element. The response to the Generic Admin Property Set message is a Generic Admin Property Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic Admin Property Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_GENERIC_PROP_CLT_AdminPropertySetUnacknowledged()**

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertySetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic Admin Property Set Unacknowledged is an unacknowledged message used to set the Generic Admin Property state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic Admin Property Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertiesGet()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertiesGet (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Generic Manufacturer Properties Get is an acknowledged message used to get the list of Generic Manufacturer Property states of an element. The response to the Generic Manufacturer Properties Get message is a Generic Manufacturer Properties Status message. The message has no parameters.

Parameters

| | | |
|------|--------|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
|------|--------|---|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertyGet()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertyGet (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic Manufacturer Property Get is an acknowledged message used to get the Generic Manufacturer Property state of an element. The response to the Generic Manufacturer Property Get message is a Generic Manufacturer Property Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic Manufacturer Property Get message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySet()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySet (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Generic Manufacturer Property Set is an acknowledged message used to set the Generic Manufacturer Property User Access state of an element. The response to the Generic Manufacturer Property Set message is a Generic Manufacturer Property Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic Manufacturer Property Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySetUnacknowledged()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Generic Manufacturer Property Set Unacknowledged is an unacknowledged message used to set the Generic Manufacturer Property User Access state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic Manufacturer Property Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_GENERIC_PROP_CLT_ClientPropertiesGet()

```
fsp_err_t RM_MESH_GENERIC_PROP_CLT_ClientPropertiesGet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Generic Client Properties Get is an acknowledged message used to get the list of Generic Client Property states of an element. The response to the Generic Client Properties Get message is a Generic Client Properties Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_generic_prop_clt control block. |
| [in] | p_parameter | Pointer to Generic Client Properties Get message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

BLE Mesh Network Generic User Property Server (rm_mesh_generic_user_prop_srv)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic User Property Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_user_prop_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_user_prop_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic User Property Server (rm_mesh_generic_user_prop_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic User Property Server (rm_mesh_generic_user_prop_srv).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|--|-------------------------------|----------------------------------|---|
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic user property server ISR occurs |
| Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh generic user property server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_generic_user_prop_srv0 | Module name. |

Data Structures

```
struct rm_mesh_generic_user_prop_srv_info_t
```

```
struct rm_mesh_generic_user_prop_srv_instance_ctrl_t
```

Data Structure Documentation

◆ **rm_mesh_generic_user_prop_srv_info_t**

| | | |
|---|--------------------|--|
| struct rm_mesh_generic_user_prop_srv_info_t | | |
| Generic User Property is a state representing a device property of an element | | |
| Data Fields | | |
| uint16_t | property_id | User Property ID field is a 2-octet Assigned Number value referencing a device property |
| uint8_t | user_access | User Access field is an enumeration indicating whether the device property can be read or written as a Generic User Property |
| uint8_t * | property_value | User Property Value field is a conditional field |
| uint16_t | property_value_len | |

◆ **rm_mesh_generic_user_prop_srv_instance_ctrl_t**

| | |
|--|--|
| struct rm_mesh_generic_user_prop_srv_instance_ctrl_t | |
| BLE mesh generic user prop instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_USER_PROP_SRV_Open() is called. | |

Function Documentation

◆ RM_MESH_GENERIC_USER_PROP_SRV_Open()

```
fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Generic_User_Property Server model. This is to initialize Generic_User_Property Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_GENERIC_USER_PROP_SRV_Open(&g_mesh_generic_user_prop_srv0_ctrl,
&g_mesh_generic_user_prop_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_GENERIC_USER_PROP_SRV_Close()

```
fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl)
```

API to terminate Generic_User_Property Server model. This is to terminate Generic_User_Property Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_GENERIC_USER_PROP_SRV_Close(&g_mesh_generic_user_prop_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_GENERIC_USER_PROP_SRV_StateUpdate()

```
fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err =
RM_MESH_GENERIC_USER_PROP_SRV_StateUpdate(&g_mesh_generic_user_prop_srv0_ctrl,
&state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

BLE Mesh Network Health Client (rm_mesh_health_clt)

Modules » Networking » BLE Mesh Network Modules

Functions

```

| fsp_err_t | RM_MESH_HEALTH_CLIENT_AttentionSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_HEALTH_CLIENT_AttentionSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |

Detailed Description

Overview

Target Devices

The BLE Mesh Network Health Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_health_ct

The following build time configurations are defined in fsp_cfg/rm_mesh_health_ct_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Health Client (rm_mesh_health_ct)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Health Client (rm_mesh_health_ct).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| Configuration | Options | Default | Description |
|---------------------------------------|-------------------------------|---------|--|
| Callback Provided when Timeout occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh health client ISR occurs |

| Configuration | Options | Default | Description |
|---------------|-------------------------------|----------------------|--------------|
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_health_ct0 | Module name. |

Data Structures

```
struct rm_mesh_health_ct_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_health_ct_instance_ctrl_t

```
struct rm_mesh_health_ct_instance_ctrl_t
```

BLE mesh health client instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_HEALTH_CLIENT_Open\(\)](#) is called.

Function Documentation

◆ RM_MESH_HEALTH_CLIENT_Open()

```
fsp_err_t RM_MESH_HEALTH_CLIENT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Health Client middleware. This is to initialize Health Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_HEALTH_CLIENT_Open(&g_mesh_health_clt0_ctrl,
&g_mesh_health_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_HEALTH_CLIENT_Close()

```
fsp_err_t RM_MESH_HEALTH_CLIENT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Health Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_HEALTH_CLIENT_Close(&g_mesh_health_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_HEALTH_CLIENT_GetModelHandle()

```
fsp_err_t RM_MESH_HEALTH_CLIENT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const  
p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Health client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of health client model. */  
err = RM_MESH_HEALTH_CLIENT_GetModelHandle(&g_mesh_health_clt0_ctrl,  
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ **RM_MESH_HEALTH_CLIENT_SendReliablePdu()**

```
fsp_err_t RM_MESH_HEALTH_CLIENT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to set the handle of Health client model.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_HEALTH_CLIENT_SendReliablePdu(&g_mesh_health_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_HEALTH_CLIENT_FaultGet()

```
fsp_err_t RM_MESH_HEALTH_CLIENT_FaultGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Health Fault Get is an acknowledged message used to get the current Registered Fault state identified by Company ID of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_health_ct control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_ct_fault_get_clear_info_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_HEALTH_CLIENT_FaultClearUnacknowledged()

```
fsp_err_t RM_MESH_HEALTH_CLIENT_FaultClearUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Health Fault Clear Unacknowledged is an unacknowledged message used to clear the current Registered Fault state identified by Company ID of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_health_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_clt_fault_get_clear_info_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_HEALTH_CLIENT_FaultClear()

```
fsp_err_t RM_MESH_HEALTH_CLIENT_FaultClear ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Health Fault Clear is an acknowledged message used to clear the current Registered Fault state identified by Company ID of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_health_ct control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_ct_fault_get_clear_info_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_HEALTH_CLIENT_FaultTest()

```
fsp_err_t RM_MESH_HEALTH_CLIENT_FaultTest ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Health Fault Test is an acknowledged message used to invoke a self-test procedure of an element. The procedure is implementation specific and may result in changing the Health Fault state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_health_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_clt_fault_test_info_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_HEALTH_CLIENT_FaultTestUnacknowledged()

```
fsp_err_t RM_MESH_HEALTH_CLIENT_FaultTestUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Health Fault Test Unacknowledged is an unacknowledged message used to invoke a self-test procedure of an element. The procedure is implementation specific and may result in changing the Health Fault state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_health_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_clt_fault_test_info_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_HEALTH_CLIENT_PeriodGet()**

```
fsp_err_t RM_MESH_HEALTH_CLIENT_PeriodGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Health Period Get is an acknowledged message used to get the current Health Period state of an element.

Parameters

| | | |
|------|--------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_health_clt control block. |
|------|--------|-----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_HEALTH_CLIENT_PeriodSetUnacknowledged()

`fsp_err_t RM_MESH_HEALTH_CLIENT_PeriodSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)`

The Health Period Set Unacknowledged is an unacknowledged message used to set the current Health Period state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_health_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_clt_period_info_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_HEALTH_CLIENT_PeriodSet()**

```
fsp_err_t RM_MESH_HEALTH_CLIENT_PeriodSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Health Period Set is an acknowledged message used to set the current Health Period state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_health_ct control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_ct_period_info_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_HEALTH_CLIENT_AttentionGet()**

```
fsp_err_t RM_MESH_HEALTH_CLIENT_AttentionGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Health Attention Get is an acknowledged message used to get the current Attention Timer state of an element.

Parameters

| | | |
|------|--------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_health_clt control block. |
|------|--------|-----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_HEALTH_CLIENT_AttentionSet()

```
fsp_err_t RM_MESH_HEALTH_CLIENT_AttentionSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Health Attention Set is an acknowledged message used to set the Attention Timer state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_health_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_clt_attention_info_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_HEALTH_CLIENT_AttentionSetUnacknowledged()

```
fsp_err_t RM_MESH_HEALTH_CLIENT_AttentionSetUnacknowledged (
  rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Health Attention Set Unacknowledged is an unacknowledged message used to set the Attention Timer state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_health_clt control block. |
| [in] | p_parameter | Pointer to the structure populated as in rm_mesh_health_clt_attention_info_t . |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

BLE Mesh Network Health Server (rm_mesh_health_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_HEALTH_SERVER_Open (rm_ble_mesh_health_server_ctrl_t
  *const p_ctrl, rm_ble_mesh_health_server_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_HEALTH_SERVER_Close (rm_ble_mesh_health_server_ctrl_t
  *const p_ctrl)
```

```
fsp_err_t RM_MESH_HEALTH_SERVER_ReportFault
(rm_ble_mesh_health_server_ctrl_t *const p_ctrl, const
rm_ble_mesh_access_model_handle_t *const model_handle, uint8_t
test_id, uint16_t company_id, uint8_t fault_code)
```

```
fsp_err_t RM_MESH_HEALTH_SERVER_PublishCurrentStatus
(rm_ble_mesh_health_server_ctrl_t *const p_ctrl, uint8_t *status,
uint16_t length)
```

Detailed Description

Overview

Target Devices

The BLE Mesh Network Health Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_health_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_health_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Health Server (rm_mesh_health_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Health Server (rm_mesh_health_srv).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|---------------------------------------|-------------------------------|------------------------|--|
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh health server ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_health_srv_0 | Module name. |
| Company ID | Invalid Company Id | 0 | Select company id. |
| Number of Self Tests | Invalid Number of Self Tests | 0 | Select number of self tests. |
| Self Tests | Name Must Be a Valid C Symbol | NULL | Self test |

Data Structures

```
struct rm_mesh_health_server_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_health_server_instance_ctrl_t

```
struct rm_mesh_health_server_instance_ctrl_t
```

BLE mesh health server instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_HEALTH_SERVER_Open()` is called.

Function Documentation

◆ RM_MESH_HEALTH_SERVER_Open()

```
fsp_err_t RM_MESH_HEALTH_SERVER_Open ( rm_ble_mesh_health_server_ctrl_t *const p_ctrl,
rm_ble_mesh_health_server_cfg_t const *const p_cfg )
```

API to initialize Health Server model. This is to initialize Health Server model and to register with Access layer.

Implements `rm_ble_mesh_health_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_HEALTH_SERVER_Open(&g_mesh_health_srv0_ctrl,
&g_mesh_health_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_HEALTH_SERVER_Close()

```
fsp_err_t RM_MESH_HEALTH_SERVER_Close ( rm_ble_mesh_health_server_ctrl_t *const p_ctrl)
```

API to terminate Health Server model. This is to terminate Health Server model and to register with Access layer.

Implements `rm_ble_mesh_health_server_api_t::close`.

Example:

```
/* Close the module. */  
err = RM_MESH_HEALTH_SERVER_Close(&g_mesh_health_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_HEALTH_SERVER_ReportFault()

```
fsp_err_t RM_MESH_HEALTH_SERVER_ReportFault ( rm_ble_mesh_health_server_ctrl_t *const p_ctrl,
const rm_ble_mesh_access_model_handle_t *const model_handle, uint8_t test_id, uint16_t
company_id, uint8_t fault_code )
```

API to report self-test fault. This is to report fault observed during self-test procedure.

Parameters

| | | |
|------|--------------|--|
| [in] | p_ctrl | rm_mesh_health_srv control block. |
| [in] | model_handle | Model Handle identifying the Health Server model instance. |
| [in] | test_id | Identifier of the self-test. |
| [in] | company_id | Company Identifier. |
| [in] | fault_code | Fault value indicating the error. |

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_MESH_HEALTH_SERVER_PublishCurrentStatus()

```
fsp_err_t RM_MESH_HEALTH_SERVER_PublishCurrentStatus ( rm_ble_mesh_health_server_ctrl_t
*const p_ctrl, uint8_t* status, uint16_t length )
```

API to publish current status.

Parameters

| | | |
|------|--------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_health_srv control block. |
| [in] | status | Current status. |
| [in] | length | Length of status. |

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

BLE Mesh Network Light Control Client (rm_mesh_light_ctl_ctl)

Modules » Networking » BLE Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_LIGHT_CTL_CTL_Open (rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_LIGHT_CTL_CTL_Close (rm_ble_mesh_model_client_ctrl_t
*const p_ctrl)
```

```
fsp_err_t RM_MESH_LIGHT_CTL_CTL_GetModelHandle
```

```
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t *const p_model_handle)
```

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_SendReliablePdu
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode,
void const *const p_parameter, uint32_t rsp_opcode)
```

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_Get (rm_ble_mesh_model_client_ctrl_t
*const p_ctrl)
```

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_Set (rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter)
```

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_SetUnacknowledged
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const
p_parameter)
```

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureGet
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureSet
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const
p_parameter)
```

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureSetUnacknowledged
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const
p_parameter)
```

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_DefaultGet
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_DefaultSet
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const
p_parameter)
```

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_DefaultSetUnacknowledged
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const
p_parameter)
```

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureRangeGet
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSet
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const
p_parameter)
```

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSetUnacknowledged
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const
p_parameter)
```

Detailed Description

Overview

Target Devices

The BLE Mesh Network Light Control Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_ctl_ctl

The following build time configurations are defined in fsp_cfg/rm_mesh_light_ctl_ctl_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light Control Client (rm_mesh_light_ctl_ctl)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light Control Client (rm_mesh_light_ctl_ctl).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|---------------------------------------|-------------------------------|------|---|
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light control client ISR occurs |
|---------------------------------------|-------------------------------|------|---|

| | | | |
|------|-------------------------------|---------------------------|--------------|
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_light_ctl_ctl_0 | Module name. |
|------|-------------------------------|---------------------------|--------------|

Data Structures

```
struct rm_mesh_light_ctl_ctl_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_light_ctl_ctl_instance_ctrl_t

```
struct rm_mesh_light_ctl_ctl_instance_ctrl_t
```

BLE mesh light ctl instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_LIGHT_CTL_CTL_Open\(\)](#) is called.

Function Documentation

◆ **RM_MESH_LIGHT_CTL_CLT_Open()**

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Light_Ctl Client middleware. This is to initialize Light_Ctl Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_CTL_CLT_Open(&g_mesh_light_ctl_clt0_ctrl,
&g_mesh_light_ctl_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ **RM_MESH_LIGHT_CTL_CLT_Close()**

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Light_Ctl Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_LIGHT_CTL_CLT_Close(&g_mesh_light_ctl_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_LIGHT_CTL_CLT_GetModelHandle()

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const  
p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Light_Ctl client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of light ctl client model. */  
err = RM_MESH_LIGHT_CTL_CLT_GetModelHandle(&g_mesh_light_ctl_clt0_ctrl,  
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_LIGHT_CTL_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_LIGHT_CTL_CLT_SendReliablePdu(&g_mesh_light_ctl_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_CTL_CLT_Get()**

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light CTL Get is an acknowledged message used to get the Light CTL state of an element. The response to the Light CTL Get message is a Light CTL Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_CTL_CLT_Set()**

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

Light CTL Set is an acknowledged message used to set the Light CTL Lightness state, Light CTL Temperature state, and the Light CTL Delta UV state of an element. The response to the Light CTL Set message is a Light CTL Status message.

Parameters

| | | |
|------|-------------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_ctl_cli control block. |
| [in] | p_parameter | Pointer to Light CTL Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_CTL_CLT_SetUnacknowledged()**

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

Light CTL Set Unacknowledged is an unacknowledged message used to set the Light CTL Lightness state, Light CTL Temperature state, and the Light CTL Delta UV state of an element

Parameters

| | | |
|------|-------------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |
| [in] | p_parameter | Pointer to Light CTL Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_CTL_CLT_TemperatureGet()**

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light CTL Temperature Get is an acknowledged message used to get the Light CTL Temperature state of an element. The response to the Light CTL Temperature Get message is a Light CTL Temperature Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureSet()

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureSet ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Light CTL Temperature Set is an acknowledged message used to set the Light CTL Temperature state and the Light CTL Delta UV state of an element. The response to the Light CTL Temperature Set message is a Light CTL Temperature Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |
| [in] | p_parameter | Pointer to Light CTL Temperature Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Light CTL Temperature Set Unacknowledged is an unacknowledged message used to set the Light CTL Temperature state and the Light CTL Delta UV state of an element

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |
| [in] | p_parameter | Pointer to Light CTL Temperature Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_CTL_CLT_DefaultGet()**

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_DefaultGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light CTL Default Get is an acknowledged message used to get the Light CTL Temperature Default and Light CTL Delta UV Default states of an element. The response to the Light CTL Default Get message is a Light CTL Default Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_CTL_CLT_DefaultSet()

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_DefaultSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Light CTL Default Set is an acknowledged message used to set the Light CTL Temperature Default state and the Light CTL Delta UV Default state of an element. The response to the Light CTL Set message is a Light CTL Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |
| [in] | p_parameter | Pointer to Light CTL Default Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_CTL_CLT_DefaultSetUnacknowledged()**

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_DefaultSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Light CTL Default Set Unacknowledged is an unacknowledged message used to set the Light CTL Temperature Default state and the Light CTL Delta UV Default state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_ctl_cli control block. |
| [in] | p_parameter | Pointer to Light CTL Default Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureRangeGet()

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureRangeGet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl)
```

The Light CTL Temperature Range Get is an acknowledged message used to get the Light CTL Temperature Range state of an element. The response to the Light CTL Temperature Range Get message is a Light CTL Temperature Range Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSet()

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSet ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Light CTL Temperature Range Set Unacknowledged is an unacknowledged message used to set the Light CTL Temperature Range state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |
| [in] | p_parameter | Pointer to Light CTL Temperature Range Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Light CTL Temperature Range Set is an acknowledged message used to set the Light CTL Temperature Range state of an element. The response to the Light CTL Temperature Range Get message is a Light CTL Temperature Range Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_ctl_clt control block. |
| [in] | p_parameter | Pointer to Light CTL Temperature Range Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

BLE Mesh Network Light Control Server (rm_mesh_light_ctl_srv)

| uint8_t | status | Status - Used in response path |

◆ **rm_mesh_light_ctl_srv_extended_cfg_t**

| | | |
|--|-------------------------------|---|
| struct rm_mesh_light_ctl_srv_extended_cfg_t | | |
| BLE mesh light ctl extension for BLE mesh light ctl. | | |
| Data Fields | | |
| rm_ble_mesh_access_instance_t const * | p_temperature_access_instance | Pointer to access instance for temperature model. |

◆ **rm_mesh_light_ctl_srv_instance_ctrl_t**

| | | |
|--|--|--|
| struct rm_mesh_light_ctl_srv_instance_ctrl_t | | |
| BLE mesh light ctl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_CTL_SRV_Open() is called. | | |

Function Documentation

◆ RM_MESH_LIGHT_CTL_SRV_Open()

```
fsp_err_t RM_MESH_LIGHT_CTL_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Light_Ctl Server model and to initialize Light_Ctl_Temperature Server model. This is to initialize Light_Ctl Server model and to register with Access layer. And this is to initialize Light_Ctl_Temperature Server model and to register with Access layer. Implements [rm_ble_mesh_model_server_api_t::open](#).

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_CTL_SRV_Open(&g_mesh_light_ctl_srv0_ctrl,
&g_mesh_light_ctl_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_LIGHT_CTL_SRV_Close()

```
fsp_err_t RM_MESH_LIGHT_CTL_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Light_Ctl Server model. This is to terminate Light_Ctl Server model and to register with Access layer.

Implements [rm_ble_mesh_model_server_api_t::close](#).

Example:

```
/* Close the module. */
err = RM_MESH_LIGHT_CTL_SRV_Close(&g_mesh_light_ctl_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_LIGHT_CTL_SRV_StateUpdate()

```
fsp_err_t RM_MESH_LIGHT_CTL_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_LIGHT_CTL_SRV_StateUpdate(&g_mesh_light_ctl_srv0_ctrl, &state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_CTL_SRV_TemperatureServerStateUpdate()

```
fsp_err_t RM_MESH_LIGHT_CTL_SRV_TemperatureServerStateUpdate (
  rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const
  p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

| | | |
|------|---------|---|
| [in] | p_ctrl | rm_mesh_light_ctl_srv control block. |
| [in] | p_state | To send reply for a request or to inform change in state. |

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

BLE Mesh Network Light Hsl Client (rm_mesh_light_hsl_clt)

Modules » Networking » BLE Mesh Network Modules

Functions

          p_parameter)
```

Detailed Description

Overview

Target Devices

The BLE Mesh Network Light Hsl Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_hsl_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_hsl_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light HSL Client (rm_mesh_light_hsl_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light HSL Client (rm_mesh_light_hsl_clt).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|---------------------------------------|-------------------------------|--------------------------|---|
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light HSL client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_light_hsl_clt0 | Module name. |

Data Structures

```
struct rm_mesh_light_hsl_clt_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_light_hsl_clt_instance_ctrl_t

```
struct rm_mesh_light_hsl_clt_instance_ctrl_t
```

BLE mesh light hsl instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_LIGHT_HSL_CLT_Open()` is called.

Function Documentation

◆ RM_MESH_LIGHT_HSL_CLT_Open()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Light_Hsl Client middleware. This is to initialize Light_Hsl Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_HSL_CLT_Open(&g_mesh_light_hsl_clt0_ctrl,
&g_mesh_light_hsl_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ **RM_MESH_LIGHT_HSL_CLT_Close()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Light_Hsl Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_LIGHT_HSL_CLT_Close(&g_mesh_light_hsl_ctl0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ **RM_MESH_LIGHT_HSL_CLT_GetModelHandle()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Light_Hsl client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of light hsl client model. */
err = RM_MESH_LIGHT_HSL_CLT_GetModelHandle(&g_mesh_light_hsl_ctl0_ctrl,
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_LIGHT_HSL_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_LIGHT_HSL_CLT_SendReliablePdu(&g_mesh_light_hsl_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_HSL_CLT_Get()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Light HSL Get is an acknowledged message used to get the Light HSL Lightness, Light HSL Hue, and Light HSL Saturation states of an element. The response to the Light HSL Get message is a Light HSL Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_HSL_CLT_Set()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Light HSL Set Unacknowledged is an unacknowledged message used to set the Light HSL Lightness state, Light HSL Hue state, and the Light HSL Saturation state of an element.

Parameters

| | | |
|------|-------------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_HSL_CLT_SetUnacknowledged()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Light HSL Set is an acknowledged message used to set the Light HSL Lightness state, Light HSL Hue state, and the Light HSL Saturation state of an element. The response to the Light HSL Set message is a Light HSL Status message.

Parameters

| | | |
|------|-------------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_HSL_CLT_TargetGet()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_TargetGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light HSL Target Get is an acknowledged message used to get the target Light HSL Lightness, Light HSL Hue, and Light HSL Saturation states of an element. The response to the Light HSL Target Get message is a Light HSL Target Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_HSL_CLT_DefaultGet()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_DefaultGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light HSL Default Get is an acknowledged message used to get the Light Lightness Default, the Light HSL Hue Default, and Light HSL Saturation Default states of an element. The response to the Light HSL Default Get message is a Light HSL Default Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_HSL_CLT_DefaultSet()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_DefaultSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Light HSL Default Set is an acknowledged message used to set the Light Lightness Default, the Light HSL Hue Default, and Light HSL Saturation Default states of an element. The response to the Light HSL Default Set message is a Light HSL Default Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Default Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_HSL_CLT_DefaultSetUnacknowledged()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_DefaultSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Light HSL Default Set Unacknowledged is an unacknowledged message used to set the Light Lightness Default, the Light HSL Hue Default, and Light HSL Saturation Default states of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Default Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_HSL_CLT_RangeGet()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_RangeGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Light HSL Range Get is an acknowledged message used to get the Light HSL Hue Range and Light HSL Saturation Range states of an element. The response to the Light HSL Range Get message is a Light HSL Range Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_HSL_CLT_RangeSet()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_RangeSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Light HSL Range Set is an acknowledged message used to set the Light HSL Hue Range and Light HSL Saturation Range states of an element. The response to the Light HSL Range Set message is a Light HSL Range Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Range Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_HSL_CLT_RangeSetUnacknowledged()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_RangeSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Light HSL Range Set Unacknowledged is an unacknowledged message used to set the Light HSL Hue Range and Light HSL Saturation Range states of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Range Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_HSL_CLT_HueGet()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_HueGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Light HSL Hue Get is an acknowledged message used to get the Light HSL Hue state of an element. The response to the Light HSL Hue Get message is a Light HSL Hue Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_HSL_CLT_HueSet()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_HueSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Light HSL Hue Set is an acknowledged message used to set the target Light HSL Hue state of an element. The response to the Light HSL Hue Set message is a Light HSL Hue Status message.

Parameters

| | | |
|------|-------------|---------------------------------------|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Hue Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_HSL_CLT_HueSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_HueSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Light HSL Hue Set Unacknowledged is an unacknowledged message used to set the target Light HSL Hue state of an element.

Parameters

| | | |
|------|-------------|---------------------------------------|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Hue Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_HSL_CLT_SaturationGet()**

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_SaturationGet ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl)
```

The Light HSL Saturation Get is an acknowledged message used to get the Light HSL Saturation state of an element. The response to the Light HSL Saturation Get message is a Light HSL Saturation Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_HSL_CLT_SaturationSet()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_SaturationSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Light HSL Saturation Set is an acknowledged message used to set the target Light HSL Saturation state of an element. The response to the Light HSL Saturation Set message is a Light HSL Saturation Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Saturation Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_HSL_CLT_SaturationSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_HSL_CLT_SaturationSetUnacknowledged (
  rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Light HSL Saturation Set Unacknowledged is an unacknowledged message used to set the target Light HSL Saturation state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_light_hsl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Saturation Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Detailed Description

Overview

Target Devices

The BLE Mesh Network Light Hsl Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_hsl_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_light_hsl_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light HSL Server (rm_mesh_light_hsl_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light HSL Server (rm_mesh_light_hsl_srv).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|--|-------------------------------|------------------------------|---|
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light HSL server ISR occurs |
| Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light HSL server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_light_hsl_sr v0 | Module name. |

Data Structure Documentation

◆ rm_mesh_light_hsl_srv_info_t

| struct rm_mesh_light_hsl_srv_info_t | | |
|--|------------------------|--|
| Light HSL state is a composite state that includes the Light HSL Lighness, the Light HSL Hue and the Light HSL Saturation states | | |
| Data Fields | | |
| uint16_t | hsl_lightness | The perceived lightness of a light emitted by the element |
| uint16_t | target_hsl_lightness | Target Perceived lightness - used in the response path |
| uint16_t | hsl_hue | The 16-bit value representing the hue |
| uint16_t | target_hsl_hue | Target hue - used in the response path |
| uint16_t | hsl_saturation | The saturation of a color light |
| uint16_t | target_hsl_saturation | Target saturation - used in the response path |
| uint8_t | tid | TID - Used in request path |
| uint8_t | transition_time | Transition Time - Used in request path. Used as remaining time in response path. |
| uint8_t | delay | Delay - Used in request path |
| uint16_t | transition_time_handle | Transition Timer Handle |

◆ rm_mesh_light_hsl_srv_target_info_t

| struct rm_mesh_light_hsl_srv_target_info_t | | |
|--|--|--|
| | | |

Light HSL Target state is a composite state that includes the Light HSL Lighness, the Light HSL Hue and the Light HSL Saturation states

| Data Fields | | |
|-------------|----------------|---|
| uint16_t | hsl_lightness | The perceived lightness of a light emitted by the element |
| uint16_t | hsl_hue | The 16-bit value representing the hue |
| uint16_t | hsl_saturation | The saturation of a color light |

◆ rm_mesh_light_hsl_srv_default_info_t

struct rm_mesh_light_hsl_srv_default_info_t

Light HSL Default state is a composite state that includes the Light HSL Lighness, the Light HSL Hue and the Light HSL Saturation states

| Data Fields | | |
|-------------|----------------|---|
| uint16_t | hsl_lightness | The perceived lightness of a light emitted by the element |
| uint16_t | hsl_hue | The 16-bit value representing the hue |
| uint16_t | hsl_saturation | The saturation of a color light |

◆ rm_mesh_light_hsl_srv_hue_info_t

struct rm_mesh_light_hsl_srv_hue_info_t

Light HSL Hue

| Data Fields | | |
|-------------|---------|---------------------------------------|
| uint16_t | hsl_hue | The 16-bit value representing the hue |

◆ rm_mesh_light_hsl_srv_saturation_info_t

struct rm_mesh_light_hsl_srv_saturation_info_t

Light HSL Saturation

| Data Fields | | |
|-------------|----------------|---------------------------------|
| uint16_t | hsl_saturation | The saturation of a color light |

◆ rm_mesh_light_hsl_srv_range_info_t

struct rm_mesh_light_hsl_srv_range_info_t

Light HSL Range state is a composite state that includes Minimum and Maximum of the Light HSL Hue and the Light HSL Saturation states

| Data Fields | | |
|-------------|---------------|---|
| uint16_t | hue_range_min | The value of the Hue Range Min field of the Light HSL Hue |

| | | Range state |
|----------|----------------------|---|
| uint16_t | hue_range_max | The value of the Hue Range Max field of the Light HSL Hue Range state |
| uint16_t | saturation_range_min | The value of the Saturation Range Min field of the Light HSL Saturation Range state |
| uint16_t | saturation_range_max | The value of the Saturation Range Max field of the Light HSL Saturation Range state |
| uint8_t | status | Status - Used only in response path |

◆ rm_mesh_light_hsl_srv_extended_cfg_t

| struct rm_mesh_light_hsl_srv_extended_cfg_t | | |
|--|------------------------------|--|
| BLE mesh light hsl extension for BLE mesh light hsl. | | |
| Data Fields | | |
| rm_ble_mesh_access_instance_t const * | p_hue_access_instance | Pointer to access instance for hue model. |
| rm_ble_mesh_access_instance_t const * | p_saturation_access_instance | Pointer to access instance for saturation model. |

◆ rm_mesh_light_hsl_srv_instance_ctrl_t

| struct rm_mesh_light_hsl_srv_instance_ctrl_t | |
|--|--|
| BLE mesh light hsl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_HSL_SRV_Open() is called. | |

Function Documentation

◆ RM_MESH_LIGHT_HSL_SRV_Open()

```
fsp_err_t RM_MESH_LIGHT_HSL_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Light_Hsl Server/Light_Hsl_Hue Server/Light_Hsl_Saturation Server model.

1. This is to initialize Light_Hsl Server model and to register with Access layer.
2. This is to initialize Light_Hsl_Hue Server model and to register with Access layer.
3. This is to initialize Light_Hsl_Saturation Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_HSL_SRV_Open(&g_mesh_light_hsl_srv0_ctrl,
&g_mesh_light_hsl_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_LIGHT_HSL_SRV_Close()

```
fsp_err_t RM_MESH_LIGHT_HSL_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Light_Hsl Server model. This is to terminate Light_Hsl Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_LIGHT_HSL_SRV_Close(&g_mesh_light_hsl_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_LIGHT_HSL_SRV_StateUpdate()

```
fsp_err_t RM_MESH_LIGHT_HSL_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_LIGHT_HSL_SRV_StateUpdate(&g_mesh_light_hsl_srv0_ctrl, &state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_HSL_SRV_HueServerStateUpdate()**

```
fsp_err_t RM_MESH_LIGHT_HSL_SRV_HueServerStateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

| | | |
|------|---------|---|
| [in] | p_ctrl | rm_mesh_light_hsl_srv control block. |
| [in] | p_state | To send reply for a request or to inform change in state. |

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_HSL_SRV_SaturationServerStateUpdate()

```
fsp_err_t RM_MESH_LIGHT_HSL_SRV_SaturationServerStateUpdate (
rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const
p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

| | | |
|------|---------|---|
| [in] | p_ctrl | rm_mesh_light_hsl_srv control block. |
| [in] | p_state | To send reply for a request or to inform change in state. |

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Detailed Description

Overview

Target Devices

The BLE Mesh Network Light Lightness Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_lightness_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_lightness_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light Lightness Client (rm_mesh_light_lightness_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light Lightness Client (rm_mesh_light_lightness_clt).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|---------------------------------------|-------------------------------|--------------------------------|---|
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light lightness client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_light_lightness_clt0 | Module name. |

Data Structures

```
struct rm_mesh_light_lightness_clt_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_light_lightness_clt_instance_ctrl_t

```
struct rm_mesh_light_lightness_clt_instance_ctrl_t
```

BLE mesh light lightness instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_LIGHT_LIGHTNESS_CLT_Open\(\)](#) is called.

Function Documentation

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_Open()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Light_Lightness Client middleware. This is to initialize Light_Lightness Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_LIGHTNESS_CLT_Open(&g_mesh_light_lightness_clt0_ctrl,
&g_mesh_light_lightness_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_Close()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Light_Lightness Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_LIGHT_LIGHTNESS_CLT_Close(&g_mesh_light_lightness_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ **RM_MESH_LIGHT_LIGHTNESS_CLT_GetModelHandle()**

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Light_Lightness client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of light lightness client model. */
err =
RM_MESH_LIGHT_LIGHTNESS_CLT_GetModelHandle(&g_mesh_light_lightness_clt0_ctrl,
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err =
RM_MESH_LIGHT_LIGHTNESS_CLT_SendReliablePdu(&g_mesh_light_lightness_clt0_ctrl,
                                             req_opcode,
                                             p_parameter,
                                             rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_Get()

`fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)`

Light Lightness Get is an acknowledged message used to get the Light Lightness Actual state of an element. The response to the Light Lightness Get message is a Light Lightn

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
|------|--------|--|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_Set()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Light Lightness Set is an acknowledged message used to set the Light Lightness Actual state of an element. The response to the Light Lightness Set message is a Light Lightness Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
| [in] | p_parameter | Pointer to Light Lightness Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_SetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Light Lightness Set Unacknowledged is an unacknowledged message used to set the Light Lightness Actual state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
| [in] | p_parameter | Pointer to Light Lightness Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_LIGHTNESS_CLT_LinearGet()**

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LinearGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light Lightness Linear Get is an acknowledged message used to get the Light Lightness Linear state of an element. The response to the Light Lightness Linear Get message is a Light Lightness Linear Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
|------|--------|--|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSet()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSet ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Light Lightness Linear Set is an acknowledged message used to set the Light Lightness Linear state of an element. The response to the Light Lightness Linear Set message is a Light Lightness Linear Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
| [in] | p_parameter | Pointer to Light Lightness Linear Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSetUnacknowledged()**

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Light Lightness Linear Set Unacknowledged is an unacknowledged message used to set the Light Lightness Linear state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
| [in] | p_parameter | Pointer to Light Lightness Linear Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_LIGHTNESS_CLT_LastGet()**

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LastGet ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl)
```

Light Lightness Last Get is an acknowledged message used to get the Light Lightness Last state of an element. The response to the Light Lightness Last Get message is a Light Lightness Last Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
|------|--------|--|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultGet()**

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light Lightness Default Get is an acknowledged message used to get the Light Lightness Default state of an element. The response to the Light Lightness Default Get message is a Light Lightness Default Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
|------|--------|--|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSet()**

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSet ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Light Lightness Default Set is an acknowledged message used to set the Light Lightness Default state of an element. The response to the Light Lightness Default Set message is a Light Lightness Default Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
| [in] | p_parameter | Pointer to Light Lightness Default Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSetUnacknowledged()**

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Light Lightness Default Set Unacknowledged is an unacknowledged message used to set the Light Lightness Default state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
| [in] | p_parameter | Pointer to Light Lightness Default Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_LIGHTNESS_CLT_RangeGet()**

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_RangeGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Light Lightness Range Get is an acknowledged message used to get the Light Lightness Range state of an element. The response to the Light Lightness Range Get message is a Light Lightness Range Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
|------|--------|--|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSet()**

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSet ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

Light Lightness Range Set is an acknowledged message used to set the Light Lightness Range state of an element. The response to the Light Lightness Range Get message is a Light Lightness Range Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
| [in] | p_parameter | Pointer to Light Lightness Range Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Light Lightness Range Set Unacknowledged is an unacknowledged message used to set the Light Lightness Range state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_lightness_clt control block. |
| [in] | p_parameter | Pointer to Light Lightness Range Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Data Structure Documentation

◆ rm_mesh_light_lightness_srv_linear_info_t

| struct rm_mesh_light_lightness_srv_linear_info_t | | |
|--|------------------|--|
| Light Lightness Linear state represents the lightness of a light on a linear scale | | |
| Data Fields | | |
| uint16_t | lightness_linear | Light Lightness Linear |
| uint16_t | lightness_target | Light Lightness Target - Used in response path. |
| uint8_t | tid | TID - Used in request path |
| uint8_t | transition_time | Transition Time - Used in request path. Used as remaining time in response path. |
| uint8_t | delay | Delay - Used in request path |

◆ rm_mesh_light_lightness_srv_actual_info_t

| struct rm_mesh_light_lightness_srv_actual_info_t | | |
|--|------------------------|--|
| Light Lightness Actual state represents the lightness of a light on a perceptually uniform lightness scale | | |
| Data Fields | | |
| uint16_t | lightness_actual | Light Lightness Actual |
| uint16_t | lightness_target | Light Lightness Target - Used in response path. |
| uint8_t | tid | TID - Used in request path |
| uint8_t | transition_time | Transition Time - Used in request path. Used as remaining time in response path. |
| uint8_t | delay | Delay - Used in request path |
| uint16_t | transition_time_handle | Transition Timer Handle |

◆ **rm_mesh_light_lightness_srv_last_info_t**

| | | |
|--|----------------|----------------------|
| struct rm_mesh_light_lightness_srv_last_info_t | | |
| Light Lightness Last state represents the lightness of a light on a perceptually uniform lightness scale | | |
| Data Fields | | |
| uint16_t | lightness_last | Light Lightness Last |

◆ **rm_mesh_light_lightness_srv_default_info_t**

| | | |
|---|-------------------|-------------------------|
| struct rm_mesh_light_lightness_srv_default_info_t | | |
| Light Lightness Default state is a value ranging from 0x0000 to 0xFFFF, representing a default lightness level for the Light Lightness Actual state | | |
| Data Fields | | |
| uint16_t | lightness_default | Light Lightness Default |

◆ **rm_mesh_light_lightness_srv_range_info_t**

| | | |
|--|---------------------|---------------------------|
| struct rm_mesh_light_lightness_srv_range_info_t | | |
| Light Lightness Range state determines the minimum and maximum lightness of an element | | |
| Data Fields | | |
| uint16_t | lightness_range_min | Light Lightness Range Min |
| uint16_t | lightness_range_max | Light Lightness Range Max |

◆ **rm_mesh_light_lightness_srv_info_t**

| | | |
|---|-------------------------|---|
| struct rm_mesh_light_lightness_srv_info_t | | |
| Light Lightness state is a composite state that includes the Light Lightness Linear, the Light Lightness Actual, the Light Lightness Last, and the Light Lightness Default states | | |
| Data Fields | | |
| rm_mesh_light_lightness_srv_linear_info_t | light_lightness_linear | Light Lightness Linear state represents the lightness of a light on a linear scale |
| rm_mesh_light_lightness_srv_actual_info_t | light_lightness_actual | Light Lightness Actual state represents the lightness of a light on a perceptually uniform lightness scale |
| rm_mesh_light_lightness_srv_last_info_t | light_lightness_last | Light Lightness Last state represents the lightness of a light on a perceptually uniform lightness scale |
| rm_mesh_light_lightness_srv_default_info_t | light_lightness_default | Light Lightness Default state is a value ranging from 0x0000 to 0xFFFF, representing a default lightness level for the Light Lightness Actual state |

| | | |
|--|---------------------------------------|---|
| rm_mesh_light_lightness_srv_range_info_t | light_lightness_range | Light Lightness Range state. |
| uint8_t | range_status | Status field used only for the Range Status |

◆ [rm_mesh_light_lightness_srv_instance_ctrl_t](#)

```
struct rm_mesh_light_lightness_srv_instance_ctrl_t
```

BLE mesh light lightness instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_LIGHT_LIGHTNESS_SRV_Open\(\)](#) is called.

Function Documentation

◆ [RM_MESH_LIGHT_LIGHTNESS_SRV_Open\(\)](#)

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Light Lightness Server model and to initialize Light Lightness_Setup Server model. This is to initialize Light Lightness Server model and to register with Access layer. And this is to initialize Light Lightness_Setup Server model and to register with Access layer. Implements [rm_ble_mesh_model_server_api_t::open](#).

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_LIGHTNESS_SRV_Open(&g_mesh_light_lightness_srv0_ctrl,
&g_mesh_light_lightness_srv0_cfg);
```

Return values

| | |
|--------------------------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_LIGHT_LIGHTNESS_SRV_Close()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const  
p_ctrl)
```

API to terminate Light_Lightness Server model. This is to terminate Light_Lightness Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */  
err = RM_MESH_LIGHT_LIGHTNESS_SRV_Close(&g_mesh_light_lightness_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_LIGHT_LIGHTNESS_SRV_StateUpdate()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_LIGHT_LIGHTNESS_SRV_StateUpdate(&g_mesh_light_lightness_srv0_ctrl,
&state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LIGHTNESS_SRV_SetupServerStateUpdate()

```
fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_SetupServerStateUpdate (
  rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const
  p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

| | | |
|------|---------|---|
| [in] | p_ctrl | rm_mesh_light_lightness_srv control block. |
| [in] | p_state | To send reply for a request or to inform change in state. |

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Detailed Description

Overview

Target Devices

The BLE Mesh Network Light Location Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_lc_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_lc_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light Lightness Controller Client (rm_mesh_light_lc_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light Lightness Controller Client (rm_mesh_light_lc_clt).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|---------------------------------------|-------------------------------|------|--|
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light lightness controller client ISR occurs |
|---------------------------------------|-------------------------------|------|--|

| | | | |
|------|-------------------------------|--------------------------|--------------|
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_light_lc_clt_0 | Module name. |
|------|-------------------------------|--------------------------|--------------|

Data Structures

```
struct rm_mesh_light_lc_clt_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_light_lc_clt_instance_ctrl_t

```
struct rm_mesh_light_lc_clt_instance_ctrl_t
```

BLE mesh light lc instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_LIGHT_LC_CLT_Open()` is called.

Function Documentation

◆ RM_MESH_LIGHT_LC_CLT_Open()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Light_Lc Client middleware. This is to initialize Light_Lc Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_LC_CLT_Open(&g_mesh_light_lc_clt0_ctrl,
&g_mesh_light_lc_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_LIGHT_LC_CLT_Close()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Light_Lc Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_LIGHT_LC_CLT_Close(&g_mesh_light_lc_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_LIGHT_LC_CLT_GetModelHandle()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Light_Lc client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of light lc client model. */
err = RM_MESH_LIGHT_LC_CLT_GetModelHandle(&g_mesh_light_lc_clt0_ctrl,
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_LIGHT_LC_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_LIGHT_LC_CLT_SendReliablePdu(&g_mesh_light_lc_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_LC_CLT_ModeGet()**

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_ModeGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light LC Mode Get is an acknowledged message used to get the Light LC Mode state of an element. The response to the Light LC Mode Get message is a Light LC Mode Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|-------------------------------------|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
|------|--------|-------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_LC_CLT_ModeSet()**

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_ModeSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Light LC Mode Set is an acknowledged message used to set the Light LC Mode state of an element. The response to the Light LC Mode Set message is a Light LC Mode Status message.

Parameters

| | | |
|------|-------------|---------------------------------------|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC Mode Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_LC_CLT_ModeSetUnacknowledged()**

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_ModeSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Light LC Mode Set Unacknowledged is an unacknowledged message used to set the Light LC Mode state of an element.

Parameters

| | | |
|------|-------------|---------------------------------------|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC Mode Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_LC_CLT_OmGet()**

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_OmGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light LC OM Get is an acknowledged message used to get the Light LC Occupancy Mode state of an element. The response to the Light LC OM Get message is a Light LC OM Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|-------------------------------------|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
|------|--------|-------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_LC_CLT_OmSet()**

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_OmSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

The Light LC OM Set is an acknowledged message used to set the Light LC Occupancy Mode state of an element. The response to the Light LC OM Set message is a Light LC OM Status message.

Parameters

| | | |
|------|-------------|-------------------------------------|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC OM Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_LC_CLT_OmSetUnacknowledged()**

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_OmSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Light LC OM Set Unacknowledged is an unacknowledged message used to set the Light LC Occupancy Mode state of an element.

Parameters

| | | |
|------|-------------|-------------------------------------|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC OM Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_LC_CLT_LightOnOffGet()**

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_LightOnOffGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light LC Light OnOff Get is an acknowledged message used to get the Light LC Light OnOff state of an element. The response to the Light LC Light OnOff Get message is a Light LC Light OnOff Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|-------------------------------------|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
|------|--------|-------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LC_CLT_LightOnOffSet()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_LightOnOffSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Light LC Light OnOff Set is an acknowledged message used to set the Light LC Light OnOff state of an element. The response to the Light LC Light OnOff Set message is a Light LC Light OnOff Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC Light OnOff Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_LC_CLT_LightOnOffSetUnacknowledged()**

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_LightOnOffSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Light LC Light OnOff Set Unacknowledged is an unacknowledged message used to set the Light LC Light OnOff state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC Light OnOff Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LC_CLT_PropertyGet()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_PropertyGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Light LC Property Get is an acknowledged message used to get the Light LC Property state of an element. The response to the Light LC Property Get message is a Light LC Property Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC Property Get message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LC_CLT_PropertySet()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_PropertySet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

The Light LC Property Set is an acknowledged message used to set the Light LC Property state of an element. The response to the Light LC Property Set message is a Light LC Property Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC Property Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LC_CLT_PropertySetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_LC_CLT_PropertySetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

The Light LC Property Set Unacknowledged is an unacknowledged message used to set the Light LC Property state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_lc_clt control block. |
| [in] | p_parameter | Pointer to Light LC Property Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Detailed Description

Overview

Target Devices

The BLE Mesh Network Light Location Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_lc_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_light_lc_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light Lightness Controller Server (rm_mesh_light_lc_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light Lightness Controller Server (rm_mesh_light_lc_srv).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|--|-------------------------------|-----------------------------|--|
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light lightness controller server ISR occurs |
| Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light lightness controller server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_light_lc_srv 0 | Module name. |

| | | |
|--|------------------------|--|
| struct rm_mesh_light_lc_srv_light_onoff_info_t | | |
| Light LC Light OnOff State | | |
| Data Fields | | |
| uint8_t | present_light_onoff | Light LC Light OnOff State |
| uint8_t | target_light_onoff | Light LC Light OnOff State |
| uint8_t | tid | TID - Used in request path |
| uint8_t | transition_time | Transition Time - Used in request path. Used as remaining time in response path. |
| uint8_t | delay | Delay - Used in request path |
| uint16_t | transition_time_handle | Transition Timer Handle |

◆ rm_mesh_light_lc_srv_property_id_info_t

| | | |
|--|--|--|
| struct rm_mesh_light_lc_srv_property_id_info_t | | |
|--|--|--|

| | | |
|---|-------------|---|
| Property ID identifying a Light LC Property | | |
| Data Fields | | |
| uint16_t | property_id | Property ID identifying a Light LC Property |

◆ rm_mesh_light_lc_srv_property_info_t

| | | |
|---|--------------------|---|
| struct rm_mesh_light_lc_srv_property_info_t | | |
| Light LC Property state | | |
| Data Fields | | |
| uint16_t | property_id | Property ID identifying a Light LC Property |
| uint8_t * | property_value | Raw value for the Light LC Property |
| uint16_t | property_value_len | |

◆ rm_mesh_light_lc_srv_extended_callback_args_t

| | | |
|--|-------------------|---|
| struct rm_mesh_light_lc_srv_extended_callback_args_t | | |
| Light LC Property state | | |
| Data Fields | | |
| rm_ble_mesh_access_model_handle_t * | p_handle | Access model handle. |
| rm_ble_mesh_light_lc_srv_event_t | event_type | Application events defined for Light LC Server Model. |
| uint8_t * | p_event_data | Event data. |
| uint16_t | event_data_length | Event data length. |

◆ rm_mesh_light_lc_srv_instance_ctrl_t

| | | |
|--|--|--|
| struct rm_mesh_light_lc_srv_instance_ctrl_t | | |
| BLE mesh light lc instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT LC_SRV_Open() is called. | | |

Enumeration Type Documentation

◆ **rm_ble_mesh_light_lc_srv_event_t**

| enum <code>rm_ble_mesh_light_lc_srv_event_t</code> | |
|---|---------------------------------------|
| Light LC light event | |
| Enumerator | |
| <code>RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_OFF</code> | Light LC Server Event Off. |
| <code>RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_STANDBY</code> | Light LC Server Event Standby. |
| <code>RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_FADE_ON</code> | Light LC Server Event Fade On. |
| <code>RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_RUN</code> | Light LC Server Event Run. |
| <code>RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_FADE</code> | Light LC Server Event Fade. |
| <code>RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_PROLONG</code> | Light LC Server Event Prolong. |
| <code>RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_FADE_STANDBY_AUTO</code> | Light LC Server Event Standby Auto. |
| <code>RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_FADE_STANDBY_MANUAL</code> | Light LC Server Event Standby Manual. |

◆ **rm_ble_mesh_light_lc_srv_state_t**

| enum <code>rm_ble_mesh_light_lc_srv_state_t</code> | |
|---|---------------------------------------|
| Light LC state | |
| Enumerator | |
| <code>RM_MESH_LIGHT_LC_SRV_STATE_OFF</code> | Light LC Server State Off. |
| <code>RM_MESH_LIGHT_LC_SRV_STATE_STANDBY</code> | Light LC Server State Standby. |
| <code>RM_MESH_LIGHT_LC_SRV_STATE_FADE_ON</code> | Light LC Server State Fade On. |
| <code>RM_MESH_LIGHT_LC_SRV_STATE_RUN</code> | Light LC Server State Run. |
| <code>RM_MESH_LIGHT_LC_SRV_STATE_FADE</code> | Light LC Server State Fade. |
| <code>RM_MESH_LIGHT_LC_SRV_STATE_PROLONG</code> | Light LC Server State Prolong. |
| <code>RM_MESH_LIGHT_LC_SRV_STATE_FADE_STANDBY_AUTO</code> | Light LC Server State Standby Auto. |
| <code>RM_MESH_LIGHT_LC_SRV_STATE_FADE_STANDBY_MANUAL</code> | Light LC Server State Standby Manual. |

◆ **rm_mesh_light_lc_srv_light_state_t**

| | |
|--|------------------|
| enum <code>rm_mesh_light_lc_srv_light_state_t</code> | |
| Light LC light state | |
| Enumerator | |
| <code>RM_MESH_LIGHT_LC_SRV_LIGHT_STATE_OFF</code> | Light state Off. |
| <code>RM_MESH_LIGHT_LC_SRV_LIGHT_STATE_ON</code> | Light state ON. |

Function Documentation◆ **RM_MESH_LIGHT_LC_SRV_Open()**

```
fsp_err_t RM_MESH_LIGHT_LC_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Light_Lc Server model. This is to initialize Light_Lc Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_LC_SRV_Open(&g_mesh_light_lc_srv0_ctrl,
&g_mesh_light_lc_srv0_cfg);
```

Return values

| | |
|-----------------------------------|--|
| <code>FSP_SUCCESS</code> | Model opened successfully. |
| <code>FSP_ERR_ASSERTION</code> | Pointer to control block or configuration structure is NULL. |
| <code>FSP_ERR_ALREADY_OPEN</code> | Model is already open. |
| <code>FSP_ERR_NOT_FOUND</code> | The number of models has exceeded the limit. |
| <code>FSP_ERR_ABORTED</code> | Model initialization is failed. |

◆ RM_MESH_LIGHT_LC_SRV_Close()

```
fsp_err_t RM_MESH_LIGHT_LC_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Light_Lc Server model. This is to terminate Light_Lc Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */  
err = RM_MESH_LIGHT_LC_SRV_Close(&g_mesh_light_lc_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_LIGHT_LC_SRV_StateUpdate()

```
fsp_err_t RM_MESH_LIGHT_LC_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_LIGHT_LC_SRV_StateUpdate(&g_mesh_light_lc_srv0_ctrl, &state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_LC_SRV_SetTimeProperty()

```
fsp_err_t RM_MESH_LIGHT_LC_SRV_SetTimeProperty ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_model_server_device_property_t property, uint32_t time_in_ms )
```

API to set Light LC Sever Specific Time Properties. This is to update the Light LC Module with any Light Control Time Properties values. Typically these LC Time properties will be needed to be updated or informed to the Light LC Module during Power-Up, Scene Recall/Restore related scenario or when ever the Local application desires to enforce an update in these device properties values. Currently this interface handles only Time related Device Properties of Light LC Module like: RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_OCCUPANCY_DELAY RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_FADE_ON RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_RUN_ON RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_FADE RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_PROLONG RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_FADE_STANDBY_AUTO RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_FADE_STANDBY_MANUAL

Parameters

| | | |
|------|------------|--|
| [in] | p_ctrl | Pointer to control structure. |
| [in] | property | LC Server Device Property ID |
| [in] | time_in_ms | Related Device Property Value time in milliseconds |

Example:

```
/* Set Light LC Sever Specific Time Properties. */
err = RM_MESH_LIGHT_LC_SRV_SetTimeProperty(&g_mesh_light_lc_srv0_ctrl, property,
time_in_ms);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Set the Light Control Time Properties values successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_MESH_LIGHT_LC_SRV_SetScenario()

```
fsp_err_t RM_MESH_LIGHT_LC_SRV_SetScenario ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_mesh_light_lc_srv_scenario_t const *const p_scenario )
```

API to locally trigger the Light LC Server state machine from the application. This typically is used in Power-Up or Scene Recall/Restore Scenario where the Application could trigger the Light LC Server from any desired LC State.

Example:

```
/* Trigger to Recall/Restore the scenario. */
err = RM_MESH_LIGHT_LC_SRV_SetScenario(&g_mesh_light_lc_srv0_ctrl, &scenario);
```

Parameters

| | | |
|------|------------|---|
| [in] | p_ctrl | Pointer to control structure. |
| [in] | p_scenario | Pointer to rm_mesh_light_lc_srv_scenario_t where Light LC Server State Informations are present |

Return values

| | |
|--------------------------|-----------------------------------|
| FSP_SUCCESS | Updated scenario successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_scenario is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_MESH_LIGHT_LC_SRV_GetCurrentScenario()

```
fsp_err_t RM_MESH_LIGHT_LC_SRV_GetCurrentScenario ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_mesh_light_lc_srv_scenario_t *const p_scenario )
```

API to fetch the Light LC Server state machine related information from the Light LC Server Module. This typically is used in Power-Up or Scene Recall/Restore Scenario where the Application uses this to fetch and persistently store the Light LC State related details.

Example:

```
/* Fetch the current scenario. */
err = RM_MESH_LIGHT_LC_SRV_GetCurrentScenario(&g_mesh_light_lc_srv0_ctrl,
&scenario);
```

Parameters

| | | |
|-------|------------|---|
| [in] | p_ctrl | Pointer to control structure. |
| [out] | p_scenario | Pointer to rm_mesh_light_lc_srv_scenario_t where Light LC Server State Informations are present |

Return values

| | |
|-------------------------|-----------------------------------|
| FSP_SUCCESS | Fetch information successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_scenario is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_LIGHT_LC_SRV_ReportOccupancy()

```
fsp_err_t RM_MESH_LIGHT_LC_SRV_ReportOccupancy ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl)
```

API to report any occupancy to Light LC Server Model.

Example:

```
/* Reports any occupancy. */
err = RM_MESH_LIGHT_LC_SRV_ReportOccupancy(&g_mesh_light_lc_srv0_ctrl);
```

Parameters

| | | |
|------|--------|-------------------------------|
| [in] | p_ctrl | Pointer to control structure. |
|------|--------|-------------------------------|

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_LIGHT_LC_SRV_ReportLightOnOff()

```
fsp_err_t RM_MESH_LIGHT_LC_SRV_ReportLightOnOff ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_mesh_light_lc_srv_light_state_t state )
```

API to report any Light ON or OFF to Light LC Server Model. There could be many triggering factors to this Light related ON/OFF events from the upper layer. This API could be used for the following scenarios

1. Manual/Physical trigger of Light ON/OFF
2. State Binding with Generic ON/OFF
3. Trigger of Light ON/OFF due to Ambient Light Sensor values

Example:

```
/* Reports any Light ON or OFF. */
err = RM_MESH_LIGHT_LC_SRV_ReportLightOnOff(&g_mesh_light_lc_srv0_ctrl, state);
```

Parameters

| | | |
|------|--------|---|
| [in] | p_ctrl | Pointer to control structure. |
| [in] | state | Desired state value of Light LC ON/OFF. |

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

```

Detailed Description

Overview

Target Devices

The BLE Mesh Network Light Xyl Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_xyl_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_xyl_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light XYL Client (rm_mesh_light_xyl_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light XYL Client (rm_mesh_light_xyl_clt).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| Configuration | Options | Default | Description |
|---------------------------------------|-------------------------------|---------|---|
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh light XYL client ISR occurs |

| Configuration | Options | Default | Description |
|---------------|-------------------------------|--------------------------|--------------|
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_light_xyl_clt0 | Module name. |

Data Structures

```
struct rm_mesh_light_xyl_clt_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_light_xyl_clt_instance_ctrl_t

```
struct rm_mesh_light_xyl_clt_instance_ctrl_t
```

BLE mesh light xyl instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_LIGHT_XYL_CLT_Open\(\)](#) is called.

Function Documentation

◆ **RM_MESH_LIGHT_XYL_CLT_Open()**

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Light_Xyl Client middleware. This is to initialize Light_Xyl Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_XYL_CLT_Open(&g_mesh_light_xyl_clt0_ctrl,
&g_mesh_light_xyl_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ **RM_MESH_LIGHT_XYL_CLT_Close()**

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Light_Xyl Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_LIGHT_XYL_CLT_Close(&g_mesh_light_xyl_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_LIGHT_XYL_CLT_GetModelHandle()

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const  
p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Light_Xyl client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of light xyl client model. */  
err = RM_MESH_LIGHT_XYL_CLT_GetModelHandle(&g_mesh_light_xyl_clt0_ctrl,  
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_LIGHT_XYL_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_LIGHT_XYL_CLT_SendReliablePdu(&g_mesh_light_xyl_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_XYL_CLT_Get()**

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Light xyl Get is an acknowledged message used to get the Light xyl Lightness, Light xyl x, and Light xyl y states of an element. Upon receiving a Light xyl Get message, the element shall respond with a Light xyl Status message. The response to the Light xyl Get message is a Light xyl Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_XYL_CLT_Set()

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

The Light xyL Set is an acknowledged message used to set the Light xyL Lightness, Light xyL x state, and the Light xyL y states of an element. The response to the Light xyL Set message is a Light xyL Status message.

Parameters

| | | |
|------|-------------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |
| [in] | p_parameter | Pointer to Light xyL Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_XYL_CLT_SetUnacknowledged()**

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_SetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

The Light xyl Set Unacknowledged is an unacknowledged message used to set the Light xyl Lightness, Light xyl x, and the Light xyl y states of an element.

Parameters

| | | |
|------|-------------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |
| [in] | p_parameter | Pointer to Light xyl Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_XYL_CLT_TargetGet()**

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_TargetGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Light xyL Target Get is an acknowledged message used to get the target Light xyL Lightness, Light xyL x, and Light xyL y states of an element. The response to the Light xyL Target Get message is a Light xyL Target Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_XYL_CLT_DefaultGet()**

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_DefaultGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Light xyl Default Get is an acknowledged message used to get the Light Lightness Default, the Light xyl x Default, and Light xyl y Default states of an element. The response to the Light xyl Default Get message is a Light xyl Default Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_XYL_CLT_DefaultSet()**

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_DefaultSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Light xyl Default Set is an acknowledged message used to set the Light Lightness Default, the Light xyl x Default, and Light xyl y Default states of an element. The response to the Light xyl Default Set message is a Light xyl Default Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Default Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_XYL_CLT_DefaultSetUnacknowledged()

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_DefaultSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Light xyl Default Set Unacknowledged is an unacknowledged message used to set the Light Lightness Default, the Light xyl x Default, and Light xyl y Default states of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |
| [in] | p_parameter | Pointer to Light HSL Default Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_XYL_CLT_RangeGet()**

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_RangeGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

The Light xyL Range Get is an acknowledged message used to get the Light xyL x Range and Light xyL y Range states of an element. The response to the Light xyL Range Get message is a Light xyL Range Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_LIGHT_XYL_CLT_RangeSet()**

```
fsp_err_t RM_MESH_LIGHT_XYL_CLT_RangeSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Light xyl Range Set is an acknowledged message used to set the Light xyl x Range and Light xyl y Range states of an element. The response to the Light xyl Range Set message is a Light xyl Range Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |
| [in] | p_parameter | Pointer to Light xyl Range Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_LIGHT_XYL_CLT_RangeSetUnacknowledged()

`fsp_err_t RM_MESH_LIGHT_XYL_CLT_RangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)`

Light xyl Range Set Unacknowledged is an unacknowledged message used to set the Light xyl x Range and Light xyl y Range states of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_light_xyl_clt control block. |
| [in] | p_parameter | Pointer to Light xyl Range Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

BLE Mesh Network Light Xyl Server (rm_mesh_light_xyl_srv)

◆ rm_mesh_light_xyl_srv_default_info_t

| | | |
|--|---------------|---|
| struct rm_mesh_light_xyl_srv_default_info_t | | |
| Light xyL default state is a composite state that includes the xyL Lightness, the Light xyL x and the Light xyL y states | | |
| Data Fields | | |
| uint16_t | xyl_lightness | The perceived lightness of a light emitted by the element |
| uint16_t | xyl_x | The 16-bit value representing the x coordinate of a CIE1931 color light |
| uint16_t | xyl_y | The 16-bit value representing the y coordinate of a CIE1931 color light |

◆ rm_mesh_light_xyl_srv_range_info_t

| | | |
|--|-----------------|--|
| struct rm_mesh_light_xyl_srv_range_info_t | | |
| Light xyL Range state determines the minimum and maximum values of the Light xyL x and syL y state of an element | | |
| Data Fields | | |
| uint16_t | xyl_x_range_min | The minimum value of a Light xyL x state of an element |
| uint16_t | xyl_x_range_max | The maximum value of a Light xyL x state of an element |
| uint16_t | xyl_y_range_min | The minimum value of a Light xyL y state of an element |
| uint16_t | xyl_y_range_max | The maximum value of a Light xyL y state of an element |
| uint8_t | status | Status - Used in the response path |

◆ rm_mesh_light_xyl_srv_instance_ctrl_t

| | |
|--|--|
| struct rm_mesh_light_xyl_srv_instance_ctrl_t | |
| BLE mesh light xyl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_XYL_SRV_Open() is called. | |

Function Documentation

◆ RM_MESH_LIGHT_XYL_SRV_Open()

```
fsp_err_t RM_MESH_LIGHT_XYL_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Light_Xyl Server model. This is to initialize Light_Xyl Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_LIGHT_XYL_SRV_Open(&g_mesh_light_xyl_srv0_ctrl,
&g_mesh_light_xyl_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_LIGHT_XYL_SRV_Close()

```
fsp_err_t RM_MESH_LIGHT_XYL_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Light_Xyl Server model. This is to terminate Light_Xyl Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_LIGHT_XYL_SRV_Close(&g_mesh_light_xyl_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_LIGHT_XYL_SRV_StateUpdate()

```
fsp_err_t RM_MESH_LIGHT_XYL_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_LIGHT_XYL_SRV_StateUpdate(&g_mesh_light_xyl_srv0_ctrl, &state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

Detailed Description

Overview

Target Devices

The BLE Mesh Network Lower Trans module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh_lower_trans

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_lower_trans_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Lower Trans (rm_ble_mesh_lower_trans)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Lower Trans (rm_ble_mesh_lower_trans).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

General

| | | | |
|----------------|-------------------------------|----------------------------|---|
| Name | Name Must Be a Valid C Symbol | g_rm_ble_mesh_lower_trans0 | Module name. |
| Channel Number | Invalid Channel Number | 0 | Select channel corresponding to the channel number of the |

hardware.

| | | | |
|---------------------|---|----------|--|
| Notification Enable | <ul style="list-style-type: none"> Enabled Disabled | Disabled | Whether to enable the notification or not. |
| Callback | Name Must Be a Valid C Symbol | NULL | Callback function name. |

Data Structures

```
struct rm_ble_mesh_lower_trans_instance_ctrl_t
```

Data Structure Documentation

◆ rm_ble_mesh_lower_trans_instance_ctrl_t

```
struct rm_ble_mesh_lower_trans_instance_ctrl_t
```

RM_BLE_MESH_LOWER_TRANS private control block. DO NOT MODIFY. Initialization occurs when `RM_BLE_MESH_LOWER_TRANS_Open()` is called.

Function Documentation

◆ RM_BLE_MESH_LOWER_TRANS_Open()

```
fsp_err_t RM_BLE_MESH_LOWER_TRANS_Open ( rm_ble_mesh_lower_trans_ctrl_t *const p_ctrl,
rm_ble_mesh_lower_trans_cfg_t const *const p_cfg )
```

Register Interface with Lower Transport Layer. This routine registers interface with the Lower Transport Layer. Transport Layer supports single Application, hence this routine shall be called once.

Implements `rm_ble_mesh_lower_trans_api_t::open`.

Example:

```
/* Open the module. */
err = RM_BLE_MESH_LOWER_TRANS_Open(&g_ble_mesh_lower_trans0_ctrl,
&g_ble_mesh_lower_trans0_cfg);
```

Return values

| | |
|-----------------------|--|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_LOWER_TRANS_Close()

```
fsp_err_t RM_BLE_MESH_LOWER_TRANS_Close ( rm_ble_mesh_provision_ctrl_t *const p_ctrl)
```

Unregister Interface with Lower Transport Layer. Implements `rm_ble_mesh_lower_trans_api_t::close`.

Example:

```
/* Close the module. */  
err = RM_BLE_MESH_LOWER_TRANS_Close(&g_ble_mesh_lower_trans0_ctrl);
```

Return values

| | |
|-----------------------|-------------------------------|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ **RM_BLE_MESH_LOWER_TRANS_SendPdu()**

```
fsp_err_t RM_BLE_MESH_LOWER_TRANS_SendPdu ( rm_ble_mesh_lower_trans_ctrl_t *const p_ctrl,
rm_ble_mesh_lower_trans_transmit_setting_t const *const p_transmit_setting,
rm_ble_mesh_buffer_t const *const p_buffer, rm_ble_mesh_lower_trans_reliable_t reliable )
```

API to send transport PDUs. This routine sends transport PDUs to peer device.

Implements `rm_ble_mesh_lower_trans_api_t::sendPdu`.

Example:

```
/* Send transport PDUs. */
err = RM_BLE_MESH_LOWER_TRANS_SendPdu(&g_ble_mesh_lower_trans0_ctrl,
                                     &transmit_setting,
                                     &buffer,
                                     RM_BLE_MESH_LOWER_TRANS_RELIABLE_ENABLE);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_transmit_setting and p_buffer are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_LOWER_TRANS_ClearSarContexts()

```
fsp_err_t RM_BLE_MESH_LOWER_TRANS_ClearSarContexts ( rm_ble_mesh_lower_trans_ctrl_t *const p_ctrl)
```

To clear all segmentation and reassembly contexts. This routine clears all segmentation and reassembly contexts.

Implements `rm_ble_mesh_lower_trans_api_t::clearSarContexts`.

Example:

```
/* Clear all segmentation and reassembly contexts. */
err = RM_BLE_MESH_LOWER_TRANS_ClearSarContexts(&g_ble_mesh_lower_trans0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_LOWER_TRANS_ClearSubnetSarContexts()

```
fsp_err_t RM_BLE_MESH_LOWER_TRANS_ClearSubnetSarContexts ( rm_ble_mesh_lower_trans_ctrl_t *const p_ctrl, rm_ble_mesh_network_subnet_handle_t subnet_handle )
```

To clear all segmentation and reassembly contexts for a given subnet. This routine clears all segmentation and reassembly contexts.

Implements `rm_ble_mesh_lower_trans_api_t::clearSubnetSarContexts`.

Example:

```
/* Clear all segmentation and reassembly contexts for a given subnet. */
err =
RM_BLE_MESH_LOWER_TRANS_ClearSubnetSarContexts(&g_ble_mesh_lower_trans0_ctrl,
subnet_handle);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_LOWER_TRANS_ReinitReplayCache()

```
fsp_err_t RM_BLE_MESH_LOWER_TRANS_ReinitReplayCache ( rm_ble_mesh_lower_trans_ctrl_t
*const p_ctrl)
```

To reinitialize all Lower Transport replay cache entries. This routine clears and reinitializes all Transport Replay Cache Entries. This needs to be invoked by the upper layer when the Network moves to a newer IV Index (Normal State) and the Sequence numbers are reset.

Implements `rm_ble_mesh_lower_trans_api_t::reinitReplayCache`.

Example:

```
/* Reinitialize all Lower Transport replay cache Entries. */
err = RM_BLE_MESH_LOWER_TRANS_ReinitReplayCache(&g_ble_mesh_lower_trans0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_LOWER_TRANS_TriggerPendingTransmits()

```
fsp_err_t RM_BLE_MESH_LOWER_TRANS_TriggerPendingTransmits ( rm_ble_mesh_lower_trans_ctrl_t
*const p_ctrl)
```

To trigger any LTRN pending transmissions. Trigger pending transmits is an interface to check for pending segments in the tx queue and schedule for transmission, which is mainly used by the LPN operation.

Implements `rm_ble_mesh_lower_trans_api_t::triggerPendingTransmits`.

Example:

```
/* Trigger any Lower Transport pending transmissions. */
err =
RM_BLE_MESH_LOWER_TRANS_TriggerPendingTransmits(&g_ble_mesh_lower_trans0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Detailed Description

Overview

Target Devices

The BLE Mesh Network Network module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh_network

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_network_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Network (rm_ble_mesh_network)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Network (rm_ble_mesh_network).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

General

| | | | |
|--------------------------|--|----------------------------|---|
| Name | Name Must Be a Valid C Symbol | g_rm_ble_mesh_networ k0 | Module name. |
| Channel Number | Invalid Channel Number | 0 | Select channel corresponding to the channel number of the hardware. |
| Ignore Netcache Wrapping | <ul style="list-style-type: none"> • Processed • Dropped | Dropped | Ignore netcache wrapping. |
| RX Callback Event Enable | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Whether to enable the RX callback event or |

not.

| | | | |
|--------------------------|---|----------|---|
| TX Callback Event Enable | <ul style="list-style-type: none"> Enabled Disabled | Disabled | Whether to enable the TX callback event or not. |
| Callback | Name Must Be a Valid C Symbol | NULL | Callback function name. |

Data Structures

```
struct rm_ble_mesh_network_instance_ctrl_t
```

Data Structure Documentation

◆ rm_ble_mesh_network_instance_ctrl_t

```
struct rm_ble_mesh_network_instance_ctrl_t
```

RM_BLE_MESH_NETWORK private control block. DO NOT MODIFY. Initialization occurs when `RM_BLE_MESH_NETWORK_Open()` is called.

Function Documentation

◆ RM_BLE_MESH_NETWORK_Open()

```
fsp_err_t RM_BLE_MESH_NETWORK_Open ( rm_ble_mesh_network_ctrl_t *const p_ctrl,
rm_ble_mesh_network_cfg_t const *const p_cfg )
```

Register Interface with Network Layer. This routine registers interface with the Network Layer. Network Layer supports only one upper layer, hence this routine shall be called once.

Implements `rm_ble_mesh_network_api_t::open`.

Example:

```
/* Open the module. */
err = RM_BLE_MESH_NETWORK_Open(&g_ble_mesh_network0_ctrl,
&g_ble_mesh_network0_cfg);
```

Return values

| | |
|-----------------------|--|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |

◆ RM_BLE_MESH_NETWORK_Close()

```
fsp_err_t RM_BLE_MESH_NETWORK_Close ( rm_ble_mesh_network_ctrl_t *const p_ctrl)
```

Unregister Interface with Network Layer. Implements `rm_ble_mesh_network_api_t::close`.

Example:

```
/* Close the module. */
err = RM_BLE_MESH_NETWORK_Close(&g_ble_mesh_network0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_NETWORK_BroadcastSecureBeacon()

```
fsp_err_t RM_BLE_MESH_NETWORK_BroadcastSecureBeacon ( rm_ble_mesh_network_ctrl_t *const
p_ctrl, rm_ble_mesh_network_subnet_handle_t subnet_handle )
```

API to send Secure Network Beacon. This routine sends Secure Network Beacon for the given subnet handle.

Implements `rm_ble_mesh_network_api_t::broadcastSecureBeacon`.

Example:

```
/* Send secure network beacon. */
err = RM_BLE_MESH_NETWORK_BroadcastSecureBeacon(&g_ble_mesh_network0_ctrl,
subnet_handle);
```

Return values

| | |
|-----------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_NETWORK_SendPduOnInterface()

```
fsp_err_t RM_BLE_MESH_NETWORK_SendPduOnInterface ( rm_ble_mesh_network_ctrl_t *const
p_ctrl, rm_ble_mesh_network_route_info_t const *const p_route_info,
rm_ble_mesh_network_header_t const *const p_header, rm_ble_mesh_buffer_t const *const
p_buffer )
```

Extension API to send Network PDUs on selected network interfaces. This routine sends NETWORK PDUs on all or selected Network Interfaces.

Implements `rm_ble_mesh_network_api_t::sendPduOnInterface`.

Example:

```
/* Send network PDUs on selected network interfaces. */
err = RM_BLE_MESH_NETWORK_SendPduOnInterface(&g_ble_mesh_network0_ctrl,
&route_info, &header, &buffer);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_route_info, p_header and p_buffer are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_NETWORK_GetAddressType()

```
fsp_err_t RM_BLE_MESH_NETWORK_GetAddressType ( rm_ble_mesh_network_ctrl_t *const p_ctrl,  
rm_ble_mesh_network_address_t addr, rm_ble_mesh_network_address_type_t *const p_type )
```

To get address type. This routine is to get address type for a given address.

Implements `rm_ble_mesh_network_api_t::getAddressType`.

Example:

```
/* Get address type. */  
err = RM_BLE_MESH_NETWORK_GetAddressType(&g_ble_mesh_network0_ctrl, addr, &type);
```

Return values

| | |
|-------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_type is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_NETWORK_FetchProxyState()

```
fsp_err_t RM_BLE_MESH_NETWORK_FetchProxyState ( rm_ble_mesh_network_ctrl_t *const p_ctrl,
rm_ble_mesh_network_gatt_proxy_state_t *const p_proxy_state )
```

Check if the proxy module is ready to handle proxy messages/events. This routine returns the current state of the Proxy. The valid states of proxy are:

1. RM_BLE_MESH_NETWORK_GATT_PROXY_STATE_NULL - If no callback registered by Upper Layers
2. RM_BLE_MESH_NETWORK_GATT_PROXY_STATE_READY - If callback registered and Proxy not connected
3. RM_BLE_MESH_NETWORK_GATT_PROXY_STATE_CONNECTED - if callback registered and Proxy connected

Implements `rm_ble_mesh_network_api_t::fetchProxyState`.

Example:

```
/* Check if the proxy module is ready to handle proxy messages/events. */
err = RM_BLE_MESH_NETWORK_FetchProxyState(&g_ble_mesh_network0_ctrl,
&proxy_state);
```

Return values

| | |
|-------------------------|--------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_proxy_state is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_NETWORK_SetProxyFilter()

```
fsp_err_t RM_BLE_MESH_NETWORK_SetProxyFilter ( rm_ble_mesh_network_ctrl_t *const p_ctrl,
rm_ble_mesh_network_route_info_t const *const p_route_info, rm_ble_mesh_proxy_filter_type_t
type )
```

Set proxy server's filter type. This function is used by the Proxy Client to set the filter type on the Proxy Server.

Implements `rm_ble_mesh_network_api_t::setProxyFilter`.

Example:

```
/* Set proxy server's filter type. */
err = RM_BLE_MESH_NETWORK_SetProxyFilter(&g_ble_mesh_network0_ctrl, &route_info,
filter_type);
```

Return values

| | |
|-------------------------|-------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_route_info is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_NETWORK_ConfigProxyFilter()

```
fsp_err_t RM_BLE_MESH_NETWORK_ConfigProxyFilter ( rm_ble_mesh_network_ctrl_t *const p_ctrl,
rm_ble_mesh_network_route_info_t const *const p_route_info,
rm_ble_mesh_proxy_config_opcode_t opcode, rm_ble_mesh_network_proxy_address_list_t *const
p_addr_list )
```

Add or Delete/Remove addresses to/from proxy filter list. This function is used by the Proxy Client to add/delete Addresses to/from the Proxy Server's filter List.

Implements `rm_ble_mesh_network_api_t::configProxyFilter`.

Example:

```
/* Add or delete/remove addresses to/from proxy filter list. */
err = RM_BLE_MESH_NETWORK_ConfigProxyFilter(&g_ble_mesh_network0_ctrl,
&route_info, opcode, &addr_list);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_route_info and p_addr_list are NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_NETWORK_StartProxyServerAdv()

```
fsp_err_t RM_BLE_MESH_NETWORK_StartProxyServerAdv ( rm_ble_mesh_network_ctrl_t *const
p_ctrl, rm_ble_mesh_network_subnet_handle_t subnet_handle,
rm_ble_mesh_network_gatt_proxy_adv_mode_t proxy_adv_mode )
```

Start connectable advertisements for a proxy server. This function is used by the Proxy Server to start Connectable Undirected Advertisements.

Implements `rm_ble_mesh_network_api_t::startProxyServerAdv`.

Example:

```
/* Start connectable advertisements for a proxy server. */
err = RM_BLE_MESH_NETWORK_StartProxyServerAdv(&g_ble_mesh_network0_ctrl,
subnet_handle, proxy_adv_mode);
```

Return values

| | |
|--------------------------|---------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The internal parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_NETWORK_StopProxyServerAdv()

```
fsp_err_t RM_BLE_MESH_NETWORK_StopProxyServerAdv ( rm_ble_mesh_network_ctrl_t *const
p_ctrl)
```

Stop connectable advertisements for a proxy server. This function is used by the Proxy Server to stop Connectable Undirected Advertisements.

Implements `rm_ble_mesh_network_api_t::stopProxyServerAdv`.

Example:

```
/* Stop connectable advertisements for a proxy server. */
err = RM_BLE_MESH_NETWORK_StopProxyServerAdv(&g_ble_mesh_network0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_NETWORK_AllocateSeqNumber()

```
fsp_err_t RM_BLE_MESH_NETWORK_AllocateSeqNumber ( rm_ble_mesh_network_ctrl_t *const
p_ctrl, uint32_t *const p_seq_num )
```

To allocate sequence number. This function is used to allocate Sequence Number.

Implements `rm_ble_mesh_network_api_t::allocateSeqNumber`.

Example:

```
/* Allocate sequence number. */
err = RM_BLE_MESH_NETWORK_AllocateSeqNumber(&g_ble_mesh_network0_ctrl, &seq_num);
```

Return values

| | |
|-------------------------|----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_seq_num is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_NETWORK_GetSeqNumberState()

```
fsp_err_t RM_BLE_MESH_NETWORK_GetSeqNumberState ( rm_ble_mesh_network_ctrl_t *const
p_ctrl, rm_ble_mesh_network_seq_number_state_t *const p_seq_num_state )
```

To get current sequence number state. This function is used to get current Sequence Number state.

Implements `rm_ble_mesh_network_api_t::getSeqNumberState`.

Example:

```
/* Get current sequence number state. */
err = RM_BLE_MESH_NETWORK_GetSeqNumberState(&g_ble_mesh_network0_ctrl,
&seq_num_state);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_seq_num_state is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_NETWORK_SetSeqNumberState()

```
fsp_err_t RM_BLE_MESH_NETWORK_SetSeqNumberState ( rm_ble_mesh_network_ctrl_t *const
p_ctrl, rm_ble_mesh_network_seq_number_state_t const *const p_seq_num_state )
```

To set current sequence number state. This function is used to get current Sequence Number state, which acquiring lock. Used from persistent storage.

Implements `rm_ble_mesh_network_api_t::setSeqNumberState`.

Example:

```
/* Set current sequence number state. */
err = RM_BLE_MESH_NETWORK_SetSeqNumberState(&g_ble_mesh_network0_ctrl,
&seq_num_state);
```

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_seq_num_state is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_NETWORK_ResetNetCache()

```
fsp_err_t RM_BLE_MESH_NETWORK_ResetNetCache ( rm_ble_mesh_network_ctrl_t *const p_ctrl)
```

To reinitialize all Network Layer cache entries. This routine clears and reinitializes all Network Cache Entries. This needs to be invoked by the upper layer when the Network moves to a newer IV Index (Normal State) and the Sequence numbers are reset.

Implements `rm_ble_mesh_network_api_t::resetNetCache`.

Example:

```
/* Reinitialize all Network Layer cache entries. */
err = RM_BLE_MESH_NETWORK_ResetNetCache(&g_ble_mesh_network0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

BLE Mesh Network Provision (rm_ble_mesh_provision)

Modules » Networking » BLE Mesh Network Modules

Functions

```
fsp_err_t RM_BLE_MESH_PROVISION_Open (rm_ble_mesh_provision_ctrl_t
*const p_ctrl, rm_ble_mesh_provision_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_BLE_MESH_PROVISION_Close (rm_ble_mesh_provision_ctrl_t
*const p_ctrl)
```

```
fsp_err_t RM_BLE_MESH_PROVISION_Setup (rm_ble_mesh_provision_ctrl_t
*const p_ctrl, rm_ble_mesh_provision_role_t role,
rm_ble_mesh_provision_device_info_t info, uint16_t timeout)
```

```
fsp_err_t RM_BLE_MESH_PROVISION_Bind (rm_ble_mesh_provision_ctrl_t
*const p_ctrl, rm_ble_mesh_provision_device_info_t info, uint8_t
attention, rm_ble_mesh_provision_handle_t *const p_handle)
```

```
fsp_err_t RM_BLE_MESH_PROVISION_SendPdu (rm_ble_mesh_provision_ctrl_t
*const p_ctrl, rm_ble_mesh_provision_handle_t const *const
p_handle, rm_ble_mesh_provision_pdu_type_t type,
rm_ble_mesh_buffer_t pdu_data)
```

```
fsp_err_t RM_BLE_MESH_PROVISION_SetAuthVal (rm_ble_mesh_provision_ctrl_t
*const p_ctrl, rm_ble_mesh_provision_handle_t const *const
p_handle, rm_ble_mesh_buffer_t auth_value)
```

```
fsp_err_t RM_BLE_MESH_PROVISION_Abort (rm_ble_mesh_provision_ctrl_t
*const p_ctrl, rm_ble_mesh_provision_handle_t const *const
p_handle, rm_ble_mesh_provision_link_close_reason_t reason)
```

```
fsp_err_t RM_BLE_MESH_PROVISION_GetLocalPublicKey
(rm_ble_mesh_provision_ctrl_t *const p_ctrl, uint8_t *const
p_public_key)
```

```
fsp_err_t RM_BLE_MESH_PROVISION_SetLocalPublicKey
(rm_ble_mesh_provision_ctrl_t *const p_ctrl, uint8_t const *const
p_public_key)
```

```
fsp_err_t RM_BLE_MESH_PROVISION_GenerateRandomizedNumber
(rm_ble_mesh_provision_ctrl_t *const p_ctrl, uint8_t *const p_key)
```

```
fsp_err_t RM_BLE_MESH_PROVISION_SetOobPublicKey
(rm_ble_mesh_provision_ctrl_t *const p_ctrl, uint8_t const *const
p_key, uint8_t size)
```

```
fsp_err_t RM_BLE_MESH_PROVISION_SetOobAuthInfo
(rm_ble_mesh_provision_ctrl_t *const p_ctrl, uint8_t const *const
p_auth_info, uint8_t size)
```

```
fsp_err_t RM_BLE_MESH_PROVISION_GenerateEcdhKey
(rm_ble_mesh_provision_ctrl_t *const p_ctrl, uint8_t *const
p_public_key)
```

Detailed Description

Overview

Target Devices

The BLE Mesh Network Provision module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh_provision

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_provision_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Provision (rm_ble_mesh_provision)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Provision (rm_ble_mesh_provision).

| Configuration | Options | Default | Description |
|------------------------|--------------------------------|--------------------------|---|
| General | | | |
| Name | Name Must Be a Valid C Symbol | g_rm_ble_mesh_provision0 | Module name. |
| Provision Capabilities | | | |
| Number of Elements | Invalid Number of Elements | 1 | Provision capabilities number of elements. |
| Supported Algorithms | Invalid Supported Algorithms | 0 | Provision capabilities supported algorithms. |
| Public Key Type | Invalid Public Key Type | 0 | Provision capabilities public key type. |
| Static OOB Type | Invalid Static OOB Type | 0 | Provision capabilities static OOB type. |
| Output OOB Action | Invalid Output OOB Action | 0 | Provision capabilities output OOB action. |
| Output OOB Size | Invalid Output OOB Size | 0 | Provision capabilities output OOB size. |
| Input OOB Action | Invalid Input OOB Action | 0 | Provision capabilities input OOB action. |
| Input OOB Size | Invalid Input OOB Size | 0 | Provision capabilities input OOB size. |
| Channel Number | Invalid Channel Number | 0 | Select channel corresponding to the channel number of the hardware. |
| Provision Callback | Name Must Be a Valid C Symbol. | NULL | Provision callback function name. |

Data Structures

```
struct rm_ble_mesh_provision_instance_ctrl_t
```

Data Structure Documentation

◆ rm_ble_mesh_provision_instance_ctrl_t

```
struct rm_ble_mesh_provision_instance_ctrl_t
```

RM_BLE_MESH_PROVISION private control block. DO NOT MODIFY. Initialization occurs when [RM_BLE_MESH_PROVISION_Open\(\)](#) is called.

Function Documentation

◆ RM_BLE_MESH_PROVISION_Open()

```
fsp_err_t RM_BLE_MESH_PROVISION_Open ( rm_ble_mesh_provision_ctrl_t *const p_ctrl,
rm_ble_mesh_provision_cfg_t const *const p_cfg )
```

Open access middleware. This function registers the provisioning capabilities of the application along with the application callback to notify events during the provisioning procedure.

Implements `rm_ble_mesh_provision_api_t::open`.

Example:

```
/* Open the module. */
err = RM_BLE_MESH_PROVISION_Open(&g_ble_mesh_provision0_ctrl,
&g_ble_mesh_provision0_cfg);
```

Return values

| | |
|-----------------------|--|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_PROVISION_Close()

```
fsp_err_t RM_BLE_MESH_PROVISION_Close ( rm_ble_mesh_provision_ctrl_t *const p_ctrl)
```

Close access middleware. Implements `rm_ble_mesh_provision_api_t::close`.

Example:

```
/* Close the module. */
err = RM_BLE_MESH_PROVISION_Close(&g_ble_mesh_provision0_ctrl);
```

Return values

| | |
|-----------------------|-------------------------------|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_PROVISION_Setup()

```
fsp_err_t RM_BLE_MESH_PROVISION_Setup ( rm_ble_mesh_provision_ctrl_t *const p_ctrl,
rm_ble_mesh_provision_role_t role, rm_ble_mesh_provision_device_info_t info, uint16_t timeout )
```

Setup the device for provisioning. This function configures the device to get in a provisionable state by specifying the role, bearer and creating a context.

Implements `rm_ble_mesh_provision_api_t::setup`.

Example:

```
/* Setup the device for provisioning. */
err = RM_BLE_MESH_PROVISION_Setup(&g_ble_mesh_provision0_ctrl, role, info,
timeout);
```

Return values

| | |
|--------------------------|---------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_POINTER | The parameter info->p_device is NULL. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_PROVISION_Bind()

```
fsp_err_t RM_BLE_MESH_PROVISION_Bind ( rm_ble_mesh_provision_ctrl_t *const p_ctrl,
rm_ble_mesh_provision_device_info_t info, uint8_t attention, rm_ble_mesh_provision_handle_t
*const p_handle )
```

Bind to the peer device for provisioning. This function establishes a provisioning link with the peer device and exchanges the capabilities for provisioning.

Implements `rm_ble_mesh_provision_api_t::bind`.

Example:

```
/* Bind to the peer device for provisioning. */
err = RM_BLE_MESH_PROVISION_Bind(&g_ble_mesh_provision0_ctrl, info, attention,
&provision_handle);
```

Return values

| | |
|--------------------------|---------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle is NULL. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_PROVISION_SendPdu()

```
fsp_err_t RM_BLE_MESH_PROVISION_SendPdu ( rm_ble_mesh_provision_ctrl_t *const p_ctrl,
rm_ble_mesh_provision_handle_t const *const p_handle, rm_ble_mesh_provision_pdu_type_t type,
rm_ble_mesh_buffer_t pdu_data )
```

Send provisioning PDUs to the peer. This function is used by the provisioning application to send the provisioning PDUs to the peer device during the procedure.

Implements `rm_ble_mesh_provision_api_t::sendPdu`.

Example:

```
/* Send provisioning PDUs to the peer. */
err = RM_BLE_MESH_PROVISION_SendPdu(&g_ble_mesh_provision0_ctrl,
&provision_handle, type, pdu_data);
```

Return values

| | |
|--------------------------|---------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle is NULL. |
| FSP_ERR_UNSUPPORTED | The pdu type is not supported. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_PROVISION_SetAuthVal()

```
fsp_err_t RM_BLE_MESH_PROVISION_SetAuthVal ( rm_ble_mesh_provision_ctrl_t *const p_ctrl,
rm_ble_mesh_provision_handle_t const *const p_handle, rm_ble_mesh_buffer_t auth_value )
```

Set the display authval. This function shall be used by the provisioning application to set the authval being displayed to the user on receiving `RM_BLE_MESH_PROVISION_EVENT_TYPE_OOB_DISPLAY` event with the respective OOB Action and Size.

Implements `rm_ble_mesh_provision_api_t::setAuthVal`.

Example:

```
rm_ble_mesh_buffer_t auth_value = {.payload = NULL, .length = 0};

/* Set the display authval. */
err = RM_BLE_MESH_PROVISION_SetAuthVal(&g_ble_mesh_provision0_ctrl,
&provision_handle, auth_value);
```

Return values

| | |
|-------------------------|---------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_PROVISION_Abort()

```
fsp_err_t RM_BLE_MESH_PROVISION_Abort ( rm_ble_mesh_provision_ctrl_t *const p_ctrl,
rm_ble_mesh_provision_handle_t const *const p_handle,
rm_ble_mesh_provision_link_close_reason_t reason )
```

Abort the provisioning procedure. This API can be used by the application to abort the ongoing provisioning procedure. This routine closes the provisioning link with the reason as specified.

Implements `rm_ble_mesh_provision_api_t::abort`.

Example:

```
/* Abort the provisioning procedure. */
err = RM_BLE_MESH_PROVISION_Abort(&g_ble_mesh_provision0_ctrl, &provision_handle,
reason);
```

Return values

| | |
|--------------------------|---------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_PROVISION_GetLocalPublicKey()

```
fsp_err_t RM_BLE_MESH_PROVISION_GetLocalPublicKey ( rm_ble_mesh_provision_ctrl_t *const
p_ctrl, uint8_t *const p_public_key )
```

Utility API to get current ECDH public key to be used for provisioning. This API can be used by the application to fetch the current ECDH P256 Public Key which is to be used for the Provisioning Procedure.

Implements `rm_ble_mesh_provision_api_t::getLocalPublicKey`.

Example:

```
/* Get current ECDH Public Key to be used for Provisioning. */
err = RM_BLE_MESH_PROVISION_GetLocalPublicKey(&g_ble_mesh_provision0_ctrl,
&public_key);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_public_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_PROVISION_SetLocalPublicKey()

```
fsp_err_t RM_BLE_MESH_PROVISION_SetLocalPublicKey ( rm_ble_mesh_provision_ctrl_t *const
p_ctrl, uint8_t const *const p_public_key )
```

Utility API to set current ECDH public key to be used for provisioning. This API can be used by the application to fetch the current ECDH P256 Public Key which is to be used for the Provisioning Procedure.

Implements `rm_ble_mesh_provision_api_t::setLocalPublicKey`.

Example:

```
/* Set current ECDH Public Key to be used for Provisioning. */
err = RM_BLE_MESH_PROVISION_SetLocalPublicKey(&g_ble_mesh_provision0_ctrl,
&public_key);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_public_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_PROVISION_GenerateRandomizedNumber()

```
fsp_err_t RM_BLE_MESH_PROVISION_GenerateRandomizedNumber ( rm_ble_mesh_provision_ctrl_t
*const p_ctrl, uint8_t *const p_key )
```

Utility API to generate 128bits (16 bytes) randomized number to be used for provisioning. The randomized number can be used for UUID, Net Key and Application Key.

Implements `rm_ble_mesh_provision_api_t::generateRandomizedNumber`.

Example:

```
/* Generate 128bits (16 bytes) randomized number. */
err = RM_BLE_MESH_PROVISION_GenerateRandomizedNumber(&g_ble_mesh_provision0_ctrl,
p_net_key);
```

Return values

| | |
|-------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_PROVISION_SetOobPublicKey()

```
fsp_err_t RM_BLE_MESH_PROVISION_SetOobPublicKey ( rm_ble_mesh_provision_ctrl_t *const p_ctrl,
uint8_t const *const p_key, uint8_t size )
```

Utility API to set device out of band public key for provisioning.

Implements `rm_ble_mesh_provision_api_t::setOobPublicKey`.

Example:

```
/* Set device out of band public key. */
err = RM_BLE_MESH_PROVISION_SetOobPublicKey(&g_ble_mesh_provision0_ctrl,
p_public_key, size);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_key is NULL. |
| FSP_ERR_INVALID_ARGUMENT | The parameter size is more than 64. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_PROVISION_SetOobAuthInfo()

```
fsp_err_t RM_BLE_MESH_PROVISION_SetOobAuthInfo ( rm_ble_mesh_provision_ctrl_t *const p_ctrl,
uint8_t const *const p_auth_info, uint8_t size )
```

Utility API to set device out of band authentication information for provisioning.

Implements `rm_ble_mesh_provision_api_t::setOobAuthInfo`.

Example:

```
/* Set device out of band authentication information. */
err = RM_BLE_MESH_PROVISION_SetOobAuthInfo(&g_ble_mesh_provision0_ctrl,
p_auth_info, size);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_auth_info is NULL. |
| FSP_ERR_INVALID_ARGUMENT | The parameter size is more than 16. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_PROVISION_GenerateEcdhKey()

```
fsp_err_t RM_BLE_MESH_PROVISION_GenerateEcdhKey ( rm_ble_mesh_provision_ctrl_t *const
p_ctrl, uint8_t *const p_public_key )
```

Utility API to generate ECDH public key to be used for provisioning.

Implements `rm_ble_mesh_provision_api_t::generateEcdhKey`.

Example:

```
/* Generate ECDH Public Key for Provisioning. */
err = RM_BLE_MESH_PROVISION_GenerateEcdhKey(&g_ble_mesh_provision0_ctrl,
&public_key);
```

Return values

| | |
|-------------------------|-------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_public_key is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

BLE Mesh Network Scene Client (rm_mesh_scene_clt)

| fsp_err_t | RM_MESH_SCENE_CLT_Delete (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |
| fsp_err_t | RM_MESH_SCENE_CLT_DeleteUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter) |

Detailed Description

Overview

Target Devices

The BLE Mesh Network Scene Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_scene_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_scene_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Scene Client (rm_mesh_scene_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Scene Client (rm_mesh_scene_clt).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|---------------------------------------|-------------------------------|------|---|
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh scene client ISR occurs |
|---------------------------------------|-------------------------------|------|---|

| | | | |
|------|-------------------------------|----------------------|--------------|
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_scene_clt0 | Module name. |
|------|-------------------------------|----------------------|--------------|

Data Structures

```
struct rm\_mesh\_scene\_clt\_instance\_ctrl\_t
```

Data Structure Documentation

◆ rm_mesh_scene_clt_instance_ctrl_t

```
struct rm\_mesh\_scene\_clt\_instance\_ctrl\_t
```

BLE mesh scene instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_SCENE_CLT_Open\(\)](#) is called.

Function Documentation

◆ RM_MESH_SCENE_CLT_Open()

```
fsp_err_t RM_MESH_SCENE_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

open Scene Client middleware. This is to initialize Scene Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_SCENE_CLT_Open(&g_mesh_scene_clt0_ctrl, &g_mesh_scene_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_SCENE_CLT_Close()

```
fsp_err_t RM_MESH_SCENE_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Scene Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_SCENE_CLT_Close(&g_mesh_scene_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_SCENE_CLT_GetModelHandle()

```
fsp_err_t RM_MESH_SCENE_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,  
rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Scene client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of scene client model. */  
err = RM_MESH_SCENE_CLT_GetModelHandle(&g_mesh_scene_clt0_ctrl, &model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_SCENE_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_SCENE_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_SCENE_CLT_SendReliablePdu(&g_mesh_scene_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_SCENE_CLT_Get()**

```
fsp_err_t RM_MESH_SCENE_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Scene Get is an acknowledged message used to get the current status of a currently active scene of an element. The response to the Scene Get message is a Scene Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|----------------------------------|
| [in] | p_ctrl | rm_mesh_scene_clt control block. |
|------|--------|----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_SCENE_CLT_Recall()

```
fsp_err_t RM_MESH_SCENE_CLT_Recall ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Scene Recall is an acknowledged message that is used to recall the current state of an element from a previously stored scene. The response to the Scene Recall message is a Scene Status message.

Parameters

| | | |
|------|-------------|----------------------------------|
| [in] | p_ctrl | rm_mesh_scene_clt control block. |
| [in] | p_parameter | Pointer to Scene Recall message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_SCENE_CLT_RecallUnacknowledged()**

```
fsp_err_t RM_MESH_SCENE_CLT_RecallUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

Scene Recall Unacknowledged is an unacknowledged message used to recall the current state of an element from a previously stored Scene.

Parameters

| | | |
|------|-------------|----------------------------------|
| [in] | p_ctrl | rm_mesh_scene_clt control block. |
| [in] | p_parameter | Pointer to Scene Recall message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_SCENE_CLT_RegisterGet()**

```
fsp_err_t RM_MESH_SCENE_CLT_RegisterGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Scene Register Get is an acknowledged message used to get the current status of the Scene Register of an element. The response to the Scene Register Get message is a Scene Register Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|----------------------------------|
| [in] | p_ctrl | rm_mesh_scene_clt control block. |
|------|--------|----------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_SCENE_CLT_Store()**

```
fsp_err_t RM_MESH_SCENE_CLT_Store ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Scene Store is an acknowledged message used to store the current state of an element as a Scene, which can be recalled later. The response to the Scene Store message is a Scene Register Status message.

Parameters

| | | |
|------|-------------|----------------------------------|
| [in] | p_ctrl | rm_mesh_scene_clt control block. |
| [in] | p_parameter | Pointer to Scene Store message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_SCENE_CLT_StoreUnacknowledged()**

```
fsp_err_t RM_MESH_SCENE_CLT_StoreUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

Scene Store Unacknowledged is an unacknowledged message used to store the current state of an element as a Scene, which can be recalled later.

Parameters

| | | |
|------|-------------|----------------------------------|
| [in] | p_ctrl | rm_mesh_scene_clt control block. |
| [in] | p_parameter | Pointer to Scene Store message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_SCENE_CLT_Delete()**

```
fsp_err_t RM_MESH_SCENE_CLT_Delete ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Scene Delete is an acknowledged message used to delete a Scene from the Scene Register state of an element. The response to the Scene Delete message is a Scene Register Status message.

Parameters

| | | |
|------|-------------|------------------------------------|
| [in] | p_ctrl | rm_mesh_scene_clt control block. |
| [in] | p_parameter | Pointer to Scene Delete parameter. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_SCENE_CLT_DeleteUnacknowledged()

```
fsp_err_t RM_MESH_SCENE_CLT_DeleteUnacknowledged ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, void const *const p_parameter )
```

Scene Delete Unacknowledged is an unacknowledged message used to delete a scene from the Scene Register state of an element.

Parameters

| | | |
|------|-------------|------------------------------------|
| [in] | p_ctrl | rm_mesh_scene_clt control block. |
| [in] | p_parameter | Pointer to Scene Delete parameter. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

BLE Mesh Network Scene Server (rm_mesh_scene_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_SCENE_SRV_Open (rm_ble_mesh_scene_server_ctrl_t
*const p_ctrl, rm_ble_mesh_scene_server_cfg_t const *const p_cfg)
```

(rm_ble_mesh_scene_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state)
```

Detailed Description

Overview

Target Devices

The BLE Mesh Network Scene Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_scene_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_scene_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Scene Server (rm_mesh_scene_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Scene Server (rm_mesh_scene_srv).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|--|-------------------------------|----------------------|---|
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh scene server ISR occurs |
| Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh scene server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_scene_srv0 | Module name. |
| Model Handle | Invalid Model Handle | 0 | Select model handle. |
| Setup Server Handle | Invalid Setup Server Handle | 0 | Select setup server handle. |

Data Structures

```
struct rm_mesh_scene_srv_number_info_t
```

```
struct rm_mesh_scene_srv_status_info_t
```

```
struct rm_mesh_scene_srv_register_status_info_t
```

```
struct rm_mesh_scene_srv_ext_tid_and_transition_info_t
```

```
struct rm_mesh_scene_srv_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_scene_srv_number_info_t

| | | |
|--|--------|--------------------------------|
| struct rm_mesh_scene_srv_number_info_t | | |
| The state to identify a scene | | |
| Data Fields | | |
| uint16_t | number | The number to identify a scene |

◆ rm_mesh_scene_srv_status_info_t

| | | |
|--|----------------|----------------------------------|
| struct rm_mesh_scene_srv_status_info_t | | |
| The current status of a currently active scene | | |
| Data Fields | | |
| uint8_t | status_code | Status Code |
| uint16_t | current_scene | Scene Number of a current scene. |
| uint16_t | target_scene | Scene Number of a target scene. |
| uint8_t | remaining_time | |

◆ rm_mesh_scene_srv_register_status_info_t

| | | |
|---|---------------|---|
| struct rm_mesh_scene_srv_register_status_info_t | | |
| The current status of scene register | | |
| Data Fields | | |
| uint8_t | status_code | Status Code |
| uint16_t | current_scene | Scene Number of a current scene. |
| uint16_t * | scenes | A list of scenes stored within an element |
| uint16_t | scenes_count | |

◆ rm_mesh_scene_srv_ext_tid_and_transition_info_t

| | | |
|---|--|--|
| struct rm_mesh_scene_srv_ext_tid_and_transition_info_t | | |
| TID and Transition is a structure which contains Transaction ID (TID) as mandatory field. Other two fields, Transition Time and Delay are optional. | | |

TID field is a transaction identifier indicating whether the message is a new message or a retransmission of a previously sent message.

If present, the Transition Time field identifies the time that an element will take to transition to the target state from the present state.

The Delay field shall be present when the Transition Time field is present. It identifies the message execution delay, representing a time interval between receiving the message by a model and executing the associated model behaviors.

◆ rm_mesh_scene_srv_instance_ctrl_t

```
struct rm_mesh_scene_srv_instance_ctrl_t
```

BLE mesh scene instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_SCENE_SRV_Open()` is called.

Function Documentation

◆ RM_MESH_SCENE_SRV_Open()

```
fsp_err_t RM_MESH_SCENE_SRV_Open ( rm_ble_mesh_scene_server_ctrl_t *const p_ctrl,
rm_ble_mesh_scene_server_cfg_t const *const p_cfg )
```

API to initialize Scene Server model. This is to initialize Scene Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_SCENE_SRV_Open(&g_mesh_scene_srv0_ctrl, &g_mesh_scene_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_SCENE_SRV_Close()

```
fsp_err_t RM_MESH_SCENE_SRV_Close ( rm_ble_mesh_scene_server_ctrl_t *const p_ctrl)
```

API to terminate Scene Server model. This is to terminate Scene Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */  
err = RM_MESH_SCENE_SRV_Close(&g_mesh_scene_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_SCENE_SRV_StateUpdate()

```
fsp_err_t RM_MESH_SCENE_SRV_StateUpdate ( rm_ble_mesh_scene_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_SCENE_SRV_StateUpdate(&g_mesh_scene_srv0_ctrl, &state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

BLE Mesh Network Scheduler Client (rm_mesh_scheduler_clt)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Scheduler Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_scheduler_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_scheduler_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Scheduler Client (rm_mesh_scheduler_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Scheduler Client (rm_mesh_scheduler_clt).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|---------------------------------------|-------------------------------|------|---------------------------------------|
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh scheduler |
|---------------------------------------|-------------------------------|------|---------------------------------------|

client ISR occurs

| | | | |
|------|-------------------------------|--------------------------|--------------|
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_scheduler_clt0 | Module name. |
|------|-------------------------------|--------------------------|--------------|

Data Structures

```
struct rm_mesh_scheduler_clt_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_scheduler_clt_instance_ctrl_t

```
struct rm_mesh_scheduler_clt_instance_ctrl_t
```

BLE mesh scheduler instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_SCHEDULER_CLT_Open()` is called.

Function Documentation

◆ RM_MESH_SCHEDULER_CLT_Open()

```
fsp_err_t RM_MESH_SCHEDULER_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Scheduler Client middleware. This is to initialize Scheduler Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_SCHEDULER_CLT_Open(&g_mesh_scheduler_clt0_ctrl,
&g_mesh_scheduler_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_SCHEDULER_CLT_Close()

```
fsp_err_t RM_MESH_SCHEDULER_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Scheduler Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_SCHEDULER_CLT_Close(&g_mesh_scheduler_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_SCHEDULER_CLT_GetModelHandle()

```
fsp_err_t RM_MESH_SCHEDULER_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Scheduler client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of scheduler client model. */
err = RM_MESH_SCHEDULER_CLT_GetModelHandle(&g_mesh_scheduler_clt0_ctrl,
&model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_SCHEDULER_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_SCHEDULER_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_SCHEDULER_CLT_SendReliablePdu(&g_mesh_scheduler_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_SCHEDULER_CLT_Get()**

```
fsp_err_t RM_MESH_SCHEDULER_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Scheduler Get is an acknowledged message used to get the current Schedule Register state of an element. The response to the Scheduler Get message is a Scheduler Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|--------------------------------------|
| [in] | p_ctrl | rm_mesh_scheduler_clt control block. |
|------|--------|--------------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_SCHEDULER_CLT_ActionGet()

```
fsp_err_t RM_MESH_SCHEDULER_CLT_ActionGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Scheduler Action Get is an acknowledged message used to report the action defined by the entry of the Schedule Register state of an element, identified by the Index field. The response to the Scheduler Action Get message is a Scheduler Action Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_scheduler_clt control block. |
| [in] | p_parameter | Pointer to Scheduler Action Get message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_SCHEDULER_CLT_ActionSet()

```
fsp_err_t RM_MESH_SCHEDULER_CLT_ActionSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Scheduler Action Set is an acknowledged message used to set the entry of the Schedule Register state of an element, identified by the Index field. The response to the Scheduler Action Set message is a Scheduler Action Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_scheduler_clt control block. |
| [in] | p_parameter | Pointer to Scheduler Action Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_SCHEDULER_CLT_ActionSetUnacknowledged()

```
fsp_err_t RM_MESH_SCHEDULER_CLT_ActionSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Scheduler Action Set Unacknowledged is an unacknowledged message used to set the entry of the Schedule Register state of an element, identified by the Index field.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_scheduler_clt control block. |
| [in] | p_parameter | Pointer to Scheduler Action Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

BLE Mesh Network Scheduler Server (rm_mesh_scheduler_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_SCHEDULER_SRV_Open (rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_SCHEDULER_SRV_Close
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

```
fsp_err_t RM_MESH_SCHEDULER_SRV_StateUpdate
```

```
(rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state)
```

Detailed Description

Overview

Target Devices

The BLE Mesh Network Scheduler Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_scheduler_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_scheduler_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Scheduler Server (rm_mesh_scheduler_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Scheduler Server (rm_mesh_scheduler_srv).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|--|-------------------------------|--------------------------|---|
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh scheduler server ISR occurs |
| Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh scheduler server timeout ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_scheduler_srv0 | Module name. |

Data Structures

```
struct rm_mesh_scheduler_srv_schedules_info_t
```

```
struct rm_mesh_scheduler_srv_entry_index_info_t
```

```
struct rm_mesh_scheduler_srv_entry_info_t
```

```
struct rm_mesh_scheduler_srv_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_scheduler_srv_schedules_info_t

| | | |
|--|-----------|---|
| struct rm_mesh_scheduler_srv_schedules_info_t | | |
| The current Schedule Register state of an element. | | |
| Data Fields | | |
| uint16_t | schedules | Bit field indicating defined Actions in the Schedule Register |

◆ rm_mesh_scheduler_srv_entry_index_info_t

| | | |
|---|-------|--------------------------------------|
| struct rm_mesh_scheduler_srv_entry_index_info_t | | |
| The entry index of the Schedule Register state | | |
| Data Fields | | |
| uint8_t | index | Index of the Schedule Register entry |

◆ rm_mesh_scheduler_srv_entry_info_t

| | | |
|---|-----------------|--|
| struct rm_mesh_scheduler_srv_entry_info_t | | |
| The entry of the Schedule Register state | | |
| Data Fields | | |
| uint8_t | index | Index of the Schedule Register entry |
| uint8_t | year | Scheduled year for the action |
| uint16_t | month | Scheduled month for the action |
| uint8_t | day | Scheduled day of the month for the action |
| uint8_t | hour | Scheduled hour for the action |
| uint8_t | minute | Scheduled minute for the action |
| uint8_t | second | Scheduled second for the action |
| uint8_t | dayofweek | Schedule days of the week for the action |
| uint8_t | action | Action to be performed at the scheduled time |
| uint8_t | transition_time | Transition time for this action |
| uint16_t | scene_number | Scene number to be used for some actions |

◆ **rm_mesh_scheduler_srv_instance_ctrl_t**

```
struct rm_mesh_scheduler_srv_instance_ctrl_t
```

BLE mesh scheduler instance control block. DO NOT INITIALIZE. Initialization occurs when `RM_MESH_SCHEDULER_SRV_Open()` is called.

Function Documentation◆ **RM_MESH_SCHEDULER_SRV_Open()**

```
fsp_err_t RM_MESH_SCHEDULER_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Scheduler Server model. This is to initialize Scheduler Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_SCHEDULER_SRV_Open(&g_mesh_scheduler_srv0_ctrl,
&g_mesh_scheduler_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_SCHEDULER_SRV_Close()

```
fsp_err_t RM_MESH_SCHEDULER_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Scheduler Server model. This is to terminate Scheduler Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */  
err = RM_MESH_SCHEDULER_SRV_Close(&g_mesh_scheduler_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_SCHEDULER_SRV_StateUpdate()

```
fsp_err_t RM_MESH_SCHEDULER_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const
p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_SCHEDULER_SRV_StateUpdate(&g_mesh_scheduler_srv0_ctrl, &state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

BLE Mesh Network Sensor Client (rm_mesh_sensor_clt)

Data Structures

```
struct rm_mesh_sensor_clt_instance_ctrl_t
```

Data Structure Documentation

◆ rm_mesh_sensor_clt_instance_ctrl_t

```
struct rm_mesh_sensor_clt_instance_ctrl_t
```

BLE mesh sensor instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_SENSOR_CLT_Open\(\)](#) is called.

Function Documentation

◆ RM_MESH_SENSOR_CLT_Open()

```
fsp_err_t RM_MESH_SENSOR_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Sensor Client middleware. This is to initialize Sensor Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_SENSOR_CLT_Open(&g_mesh_sensor_clt0_ctrl, &g_mesh_sensor_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_SENSOR_CLT_Close()

```
fsp_err_t RM_MESH_SENSOR_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Sensor Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_SENSOR_CLT_Close(&g_mesh_sensor_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_SENSOR_CLT_GetModelHandle()

```
fsp_err_t RM_MESH_SENSOR_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,  
rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Sensor client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of sensor client model. */  
err = RM_MESH_SENSOR_CLT_GetModelHandle(&g_mesh_sensor_clt0_ctrl, &model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_SENSOR_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_SENSOR_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_SENSOR_CLT_SendReliablePdu(&g_mesh_sensor_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_SENSOR_CLT_DescriptorGet()**

```
fsp_err_t RM_MESH_SENSOR_CLT_DescriptorGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Sensor Descriptor Get is an acknowledged message used to get the Sensor Descriptor state of all sensors within an element. The response to a Sensor Descriptor Get message is a Sensor Descriptor Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Descriptor Get message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_SENSOR_CLT_Get()**

```
fsp_err_t RM_MESH_SENSOR_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Sensor Get is an acknowledged message used to get the Sensor Data state. The response to the Sensor Get message is a Sensor Status message.

Parameters

| | | |
|------|-------------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Get message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_SENSOR_CLT_ColumnGet()**

```
fsp_err_t RM_MESH_SENSOR_CLT_ColumnGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

Sensor Column Get is an acknowledged message used to get the Sensor Series Column state. The response to the Sensor Column Get message is a Sensor Column Status message

Parameters

| | | |
|------|-------------|---------------------------------------|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Column Get message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_SENSOR_CLT_SeriesGet()**

```
fsp_err_t RM_MESH_SENSOR_CLT_SeriesGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

Sensor Series Get is an acknowledged message used to get a sequence of the Sensor Series Column states. The response to the Sensor Series Get message is a Sensor Series Status message.

Parameters

| | | |
|------|-------------|---------------------------------------|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Series Get message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_SENSOR_CLT_CadenceGet()**

```
fsp_err_t RM_MESH_SENSOR_CLT_CadenceGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Sensor Cadence Get is an acknowledged message used to get the Sensor Cadence state of an element. The response to the Sensor Cadence Get message is a Sensor Cadence Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Cadence Get message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_SENSOR_CLT_CadenceSet()**

```
fsp_err_t RM_MESH_SENSOR_CLT_CadenceSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Sensor Cadence Set is an acknowledged message used to set the Sensor Cadence state of an element. The response to the Sensor Cadence Set message is a Sensor Cadence Status message.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Cadence Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_SENSOR_CLT_CadenceSetUnacknowledged()**

```
fsp_err_t RM_MESH_SENSOR_CLT_CadenceSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Sensor Cadence Set Unacknowledged is an unacknowledged message used to set the Sensor Cadence state of an element.

Parameters

| | | |
|------|-------------|--|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Cadence Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_SENSOR_CLT_SettingsGet()**

```
fsp_err_t RM_MESH_SENSOR_CLT_SettingsGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
void const *const p_parameter )
```

Sensor Settings Get is an acknowledged message used to get the list of Sensor Setting states of an element. The response to the Sensor Settings Get message is a Sensor Settings Status message

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Settings Get message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_SENSOR_CLT_SettingGet()**

```
fsp_err_t RM_MESH_SENSOR_CLT_SettingGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

Sensor Setting Get is an acknowledged message used to get the Sensor Setting state of an element. The response to the Sensor Setting Get message is a Sensor Setting Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Settings Get message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_SENSOR_CLT_SettingSet()**

```
fsp_err_t RM_MESH_SENSOR_CLT_SettingSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

Sensor Setting Set is an acknowledged message used to set the Sensor Setting state of an element. The response to the Sensor Setting Set message is a Sensor Setting Status message.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Settings Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_SENSOR_CLT_SettingSetUnacknowledged()

```
fsp_err_t RM_MESH_SENSOR_CLT_SettingSetUnacknowledged ( rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter )
```

Sensor Setting Set Unacknowledged is an unacknowledged message used to set the Sensor Setting state of an element.

Parameters

| | | |
|------|-------------|---|
| [in] | p_ctrl | rm_mesh_sensor_clt control block. |
| [in] | p_parameter | Pointer to Sensor Settings Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

BLE Mesh Network Sensor Server (rm_mesh_sensor_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

```

rm_ble_mesh_access_server_state_t const *const p_state)
```

Detailed Description

Overview

Target Devices

The BLE Mesh Network Sensor Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_sensor_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_sensor_srv_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Sensor Server (rm_mesh_sensor_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Sensor Server (rm_mesh_sensor_srv).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupts

| | | | |
|---------------------------------------|-------------------------------|------|--|
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh sensor server ISR occurs |
|---------------------------------------|-------------------------------|------|--|

| | | | |
|--|-------------------------------|------|--|
| Callback Provided when an Timeout ISR Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh sensor server timeout ISR occurs |
|--|-------------------------------|------|--|

| | | | |
|------|-------------------------------|---------------------------|--------------|
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_sensor_srv 0 | Module name. |
|------|-------------------------------|---------------------------|--------------|

Data Structure Documentation

◆ rm_mesh_sensor_srv_descriptor_info_t

| struct rm_mesh_sensor_srv_descriptor_info_t | | |
|--|---------------------------|--|
| Sensor Descriptor state represents the attributes describing the sensor data | | |
| Data Fields | | |
| uint16_t | sensor_property_id | Sensor Property ID field is a 2-octet value referencing a device property that describes the meaning and the format of data reported by a sensor |
| uint16_t | sensor_positive_tolerance | Sensor Positive Tolerance field is a 12-bit value representing the magnitude of a possible positive error associated with the measurements that the sensor is reporting |
| uint16_t | sensor_negative_tolerance | Sensor Negative Tolerance field is a 12-bit value representing the magnitude of a possible negative error associated with the measurements that the sensor is reporting |
| uint8_t | sensor_sampling_function | Sensor Sampling Function field specifies the averaging operation or type of sampling function applied to the measured value |
| uint8_t | sensor_measurement_period | Sensor Measurement Period field specifies a uint8 value n that represents the averaging time span, accumulation time, or measurement period in seconds over which the measurement is taken |
| uint8_t | sensor_update_interval | measurement reported by a sensor is internally refreshed at |

| | | |
|---------|--------|--|
| | | the frequency indicated in the Sensor Update Interval field |
| uint8_t | status | Status - used in response to indicate if other fields to be included |

◆ rm_mesh_sensor_srv_settings_info_t

| | | |
|---|----------------------------|--|
| struct rm_mesh_sensor_srv_settings_info_t | | |
| Sensor Settings state controls parameters of a sensor | | |
| Data Fields | | |
| uint16_t | sensor_property_id | Property ID of a sensor |
| uint16_t * | setting_property_ids | Property ID of a setting within a sensor |
| uint16_t | setting_property_ids_count | |

◆ rm_mesh_sensor_srv_setting_info_t

| | | |
|--|----------------------------|--|
| struct rm_mesh_sensor_srv_setting_info_t | | |
| Sensor Setting state controls parameters of a sensor | | |
| Data Fields | | |
| uint16_t | sensor_property_id | Property ID of a sensor |
| uint16_t | sensor_setting_property_id | Property ID of a setting within a sensor |
| uint8_t | sensor_setting_access | Read/Write access rights for the setting |
| uint8_t * | sensor_setting_raw | Raw value of a setting within a sensor |
| uint16_t | sensor_setting_raw_len | |
| uint8_t | status | |

◆ rm_mesh_sensor_srv_cadence_info_t

| | | |
|---|-------------------------------|--|
| struct rm_mesh_sensor_srv_cadence_info_t | | |
| Sensor Cadence state controls the cadence of sensor reports | | |
| Data Fields | | |
| uint16_t | sensor_property_id | Property ID of a sensor |
| uint8_t | fast_cadence_period_divisor | Divisor for the Publish Period |
| uint8_t | status_trigger_type | Defines the unit and format of the Status Trigger Delta fields |
| uint8_t * | status_trigger_delta_down | Delta down value that triggers a status message |
| uint16_t | status_trigger_delta_down_len | |

| | | |
|-----------|-----------------------------|--|
| uint8_t * | status_trigger_delta_up | Delta up value that triggers a status message |
| uint16_t | status_trigger_delta_up_len | |
| uint8_t | status_min_interval | Minimum interval between two consecutive Status messages APPLICATION NOTE: The Current Sensor Server Model implementation does not inherently check for the time interval between two consecutive status messages. The application layer which manages the data for the Sensor Server Model holds the responsibility for interleaving consecutive status messages with the configured Minimum time interval for statuses. |
| uint8_t * | fast_cadence_low | Low value for the fast cadence range |
| uint16_t | fast_cadence_low_len | |
| uint8_t * | fast_cadence_high | High value for the fast cadence range |
| uint16_t | fast_cadence_high_len | |
| uint8_t | status | Status - used in response path |

◆ rm_mesh_sensor_srv_data_info_t

| | | |
|--|-----------------|---|
| struct rm_mesh_sensor_srv_data_info_t | | |
| The Sensor Data state is a sequence of one or more pairs of Sensor Property ID and Raw Value fields, with each Raw Value field size and representation defined by the characteristics referenced by the Sensor Property ID | | |
| Data Fields | | |
| uint16_t | property_id_1 | ID of the 1st device property of the sensor |
| uint8_t * | raw_value_1 | Raw Value field with a size and representation defined by the 1st device property |
| uint16_t | raw_value_1_len | |
| uint16_t | property_id_2 | ID of the 2nd device property of the sensor |
| uint8_t * | raw_value_2 | Raw Value field with a size and representation defined by the 2nd device property |
| uint16_t | raw_value_2_len | |

| | | |
|-----------|-----------------|---|
| uint16_t | property_id_n | ID of the nth device property of the sensor |
| uint8_t * | raw_value_n | Raw Value field with a size and representation defined by the nth device property |
| uint16_t | raw_value_n_len | |
| uint8_t | status | Status - used in response path |

◆ rm_mesh_sensor_srv_series_column_info_t

| | | |
|--|-------------------------|--|
| struct rm_mesh_sensor_srv_series_column_info_t | | |
| Values measured by sensors may be organized as arrays (and represented as series of columns, such as histograms) | | |
| Data Fields | | |
| uint16_t | sensor_property_id | Property describing the data series of the sensor |
| uint8_t * | sensor_raw_value_x | Raw value representing the left corner of a column on the X axis |
| uint16_t | sensor_raw_value_x_len | |
| uint8_t * | sensor_column_width | Raw value representing the width of the column |
| uint16_t | sensor_column_width_len | |
| uint8_t * | sensor_raw_value_y | Raw value representing the height of the column on the Y axis |
| uint16_t | sensor_raw_value_y_len | |
| uint8_t | status | Status - used in response path |

◆ rm_mesh_sensor_srv_instance_ctrl_t

| | | |
|--|--|--|
| struct rm_mesh_sensor_srv_instance_ctrl_t | | |
| BLE mesh sensor instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SENSOR_SRV_Open() is called. | | |

Function Documentation

◆ RM_MESH_SENSOR_SRV_Open()

```
fsp_err_t RM_MESH_SENSOR_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Sensor Server model and to initialize Sensor_Setup Server model. This is to initialize Sensor Server model and to register with Access layer. And this is to initialize Sensor_Setup Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_SENSOR_SRV_Open(&g_mesh_sensor_srv0_ctrl, &g_mesh_sensor_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_SENSOR_SRV_Close()

```
fsp_err_t RM_MESH_SENSOR_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Sensor Server model. This is to terminate Sensor Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_SENSOR_SRV_Close(&g_mesh_sensor_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_SENSOR_SRV_StateUpdate()

```
fsp_err_t RM_MESH_SENSOR_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_SENSOR_SRV_StateUpdate(&g_mesh_sensor_srv0_ctrl, &state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_SENSOR_SRV_SetupServerStateUpdate()

```
fsp_err_t RM_MESH_SENSOR_SRV_SetupServerStateUpdate ( rm_ble_mesh_model_server_ctrl_t
*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

| | | |
|------|---------|---|
| [in] | p_ctrl | rm_mesh_sensor_srv control block. |
| [in] | p_state | To send reply for a request or to inform change in state. |

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

BLE Mesh Network Time Client (rm_mesh_time_clt)

Modules » Networking » BLE Mesh Network Modules

Functions

```
fsp_err_t RM_MESH_TIME_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const
p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_MESH_TIME_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const
p_ctrl)
```

```
fsp_err_t RM_MESH_TIME_CLT_GetModelHandle
```

```
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t *const p_model_handle)
```

```
fsp_err_t RM_MESH_TIME_CLT_SendReliablePdu
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode,
void const *const p_parameter, uint32_t rsp_opcode)
```

```
fsp_err_t RM_MESH_TIME_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const
p_ctrl)
```

```

```

```
fsp_err_t RM_MESH_TIME_CLT_TaiUtcDeltaGet
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

```
fsp_err_t RM_MESH_TIME_CLT_TaiUtcDeltaSet
(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const
p_parameter)
```

```
fsp_err_t RM_MESH_TIME_CLT_RoleGet (rm_ble_mesh_model_client_ctrl_t
*const p_ctrl)
```

```
fsp_err_t RM_MESH_TIME_CLT_RoleSet (rm_ble_mesh_model_client_ctrl_t
*const p_ctrl, void const *const p_parameter)
```

Detailed Description

Overview

Target Devices

The BLE Mesh Network Time Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_time_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_time_clt_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Time Client (rm_mesh_time_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Time Client (rm_mesh_time_clt).

| Configuration | Options | Default | Description |
|---------------------------------------|-------------------------------|---------------------|--|
| Interrupts | | | |
| Callback Provided when Timeout Occurs | Name Must Be a Valid C Symbol | NULL | Callback provided when mesh time client ISR occurs |
| Name | Name Must Be a Valid C Symbol | g_rm_mesh_time_clt0 | Module name. |

Data Structures

```
struct rm\_mesh\_time\_clt\_instance\_ctrl\_t
```

Data Structure Documentation

◆ [rm_mesh_time_clt_instance_ctrl_t](#)

```
struct rm\_mesh\_time\_clt\_instance\_ctrl\_t
```

BLE mesh time instance control block. DO NOT INITIALIZE. Initialization occurs when [RM_MESH_TIME_CLT_Open\(\)](#) is called.

Function Documentation

◆ RM_MESH_TIME_CLT_Open()

```
fsp_err_t RM_MESH_TIME_CLT_Open ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_model_client_cfg_t const *const p_cfg )
```

Open Time Client middleware. This is to initialize Time Client model and to register with Access layer.

Implements `rm_ble_mesh_model_client_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_TIME_CLT_Open(&g_mesh_time_clt0_ctrl, &g_mesh_time_clt0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_TIME_CLT_Close()

```
fsp_err_t RM_MESH_TIME_CLT_Close ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Close Time Client middleware.

Implements `rm_ble_mesh_model_client_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_TIME_CLT_Close(&g_mesh_time_clt0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_TIME_CLT_GetModelHandle()

```
fsp_err_t RM_MESH_TIME_CLT_GetModelHandle ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl,
rm_ble_mesh_access_model_handle_t *const p_model_handle )
```

This is to get the handle of Time client model.

Implements `rm_ble_mesh_model_client_api_t::getModelHandle`.

Example:

```
/* Get the handle of time client model. */
err = RM_MESH_TIME_CLT_GetModelHandle(&g_mesh_time_clt0_ctrl, &model_handle);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Got model handle successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_POINTER | The parameter p_model_handle is NULL. |

◆ RM_MESH_TIME_CLT_SendReliablePdu()

```
fsp_err_t RM_MESH_TIME_CLT_SendReliablePdu ( rm_ble_mesh_model_client_ctrl_t*const p_ctrl,
uint32_t req_opcode, void const*const p_parameter, uint32_t rsp_opcode )
```

This is to initialize sending acknowledged commands.

Implements `rm_ble_mesh_model_client_api_t::sendReliablePdu`.

Example:

```
/* Initialize sending acknowledged commands. */
err = RM_MESH_TIME_CLT_SendReliablePdu(&g_mesh_time_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_TIME_CLT_Get()**

```
fsp_err_t RM_MESH_TIME_CLT_Get ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Time Get is a message used to get the Time state of neighbor nodes. The response to the Time Get message is a Time Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|---------------------------------|
| [in] | p_ctrl | rm_mesh_time_clt control block. |
|------|--------|---------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_TIME_CLT_Set()**

```
fsp_err_t RM_MESH_TIME_CLT_Set ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Time Set is an acknowledged message used to set the Time state of an element. The response to the Time Set message is a Time Status message.

Parameters

| | | |
|------|-------------|---------------------------------|
| [in] | p_ctrl | rm_mesh_time_clt control block. |
| [in] | p_parameter | Pointer to Time Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_TIME_CLT_ZoneGet()**

```
fsp_err_t RM_MESH_TIME_CLT_ZoneGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Time Zone Get is an acknowledged message used to get the Time Zone Offset Current state, the Time Zone Offset New state, and the TAI of Zone Change state. The response to the Time Zone Get message is a Time Zone Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|---------------------------------|
| [in] | p_ctrl | rm_mesh_time_clt control block. |
|------|--------|---------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_TIME_CLT_ZoneSet()**

```
fsp_err_t RM_MESH_TIME_CLT_ZoneSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Time Zone Set is an acknowledged message used to set the Time Zone Offset New state and the TAI of Zone Change state.

Parameters

| | | |
|------|-------------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_time_clt control block. |
| [in] | p_parameter | Pointer to Time Zone Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_TIME_CLT_TaiUtcDeltaGet()**

```
fsp_err_t RM_MESH_TIME_CLT_TaiUtcDeltaGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

TAI-UTC Delta Get is an acknowledged message used to get the TAI-UTC Delta Current state, the TAI-UTC Delta New state, and the TAI of Delta Change state. The response to the TAI-UTC Delta Get message is a TAI-UTC Delta Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|---------------------------------|
| [in] | p_ctrl | rm_mesh_time_clt control block. |
|------|--------|---------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_TIME_CLT_TaiUtcDeltaSet()**

```
fsp_err_t RM_MESH_TIME_CLT_TaiUtcDeltaSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void
const *const p_parameter )
```

TAI-UTC Delta Set is an acknowledged message used to set the TAI-UTC Delta New state and the TAI of Delta Change state.

Parameters

| | | |
|------|-------------|---------------------------------------|
| [in] | p_ctrl | rm_mesh_time_clt control block. |
| [in] | p_parameter | Pointer to TAI-UTC Delta Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ **RM_MESH_TIME_CLT_RoleGet()**

```
fsp_err_t RM_MESH_TIME_CLT_RoleGet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
```

Time Role Get is an acknowledged message used to get the Time Role state of an element. The response to the Time Role Get message is a Time Role Status message. There are no parameters for this message.

Parameters

| | | |
|------|--------|---------------------------------|
| [in] | p_ctrl | rm_mesh_time_clt control block. |
|------|--------|---------------------------------|

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

◆ RM_MESH_TIME_CLT_RoleSet()

```
fsp_err_t RM_MESH_TIME_CLT_RoleSet ( rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter )
```

Time Role Set is an acknowledged message used to set the Time Role state of an element. The response to the Time Role Set message is a Time Role Status message.

Parameters

| | | |
|------|-------------|-----------------------------------|
| [in] | p_ctrl | rm_mesh_time_clt control block. |
| [in] | p_parameter | Pointer to Time Role Set message. |

Return values

| | |
|--------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_INVALID_POINTER | The parameter p_parameter is NULL. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

BLE Mesh Network Time Server (rm_mesh_time_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

```

struct rm\_mesh\_time\_srv\_info\_t
```

```
struct rm\_mesh\_time\_srv\_zone\_info\_t
```

```
struct rm\_mesh\_time\_srv\_tai\_utc\_delta\_info\_t
```

```
struct rm\_mesh\_time\_srv\_role\_info\_t
```

```
struct rm\_mesh\_time\_srv\_instance\_ctrl\_t
```

Data Structure Documentation

◆ rm_mesh_time_srv_info_t

| struct rm_mesh_time_srv_info_t | | |
|--|------------------|--|
| Mesh defines times based on International Atomic Time (TAI). The base representation of times is the number of seconds after 00:00:00 TAI on 2000-01-01 (that is, 1999-12-31T23:59:28 UTC) | | |
| Data Fields | | |
| uint8_t | tai_seconds[5] | Current TAI time in seconds since the epoch. |
| uint8_t | subsecond | The sub-second time in units of 1/256s. |
| uint8_t | uncertainty | Estimated uncertainty in 10-millisecond steps. |
| uint8_t | time_authority | 0 = No Time Authority. The element does not have a trusted OOB source of time, such as GPS or NTP. 1 = Time Authority. The element has a trusted OOB source of time, such as GPS or NTP or a battery-backed, properly initialized RTC. |
| uint16_t | tai_utc_delta | Current difference between TAI and UTC in seconds |
| uint8_t | time_zone_offset | The local time zone offset in 15-minute increments |

◆ rm_mesh_time_srv_zone_info_t

| struct rm_mesh_time_srv_zone_info_t | | |
|-------------------------------------|--------------------------|---|
| Time Zone | | |
| Data Fields | | |
| uint8_t | time_zone_offset_current | Current local time zone offset. Meaningful only in 'Time Zone Status' response. |
| uint8_t | time_zone_offset_new | Upcoming local time zone offset. |
| uint8_t | tai_of_zone_change[5] | Absolute TAI time when the Time Zone Offset will change from Current to New. |

◆ rm_mesh_time_srv_tai_utc_delta_info_t

| struct rm_mesh_time_srv_tai_utc_delta_info_t | | |
|--|--|--|
| TAI-UTC Delta | | |

| Data Fields | | |
|-------------|------------------------|--|
| uint16_t | tai_utc_delta_current | Current difference between TAI and UTC in seconds. Meaningful only in 'TAI-UTC Delta Status' response. |
| uint16_t | tai_utc_delta_new | Upcoming difference between TAI and UTC in seconds. |
| uint8_t | padding | Always 0b0. Other values are Prohibited. |
| uint8_t | tai_of_delta_change[5] | TAI Seconds time of the upcoming TAI-UTC Delta change |

◆ rm_mesh_time_srv_role_info_t

| struct rm_mesh_time_srv_role_info_t | | |
|-------------------------------------|------|-----------|
| The Time Role state of an element | | |
| Data Fields | | |
| uint8_t | role | Time Role |

◆ rm_mesh_time_srv_instance_ctrl_t

| | | |
|--|--|--|
| struct rm_mesh_time_srv_instance_ctrl_t | | |
| BLE mesh time instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_TIME_SRV_Open() is called. | | |

Function Documentation

◆ RM_MESH_TIME_SRV_Open()

```
fsp_err_t RM_MESH_TIME_SRV_Open ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_model_server_cfg_t const *const p_cfg )
```

API to initialize Time Server model. This is to initialize Time Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::open`.

Example:

```
/* Open the module. */
err = RM_MESH_TIME_SRV_Open(&g_mesh_time_srv0_ctrl, &g_mesh_time_srv0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Model opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Model is already open. |
| FSP_ERR_NOT_FOUND | The number of models has exceeded the limit. |
| FSP_ERR_ABORTED | Model initialization is failed. |

◆ RM_MESH_TIME_SRV_Close()

```
fsp_err_t RM_MESH_TIME_SRV_Close ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
```

API to terminate Time Server model. This is to terminate Time Server model and to register with Access layer.

Implements `rm_ble_mesh_model_server_api_t::close`.

Example:

```
/* Close the module. */
err = RM_MESH_TIME_SRV_Close(&g_mesh_time_srv0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Model successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |

◆ RM_MESH_TIME_SRV_StateUpdate()

```
fsp_err_t RM_MESH_TIME_SRV_StateUpdate ( rm_ble_mesh_model_server_ctrl_t *const p_ctrl,
rm_ble_mesh_access_server_state_t const *const p_state )
```

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements `rm_ble_mesh_model_server_api_t::stateUpdate`.

Example:

```
/* Update server status. */
err = RM_MESH_TIME_SRV_StateUpdate(&g_mesh_time_srv0_ctrl, &state);
```

Return values

| | |
|--------------------------|-------------------------------------|
| FSP_SUCCESS | Updated server status successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_state is NULL. |
| FSP_ERR_NOT_OPEN | Model is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_APPROXIMATION | Lower layer is invalid state. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_ABORTED | Operation is failed. |

BLE Mesh Network Upper Trans (rm_ble_mesh_upper_trans)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Upper Trans module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh_upper_trans

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_upper_trans_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Upper Trans (rm_ble_mesh_upper_trans)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Upper Trans (rm_ble_mesh_upper_trans).

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

General

| | | | |
|------------------------------|---|----------------------------|---|
| Name | Name Must Be a Valid C Symbol | g_rm_ble_mesh_upper_trans0 | Module name. |
| Channel Number | Invalid Channel Number | 0 | Select channel corresponding to the channel number of the hardware. |
| Control Message Event Enable | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Whether to enable the control message event or not. |
| Access Message Event Enable | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Whether to enable the access message event or not. |
| Callback | Name Must Be a Valid C Symbol | NULL | Callback function name. |

Data Structures

```
struct rm\_ble\_mesh\_upper\_trans\_instance\_ctrl\_t
```

Data Structure Documentation

◆ [rm_ble_mesh_upper_trans_instance_ctrl_t](#)

```
struct rm\_ble\_mesh\_upper\_trans\_instance\_ctrl\_t
```

RM_BLE_MESH_UPPER_TRANS private control block. DO NOT MODIFY. Initialization occurs when [RM_BLE_MESH_UPPER_TRANS_Open\(\)](#) is called.

Function Documentation

◆ RM_BLE_MESH_UPPER_TRANS_Open()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_Open ( rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl,
rm_ble_mesh_upper_trans_cfg_t const *const p_cfg )
```

Register Interface with Transport Layer. This routine registers interface with the Transport Layer. Transport Layer supports single Application, hence this routine shall be called once.

Implements `rm_ble_mesh_upper_trans_api_t::open`.

Example:

```
/* Open the module. */
err = RM_BLE_MESH_UPPER_TRANS_Open(&g_ble_mesh_upper_trans0_ctrl,
&g_ble_mesh_upper_trans0_cfg);
```

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |

◆ RM_BLE_MESH_UPPER_TRANS_Close()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_Close ( rm_ble_mesh_provision_ctrl_t *const p_ctrl)
```

Unregister Interface with Transport Layer. Implements `rm_ble_mesh_upper_trans_api_t::close`.

Example:

```
/* Close the module. */
err = RM_BLE_MESH_UPPER_TRANS_Close(&g_ble_mesh_upper_trans0_ctrl);
```

Return values

| | |
|-----------------------|-------------------------------|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_UPPER_TRANS_SendAccessPdu()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_SendAccessPdu ( rm_ble_mesh_upper_trans_ctrl_t *const
p_ctrl, rm_ble_mesh_upper_trans_access_layer_pdu_t const *const p_access_layer_pdu,
rm_ble_mesh_lower_trans_reliable_t reliable )
```

API to send Access Layer PDUs. This routine sends Access Layer PDUs to peer device.

Implements `rm_ble_mesh_upper_trans_api_t::sendAccessPdu`.

Example:

```
/* Send Access Layer PDUs. */
err = RM_BLE_MESH_UPPER_TRANS_SendAccessPdu(&g_ble_mesh_upper_trans0_ctrl,
                                             &access_layer_pdu,
RM_BLE_MESH_LOWER_TRANS_RELIABLE_ENABLE);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_access_layer_pdu is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_UPPER_TRANS_SendControlPdu()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_SendControlPdu ( rm_ble_mesh_upper_trans_ctrl_t *const
p_ctrl, rm_ble_mesh_upper_trans_control_pdu_t const *const p_control_pdu )
```

API to send transport Control PDUs. This routine sends transport Control PDUs to peer device.

Implements `rm_ble_mesh_upper_trans_api_t::sendControlPdu`.

Example:

```
/* Send Upper Transport control PDUs. */
err = RM_BLE_MESH_UPPER_TRANS_SendControlPdu(&g_ble_mesh_upper_trans0_ctrl,
&control_pdu);
```

Return values

| | |
|--------------------------|--------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_control_pdu is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_UPPER_TRANS_LpnSetupFriendship()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnSetupFriendship ( rm_ble_mesh_upper_trans_ctrl_t
*const p_ctrl, rm_ble_mesh_upper_trans_friendship_setting_t const *const p_setting )
```

API to setup Friendship. This routine is used by the device acting as a low power node to setup a friendship procedure to any available friend nodes.

Implements `rm_ble_mesh_upper_trans_api_t::lpnSetupFriendship`.

Example:

```
/* Setup friendship. */
err = RM_BLE_MESH_UPPER_TRANS_LpnSetupFriendship(&g_ble_mesh_upper_trans0_ctrl,
&setting);
```

Return values

| | |
|-------------------------|----------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_setting is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Lower layer is invalid state. |

◆ RM_BLE_MESH_UPPER_TRANS_LpnClearFriendship()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnClearFriendship ( rm_ble_mesh_upper_trans_ctrl_t
*const p_ctrl)
```

API to terminate friendship. This routine is used by the device acting as a low power node terminate friendship with an active Friend node.

Implements `rm_ble_mesh_upper_trans_api_t::lpnClearFriendship`.

Example:

```
/* Terminate friendship. */
err = RM_BLE_MESH_UPPER_TRANS_LpnClearFriendship(&g_ble_mesh_upper_trans0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_UPPER_TRANS_LpnManageSubscription()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnManageSubscription ( rm_ble_mesh_upper_trans_ctrl_t
*const p_ctrl, rm_ble_mesh_upper_trans_control_opcode_t action, uint16_t const *const
p_addr_list, uint16_t count )
```

API to manage friend subscription list. This routine is used by the device acting as a low power node add/remove addresses to/from the friends subscription list.

Implements `rm_ble_mesh_upper_trans_api_t::lpnManageSubscription`.

Example:

```
/* Manage friend subscription list. */
err =
RM_BLE_MESH_UPPER_TRANS_LpnManageSubscription(&g_ble_mesh_upper_trans0_ctrl,
RM_BLE_MESH_UPPER_TRANS_CONTROL_OPCODE_FRIEND_POLL,
&addr_list,
count);
```

Return values

| | |
|-------------------------|------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_addr_list is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |

◆ RM_BLE_MESH_UPPER_TRANS_LpnPoll()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnPoll ( rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl)
```

To trigger Friend Poll from application. This routine enables the application to trigger a Friend Poll even before the expiry of an active poll period configured during the friendship establishment. The poll period will get reset at this point.

Implements `rm_ble_mesh_upper_trans_api_t::lpnPoll`.

Example:

```
/* Trigger friend poll from application. */
err = RM_BLE_MESH_UPPER_TRANS_LpnPoll(&g_ble_mesh_upper_trans0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_UPPER_TRANS_IsValidLpnElementAddress()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_IsValidLpnElementAddress (
rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_network_address_t addr,
rm_ble_mesh_lower_trans_lpn_handle_t *const p_lpn_handle )
```

To check if address matches with any of the LPN. This routine checks if destination address in a received packet matches with any of the known element address of LPN.

Implements `rm_ble_mesh_upper_trans_api_t::isValidLpnElementAddress`.

Example:

```
/* Check if address matches with any of the LPN. */
err =
RM_BLE_MESH_UPPER_TRANS_IsValidLpnElementAddress(&g_ble_mesh_upper_trans0_ctrl, addr,
&lpn_handle);
```

Return values

| | |
|-------------------------|-------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_lpn_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_UPPER_TRANS_IsValidLpnSubscriptionAddress()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_IsValidLpnSubscriptionAddress (
  rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_network_address_t addr,
  rm_ble_mesh_lower_trans_lpn_handle_t *const p_lpn_handle )
```

To check if valid subscription address of an LPN to receive a packet. This routine checks if destination address in a received packet matches with any of the known subscription address of an LPN.

Implements `rm_ble_mesh_upper_trans_api_t::IsValidLpnSubscriptionAddress`.

Example:

```
/* Check if valid subscription address of an LPN to receive a packet. */
err =
RM_BLE_MESH_UPPER_TRANS_IsValidLpnSubscriptionAddress(&g_ble_mesh_upper_trans0_ctrl,
addr, &lpn_handle);
```

Return values

| | |
|-------------------------|-------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_lpn_handle is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |

◆ RM_BLE_MESH_UPPER_TRANS_GetLpnPolltimeout()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_GetLpnPolltimeout ( rm_ble_mesh_upper_trans_ctrl_t
*const p_ctrl, rm_ble_mesh_network_address_t lpn_addr, uint32_t *const p_poll_timeout )
```

To get Poll Timeout of an LPN. This routine checks if LPN address is valid and then returns Poll Timeout configured for the LPN.

Implements `rm_ble_mesh_upper_trans_api_t::getLpnPolltimeout`.

Example:

```
/* Get poll timeout of an LPN. */
err = RM_BLE_MESH_UPPER_TRANS_GetLpnPolltimeout(&g_ble_mesh_upper_trans0_ctrl,
addr, &poll_timeout);
```

Return values

| | |
|-------------------------|---------------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_poll_timeout is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_UPPER_TRANS_GetFriendshipInfo()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_GetFriendshipInfo ( rm_ble_mesh_upper_trans_ctrl_t *const
p_ctrl, rm_ble_mesh_upper_trans_friend_role_t role, uint16_t lpn_index,
rm_ble_mesh_upper_trans_friendship_info_t *const p_node )
```

To get the LPN node information. This routine fetches the node information of the LPN element at the given index

Implements `rm_ble_mesh_upper_trans_api_t::getFriendshipInfo`.

Example:

```
/* Get the LPN node information. */
err = RM_BLE_MESH_UPPER_TRANS_GetFriendshipInfo(&g_ble_mesh_upper_trans0_ctrl,
RM_BLE_MESH_UPPER_TRANS_FRIEND_ROLE_FRIEND,
                                lpn_index,
                                &node);
```

Return values

| | |
|-------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_node is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_UPPER_TRANS_LpnRegisterSecurityUpdate()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnRegisterSecurityUpdate (
  rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_network_subnet_handle_t
  subnet_handle, uint8_t flag, uint32_t ivindex )
```

To add the security update information. This routine updates the security state of the network to all the active LPN elements. This will be forwarded to the elements when it polls for the next packet available.

Implements `rm_ble_mesh_upper_trans_api_t::lpnRegisterSecurityUpdate`.

Example:

```
/* Add the security update information. */
err =
  RM_BLE_MESH_UPPER_TRANS_LpnRegisterSecurityUpdate(&g_ble_mesh_upper_trans0_ctrl,
  subnet_handle, flag, ivindex);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_UPPER_TRANS_ClearAllLpn()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_ClearAllLpn ( rm_ble_mesh_upper_trans_ctrl_t *const
  p_ctrl)
```

To clear information related to all LPNs. This routine clears information related to all LPNs.

Implements `rm_ble_mesh_upper_trans_api_t::clearAllLpn`.

Example:

```
/* Clear information related to all LPNs. */
err = RM_BLE_MESH_UPPER_TRANS_ClearAllLpn(&g_ble_mesh_upper_trans0_ctrl);
```

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_UPPER_TRANS_SetHeartbeatPublication()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_SetHeartbeatPublication ( rm_ble_mesh_upper_trans_ctrl_t
*const p_ctrl, rm_ble_mesh_upper_trans_heartbeat_publication_info_t *const p_info )
```

To set the Heartbeat publication data. This routine configures the Heartbeat publication information

Implements `rm_ble_mesh_upper_trans_api_t::setHeartbeatPublication`.

Example:

```
/* Set the heartbeat publication data. */
err =
RM_BLE_MESH_UPPER_TRANS_SetHeartbeatPublication(&g_ble_mesh_upper_trans0_ctrl,
&ut_hp_info);
```

Return values

| | |
|--------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_info is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |

◆ RM_BLE_MESH_UPPER_TRANS_GetHeartbeatPublication()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_GetHeartbeatPublication ( rm_ble_mesh_upper_trans_ctrl_t
*const p_ctrl, rm_ble_mesh_upper_trans_heartbeat_publication_info_t *const p_info )
```

To get the Heartbeat publication data. This routine retrieves the Heartbeat publication information
Implements `rm_ble_mesh_upper_trans_api_t::getHeartbeatPublication`.

Example:

```
/* Get the heartbeat publication data. */
err =
RM_BLE_MESH_UPPER_TRANS_GetHeartbeatPublication(&g_ble_mesh_upper_trans0_ctrl,
&ut_hp_info);
```

Return values

| | |
|-------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_info is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_UPPER_TRANS_SetHeartbeatSubscription()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_SetHeartbeatSubscription ( rm_ble_mesh_upper_trans_ctrl_t
*const p_ctrl, rm_ble_mesh_upper_trans_heartbeat_subscription_info_t *const p_info )
```

To set the Heartbeat subscription data. This routine configures the Heartbeat subscription information

Implements `rm_ble_mesh_upper_trans_api_t::setHeartbeatSubscription`.

Example:

```
/* Set the heartbeat subscription data. */
err =
RM_BLE_MESH_UPPER_TRANS_SetHeartbeatSubscription(&g_ble_mesh_upper_trans0_ctrl,
&ut_hs_info);
```

Return values

| | |
|-------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_info is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ADDRESS | Invalid source address. |

◆ RM_BLE_MESH_UPPER_TRANS_GetHeartbeatSubscription()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_GetHeartbeatSubscription (
  rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl,
  rm_ble_mesh_upper_trans_heartbeat_subscription_info_t *const p_info )
```

To get the Heartbeat subscription data. This routine retrieves the Heartbeat subscription information

Implements `rm_ble_mesh_upper_trans_api_t::getHeartbeatSubscription`.

Example:

```
/* Get the heartbeat subscription data. */
err =
RM_BLE_MESH_UPPER_TRANS_GetHeartbeatSubscription(&g_ble_mesh_upper_trans0_ctrl,
&ut_hs_info);
```

Return values

| | |
|-------------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_INVALID_POINTER | The parameter p_info is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_BLE_MESH_UPPER_TRANS_TriggerHeartbeat()

```
fsp_err_t RM_BLE_MESH_UPPER_TRANS_TriggerHeartbeat ( rm_ble_mesh_upper_trans_ctrl_t *const
p_ctrl, uint8_t change_in_feature_bit )
```

To trigger Heartbeat send on change in feature. This routine triggers the Heartbeat send on change in state of supported features.

Implements `rm_ble_mesh_upper_trans_api_t::triggerHeartbeat`.

Example:

```
/* Trigger heartbeat send on change in feature. */
err = RM_BLE_MESH_UPPER_TRANS_TriggerHeartbeat(&g_ble_mesh_upper_trans0_ctrl,
change_in_feature_bit);
```

Return values

| | |
|--------------------------|---------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input parameter is invalid. |
| FSP_ERR_OUT_OF_MEMORY | Memory allocation is failed. |
| FSP_ERR_OVERFLOW | TX queue is full. |
| FSP_ERR_UNDERFLOW | TX queue is empty. |
| FSP_ERR_NOT_FOUND | Input parameter is not found. |
| FSP_ERR_INVALID_POINTER | The internal parameter is NULL. |

void comm_uart_aws_callback (uart_callback_args_t *p_args)

```

Detailed Description

Middleware implementing the AWS Cellular Comm Interface for the FSP UART API.

Overview

See AWS documentation for how the Cellular Comm Interface works:

https://www.freertos.org/Documentation/api-ref/cellular/cellular_porting.html#cellular_porting_comm_if

Configuration

Note

Using DTC with UART is recommended to reduce the number of interrupts in the system.

Build Time Configurations for rm_cellular_comm_uart_aws

The following build time configurations are defined in fsp_cfg/middleware/rm_cellular_comm_uart_aws_cfg.h:

| Configuration | Options | Default | Description |
|-----------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | Selects if code for parameter checking is to be included in the build. |
| Receive Buffer | Size should be greater than zero | 256 | Temporary buffer for received bytes. When read function is called remaining bytes will be read directly into buffer specified by read function argument. |
| Receive Transfer Size | Size should be greater than zero | 512 | The comm interface will break down UART reads into smaller read requests based on this number. For instance if this is set to 512 bytes then the interface will request 512 bytes at a time until the |

requested length is met or timeout. This is helpful for making use of DTC without having a long timeout period. AWS Cellular Interface Common->Comm Interface Receive Timeout is the timeout used for individual reads and should set accordingly based on this setting.

Configurations for Networking > Cellular Comm Interface on UART (rm_cellular_comm_uart_aws)

| Configuration | Options | Default | Description |
|---------------|-------------------------------|--------------------------|--------------|
| Name | Name must be a valid C symbol | g_rm_cellular_comm_uart0 | Module name. |

Function Documentation

◆ RM_CELLULAR_COMM_UART_AWS_Open()

```
CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Open (
  rm_cellular_comm_uart_aws_instance_ctrl_t * p_instance_ctrl,
  CellularCommInterfaceReceiveCallback_t receive_callback, void * pUserData )
```

Implements open for CellularCommInterface_t

Parameters

| | | |
|------|------------------|--|
| [in] | receive_callback | Callback to call upon receiving data |
| [in] | pUserData | Pointer to user data to be passed through callback |
| [in] | p_instance_ctrl | Pointer to a rm_cellular_comm_uart_aws_instance_ctrl_t |

Return values

| | |
|----------------------------------|-----------------------------|
| IOT_COMM_INTERFACE_SUCCESS | Open succeeded |
| IOT_COMM_INTERFACE_BAD_PARAMETER | Bad parameter was passed in |
| IOT_COMM_INTERFACE_FAILURE | General failure |
| IOT_COMM_INTERFACE_DRIVER_ERROR | Lower level failure |

◆ **RM_CELLULAR_COMM_UART_AWS_Send()**

```
CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Send (
CellularCommInterfaceHandle_t commInterfaceHandle, const uint8_t* pData, uint32_t
dataLength, uint32_t timeoutMilliseconds, uint32_t* pDataSentLength )
```

Implements send for CellularCommInterface_t. This function will block the calling thread until data is sent.

Parameters

| | | |
|------|---------------------|--|
| [in] | commInterfaceHandle | CellularCommInterfaceHandle_t assigned in open |
| [in] | pData | Pointer to data to send |
| [in] | dataLength | Length of data to send |
| [in] | timeoutMilliseconds | Timeout in MS to wait for data to send |
| [in] | pDataSentLength | Actual length of data sent |

Return values

| | |
|----------------------------------|-----------------------------|
| IOT_COMM_INTERFACE_SUCCESS | Send succeeded |
| IOT_COMM_INTERFACE_BAD_PARAMETER | Bad parameter was passed in |
| IOT_COMM_INTERFACE_FAILURE | General failure |
| IOT_COMM_INTERFACE_DRIVER_ERROR | Lower level failure |
| IOT_COMM_INTERFACE_TIMEOUT | Send operation timed out |

◆ **RM_CELLULAR_COMM_UART_AWS_Receive()**

```
CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Receive (
CellularCommInterfaceHandle_t commInterfaceHandle, uint8_t* pBuffer, uint32_t bufferSize,
uint32_t timeoutMilliseconds, uint32_t* pDataReceivedLength )
```

Implements receive for CellularCommInterface_t. This function will block the calling thread until data is received.

Parameters

| | | |
|------|---------------------|--|
| [in] | commInterfaceHandle | CellularCommInterfaceHandle_t assigned in open |
| [in] | pBuffer | Pointer to buffer to receive to |
| [in] | bufferLength | Length of buffer |
| [in] | timeoutMilliseconds | Timeout in MS to wait for data reception |
| [in] | pDataReceivedLength | Actual length of data received |

Return values

| | |
|----------------------------------|-----------------------------|
| IOT_COMM_INTERFACE_SUCCESS | Receive succeeded |
| IOT_COMM_INTERFACE_BAD_PARAMETER | Bad parameter was passed in |
| IOT_COMM_INTERFACE_FAILURE | General failure |
| IOT_COMM_INTERFACE_DRIVER_ERROR | Lower level failure |

◆ **RM_CELLULAR_COMM_UART_AWS_Close()**

```
CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Close (
CellularCommInterfaceHandle_t commInterfaceHandle)
```

Implements close for CellularCommInterface_t

Parameters

| | | |
|------|---------------------|--|
| [in] | commInterfaceHandle | CellularCommInterfaceHandle_t assigned in open |
|------|---------------------|--|

Return values

| | |
|----------------------------------|-----------------------------|
| IOT_COMM_INTERFACE_SUCCESS | Close succeeded |
| IOT_COMM_INTERFACE_BAD_PARAMETER | Bad parameter was passed in |
| IOT_COMM_INTERFACE_FAILURE | General failure |

◆ **comm_uart_aws_callback()**

```
void comm_uart_aws_callback ( uart_callback_args_t * p_args)
```

Callback for UART driver

Parameters

| | | |
|------|--------|------------------------------------|
| [in] | p_args | Arguments from UART RX/TX callback |
|------|--------|------------------------------------|

5.2.12.13 DA16XXX Transport Layer (rm_at_transport_da16xxx_uart)

Modules » [Networking](#)

Functions

```
void rm_at_transport_da16xxx_uart_callback (uart_callback_args_t *p_args)
```

```

```

```
fsp_err_t rm_at_transport_da16xxx_uart_atCommandSendThreadSafe (at_transport_da16xxx_ctrl_t *const p_ctrl, at_transport_da16xxx_data_t *p_at_cmd)
```

```
fsp_err_t rm_at_transport_da16xxx_uart_atCommandSend (at_transport_da16xxx_ctrl_t *const p_ctrl, at_transport_da16xxx_data_t *p_at_cmd)
```

```
fsp_err_t rm_at_transport_da16xxx_uart_giveMutex (at_transport_da16xxx_ctrl_t *const p_ctrl, uint32_t mutex_flag)
```

```
fsp_err_t rm_at_transport_da16xxx_uart_takeMutex (at_transport_da16xxx_ctrl_t *const p_ctrl, uint32_t mutex_flag)
```

```
size_t rm_at_transport_da16xxx_uart_bufferRecv (at_transport_da16xxx_ctrl_t *const p_ctrl, const char *p_data, uint32_t length, uint32_t rx_timeout)
```

```
fsp_err_t rm_at_transport_da16xxx_statusGet (at_transport_da16xxx_ctrl_t *const p_ctrl, at_transport_da16xxx_status_t *p_status)
```

```
fsp_err_t rm_at_transport_da16xxx_uartClose (at_transport_da16xxx_ctrl_t *const p_ctrl)
```

Detailed Description

Transport layer implementation for linking DA16XXX Drivers with Communications layer.

Overview

This Transport Layer provides an abstraction interface between the DA16XXX driver and communications layers. Currently, the module supports only UART, but will support SPI in future.

Refer to [WiFi Onchip DA16XXX Framework Driver \(rm_wifi_da16xxx\)](#).

Features

- Configuring internal send/receive buffers.
- Providing thread-safe access to the communications interface (mutex) when sending AT commands.
- Implementing AT command send function based on user communication option (UART or SPI (future)). This function must be able to check the module response.
- Implement a receive function based on user communication option (UART or SPI (future)). Handles income data from the communications interface and stacks it on an internal buffer.

Refer to [WiFi Onchip DA16XXX Framework Driver \(rm_wifi_da16xxx\)](#).

Configuration

Build Time Configurations for rm_at_transport_da16xxx_uart

The following build time configurations are defined in fsp_cfg/rm_at_transport_da16xxx_uart_cfg.h:

| Configuration | Options | Default | Description |
|-----------------------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Size of RX buffer for CMD Port | Manual Entry | 3000 | |
| Semaphore maximum timeout | Manual Entry | 10000 | |
| Number of retries for AT commands | Manual Entry | 10 | |
| Module Reset Port | Refer to the RA Configuration tool for available options. | 06 | Specify the module reset pin port for the MCU. |
| Module Reset Pin | Refer to the RA Configuration tool for available options. | 03 | Specify the module reset pin for the MCU. |

Refer to [WiFi Onchip DA16XXX Framework Driver \(rm_wifi_da16xxx\)](#).

Interrupt Configuration

Refer to [UART \(r_sci_uart\)](#).

Clock Configuration

Refer to [UART \(r_sci_uart\)](#).

Pin Configuration

Refer to [UART \(r_sci_uart\)](#).

Usage Notes

- This module is not designed to be used directly, users will access this module via the DA16XXX driver

Limitations

Refer to [WiFi Onchip DA16XXX Framework Driver \(rm_wifi_da16xxx\)](#).

Data Structures

```
struct at_transport_da16xxx_extended_cfg_t
```

```
struct at_transport_da16xxx_instance_ctrl_t
```

Data Structure Documentation

◆ at_transport_da16xxx_extended_cfg_t

| struct at_transport_da16xxx_extended_cfg_t | | |
|---|--|-----------------------------------|
| User configuration structure, used in open function | | |
| Data Fields | | |
| const uint32_t | num_uarts | Number of UART interfaces to use. |
| const uart_instance_t * | uart_instances[AT_TRANSPORT_DA16XXX_CFG_MAX_NUMBER_UART_PORTS] | SCI UART instances. |
| const bsp_io_port_pin_t | reset_pin | Reset pin used for module. |

◆ at_transport_da16xxx_instance_ctrl_t

| struct at_transport_da16xxx_instance_ctrl_t | |
|--|------------------------------------|
| AT_TRANSPORT_DA16XXX private control block. DO NOT MODIFY. | |
| Data Fields | |
| at_transport_da16xxx_cfg_t const * | p_cfg |
| | Pointer to initial configurations. |

| | |
|-----------------------------------|---|
| | |
| uint32_t | num_uarts |
| | number of UARTS currently used for communication with module |
| | |
| uint32_t | curr_cmd_port |
| | Current UART instance index for AT commands. |
| | |
| uint32_t | open |
| | Flag to indicate if transport instance has been initialized. |
| | |
| uint8_t | cmd_rx_queue_buf [AT_TRANSPORT_DA16XXX_CFG_CMD_RX_BUF_SIZE] |
| | Command port receive buffer used by byte queue // FreeRTOS. |
| | |
| StreamBufferHandle_t | socket_byteq_hdl |
| | Socket stream buffer handle. |
| | |
| StaticStreamBuffer_t | socket_byteq_struct |
| | Structure to hold stream buffer info. |
| | |
| SemaphoreHandle_t | tx_sem |
| | Transmit binary semaphore handle. |
| | |
| SemaphoreHandle_t | rx_sem |
| | Receive binary semaphore handle. |
| | |
| uart_instance_t * | uart_instance_objects [AT_TRANSPORT_DA16XXX_CFG_MAX_NUMBER_UART_PORTS] |
| | UART instance object. |

| | |
|-------------------------|--|
| SemaphoreHandle_t | uart_tei_sem [AT_TRANSPORT_DA16XXX_CFG_MAX_NUMBER_UART_PORTS] |
| | UART transmission end binary semaphore. |
| const bsp_io_port_pin_t | reset_pin |
| | Reset pin used for module. |
| bool(* | p_callback)(at_transport_da16xxx_callback_args_t *p_args) |
| | Pointer to callback function. |
| void const * | p_context |
| | Pointer to the user-provided context. |

Function Documentation

◆ rm_at_transport_da16xxx_uart_callback()

```
void rm_at_transport_da16xxx_uart_callback ( uart\_callback\_args\_t * p_args)
```

UART Callback routine.

Parameters

| | | |
|------|---------------|-------------------------------------|
| [in] | <i>p_args</i> | Pointer to uart callback structure. |
|------|---------------|-------------------------------------|

◆ **rm_at_transport_da16xxx_uartOpen()**

```
fsp_err_t rm_at_transport_da16xxx_uartOpen ( at_transport_da16xxx_ctrl_t *const p_ctrl,
at_transport_da16xxx_cfg_t const *const p_cfg )
```

Opens and configures the WIFI_DA16XXX Middleware module.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | Pointer to Transport layer instance control structure. |
| [in] | p_cfg | Pointer to pin configuration structure. |

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | WIFI_DA16XXX successfully configured. |
| FSP_ERR_ASSERTION | The parameter p_cfg or p_instance_ctrl is NULL. |
| FSP_ERR_OUT_OF_MEMORY | There is no more heap memory available. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_WIFI_INIT_FAILED | WiFi module initialization failed. |

◆ **rm_at_transport_da16xxx_uart_atCommandSendThreadSafe()**

```
fsp_err_t rm_at_transport_da16xxx_uart_atCommandSendThreadSafe ( at_transport_da16xxx_ctrl_t
*const p_ctrl, at_transport_da16xxx_data_t * p_at_cmd )
```

Send an AT command with testing for return response.

Parameters

| | | |
|------|----------|--|
| [in] | p_ctrl | Pointer to Transport layer instance control structure. |
| [in] | p_at_cmd | Pointer to AT command data structure. |

Return values

| | |
|---------------------|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |

◆ **rm_at_transport_da16xxx_uart_atCommandSend()**

```
fsp_err_t rm_at_transport_da16xxx_uart_atCommandSend ( at_transport_da16xxx_ctrl_t *const
p_ctrl, at_transport_da16xxx_data_t * p_at_cmd )
```

Send and receive an AT command with testing for return. Thread-Safe

Parameters

| | | |
|------|----------|--|
| [in] | p_ctrl | Pointer to Transport layer instance control structure. |
| [in] | p_at_cmd | Pointer to Transport layer instance data structure. |

Return values

| | |
|---------------------|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | Assertion error occurred. |

◆ **rm_at_transport_da16xxx_uart_giveMutex()**

```
fsp_err_t rm_at_transport_da16xxx_uart_giveMutex ( at_transport_da16xxx_ctrl_t *const p_ctrl,
uint32_t mutex_flag )
```

Give the mutex for the send basic call.

Parameters

| | | |
|------|------------|--|
| [in] | p_ctrl | Pointer to Transport layer instance control structure. |
| [in] | mutex_flag | Flags for the mutex. |

Return values

| | |
|---------------------|----------------------------------|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred giving the mutex. |

◆ **rm_at_transport_da16xxx_uart_takeMutex()**

```
fsp_err_t rm_at_transport_da16xxx_uart_takeMutex ( at_transport_da16xxx_ctrl_t *const p_ctrl,
uint32_t mutex_flag )
```

Take the mutex for the send basic call.

Parameters

| | | |
|------|------------|--|
| [in] | p_ctrl | Pointer to Transport layer instance control structure. |
| [in] | mutex_flag | Flags for the mutex. |

Return values

| | |
|---------------------|----------------------------------|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred taking the mutex. |

◆ **rm_at_transport_da16xxx_uart_bufferRecv()**

```
size_t rm_at_transport_da16xxx_uart_bufferRecv ( at_transport_da16xxx_ctrl_t *const p_ctrl, const
char * p_data, uint32_t length, uint32_t rx_timeout )
```

Receive data from stream buffer.

Parameters

| | | |
|------|------------|--|
| [in] | p_ctrl | Pointer to Transport layer instance control structure. |
| [in] | p_data | Pointer to data. |
| [in] | length | Data length. |
| [in] | rx_timeout | Timeout for receiving data on the buffer. |

Return values

| | |
|----------------------|---|
| Number | of bytes pulled from Streambuffer |
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | Assertion error occurred. |
| FSP_ERR_INVALID_DATA | Accuracy of data is not guaranteed |

◆ **rm_at_transport_da16xxx_statusGet()**

```
fsp_err_t rm_at_transport_da16xxx_statusGet ( at_transport_da16xxx_ctrl_t *const p_ctrl,
at_transport_da16xxx_status_t * p_status )
```

Gets the status of the configured DA16xxx transport.

Return values

| | |
|-------------------|----------------------------|
| FSP_SUCCESS | Status stored in p_status. |
| FSP_ERR_ASSERTION | NULL pointer. |

◆ **rm_at_transport_da16xxx_uartClose()**

```
fsp_err_t rm_at_transport_da16xxx_uartClose ( at_transport_da16xxx_ctrl_t *const p_ctrl)
```

Closes the AT Transport DA16XXX Middleware module.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | Pointer to Transport layer instance control structure. |
|------|--------|--|

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | WIFI_DA16XXX successfully configured. |
| FSP_ERR_ASSERTION | The parameter p_cfg or p_instance_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | The Transport layer instance is not open. |

5.2.12.14 Ethernet (r_ether)

Modules » Networking

Functions

fsp_err_t R_ETHER_Open (ether_ctrl_t *const p_ctrl, ether_cfg_t const *const p_cfg)

After ETHERC, EDMAC and PHY-LSI are reset in software, an auto negotiation of PHY-LSI is begun. Afterwards, the link signal change interrupt is permitted. Implements [ether_api_t::open](#). [More...](#)

fsp_err_t R_ETHER_Close (ether_ctrl_t *const p_ctrl)

Disables interrupts. Removes power and releases hardware lock. Implements [ether_api_t::close](#). [More...](#)

`fsp_err_t R_ETHER_BufferRelease (ether_ctrl_t *const p_ctrl)`
Move to the next buffer in the circular receive buffer list. Implements `ether_api_t::bufferRelease`. [More...](#)

`fsp_err_t R_ETHER_RxBufferUpdate (ether_ctrl_t *const p_ctrl, void *const p_buffer)`
Change the buffer pointer of the current rx buffer descriptor. Implements `ether_api_t::rxBufferUpdate`. [More...](#)

`fsp_err_t R_ETHER_LinkProcess (ether_ctrl_t *const p_ctrl)`
The Link up processing, the Link down processing, and the magic packet detection processing are executed. Implements `ether_api_t::linkProcess`. [More...](#)

`fsp_err_t R_ETHER_WakeOnLANEnable (ether_ctrl_t *const p_ctrl)`
The setting of ETHERC is changed from normal sending and receiving mode to magic packet detection mode. Implements `ether_api_t::wakeOnLANEnable`. [More...](#)

`fsp_err_t R_ETHER_Read (ether_ctrl_t *const p_ctrl, void *const p_buffer, uint32_t *const length_bytes)`
Receive Ethernet frame. Receives data to the location specified by the pointer to the receive buffer. In zero copy mode, the address of the receive buffer is returned. In non zero copy mode, the received data in the internal buffer is copied to the pointer passed by the argument. Implements `ether_api_t::read`. [More...](#)

`fsp_err_t R_ETHER_Write (ether_ctrl_t *const p_ctrl, void *const p_buffer, uint32_t const frame_length)`
Transmit Ethernet frame. Transmits data from the location specified by the pointer to the transmit buffer, with the data size equal to the specified frame length. In the non zero copy mode, transmits data after being copied to the internal buffer. Implements `ether_api_t::write`. [More...](#)

`fsp_err_t R_ETHER_TxStatusGet (ether_ctrl_t *const p_ctrl, void *const p_buffer_address)`

`fsp_err_t R_ETHER_CallbackSet (ether_ctrl_t *const p_api_ctrl, void(*p_callback)(ether_callback_args_t*), void const *const p_context, ether_callback_args_t *const p_callback_memory)`

Detailed Description

Driver for the Ethernet peripheral on RA MCUs. This module implements the [Ethernet Interface](#).

Overview

This module performs Ethernet frame transmission and reception using an Ethernet controller and an Ethernet DMA controller.

Features

The Ethernet module supports the following features:

- Transmit/receive processing
- Optional zero-copy buffering
- Callback function with returned event code
- Magic packet detection mode support
- Auto negotiation support
- Flow control support
- Multicast filtering support
- Broadcast filtering support
- Promiscuous mode support

Configuration

Build Time Configurations for r_ether

The following build time configurations are defined in fsp_cfg/r_ether_cfg.h:

| Configuration | Options | Default | Description |
|-----------------------------|--|---------------|--|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| ET0_LINKSTA Pin Status Flag | <ul style="list-style-type: none"> • Fall -> Rise • Rise -> Fall | Fall -> Rise | Specify the polarity of the link signal output by the PHY-LSI. When 0 is specified, link-up and link-down correspond respectively to the fall and rise of the LINKSTA signal. When 1 is specified, link-up and link-down correspond respectively to the rise and fall of the LINKSTA signal. |
| Link Signal Change Flag | <ul style="list-style-type: none"> • Unused • Used | Unused | Use LINKSTA signal for detect link status changes 0 = unused (use PHY-LSI status register) 1 = use (use LINKSTA signal) |

Configurations for Networking > Ethernet (r_ether)

This module can be added to the Stacks tab via New Stack > Networking > Ethernet (r_ether). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|----------------------------|--|-------------------|---|
| General | | | |
| Name | Name must be a valid C symbol | g_ether0 | Module name. |
| Channel | 0 | 0 | Select the ether channel number. |
| MAC address | Must be a valid MAC address | 00:11:22:33:44:55 | MAC address of this channel. |
| Zero-copy Mode | <ul style="list-style-type: none"> • Disable • Enable | Disable | Enable or disable zero-copy mode. |
| Flow control functionality | <ul style="list-style-type: none"> • Disable • Enable | Disable | Enable or disable flow control. |
| Filters | | | |
| Multicast Mode | <ul style="list-style-type: none"> • Disable • Enable | Enable | Enable or disable multicast frame reception. |
| Promiscuous Mode | <ul style="list-style-type: none"> • Disable • Enable | Disable | Enable this option to receive packets addressed to other NICs. |
| Broadcast filter | Must be a valid non-negative integer with maximum configurable value of 65535. | 0 | Limit of the number of broadcast frames received continuously |
| Buffers | | | |
| Number of TX buffer | Must be an integer from 1 to 8 | 1 | Number of transmit buffers |
| Number of RX buffer | Must be an integer from 1 to 8 | 1 | Number of receive buffers |
| Allocate RX buffer | <ul style="list-style-type: none"> • Disable • Enable | Enable | Allocates the RX buffer when generating the configuration structure |
| Buffer size | Must be at least 1514 which is the maximum Ethernet frame size. | 1514 | Size of Ethernet buffer |
| Padding size | <ul style="list-style-type: none"> • Disable • 1 Byte • 2 Bytes | Disable | The padding size that is automatically inserted into the |

| | | | |
|--------------------|-------------------------------|------|---|
| | • 3 Bytes | | received packets |
| Padding offset | Must be less than 64 bytes. | 0 | The offset into a receive buffer to insert padding bytes. |
| Interrupts | | | |
| Interrupt priority | MCU Specific Options | | Select the EDMAC interrupt priority. |
| Callback | Name must be a valid C symbol | NULL | Callback provided when an ISR occurs |

Interrupt Configuration

The first [R_ETHER_Open](#) function call sets EINT interrupts. The user could provide callback function which would be invoked when EINT interrupt handler has been completed. The callback arguments will contain information about a channel number, the ETHERC and EDMAC status, the event code, and a pointer to the user defined context.

Callback Configuration

The user could provide callback function which would be invoked when either a magic packet or a link signal change is detected. When the callback function is called, a variable in which the channel number for which the detection occurred and a constant shown in Table 2.4 are stored is passed as an argument. If the value of this argument is to be used outside the callback function, its value should be copied into, for example, a global variable.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

| MCU Group | Peripheral Clock |
|-----------|------------------|
| RA4E2 | PCLKA |
| RA4T1 | PCLKA |
| RA6E1 | PCLKA |
| RA6E2 | PCLKA |
| RA6M2 | PCLKA |
| RA6M3 | PCLKA |
| RA6M4 | PCLKA |
| RA6M5 | PCLKA |
| RA6T3 | PCLKA |

Note

1. When using ETHERC, the PCLKA frequency is in the range $12.5 \text{ MHz} \leq PCLKA \leq 120 \text{ MHz}$.
2. When using ETHERC, $PCLKA = ICLK$.

Pin Configuration

To use the Ethernet module, input/output signals of the peripheral function have to be allocated to pins with the multi-function pin controller (MPC). Please perform the pin setting before calling the [R_ETHER_Open](#) function.

Usage Notes

Ethernet Frame Format

The Ethernet module supports the Ethernet II/IEEE 802.3 frame format.

Frame Format for Data Transmission and Reception

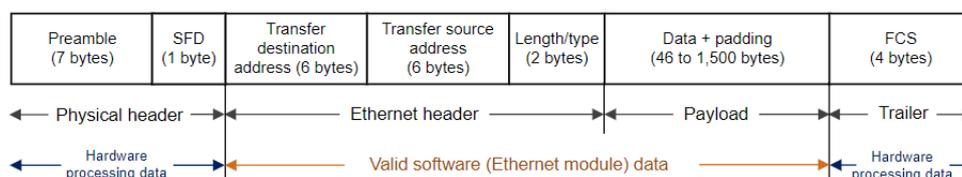

Figure 283: Frame Format Image

The preamble and SFD signal the start of an Ethernet frame. The FCS contains the CRC of the Ethernet frame and is calculated on the transmitting side. When data is received the CRC value of the frame is calculated in hardware, and the Ethernet frame is discarded if the values do not match. When the hardware determines that the data is normal, the valid range of receive data is: (transmission destination address) + (transmission source address) + (length/type) + (data).

PAUSE Frame Format

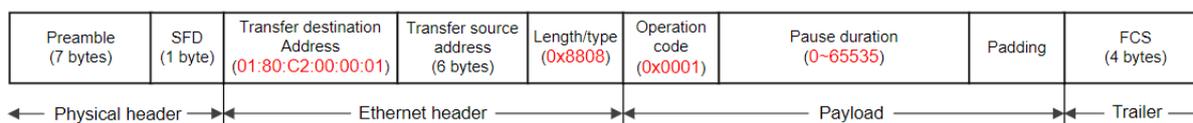

Figure 284: Pause Frame Format Image

The transmission destination address is specified as 01:80:C2:00:00:01 (a multicast address reserved for PAUSE frames). At the start of the payload the length/type is specified as 0x8808 and the operation code as 0x0001. The pause duration in the payload is specified by the value of the automatic PAUSE (AP) bits in the automatic PAUSE frame setting register (APR), or the manual PAUSE time setting (MP) bits in the manual PAUSE frame setting register (MPR).

Magic Packet Frame Format

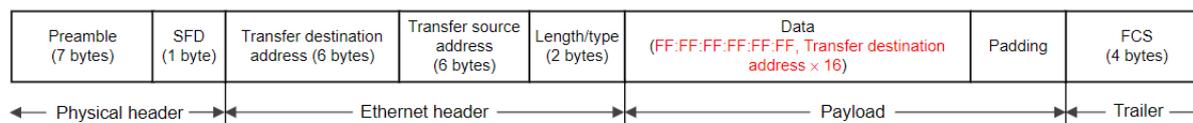

Figure 285: Magic Packet Frame Format Image

In a Magic Packet, the value FF:FF:FF:FF:FF:FF followed by the transmission destination address repeated 16 times is inserted somewhere in the Ethernet frame data.

Limitations

Memory alignment limitation for Ethernet buffer

The Ethernet Driver has several alignment constraints:

- 16-byte alignment for the descriptor
- 32-byte aligned read buffer for `R_ETHER_RxBufferUpdate` when zero copy mode is enabled

Functional limitations in TrustZone Security Extensions

The Ethernet Driver has several security constraints:

| MCU | Has Security Extension | Support Flat project | Support TrustZone project | |
|-------|------------------------|----------------------|---------------------------|------------|
| | | | Secure | Non-Secure |
| RA6M2 | - | x | - | - |
| RA6M3 | - | x | - | - |
| RA6M4 | - *1 | x | - | x |
| RA6M5 | - *1 | x | - | x |
| RA8M1 | x | x | x | x |

Note

1. *ETHERC/EDMAC is always Non-secure peripheral in this MCU.*

Examples

ETHER Basic Example

This is a basic example of minimal use of the ETHER in an application.

Note

In this example zero-copy mode is disabled and there are no restrictions on buffer alignment.

```
#define ETHER_EXAMPLE_MAXIMUM_ETHERNET_FRAME_SIZE (1514)
#define ETHER_EXAMPLE_TRANSMIT_ETHERNET_FRAME_SIZE (60)
#define ETHER_EXAMPLE_SOURCE_MAC_ADDRESS 0x74, 0x90, 0x50, 0x00, 0x79, 0x01
#define ETHER_EXAMPLE_DESTINATION_MAC_ADDRESS 0x74, 0x90, 0x50, 0x00, 0x79, 0x02
#define ETHER_EXAMPLE_FRAME_TYPE 0x00, 0x2E
#define ETHER_EXAMPLE_PAYLOAD 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00,
0x00, \
    0x00, \
    0x00, \
```

```
0x00, \

/* Receive data buffer */
static uint8_t gp_read_buffer[ETHER_EXAMPLE_MAXIMUM_ETHERNET_FRAME_SIZE] = {0};
/* Transmit data buffer */
static uint8_t gp_send_data[ETHER_EXAMPLE_TRANSMIT_ETHERNET_FRAME_SIZE] =
{
    ETHER_EXAMPLE_DESTINATION_MAC_ADDRESS, /* Destination MAC address */

    ETHER_EXAMPLE_FRAME_TYPE,             /* Type field */
    ETHER_EXAMPLE_PAYLOAD                  /* Payload value (46byte) */
};
void ether_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Source MAC Address */
    static uint8_t mac_address_source[6] = {ETHER_EXAMPLE_SOURCE_MAC_ADDRESS};
    uint32_t read_data_size = 0;
    g_ether0_cfg.p_mac_address = mac_address_source;
    /* Open the ether instance with initial configuration. */
    err = R_ETHER_Open(&g_ether0_ctrl, &g_ether0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    do
    {
        /* When the Ethernet link status read from the PHY-LSI Basic Status register is link-
up,
        * Initializes the module and make auto negotiation. */
        err = R_ETHER_LinkProcess(&g_ether0_ctrl);
    } while (FSP_SUCCESS != err);
    /* Transmission is non-blocking. */
    /* User data copy to internal buffer and is transferred by DMA in the background. */
    err = R_ETHER_Write(&g_ether0_ctrl, (void *) gp_send_data, sizeof(gp_send_data));
    assert(FSP_SUCCESS == err);
}
```

```
/* received data copy to user buffer from internal buffer. */
err = R_ETHER_Read(&g_ether0_ctrl, (void *) gp_read_buffer, &read_data_size);
assert(FSP_SUCCESS == err);

/* Disable transmission and receive function and close the ether instance. */
R_ETHER_Close(&g_ether0_ctrl);
}
```

ETHER Advanced Example

The example demonstrates using send and receive function in zero copy mode. Transmit buffers must be 32-byte aligned and the receive buffer must be released once its contents have been used.

```
#define ETHER_EXAMPLE_FLAG_ON (1U)
#define ETHER_EXAMPLE_FLAG_OFF (0U)

Data Structure Documentation

◆ ether_instance_descriptor_t

struct [ether_instance_descriptor_t](#)

EDMAC descriptor as defined in the hardware manual. Structure must be packed at 1 byte.

◆ ether_extended_cfg_t

struct [ether_extended_cfg_t](#)

ETHER extension configures the buffer descriptor for ETHER.

Data Fields

| | | |
|---|----------------------------------|----------------------------------|
| ether_instance_descriptor_t * | p_rx_descriptors | Receive descriptor buffer pool. |
| ether_instance_descriptor_t * | p_tx_descriptors | Transmit descriptor buffer pool. |

◆ ether_instance_ctrl_t

struct [ether_instance_ctrl_t](#)

ETHER control block. DO NOT INITIALIZE. Initialization occurs when [ether_api_t::open](#) is called.

Data Fields

uint32_t [open](#)

Used to determine if the channel is configured.

Function Documentation

◆ R_ETHER_Open()

```
fsp_err_t R_ETHER_Open ( ether_ctrl_t *const p_ctrl, ether_cfg_t const *const p_cfg )
```

After ETHERC, EDMAC and PHY-LSI are reset in software, an auto negotiation of PHY-LSI is begun. Afterwards, the link signal change interrupt is permitted. Implements `ether_api_t::open`.

Return values

| | |
|---------------------------------------|--|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened or channel is being used by another instance. Call <code>close()</code> then <code>open()</code> to reconfigure. |
| FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION | Initialization of PHY-LSI failed. |
| FSP_ERR_INVALID_CHANNEL | Invalid channel number is given. |
| FSP_ERR_INVALID_POINTER | Pointer to extend config structure or MAC address is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Interrupt is not enabled. |
| FSP_ERR_ETHER_PHY_ERROR_LINK | Initialization of PHY-LSI failed. |

◆ R_ETHER_Close()

```
fsp_err_t R_ETHER_Close ( ether_ctrl_t *const p_ctrl)
```

Disables interrupts. Removes power and releases hardware lock. Implements `ether_api_t::close`.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

◆ **R_ETHER_BufferRelease()**

```
fsp_err_t R_ETHER_BufferRelease ( ether_ctrl_t *const p_ctrl)
```

Move to the next buffer in the circular receive buffer list. Implements `ether_api_t::bufferRelease`.

Return values

| | |
|---------------------------------------|---|
| FSP_SUCCESS | Processing completed successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_ETHER_ERROR_LINK | Auto-negotiation is not completed, and reception is not enabled. |
| FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE | As a Magic Packet is being detected, transmission and reception is not enabled. |

◆ **R_ETHER_RxBufferUpdate()**

```
fsp_err_t R_ETHER_RxBufferUpdate ( ether_ctrl_t *const p_ctrl, void *const p_buffer )
```

Change the buffer pointer of the current rx buffer descriptor. Implements `ether_api_t::rxBufferUpdate`.

Return values

| | |
|-------------------------------------|--|
| FSP_SUCCESS | Processing completed successfully. |
| FSP_ERR_ASSERTION | A pointer argument is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_POINTER | The pointer of buffer is NULL or not aligned on a 32-bit boundary. |
| FSP_ERR_INVALID_MODE | Driver is configured to non zero copy mode. |
| FSP_ERR_ETHER_RECEIVE_BUFFER_ACTIVE | All descriptor is active. |

◆ **R_ETHER_LinkProcess()**

```
fsp_err_t R_ETHER_LinkProcess ( ether_ctrl_t *const p_ctrl)
```

The Link up processing, the Link down processing, and the magic packet detection processing are executed. Implements `ether_api_t::linkProcess`.

Return values

| | |
|---------------------------------------|--|
| FSP_SUCCESS | Link is up. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ETHER_ERROR_LINK | Link is down. |
| FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION | When reopening the PHY interface initialization of the PHY-LSI failed. |
| FSP_ERR_ALREADY_OPEN | When reopening the PHY interface it was already opened. |
| FSP_ERR_INVALID_CHANNEL | When reopening the PHY interface an invalid channel was passed. |
| FSP_ERR_INVALID_POINTER | When reopening the PHY interface the MAC address pointer was NULL. |
| FSP_ERR_INVALID_ARGUMENT | When reopening the PHY interface the interrupt was not enabled. |
| FSP_ERR_ETHER_PHY_ERROR_LINK | Initialization of the PHY-LSI failed. |

◆ **R_ETHER_WakeOnLANEnable()**

```
fsp_err_t R_ETHER_WakeOnLANEnable ( ether_ctrl_t *const p_ctrl)
```

The setting of ETHERC is changed from normal sending and receiving mode to magic packet detection mode. Implements `ether_api_t::wakeOnLANEnable`.

Return values

| | |
|------------------------------|--|
| FSP_SUCCESS | Processing completed successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ETHER_ERROR_LINK | Auto-negotiation is not completed, and reception is not enabled. |
| FSP_ERR_ETHER_PHY_ERROR_LINK | Initialization of PHY-LSI failed. |

◆ **R_ETHER_Read()**

```
fsp_err_t R_ETHER_Read ( ether_ctrl_t *const p_ctrl, void *const p_buffer, uint32_t *const length_bytes )
```

Receive Ethernet frame. Receives data to the location specified by the pointer to the receive buffer. In zero copy mode, the address of the receive buffer is returned. In non zero copy mode, the received data in the internal buffer is copied to the pointer passed by the argument. Implements [ether_api_t::read](#).

Return values

| | |
|---------------------------------------|---|
| FSP_SUCCESS | Processing completed successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ETHER_ERROR_NO_DATA | There is no data in receive buffer. |
| FSP_ERR_ETHER_ERROR_LINK | Auto-negotiation is not completed, and reception is not enabled. |
| FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE | As a Magic Packet is being detected, transmission and reception is not enabled. |
| FSP_ERR_ETHER_ERROR_FILTERING | Multicast Frame filter is enable, and Multicast Address Frame is received. |
| FSP_ERR_INVALID_POINTER | Value of the pointer is NULL. |

◆ **R_ETHER_Write()**

```
fsp_err_t R_ETHER_Write ( ether_ctrl_t *const p_ctrl, void *const p_buffer, uint32_t const frame_length )
```

Transmit Ethernet frame. Transmits data from the location specified by the pointer to the transmit buffer, with the data size equal to the specified frame length. In the non zero copy mode, transmits data after being copied to the internal buffer. Implements `ether_api_t::write`.

Return values

| | |
|--|---|
| FSP_SUCCESS | Processing completed successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ETHER_ERROR_LINK | Auto-negotiation is not completed, and reception is not enabled. |
| FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE | As a Magic Packet is being detected, transmission and reception is not enabled. |
| FSP_ERR_ETHER_ERROR_TRANSMIT_BUFFER_FULL | Transmit buffer is not empty. |
| FSP_ERR_INVALID_POINTER | Value of the pointer is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Value of the send frame size is out of range. |

◆ **R_ETHER_TxStatusGet()**

```
fsp_err_t R_ETHER_TxStatusGet ( ether_ctrl_t *const p_ctrl, void *const p_buffer_address )
```

Provides status of Ethernet driver in the user provided pointer. Implements `ether_api_t::txStatusGet`.

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Transmit buffer address is stored in provided p_buffer_address. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_POINTER | p_status is NULL. |
| FSP_ERR_NOT_FOUND | Transmit buffer address has been overwritten in transmit descriptor. |

◆ R_ETHER_CallbackSet()

```
fsp_err_t R_ETHER_CallbackSet ( ether_ctrl_t *const p_api_ctrl, void(*) (ether_callback_args_t *)
p_callback, void const *const p_context, ether_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `ether_api_t::callbackSet`.

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | <code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL. |

5.2.12.15 Ethernet (r_ether_phy)

Modules » Networking

Functions

```
fsp_err_t R_ETHER_PHY_Open (ether_phy_ctrl_t *const p_ctrl, ether_phy_cfg_t
const *const p_cfg)
```

Resets Ethernet PHY device. Implements `ether_phy_api_t::open`.
More...

```
fsp_err_t R_ETHER_PHY_Close (ether_phy_ctrl_t *const p_ctrl)
```

Close Ethernet PHY device. Implements `ether_phy_api_t::close`.
More...

```
fsp_err_t R_ETHER_PHY_StartAutoNegotiate (ether_phy_ctrl_t *const p_ctrl)
```

Starts auto-negotiate. Implements `ether_phy_api_t::startAutoNegotiate`. More...

```
fsp_err_t R_ETHER_PHY_LinkPartnerAbilityGet (ether_phy_ctrl_t *const p_ctrl,
uint32_t *const p_line_speed_duplex, uint32_t *const p_local_pause,
uint32_t *const p_partner_pause)
```

Reports the other side's physical capability. Implements `ether_phy_api_t::linkPartnerAbilityGet`. More...

`fsp_err_t` [R_ETHER_PHY_LinkStatusGet](#) (`ether_phy_ctrl_t *const p_ctrl`)

Returns the status of the physical link. Implements [ether_phy_api_t::linkStatusGet](#). [More...](#)

`fsp_err_t` [R_ETHER_PHY_ChipInit](#) (`ether_phy_ctrl_t *const p_ctrl`,
`ether_phy_cfg_t const *const p_cfg`)

Initialize Ethernet PHY device. Implements [ether_phy_api_t::chipInit](#). [More...](#)

`fsp_err_t` [R_ETHER_PHY_Read](#) (`ether_phy_ctrl_t *const p_ctrl`, `uint32_t`
`reg_addr`, `uint32_t *const p_data`)

Read data from register of PHY-LSI . Implements [ether_phy_api_t::read](#). [More...](#)

`fsp_err_t` [R_ETHER_PHY_Write](#) (`ether_phy_ctrl_t *const p_ctrl`, `uint32_t`
`reg_addr`, `uint32_t data`)

Write data to register of PHY-LSI . Implements [ether_phy_api_t::write](#). [More...](#)

Detailed Description

The Ethernet PHY module (`r_ether_phy`) provides an API for standard Ethernet PHY communications applications that use the ETHERC peripheral. It implements the [Ethernet PHY Interface](#).

Overview

The Ethernet PHY module is used to setup and manage an external Ethernet PHY device for use with the on-chip Ethernet Controller (ETHERC) peripheral. It performs auto-negotiation to determine the optimal connection parameters between link partners. Once initialized the connection between the external PHY and the onboard controller is automatically managed in hardware.

Features

The Ethernet PHY module supports the following features:

- Auto negotiation support
- Flow control support
- Link status check support

Configuration

Build Time Configurations for `r_ether_phy`

The following build time configurations are defined in `fsp_cfg/r_ether_phy_cfg.h`:

| Configuration | Options | Default | Description |
|----------------------------------|--|---------------|--|
| Parameter Checking | <ul style="list-style-type: none"> Default (BSP) Enabled Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| KSZ8091RNB Target | <ul style="list-style-type: none"> Disabled Enabled | Disabled | Select whether to use KSZ8091RNB Phy LSI or not. |
| KSZ8041 Target | <ul style="list-style-type: none"> Disabled Enabled | Disabled | Select whether to use KSZ8041 Phy LSI or not. |
| DP83620 Target | <ul style="list-style-type: none"> Disabled Enabled | Disabled | Select whether to use DP83620 Phy LSI or not. |
| ICS1894 Target | <ul style="list-style-type: none"> Disabled Enabled | Disabled | Select whether to use ICS1894 Phy LSI or not. |
| User Own Target | <ul style="list-style-type: none"> Disabled Enabled | Disabled | Select whether to use User own Phy LSI or not. |
| Reference Clock | <ul style="list-style-type: none"> Default Enabled Disabled | Default | Select whether to use the RMII reference clock. Selecting 'Default' will automatically choose the correct option when using a Renesas development board. |
| Reference Clock | <ul style="list-style-type: none"> Default Enabled Disabled | Default | Select whether to use the RMII reference clock. Selecting 'Default' will automatically choose the correct option when using a Renesas development board. |
| Automatic Phy LSI Initialization | <ul style="list-style-type: none"> Enabled Disabled | Enabled | Select whether to initialize the Ethernet Phy LSI in the open function. |

Configurations for Networking > Ethernet (r_ether_phy)

This module can be added to the Stacks tab via New Stack > Networking > Ethernet (r_ether_phy). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---------------|-------------------------------|--------------|--------------|
| Name | Name must be a valid C symbol | g_ether_phy0 | Module name. |

| | | | |
|---|---|---------------|--|
| Channel | <ul style="list-style-type: none"> • 0 • 1 | 0 | Select the Ethernet controller channel number. |
| PHY-LSI Address | Specify a value between 0 and 31. | 0 | Specify the address of the PHY-LSI used. |
| PHY-LSI Reset Completion Timeout | Specify a value between 0x1 and 0xFFFFFFFF. | 0x00020000 | Specify the number of times to read the PHY-LSI control register while waiting for reset completion. This value should be adjusted experimentally based on the PHY-LSI used. |
| Select MII type | <ul style="list-style-type: none"> • MII • RMII | RMII | Specify whether to use MII or RMII. |
| Phy LSI type | <ul style="list-style-type: none"> • Kit Component • DEFAULT • KSZ8091RNB • KSZ8041 • DP83620 • ICS1894 • User own PHY | Kit Component | Select the Phy LSI target. Selecting 'Kit Component' will automatically choose the correct option when using a Renesas development board. |
| Port Custom Init Function | Name must be a valid C symbol | NULL | Set the initial function of the PHY-LSI, When using your own PHY-LSI. |
| Port Custom Link Partner Ability Get Function | Name must be a valid C symbol | NULL | Set the link partner ability get function of the PHY-LSI, When using your own PHY-LSI. |
| MII/RMII Register Access Wait-time | Specify a value between 0x1 and 0x7FFFFFFF. | 8 | Specify the bit timing for MII/RMII register accesses during PHY initialization. This value should be adjusted experimentally based on the PHY-LSI used. |
| Flow Control | <ul style="list-style-type: none"> • Disable • Enable | Disable | Select whether to enable or disable flow control. |

Usage Notes

Note

See the [example](#) below for details on how to initialize the Ethernet PHY module.

Accessing the MII and RMII Registers

Use the PIR register to access the MII and RMII registers in the PHY-LSI. Serial data in the MII and RMII management frame format is transmitted and received through the ET0_MDC and ET0_MDIO pins controlled by software.

MII and RMII management frame format

The below table lists the MII and RMII management frame formats.

| Access type | MII and RMII management frame | | | | | | | | |
|----------------|-------------------------------|----|----|-------|-------|----|------------------------------|------|--|
| Item | PRE | ST | OP | PHYAD | REGAD | TA | DATA | IDLE | |
| Number of bits | 32 | 2 | 2 | 5 | 5 | 2 | 16 | 1 | |
| Read | 1...1 | 01 | 10 | 00001 | RRRRR | Z0 | DDDDD DDDDD DDDDD D | Z | |
| Write | 1...1 | 01 | 01 | 00001 | RRRRR | 10 | DDDDD DDDDD DDDDD D | Z | |

Note

- *PRE (preamble):* Send 32 consecutive 1s.
- *ST (start of frame):* Send 01b.
- *OP (operation code):* Send 10b for read or 01b for write.
- *PHYAD (PHY address):* Up to 32 PHY-LSIs can be connected to one MAC. PHY-LSIs are selected with these 5 bits. When the PHY-LSI address is 1, send 00001b.
- *REGAD (register address):* One register is selected from up to 32 registers in the PHY-LSI. When the register address is 1, send 00001b.
- *TA (turnaround):* Use 2-bit turnaround time to avoid contention between the register address and data during a read operation.
Send 10b during a write operation. Release the bus for 1 bit during a read operation (Z is output).
(This is indicated as Z0 because 0 is output from the PHY-LSI on the next clock cycle.)
- *DATA (data):* 16-bit data. Sequentially send or receive starting from the MSB.
- *IDLE (IDLE condition):* Wait time before inputting the next MII or RMII management format. Release the bus during a write operation (Z is output). No control is required, because a bus was already released during a read operation.

Limitations

- The r_ether_phy module may need to be customized for PHY devices other than the ones currently supported. Use the existing code as a starting point for creating a custom implementation. Supported PHY devices are as follows.
 - KSZ8091RNB
 - KSZ8041
 - DP83620
 - ICS1894

Examples

ETHER PHY Basic Example

This is a basic example of minimal use of the ETHER PHY in an application.

```
void ether_phy_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    g_ether_phy0_ctrl.open    = 0U;
    g_ether_phy0_cfg.channel = 0;

    /* Initializes the module. */
    err = R_ETHER_PHY_Open(&g_ether_phy0_ctrl, &g_ether_phy0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Start auto negotiation. */
    err = R_ETHER_PHY_StartAutoNegotiate(&g_ether_phy0_ctrl);
    assert(FSP_SUCCESS == err);

    /* Polling until link is established. */
    while (FSP_SUCCESS != R_ETHER_PHY_LinkStatusGet(&g_ether_phy0_ctrl))
    {
        /* Do nothing */
    }

    /* Get link partner ability from phy interface. */
    err = R_ETHER_PHY_LinkPartnerAbilityGet(&g_ether_phy0_ctrl,
                                             &g_ether_phy0_line_speed_duplex,
                                             &g_ether_phy0_local_pause,
                                             &g_ether_phy0_partner_pause);

    assert(FSP_SUCCESS == err);

    /* Check current link status. */
    err = R_ETHER_PHY_LinkStatusGet(&g_ether_phy0_ctrl);
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct ether_phy_extended_cfg_t

Enumerations

enum [ether_phy_interface_status_t](#)

Data Structure Documentation

◆ ether_phy_instance_ctrl_t

| struct ether_phy_instance_ctrl_t | | |
|---|------------------|---|
| ETHER PHY control block. DO NOT INITIALIZE. Initialization occurs when ether_phy_api_t::open is called. | | |
| Data Fields | | |
| uint32_t | open | Used to determine if the channel is configured. |
| ether_phy_cfg_t const * | p_ether_phy_cfg | Pointer to initial configurations. |
| volatile uint32_t * | p_reg_pir | Pointer to ETHERC peripheral registers. |
| uint32_t | local_advertise | Capabilities bitmap for local advertising. |
| ether_phy_interface_status_t | interface_status | Initialized status of ETHER PHY interface. |

◆ ether_phy_extended_cfg_t

| struct ether_phy_extended_cfg_t | | |
|-----------------------------------|---|---|
| ETHER PHY extended configuration. | | |
| Data Fields | | |
| void(*) | p_target_init)(ether_phy_instance_ctrl_t *p_instance_ctrl) | |
| | | Pointer to callback that is called to initialize the target. |
| bool(*) | p_target_link_partner_ability_get)(ether_phy_instance_ctrl_t *p_instance_ctrl, uint32_t line_speed_duplex) | |
| | | Pointer to callback that is called to get the link partner ability. |

Enumeration Type Documentation

◆ ether_phy_interface_status_t

| | |
|--|---------------------------------------|
| enum ether_phy_interface_status_t | |
| Initialization state for read/write | |
| Enumerator | |
| ETHER_PHY_INTERFACE_STATUS_UNINITIALIZED | ETHER PHY interface is uninitialized. |
| ETHER_PHY_INTERFACE_STATUS_INITIALIZED | ETHER PHY interface is initialized. |

Function Documentation

◆ R_ETHER_PHY_Open()

| | |
|---|--|
| fsp_err_t R_ETHER_PHY_Open (ether_phy_ctrl_t *const p_ctrl, ether_phy_cfg_t const *const p_cfg) | |
| Resets Ethernet PHY device. Implements ether_phy_api_t::open. | |
| Return values | |
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHER_PHY control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure. |
| FSP_ERR_INVALID_CHANNEL | Invalid channel number is given. |
| FSP_ERR_INVALID_POINTER | Pointer to p_cfg is NULL. |
| FSP_ERR_TIMEOUT | PHY-LSI Reset wait timeout. |
| FSP_ERR_INVALID_ARGUMENT | Register address is incorrect |
| FSP_ERR_NOT_INITIALIZED | The control block has not been initialized. |

◆ **R_ETHER_PHY_Close()**

```
fsp_err_t R_ETHER_PHY_Close ( ether_phy_ctrl_t *const p_ctrl)
```

Close Ethernet PHY device. Implements `ether_phy_api_t::close`.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | Pointer to ETHER_PHY control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

◆ **R_ETHER_PHY_StartAutoNegotiate()**

```
fsp_err_t R_ETHER_PHY_StartAutoNegotiate ( ether_phy_ctrl_t *const p_ctrl)
```

Starts auto-negotiate. Implements `ether_phy_api_t::startAutoNegotiate`.

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | ETHER_PHY successfully starts auto-negotiate. |
| FSP_ERR_ASSERTION | Pointer to ETHER_PHY control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_INVALID_ARGUMENT | Register address is incorrect |
| FSP_ERR_INVALID_POINTER | Pointer to read buffer is NULL. |
| FSP_ERR_NOT_INITIALIZED | The control block has not been initialized |

◆ **R_ETHER_PHY_LinkPartnerAbilityGet()**

```
fsp_err_t R_ETHER_PHY_LinkPartnerAbilityGet ( ether_phy_ctrl_t *const p_ctrl, uint32_t *const
p_line_speed_duplex, uint32_t *const p_local_pause, uint32_t *const p_partner_pause )
```

Reports the other side's physical capability. Implements [ether_phy_api_t::linkPartnerAbilityGet](#).

Return values

| | |
|------------------------------|--|
| FSP_SUCCESS | ETHER_PHY successfully get link partner ability. |
| FSP_ERR_ASSERTION | Pointer to ETHER_PHY control block is NULL. |
| FSP_ERR_INVALID_POINTER | Pointer to arguments are NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_ETHER_PHY_ERROR_LINK | PHY-LSI is not link up. |
| FSP_ERR_ETHER_PHY_NOT_READY | The auto-negotiation isn't completed |
| FSP_ERR_INVALID_ARGUMENT | Status register address is incorrect |
| FSP_ERR_NOT_INITIALIZED | The control block has not been initialized |

◆ **R_ETHER_PHY_LinkStatusGet()**

```
fsp_err_t R_ETHER_PHY_LinkStatusGet ( ether_phy_ctrl_t *const p_ctrl)
```

Returns the status of the physical link. Implements [ether_phy_api_t::linkStatusGet](#).

Return values

| | |
|------------------------------|--|
| FSP_SUCCESS | ETHER_PHY successfully get link partner ability. |
| FSP_ERR_ASSERTION | Pointer to ETHER_PHY control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_ETHER_PHY_ERROR_LINK | PHY-LSI is not link up. |
| FSP_ERR_INVALID_ARGUMENT | Status register address is incorrect |
| FSP_ERR_INVALID_POINTER | Pointer to read buffer is NULL. |
| FSP_ERR_NOT_INITIALIZED | The control block has not been initialized |

◆ **R_ETHER_PHY_ChipInit()**

```
fsp_err_t R_ETHER_PHY_ChipInit ( ether_phy_ctrl_t *const p_ctrl, ether_phy_cfg_t const *const p_cfg )
```

Initialize Ethernet PHY device. Implements `ether_phy_api_t::chipInit`.

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | PHY device initialized successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHER_PHY control block or configuration structure is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Address or data is not a valid size. |
| FSP_ERR_INVALID_POINTER | Pointer to p_cfg is NULL. |
| FSP_ERR_NOT_INITIALIZED | The control block has not been initialized. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_TIMEOUT | PHY-LSI Reset wait timeout. |

◆ **R_ETHER_PHY_Read()**

```
fsp_err_t R_ETHER_PHY_Read ( ether_phy_ctrl_t *const p_ctrl, uint32_t reg_addr, uint32_t *const p_data )
```

Read data from register of PHY-LSI . Implements `ether_phy_api_t::read`.

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | ETHER_PHY successfully read data. |
| FSP_ERR_ASSERTION | Pointer to ETHER_PHY control block is NULL. |
| FSP_ERR_INVALID_POINTER | Pointer to read buffer is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Address is not a valid size |
| FSP_ERR_NOT_INITIALIZED | The control block has not been initialized |

◆ R_ETHER_PHY_Write()

```
fsp_err_t R_ETHER_PHY_Write ( ether_phy_ctrl_t *const p_ctrl, uint32_t reg_addr, uint32_t data )
```

Write data to register of PHY-LSI . Implements [ether_phy_api_t::write](#).

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | ETHER_PHY successfully write data. |
| FSP_ERR_ASSERTION | Pointer to ETHER_PHY control block is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Address or data is not a valid size |
| FSP_ERR_NOT_INITIALIZED | The control block has not been initialized |

5.2.12.16 FreeRTOS+TCP Wrapper to r_ether (rm_freertos_plus_tcp)

[Modules](#) » [Networking](#)

Middleware for using TCP on RA MCUs.

Overview

FreeRTOS Plus TCP is a TCP stack created for use with FreeRTOS.

This module provides the NetworkInterface required to use FreeRTOS Plus TCP with the [Ethernet \(r_ether\)](#) driver.

Please refer to the [FreeRTOS Plus TCP documentation](#) for further details.

Configuration**Build Time Configurations for FreeRTOS_Plus_TCP**

The following build time configurations are defined in `aws/FreeRTOSIPConfig.h`:

| Configuration | Options | Default | Description |
|--------------------------|---|---------|--|
| Print debug messages | <ul style="list-style-type: none"> Disable Enable | Disable | If <code>ipconfigHAS_DEBUG_PRINTF</code> is set to 1 then <code>FreeRTOS_debug_printf</code> should be defined to the function used to print out the debugging messages. |
| Backward Compatible Mode | <ul style="list-style-type: none"> No Yes | Yes | Run the code in backward compatible |

| | | | |
|------------------------------|---|--------------------------|--|
| Enable IPV6 | <ul style="list-style-type: none"> • Disable • Enable | Disable | mode Stack supports handling IPv6 packets (including handling IPv6 header, ND, RA, and so on) when enabled |
| Print info messages | <ul style="list-style-type: none"> • Disable • Enable | Disable | Set to 1 to print out non debugging messages, for example the output of the FreeRTOS_netstat() command, and ping replies. If ipconfigHAS_PRINTF is set to 1 then FreeRTOS_printf should be set to the function used to print out the messages. |
| Byte order of the target MCU | pdFREERTOS_LITTLE_ENDIAN | pdFREERTOS_LITTLE_ENDIAN | Define the byte order of the target MCU |
| IP/TCP/UDP checksums | <ul style="list-style-type: none"> • Disable • Enable | Enable | If the network card/driver includes checksum offloading (IP/TCP/UDP checksums) then set ipconfigDRIVER_INCLUDED_RX_IP_CHECKSUM to 1 to prevent the software stack repeating the checksum calculations. |
| Receive Block Time | Value must be a non-negative integer | 10000 | Amount of time FreeRTOS_recv() will block for. The timeouts can be set per socket, using setsockopt(). |
| Send Block Time | Value must be a non-negative integer | 10000 | Amount of time FreeRTOS_send() will block for. The timeouts can be set per socket, using setsockopt(). |
| DNS caching | <ul style="list-style-type: none"> • Disable • Enable | Enable | DNS caching |
| DNS Request Attempts | Value must be an integer | 2 | When a cache is present, ipconfigDNS_REQUEST_ATTEMPTS can be kept low and also DNS may use small |

| | | | |
|--|---|------------------------------|--|
| IP stack task priority | Only symbols, numbers and arithmetic operators are valid. | configMAX_PRIORITIES - 2 | Set the priority of the task that executes the IP stack. |
| Stack size in words (not bytes) | Only symbols, numbers and arithmetic operators are valid. | configMINIMAL_STACK_SIZE * 5 | The size, in words (not bytes), of the stack allocated to the FreeRTOS+TCP stack. |
| Network Events call vApplicationIPNetworkEventHook | <ul style="list-style-type: none"> • Disable • Enable | Enable | vApplicationIPNetworkEventHook is called when the network connects or disconnects. |
| Max UDP send block time | Only symbols, numbers and arithmetic operators are valid. | 15000 / portTICK_PERIOD_MS | Max UDP send block time |
| Use DHCP | <ul style="list-style-type: none"> • Disable • Enable | Enable | If ipconfigUSE_DHCP is 1 then FreeRTOS+TCP will attempt to retrieve an IP address, netmask, DNS server address and gateway address from a DHCP server. |
| DHCP Register Hostname | <ul style="list-style-type: none"> • Disable • Enable | Enable | Register hostname when using DHCP |
| DHCP Uses Unicast | <ul style="list-style-type: none"> • Disable • Enable | Enable | DHCP uses unicast. |
| DHCP callback function | <ul style="list-style-type: none"> • Disable • Enable | Disable | Provide an implementation of the DHCP callback function (xApplicationDHCPHook) |
| Interval between transmissions | Only symbols, numbers and arithmetic operators are valid. | 120000 / portTICK_PERIOD_MS | When ipconfigUSE_DHCP is set to 1, DHCP requests will be sent out at increasing time intervals until either a reply is received from a DHCP server and accepted, or the interval between transmissions reaches ipconfigMAXIMUM_DISCOVER_TX_PERIOD. |
| ARP Cache Entries | Value must be an integer | 6 | The maximum number of entries that can exist in the ARP table at any |

| | | | |
|---|---|---|---|
| ARP Request Retransmissions | Value must be an integer | 5 | one time ARP requests that do not result in an ARP response will be re-transmitted a maximum of ipconfigM AX_ARP_RETRANSMISSI ONS times before the ARP request is aborted. |
| Maximum time before ARP table entry becomes stale | Value must be an integer | 150 | The maximum time between an entry in the ARP table being created or refreshed and the entry being removed because it is stale |
| Use string for IP Address | <ul style="list-style-type: none"> • Disable • Enable | Enable | Take an IP in decimal dot format (for example, "192.168.0.1") as its parameter FreeRTOS_in et_addr_quick() takes an IP address as four separate numerical octets (for example, 192, 168, 0, 1) as its parameters |
| Total number of available network buffers | Value must be an integer | 10 | Define the total number of network buffer that are available to the IP stack |
| Set the maximum number of events | Only symbols, numbers and arithmetic operators are valid. | ipconfigNUM_NETWORK_BUFFER_DESCRIPTOR + 5 | Set the maximum number of events that can be queued for processing at any one time. The event queue must be a minimum of 5 greater than the total number of network buffers |
| Enable FreeRTOS_sendto() without calling Bind | <ul style="list-style-type: none"> • Enable • Disable | Disable | Set to 1 then calling FreeRTOS_sendto() on a socket that has not yet been bound will result in the IP stack automatically binding the socket to a port number from the range socketAUTO_PORT_ALLO CATION_START_NUMB |

| The socket semaphore to unblock the MQTT task (WAKE_CALLBACK) | <ul style="list-style-type: none"> • Disable • Enable | Enable | The socket semaphore is used to unblock the MQTT task |
| The socket semaphore to unblock the MQTT task (USE_CALLBACKS) | <ul style="list-style-type: none"> • Disable • Enable | Disable | The socket semaphore is used to unblock the MQTT task |
| The socket semaphore | <ul style="list-style-type: none"> • Disable | Disable | The socket semaphore |

| | | | |
|---|---|---------|---|
| to unblock the MQTT task (TX_DRIVER) | <ul style="list-style-type: none"> • Enable | | is used to unblock the MQTT task |
| The socket semaphore to unblock the MQTT task (RX_DRIVER) | <ul style="list-style-type: none"> • Disable • Enable | Disable | The socket semaphore is used to unblock the MQTT task |
| Possible optimisation for expert users | <ul style="list-style-type: none"> • Disable • Enable | Disable | Possible optimisation for expert users - requires network driver support. It is useful when there is high network traffic. If non-zero value then instead of passing received packets into the IP task one at a time the network interface can chain received packets together and pass them into the IP task in one go. If set to 0 then only one buffer will be sent at a time. |

Usage Notes

In order to use the NetworkInterface implementation provided by Renesas for RA devices:

- Configure an r_ether instance and provide a pointer to the instance of the NetworkInterface as follows:

```
/* Reference used by the NetworkInterface to access the ethernet instance. */
extern ether_instance_t const * gp_freertos_ether;
...
/* Make it reference the configured ether instance. */
ether_instance_t const * gp_freertos_ether = &g_ether_instance;
```

- Some of the stack initialisation APIs have been deprecated as of FreeRTOS V4.0.0 onwards. Please refer to [FreeRTOS+TCP Networking Tutorial: Initializing the TCP/IP Stack](#) for the new APIs supporting IPv6, Multiple Endpoints and Multiple interfaces. To use the deprecated APIs please set it to "Yes" for the stack property "Common|Backward Compatible Mode".

Note

The MAC address passed to FreeRTOS_FillEndPoint must match the MAC address configured in the r_ether instance.

g_ether_instance must have vEtherISRcallback configured as the callback.

The xApplicationGetRandomNumber and ulApplicationGetNextSequenceNumber functions should be implemented in systems using FreeRTOS Plus TCP without Secure Sockets.

To connect to a server using an IP address the macro ipconfigINCLUDE_FULL_INET_ADDR must be set to 1.

Limitations

- Zero-copy is not currently supported by the NetworkInterface.

5.2.12.17 GTL BLE Abstraction (rm_ble_abs_gtl)

Modules » Networking

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the [BLE ABS Interface](#).

Overview

This module provides BLE GAP functionality that complies with the Bluetooth Core Specification version 5.0 specified by the Bluetooth SIG. This module is configured via the [QE for BLE](#). QE for BLE provides standard and custom services defined by the user.

The module supports the Renesas Electronics DA14531 Bluetooth® Low Energy 5 Module. The `rm_ble_abs_gtl` driver interfaces with the DA14531 module over UART.

Features

The Bluetooth Low Energy (BLE) Abstraction module with GTL supports the following features:

- Common functionality
 - Open/Close the BLE protocol stack.
- The following GAP Role support
 - Peripheral: The device that accepts a connection request from Central and establishes a connection.
- GAP functionality
 - Initialize the Host stack.
 - Setting address.
 - Start/Stop Advertising.
 - Connect/Disconnect a link.
- GATT Common functionality
 - Get MTU Size.
- GATT Server functionality
 - Initialization of GATT Server.
 - Loading of Profile definition.
 - Notification of characteristics modification.
 - Read/Write of GATT Profile from host.

Configuration

Pin Configuration

Pins used by the BLE driver to control the DA14531 module:

- Reset Pin : Active low reset line for DA14531 module

- [UART Interface](#) : RX/TX Pins

Usage Notes

Getting Started Guide

The below guide walks users through building a fully working solution that allows booting from the host via 1-wire UART in order to run a BLE application from the RA MCU using the GTL interface.

https://lpccs-docs.renesas.com/DA1453x-FSP_BLE_Framework/UM-B-172/index.html

Addresses

When using a public BD address the address pre-programmed into the DA14531 will be used and can't be overridden.

A random address can be set by calling the `R_BLE_VS_SetBdAddr` function before the `R_BLE_GAP_Init` function is called.

Heap Requirements

Ensure the BSP heap size is set to at least 2K bytes.

When using FreeRTOS ensure the heap 4 size is set to a minimum of 2K bytes.

Module Firmware Compatibility

This middleware module is compatible with GTL binary version 6.0.18 and later. You must ensure that the DA14531 Module (or PMOD) you are using contains this version (or later) firmware or that you use the boot from host feature and have the host MCU load the binary into the DA14531.

Instructions detailing how to upgrade the firmware in a DA14531 Module can be found here:

https://lpccs-docs.renesas.com/US159-DA14531EVZ_Firmware_Upgrade/index.html

The GTL binary file can be downloaded using the tool described in the above instructions, or by using the following link:

<https://www.renesas.com/us/en/document/swo/fsp-gtl-binary-us159-da14531evz-pmod-programming?r=1564826>

Limitations

Developers should be aware of the following limitations when using the BLE_ABS:

Following a power on reset, the `R_BLE_VS_GetRand` function always returns the same number. Subsequent calls to this function produce random numbers.

Service and characteristic write callback functions, created when using the QE Tool are not supported

The boot from host feature currently only supports 1-wire UART operation. This means that the UART RX and TX pins on the host RA MCU must be tied together using a 1K ohm resistor in order to boot the DA14531 - this resistor can remain in place after the boot operation has been completed.

Currently supported rm_ble_abs_gtl interface functions:

- RM_BLE_ABS_Open
- RM_BLE_ABS_Close
- RM_BLE_ABS_StartLegacyAdvertising

Currently supported r_ble_api interface functions:

- R_BLE_Open
- R_BLE_Close
- R_BLE_Execute
- R_BLE_IsTaskFree
- R_BLE_GetVersion
- R_BLE_GAP_Init
- R_BLE_GAP_Terminate
- R_BLE_GAP_UpdConn
- R_BLE_GAP_SetDataLen
- R_BLE_GAP_Disconnect
- R_BLE_GAP_GetVerInfo
- R_BLE_GAP_ReadRssi
- R_BLE_GAP_ReadChMap
- R_BLE_GAP_SetAdvParam
- R_BLE_GAP_SetAdvSresData
- R_BLE_GAP_StartAdv
- R_BLE_GAP_StopAdv
- R_BLE_GAP_GetRemainAdvBufSize
- R_BLE_GAP_GetRemDevInfo
- R_BLE_GATTS_SetDbInst
- R_BLE_GATT_GetMtu
- R_BLE_GATTS_RegisterCb
- R_BLE_GATTS_DeregisterCb
- R_BLE_GATTS_Notification
- R_BLE_GATTS_Indication
- R_BLE_GATTS_GetAttr
- R_BLE_GATTS_SetAttr
- R_BLE_GATTC_RegisterCb
- R_BLE_GATTC_DeregisterCb
- R_BLE_GATTC_ReqExMtu
- R_BLE_GATTC_DiscAllPrimServ
- R_BLE_GATTC_DiscIncServ
- R_BLE_GATTC_ReadChar
- R_BLE_GATTC_WriteCharWithoutRsp
- R_BLE_GATTC_SignedWriteChar
- R_BLE_GATTC_WriteChar
- R_BLE_GATTC_WriteLongChar
- R_BLE_GATTC_ExecWrite
- R_BLE_VS_Init
- R_BLE_VS_GetBdAddr
- R_BLE_VS_SetBdAddr
- R_BLE_VS_GetRand

Currently supported callback events:

- BLE_GAP_EVENT_STACK_ON
- BLE_GAP_EVENT_STACK_OFF

- BLE_GAP_EVENT_CONN_IND
- BLE_GAP_EVENT_DISCONN_IND
- BLE_GAP_EVENT_DATA_LEN_CHG
- BLE_GAP_EVENT_CONN_PARAM_UPD_COMP
- BLE_GAP_EVENT_ADV_ON
- BLE_GAP_EVENT_ADV_OFF
- BLE_GAP_EVENT_SET_DATA_LEN_COMP
- BLE_GAP_EVENT_LOC_VER_INFO
- BLE_GAP_EVENT_RSSI_RD_COMP
- BLE_GAP_EVENT_CH_MAP_RD_COMP
- BLE_GAP_EVENT_GET_REM_DEV_INFO
- BLE_GATTS_EVENT_WRITE_RSP_COMP
- BLE_GATTS_EVENT_HDL_VAL_CNF
- BLE_GATTS_EVENT_DB_ACCESS_IND
- BLE_GATTC_EVENT_EX_MTU_RSP
- BLE_GATTC_EVENT_PRIM_SERV_16_DISC_IND
- BLE_GATTC_EVENT_PRIM_SERV_128_DISC_IND
- BLE_GATTC_EVENT_ALL_PRIM_SERV_DISC_COMP

Examples

BLE_ABS_GTL Basic Example

This is a basic example of minimal use of the BLE_ABS_GTL in an application.

```
/* The callback is called when peripheral event occurs. */
void gap_peripheral_cb (uint16_t type, ble_status_t result, st_ble_evt_data_t *
p_data)
{
    FSP_PARAMETER_NOT_USED(result);
    FSP_PARAMETER_NOT_USED(p_data);
    switch (type)
    {
    case BLE_GAP_EVENT_STACK_ON:
        {
            g_ble_event_flag = g_ble_event_flag | BLE_ABS_EVENT_FLAG_STACK_ON;
        }
        break;
    case BLE_GAP_EVENT_ADV_ON:
        {
            st_ble_gap_adv_set_evt_t * p_gap_adv_set_evt_param = (st_ble_gap_adv_set_evt_t *)
p_data->p_param;
            g_advertising_handle = p_gap_adv_set_evt_param->adv_hdl;
        }
    }
}
```

```
        g_ble_event_flag |= BLE_ABS_EVENT_FLAG_ADV_ON;
break;
    }
case BLE_GAP_EVENT_ADV_OFF:
    {
        g_ble_event_flag |= BLE_ABS_EVENT_FLAG_ADV_OFF;
break;
    }
case BLE_GAP_EVENT_CONN_IND:
    {
        g_ble_event_flag |= BLE_ABS_EVENT_FLAG_CONN_IND;
break;
    }
    {
/* Do nothing. */
break;
    }
default:
break;
    }
}
```

```
#define BLE_ABS_EVENT_FLAG_STACK_ON (0x01 << 0)

5.2.12.18 NetX Duo Ethernet Driver (rm_netxduo_ether)

[Modules](#) » [Networking](#)

Overview

This module provides a NetX Duo driver that is implemented using the [Ethernet Interface](#).

Please refer to the [NetXDuo documentation](#) for further details.

Features

- Packet Types Supported
 - ARP
 - IPv4
 - IPv6
- Link status callback
- Configurable IP MTU

Configuration

Configurations for Networking > NetX Duo Ethernet Driver (rm_netxduo_ether)

| Configuration | Options | Default | Description |
|---------------|---|-------------------|--------------|
| Name | Name must be a valid C symbol | g_netxduo_ether_0 | Module name. |
| IP MTU | Value must be in the range [576, 1500] bytes. | 1500 | IP MTU |

Usage Notes

Calculating the Packet Size for an IP instance

In order to ensure that there is enough space to store an entire Ethernet frame, the packet pool used

for receiving packets must have a payload size that is 32 bytes larger than the configured `ether_cfg_t::ether_buffer_size`. The extra 32 bytes is needed in order to ensure that the allocated packets are properly aligned to 32 bytes.

`ether_cfg_t::ether_buffer_size` is calculated from the IP MTU using the following formula:

$$\text{ceil}((\text{rm_netxduo_ether_cfg_t::mtu} + \text{Ethernet Header (14)} + \text{Padding Bytes (2)}) / 32) * 32$$

Examples

Basic Example

This is a basic example of minimal use of the NetX Duo Ether Driver in an application.

```
#define NETXDUO_EXAMPLE_IP_STACK_SIZE (2048U)
#define NETXDUO_EXAMPLE_ARP_CACHE_SIZE (2048U)
#define NETXDUO_EXAMPLE_PACKET_SIZE (1568U)
#define NETXDUO_EXAMPLE_PACKET_NUM (100U)
#define NETXDUO_EXAMPLE_PACKET_POOL_SIZE ((sizeof(NX_PACKET) +
NETXDUO_EXAMPLE_PACKET_SIZE) * \
    NETXDUO_EXAMPLE_PACKET_NUM)
#define NETXDUO_EXAMPLE_MAC_ADDRESS_MSW (0)
#define NETXDUO_EXAMPLE_MAC_ADDRESS_LSW (0)

static NX_IP g_ip;
static NX_PACKET_POOL g_packet_pool;
static uint8_t g_ip_stack_memory[NETXDUO_EXAMPLE_IP_STACK_SIZE]
BSP_ALIGN_VARIABLE(4);
static uint8_t g_packet_pool_memory[NETXDUO_EXAMPLE_PACKET_POOL_SIZE]
BSP_ALIGN_VARIABLE(4);
static uint8_t g_ip_arp_cache_memory[NETXDUO_EXAMPLE_ARP_CACHE_SIZE]
BSP_ALIGN_VARIABLE(4);

static void rm_netxduo_ether0 (NX_IP_DRIVER * driver_req_ptr)
{
    /* Pass the driver request and ethernet driver configuration to the NetX Duo Ether
Driver. */
    rm_netxduo_ether(driver_req_ptr, &g_netxduo_ether_instance);
}

void rm_netxduo_ether_example ()
{
```

```
    UINT status;

    nx_system_initialize();

    /* Create a packet pool for the IP instance. */
    status = nx_packet_pool_create(&g_packet_pool,
    "Packet Pool",
                                NETXDUEXAMPLE_PACKET_SIZE,
                                &g_packet_pool_memory[0],
                                NETXDUEXAMPLE_PACKET_POOL_SIZE);

    assert(NX_SUCCESS == status);

    /* Create an IP instance using the rm_netxduo_ether driver and packet pool instance.
    */
    status = nx_ip_create(&g_ip,
    "IP Instance",
                                IP_ADDRESS(192, 168, 1, 2),
                                IP_ADDRESS(255, 255, 255, 0),
                                &g_packet_pool,
                                rm_netxduo_ether0,
                                &g_ip_stack_memory[0],
                                sizeof(g_ip_stack_memory),
                                0);

    assert(NX_SUCCESS == status);

    /* Enable all modules that are required by the application. */
    status = nx_arp_enable(&g_ip, g_ip_arp_cache_memory, sizeof
(g_ip_arp_cache_memory));

    assert(NX_SUCCESS == status);
    status = nx_tcp_enable(&g_ip);
    assert(NX_SUCCESS == status);
    status = nx_icmp_enable(&g_ip);
    assert(NX_SUCCESS == status);
}
```

Changing MAC address Example

This is an example of changing the MAC address after an IP instance has already been created.

```
void rm_netxduo_ether_change_mac_address_example ()
{
    ULONG driver_status;
    UINT status;
    /* Disable the link. */
    status = nx_ip_driver_interface_direct_command(&g_ip, NX_LINK_DISABLE, 0,
&driver_status);
    assert(NX_SUCCESS == status);
    /* Update the MAC address. */
    status = nx_ip_interface_physical_address_set(&g_ip,
                                                0,
                                                NETXDUEXAMPLE_MAC_ADDRESS_MSW,
                                                NETXDUEXAMPLE_MAC_ADDRESS_LSW,
                                                NX_TRUE);
    assert(NX_SUCCESS == status);
    /* Re-enable the link. */
    status = nx_ip_driver_interface_direct_command(&g_ip, NX_LINK_ENABLE, 0,
&driver_status);
    assert(NX_SUCCESS == status);
}
```

5.2.12.19 NetX Duo WiFi Driver (rm_netxduo_wifi)

[Modules](#) » [Networking](#)

Overview

This module provides a NetX Duo driver that is implemented using the rm_wifi_onchip_silex driver.

Please refer to the [NetXDuo documentation](#) for further details.

Features

- Packet Types Supported
 - TCP/IPv4
 - UDP
- Configurable IP MTU

Configuration

Build Time Configurations for rm_netxduo_wifi

The following build time configurations are defined in fsp_cfg/middleware/rm_netxduo_wifi_cfg.h:

| Configuration | Options | Default | Description |
|----------------|---|---------|-------------|
| IP MTU (bytes) | Value must be in the range [576, 1500] bytes. | 1500 | IP MTU |

Usage Notes

Connecting to a Wireless Network

NetX Duo does not support connecting to a wireless network directly and instead the driver functions should be called directly to establish a connection.

- `rm_wifi_onchip_silex_open()` should be called to initialize the WiFi module driver.
- `rm_wifi_onchip_silex_scan()` should be used to scan for access points.
- `rm_wifi_onchip_silex_connect()` should be used before opening a NetX IP instance in order to connect it to a network.
- `rm_wifi_onchip_silex_network_info_get()` should be used after an access point connection has been established to get DHCP acquired IP address, subnet mask, and gateway.

Unsupported NetX Duo Features

These features are currently not supported due to lack of support in the `rm_wifi_onchip_silex` driver or in the WiFi module hardware/firmware:

- IPv6 functionality
- TCP/UDP server mode
- ARP is handled directly by the WiFi module
- DHCP is always enabled on module by the `rm_wifi_onchip_silex` driver, thus the software DHCP stack is unsupported.
- The source port will not be used when binding a TCP or UDP socket. Applications should set the source port to `NX_ANY_PORT`.

On Module Alternatives

Instead of using NetX Duo Software Addons the following features can be performed directly on the WiFi module by calling the appropriate function instead if desired:

- DNS: The user can preform a DNS lookup by calling `rm_wifi_onchip_silex_dns_query`.
- ICMP: The user can perform a ping by calling `rm_wifi_onchip_silex_ping`.
- SNTP: The WiFi module has multiple public APIs for time related functions:
 - `RM_WIFI_ONCHIP_SILEX_EpochTimeGet`
 - `RM_WIFI_ONCHIP_SILEX_LocalTimeGet`
 - `RM_WIFI_ONCHIP_SILEX_SntpEnableSet`
 - `RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet`
 - `RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet`

Examples

Basic Example

This is a basic example of minimal use of the NetX Duo WiFi Driver in an application.

```
#define NETXDUEXAMPLE_IP_STACK_SIZE (2048U)
#define NETXDUEXAMPLE_ARP_CACHE_SIZE (2048U)
#define NETXDUEXAMPLE_PACKET_SIZE (1568U)
#define NETXDUEXAMPLE_PACKET_NUM (100U)
#define NETXDUEXAMPLE_PACKET_POOL_SIZE ((sizeof(NX_PACKET) +
NETXDUEXAMPLE_PACKET_SIZE) * \
    NETXDUEXAMPLE_PACKET_NUM)
#define NETXDUEXAMPLE_SSID "ssidName"
#define NETXDUEXAMPLE_PASSWORD "password"
static NX_IP g_ip0;
static NX_PACKET_POOL g_packet_pool0;
static uint8_t g_ip0_stack_memory[NETXDUEXAMPLE_IP_STACK_SIZE]
BSP_ALIGN_VARIABLE(4);
static uint8_t g_packet_pool0_pool_memory[NETXDUEXAMPLE_PACKET_POOL_SIZE]
BSP_ALIGN_VARIABLE(4);
extern wifi_onchip_silex_cfg_t g_wifi_onchip_silex_cfg;
void rm_netxduo_wifi_example ()
{
    UINT status;
    fsp_err_t err;
    nx_system_initialize();
    /* Open WiFi module */
    err = rm_wifi_onchip_silex_open(&g_wifi_onchip_silex_cfg);
    assert(FSP_SUCCESS == err);
    /* Connect to desired AP */
    err = rm_wifi_onchip_silex_connect(NETXDUEXAMPLE_SSID, eWiFiSecurityWPA2,
NETXDUEXAMPLE_PASSWORD);
    assert(FSP_SUCCESS == err);
    /* Create a packet pool for the IP instance. */
    status = nx_packet_pool_create(&g_packet_pool0,
```

```
"Packet Pool",

                                NETXDUE_EXAMPLE_PACKET_SIZE,
                                &g_packet_pool0_pool_memory[0],
                                NETXDUE_EXAMPLE_PACKET_POOL_SIZE);

    assert(NX_SUCCESS == status);

/* Create an IP instance using the rm_netxduo_wifi driver and packet pool instance.
*/

    status = nx_ip_create(&g_ip0,

}
```

UDP Example

This is a basic example of connecting a UDP socket.

```
#define NETXDUEXAMPLE_TESTS_SOCKET_TIMEOUT (3000)
#define NETXDUEXAMPLE_TESTS_UDP_TX_PORT (5000)
```

```
#define NETXDUAL_TESTS_SERVER_IP (0xC0A80064)

void rm_netxdual_wifi_udp_example (void)
{
    NX_UDP_SOCKET udp_client_socket;
    /* IP Address of the remote socket. */
    NXD_ADDRESS g_ip_address = NETXDUAL_TESTS_SERVER_IP;
    /* Create the socket. */
    nx_udp_socket_create(&g_ip, &udp_client_socket, "Socket 0", NX_IP_NORMAL,
NX_FRAGMENT_OKAY, 0, 5);
    /* Bind to the UDP port. */
    nx_udp_socket_bind(&udp_client_socket, NETXDUAL_TESTS_UDP_TX_PORT,
TX_WAIT_FOREVER);
    NX_PACKET * p_nx_packet = NX_NULL;
    /* Allocate a packet for message data */
    nx_packet_allocate(&g_packet_pool0, &p_nx_packet, NX_UDP_PACKET,
NETXDUAL_TESTS_SOCKET_TIMEOUT)
    /* Append message data to packet */
    nx_packet_data_append(&p_nx_packet, "Hello World", 12, &g_packet_pool0,
NX_WAIT_FOREVER);
    /* Send UDP message to server */
    nx_udp_socket_send(&udp_client_socket, &p_nx_packet, &g_ip_address,
NETXDUAL_TESTS_UDP_TX_PORT);
    NX_PACKET * p_nx_packet_recv;
    /* Receive any response from UDP server */
    nx_udp_socket_receive(&udp_client_socket, &p_nx_packet_recv,
NETXDUAL_TESTS_SOCKET_TIMEOUT);
    /* Unbind and delete the udp socket. */
    nx_udp_socket_unbind(&udp_client_socket);
    nx_udp_socket_delete(&udp_client_socket);
}
```

5.2.12.20 On Chip HTTP Client on DA16XXX (rm_http_onchip_da16xxx)

[Modules](#) » [Networking](#)

Functions

`fsp_err_t` `RM_HTTP_DA16XXX_Open` (`http_onchip_da16xxx_instance_ctrl_t`, `*p_ctrl`, `http_onchip_da16xxx_cfg_t` `const` `*const_p_cfg`)

`fsp_err_t` `RM_HTTP_DA16XXX_Send` (`http_onchip_da16xxx_instance_ctrl_t`, `*p_ctrl`, `http_onchip_da16xxx_request_t` `*p_request`, `http_onchip_da16xxx_buffer_t` `*p_buffer`)

`fsp_err_t` `RM_HTTP_DA16XXX_Close` (`http_onchip_da16xxx_instance_ctrl_t`, `*p_ctrl`)

Detailed Description

HTTP client implementation using the DA16XXX WiFi module on RA MCUs.

Overview

This Middleware module supplies an implementation for the HTTP Client on the DA16XXX module. The network stack is run on the DA16XXX and this module inherits and extends the core functionality from the DA16XXX WiFi driver. The DA16XXX HTTP module only supports FreeRTOS currently (Microsoft Azure support expected in future release).

The DA16XXX module supports the following modules:

- DA16200
- DA16600

Refer to [WiFi Onchip DA16XXX Framework Driver \(rm_wifi_da16xxx\)](#).

Features

The HTTP Onchip da16xxx Middleware driver supplies these features:

- Supports sending a request header (GET, PUT, and POST) to an HTTP server and receiving a response header
- Supports unsecure and secure connection via TLS encryption
- Supports parsing of the response header and returning to the user
- Supports other optional configurations such as Server Name Indication (SNI) and ALPNs

Configuration

Build Time Configurations for `rm_http_onchip_da16xxx`

The following build time configurations are defined in `fsp_cfg/rm_http_onchip_da16xxx_cfg.h`:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Refer to [WiFi Onchip DA16XXX Framework Driver \(rm_wifi_da16xxx\)](#).

Interrupt Configuration

Refer to [UART \(r_sci_uart\)](#). `R_SCI_UART_Open()` is called by [WiFi Onchip DA16XXX Framework Driver \(rm_wifi_da16xxx\)](#).

Clock Configuration

Refer to [UART \(r_sci_uart\)](#).

Pin Configuration

Refer to [UART \(r_sci_uart\)](#). `R_SCI_UART_Open()` is called by [WiFi Onchip DA16XXX Framework Driver \(rm_wifi_da16xxx\)](#).

Usage Notes

Refer to [WiFi Onchip DA16XXX Framework Driver \(rm_wifi_da16xxx\)](#).

- When the user intends to use secure TLS in their application, they need to provide certificates (root certificate authority, client certificate, and private key) in a header file
- The user must provide certificate macro names in the FSP Configurator properties, as well as the name of the header file (to link the module, certificates, and header together)
- If the user provides these credentials in the Configurator, they must create a new header file in their `/src/` folder with the same name as they provided in the Configurator properties. When the code is generated, a build error will occur if the header file is not created

Limitations

Refer to [WiFi Onchip DA16XXX Framework Driver \(rm_wifi_da16xxx\)](#).

- This module is not a standalone module - ensure that the WiFi module APIs are invoked first to configure the DA16XXX module and connect to an Access Point before using the HTTP module
- Ensure that DA16XXX SDK version v3.2.6 or later is being used, where the default buffer size for incoming TLS is 6KB and outgoing TLS is 4KB. Using earlier versions may result in failure to connect to an HTTP server with TLS (unless buffer size settings are altered manually)

Examples

Basic Example

This is a basic example of minimal use of HTTP Middleware in an application.

```
void http_onchip_basic_example (void)
{
    WIFIReturnCode_t wifi_err;
    fsp_err_t        http_err;

    /* Setup Access Point connection parameters */
}
```

```
WIFINetworkParams_t net_params =
{
    .ucChannel                = 0,
    .xPassword.xWPA.cPassphrase = WIFI_PWD,
    .ucSSID                  = WIFI_SSID,
    .xPassword.xWPA.ucLength = sizeof(WIFI_PWD),
    .ucSSIDLength            = sizeof(WIFI_SSID),
    .xSecurity                = eWiFiSecurityWPA2,
};

/* Open connection to the Wifi Module */
wifi_err = WIFI_On();
assert(eWiFiSuccess == wifi_err);

/* Connect to the Access Point */
wifi_err = WIFI_ConnectAP(&net_params);
assert(eWiFiSuccess == wifi_err);

/* Initialize the HTTP Client connection */
http_err = RM_HTTP_DA16XXX_Open(&g_rm_http_onchip_da16xxx_instance,
&g_http_onchip_da16xxx_cfg);
assert(FSP_SUCCESS == http_err);

/* Initialize the HTTP Client connection */
http_err = RM_HTTP_DA16XXX_Send(&g_rm_http_onchip_da16xxx_instance, &test_req,
&user_buf);
assert(FSP_SUCCESS == http_err);

/* Close the HTTP Client module */
http_err = RM_HTTP_DA16XXX_Close(&g_rm_http_onchip_da16xxx_instance);
assert(FSP_SUCCESS == http_err);
}
```

Data Structures

struct [http_onchip_da16xxx_request_t](#)

struct [http_onchip_da16xxx_buffer_t](#)

struct [http_onchip_da16xxx_cfg_t](#)

struct [http_onchip_da16xxx_instance_ctrl_t](#)

Macros

```
#define HTTP_ONCHIP_DA16XXX_MAX_ALPN
    Maximum number of ALPNs supported by DA16XXX.
```

```
#define HTTP_ONCHIP_DA16XXX_MAX_SNI_LEN
    Maximum length of SNI supported by DA16XXX.
```

```
#define HTTP_ONCHIP_DA16XXX_MAX_GET_LEN
    Maximum length of HTTP GET request.
```

Enumerations

```
enum http_onchip_da16xxx_method_t
```

```
enum http_onchip_da16xxx_tls_auth_t
```

Data Structure Documentation

◆ http_onchip_da16xxx_request_t

| struct http_onchip_da16xxx_request_t | | |
|--|-----------------|---|
| HTTP Request Buffer | | |
| Data Fields | | |
| const char * | p_http_endpoint | Defines the URL to send HTTP requests to. |
| const char * | p_request_body | Pointer to optional buffer for body. |
| http_onchip_da16xxx_method_t | method | Request method to be used. |
| uint32_t | length | Length of optional body buffer. |

◆ http_onchip_da16xxx_buffer_t

| struct http_onchip_da16xxx_buffer_t | | |
|-------------------------------------|-------------------|------------------------------|
| HTTP User Buffers | | |
| Data Fields | | |
| char * | p_request_buffer | User HTTP request buffer. |
| uint32_t | req_length | Size of HTTP request buffer. |
| char * | p_response_buffer | User HTTP request buffer. |
| uint32_t | resp_length | Size of HTTP request buffer. |

◆ http_onchip_da16xxx_cfg_t

| struct http_onchip_da16xxx_cfg_t | | |
|--|---|--|
| HTTP Configuration | | |
| Data Fields | | |
| at_transport_da16xxx_instance_t const * | p_transport_instance | |
| const char * | p_alpns[HTTP_ONCHIP_DA16XXX_MAX_ALPN] | Buffer for storing ALPN names. |
| uint8_t | alpn_count | ALPN Protocols count. Max value is 3. |
| const char * | p_sni_name | Pointer to Server Name Indication. |
| http_onchip_da16xxx_tls_auth_t | tls_level | Set TLS Authentication Level (0, 1, or 2) |
| const char * | p_root_ca | String representing a trusted server root certificate. |
| uint32_t | root_ca_size | Size associated with root CA Certificate. |
| const char * | p_client_cert | String representing a Client certificate. |
| uint32_t | client_cert_size | Size associated with Client certificate. |
| const char * | p_client_private_key | String representing Client Private Key. |
| uint32_t | private_key_size | Size associated with Client Private Key. |

◆ http_onchip_da16xxx_instance_ctrl_t

| struct http_onchip_da16xxx_instance_ctrl_t | | |
|---|-------|---|
| HTTP_ONCHIP_DA16XXX private control block. DO NOT MODIFY. | | |
| Data Fields | | |
| uint32_t | open | Flag to indicate if HTTP has been opened. |
| http_onchip_da16xxx_cfg_t const * | p_cfg | Pointer to p_cfg for HTTP. |

Enumeration Type Documentation

◆ **http_onchip_da16xxx_method_t**

| enum http_onchip_da16xxx_method_t | |
|---|-----------------------------------|
| HTTP Request Method | |
| Enumerator | |
| HTTP_ONCHIP_DA16XXX_GET | Value converted to "get" string. |
| HTTP_ONCHIP_DA16XXX_POST | Value converted to "post" string. |
| HTTP_ONCHIP_DA16XXX_PUT | Value converted to "put" string. |

◆ **http_onchip_da16xxx_tls_auth_t**

| enum http_onchip_da16xxx_tls_auth_t | |
|---|-------------------------------|
| HTTP TLS Authentication Level | |
| Enumerator | |
| HTTP_ONCHIP_DA16XXX_TLS_VERIFY_NONE | TLS verification is not used. |
| HTTP_ONCHIP_DA16XXX_TLS_VERIFY_OPTIONAL | TLS verification is optional. |
| HTTP_ONCHIP_DA16XXX_TLS_VERIFY_REQUIRED | TLS verification is required. |

Function Documentation

◆ **RM_HTTP_DA16XXX_Open()**

```
fsp_err_t RM_HTTP_DA16XXX_Open ( http_onchip_da16xxx_instance_ctrl_t * p_ctrl,
http_onchip_da16xxx_cfg_t const *const p_cfg )
```

Initialize the DA16XXX on-chip HTTP Client service.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | Pointer to HTTP Client instance control structure. |
| [in] | p_cfg | Pointer to HTTP Client configuration structure. |

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | Parameter checking was unsuccessful. |
| FSP_ERR_INVALID_ARGUMENT | Data size is too large or NULL. |
| FSP_ERR_ALREADY_OPEN | The instance has already been opened. |

◆ **RM_HTTP_DA16XXX_Send()**

```
fsp_err_t RM_HTTP_DA16XXX_Send ( http_onchip_da16xxx_instance_ctrl_t * p_ctrl,
http_onchip_da16xxx_request_t * p_request, http_onchip_da16xxx_buffer_t * p_buffer )
```

Send the HTTP request with the configured buffers.

Parameters

| | | |
|------|-----------|--|
| [in] | p_ctrl | Pointer to HTTP Client instance control structure. |
| [in] | p_request | Pointer to HTTP request control structure. |
| [in] | p_buffer | Pointer to HTTP user buffer struct for request and response. |

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | Parameter checking was unsuccessful. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_INVALID_ARGUMENT | Data size is too large. |
| FSP_ERR_INVALID_DATA | Data was not received correctly. |

◆ **RM_HTTP_DA16XXX_Close()**

```
fsp_err_t RM_HTTP_DA16XXX_Close ( http_onchip_da16xxx_instance_ctrl_t * p_ctrl)
```

Close the DA16XXX HTTP Client service.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | Pointer to HTTP Client instance control structure. |
|------|--------|--|

Return values

| | |
|-------------------|--------------------------------------|
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_ASSERTION | Parameter checking was unsuccessful. |

5.2.12.21 On Chip MQTT Client on DA16XXX (rm_mqtt_onchip_da16xxx)

[Modules](#) » [Networking](#)

Functions

| | |
|-----------|--|

Detailed Description

MQTT client implementation using the DA16XXX WiFi module on RA MCUs.

Overview

This Middleware module supplies an implementation for the MQTT Client on the DA16XXX module. The network stack is run on the DA16XXX and this module inherits and extends the core functionality from the DA16XXX WiFi driver. The DA16XXX MQTT module only supports FreeRTOS currently (Microsoft Azure support expected in future release).

The DA16XXX module supports the following modules:

- DA16200
- DA16600

Refer to [WiFi Onchip DA16XXX Framework Driver \(rm_wifi_da16xxx\)](#).

Features

The MQTT Onchip da16xxx Middleware driver supplies these features:

- Supports connect/disconnect to an MQTT broker via hostname, port, and user credentials
- Supports unsecure and secure connection via TLS encryption
- Supports the MQTT subscribe/publish model for multiple topics
- Supports other optional configurations such as MQTT v3.1.1, Quality-of-service (QoS) level, TLS cipher suites, and ALPNs

Configuration

Build Time Configurations for rm_mqtt_onchip_da16xxx

The following build time configurations are defined in fsp_cfg/rm_mqtt_onchip_da16xxx_cfg.h:

| Configuration | Options | Default | Description |
|------------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Size of MQTT RX buffer | Must be an integer greater than 0 | 512 | Size in bytes of the MQTT buffer used for receiving subscribed data. Must be an integer greater than 0. |
| Size of MQTT TX buffer | Must be an integer greater than 200 and less than 2064 | 512 | Size in bytes of the MQTT buffer used for sending commands and publishing data. Maximum publishing length is 2063 bytes |

Refer to [WiFi Onchip DA16XXX Framework Driver \(rm_wifi_da16xxx\)](#).

Note: This module provides the basic configurations in the FSP Configurator required to connect to an MQTT broker such as credential information (user, password, client key, etc.), publish/subscribe topics, and optional configurations as required. The user can then copy these configurations to a new structure if they want to connect to a new endpoint/make changes to the configurations dynamically.

Interrupt Configuration

Refer to [UART \(r_sci_uart\)](#). `R_SCI_UART_Open()` is called by [WiFi Onchip DA16XXX Framework Driver \(rm_wifi_da16xxx\)](#).

Clock Configuration

Refer to [UART \(r_sci_uart\)](#).

Pin Configuration

Refer to [UART \(r_sci_uart\)](#). `R_SCI_UART_Open()` is called by [WiFi Onchip DA16XXX Framework Driver \(rm_wifi_da16xxx\)](#)

Usage Notes

Refer to [WiFi Onchip DA16XXX Framework Driver \(rm_wifi_da16xxx\)](#).

- This module is not a standalone module - ensure that the WiFi module APIs are invoked first to configure the DA16XXX module and connect to an Access Point before using the MQTT module where the default buffer size for incoming TLS is 6KB and outgoing TLS is 4KB.
- When the user intends to use secure TLS in their application, they need to provide certificates (root certificate authority, client certificate, and private key) in a header file
- The user must provide certificate macro names in the FSP Configurator properties, as well as the name of the header file (to link the module, certificates, and header together)
- If the user provides these credentials in the Configurator, they must create a new header file in their /src/ folder with the same name as they provided in the Configurator properties. When the code is generated, a build error will occur if the header file is not created
- If only using username and password, these fields can be left blank (default), and a header file does not need to be created

Limitations

Refer to [WiFi Onchip DA16XXX Framework Driver \(rm_wifi_da16xxx\)](#).

- Ensure that DA16XXX SDK version v3.2.6 or later is being used, where the default buffer size for incoming TLS is 6KB and outgoing TLS is 4KB. Using earlier versions may result in failure to connect to an MQTT broker with TLS (unless buffer size settings are altered manually)
- For publish/subscribe topics, a separate QoS level cannot be set per topic - only one QoS level can be set which applies to all messages
- Currently the module only supports unsecured MQTT with username/password or secure MQTT/TLS with certificates (root CA, client certificate, and private key). The module does not accept username/password with certificates.

Examples

Basic Example

This is a basic example of minimal use of MQTT Middleware in an application.

```
void mqtt_onchip_basic_example (void)
{
    WIFIReturnCode_t wifi_err;
    fsp_err_t        mqtt_err;

    /* Setup Access Point connection parameters */
    WIFINetworkParams_t net_params =
    {
        .ucChannel          = 0,
        .xPassword.xWPA.cPassphrase = WIFI_PWD,
        .ucSSID             = WIFI_SSID,
    }
}
```

```
.xPassword.xWPA.ucLength = sizeof(WIFI_PWD),
.xucSSIDLength           = sizeof(WIFI_SSID),
.xSecurity                = eWiFiSecurityWPA2,
};

/* Open connection to the Wifi Module */
wifi_err = WIFI_On();
assert(eWiFiSuccess == wifi_err);

/* Connect to the Access Point */
wifi_err = WIFI_ConnectAP(&net_params);
assert(eWiFiSuccess == wifi_err);

/* Initialize the MQTT Client connection */
mqtt_err = RM_MQTT_DA16XXX_Open(&g_rm_mqtt_onchip_da16xxx_instance,
&g_mqtt_onchip_da16xxx_cfg);
assert(FSP_SUCCESS == mqtt_err);

/* Subscribe to MQTT topics to be received */
mqtt_err = RM_MQTT_DA16XXX_Subscribe(&g_rm_mqtt_onchip_da16xxx_instance,
subTopics, 1);
assert(FSP_SUCCESS == mqtt_err);

/* Connect to the MQTT Broker */
mqtt_err = RM_MQTT_DA16XXX_Connect(&g_rm_mqtt_onchip_da16xxx_instance,
CONNECT_TIMEOUT);
assert(FSP_SUCCESS == mqtt_err);

/* Publish data to the MQTT Broker */
mqtt_err = RM_MQTT_DA16XXX_Publish(&g_rm_mqtt_onchip_da16xxx_instance,
&pubTopics[0]);
assert(FSP_SUCCESS == mqtt_err);

/* Loop to receive data from the MQTT Broker */
do
{
    RM_MQTT_DA16XXX_Receive(&g_rm_mqtt_onchip_da16xxx_instance,
&g_mqtt_onchip_da16xxx_cfg);
    R_BSP_SoftwareDelay(CONNECT_TIMEOUT, BSP_DELAY_UNITS_MILLISECONDS);
} while (cb_flag == 0);

/* Disconnect from the MQTT Broker */
```

```
mqtt_err = RM_MQTT_DA16XXX_Disconnect(&g_rm_mqtt_onchip_da16xxx_instance);
assert(FSP_SUCCESS == mqtt_err);
/* Close the MQTT Client module */
mqtt_err = RM_MQTT_DA16XXX_Close(&g_rm_mqtt_onchip_da16xxx_instance);
assert(FSP_SUCCESS == mqtt_err);
}
```

Data Structure Documentation

◆ mqtt_onchip_da16xxx_sub_info_t

| | | |
|---------------------------------------|---------------------|--------------------------------------|
| struct mqtt_onchip_da16xxx_sub_info_t | | |
| MQTT SUBSCRIBE packet parameters | | |
| Data Fields | | |
| mqtt_onchip_da16xxx_qos_t | qos | Quality of Service for subscription. |
| const char * | p_topic_filter | Topic filter to subscribe to. |
| uint16_t | topic_filter_length | Length of subscription topic filter. |

◆ mqtt_onchip_da16xxx_pub_info_t

| | | |
|---------------------------------------|-------------------|---|
| struct mqtt_onchip_da16xxx_pub_info_t | | |
| MQTT PUBLISH packet parameters | | |
| Data Fields | | |
| mqtt_onchip_da16xxx_qos_t | qos | Quality of Service for subscription. |
| const char * | p_topic_name | Topic name on which the message is published. |
| uint16_t | topic_name_Length | Length of topic name. |
| const char * | p_payload | Message payload. |
| uint32_t | payload_length | Message payload length. |

◆ mqtt_onchip_da16xxx_callback_args_t

| | | |
|--|--|--|
| struct mqtt_onchip_da16xxx_callback_args_t | | |
| MQTT Packet info structure to be passed to user callback | | |
| | | |

| Data Fields | | |
|--------------|-------------|--|
| uint8_t * | p_data | Payload received from subscribed MQTT topic. |
| const char * | p_topic | Topic to which the message payload belongs to. |
| uint32_t | data_length | Length of the MQTT payload. |
| void const * | p_context | Placeholder for user data. |

◆ mqtt_onchip_da16xxx_cfg_t

| | | |
|----------------------------------|---|---|
| struct mqtt_onchip_da16xxx_cfg_t | | |
| MQTT Configuration | | |
| Data Fields | | |
| const uint8_t | use_mqtt_v311 | |
| | | Flag to use MQTT v3.1.1. |
| const uint16_t | rx_timeout | |
| | | MQTT Rx timeout in milliseconds. |
| const uint16_t | tx_timeout | |
| | | MQTT Tx timeout in milliseconds. |
| void(* | p_callback)(mqtt_onchip_da16xxx_callback_args_t *p_args) | |
| | | Location of user callback. |
| void const * | p_context | |
| | | Placeholder for user data. Passed to the user callback in mqtt_onchip_da16xxx_callback_args_t . |
| uint8_t | clean_session | |
| | | Whether to establish a new, clean session or resume a previous session. |
| | | |

| | |
|----------------|--|
| uint8_t | alpn_count |
| | ALPN Protocols count. Max value is 3. |
| const char * | p_alpns [MQTT_ONCHIP_DA16XXX_MAX_ALPN] |
| | ALPN Protocols. |
| uint8_t | tls_cipher_count |
| | TLS Cipher suites count. Max value is 17. |
| uint16_t | keep_alive_seconds |
| | MQTT keep alive period. |
| const char * | p_client_identifier |
| | MQTT Client identifier. Must be unique per client. |
| uint16_t | client_identifier_length |
| | Length of the client identifier. |
| const char * | p_host_name |
| | MQTT endpoint host name. |
| const uint16_t | mqtt_port |
| | MQTT Port number. |
| const char * | p_mqtt_user_name |
| | MQTT user name. Set to NULL if not used. |
| uint16_t | user_name_length |

| | |
|--------------|--|
| | Length of MQTT user name. Set to 0 if not used. |
| const char * | p_mqtt_password |
| | MQTT password. Set to NULL if not used. |
| uint16_t | password_length |
| | Length of MQTT password. Set to 0 if not used. |
| const char * | p_root_ca |
| | String representing a trusted server root certificate. |
| uint32_t | root_ca_size |
| | Size associated with root CA Certificate. |
| const char * | p_client_cert |
| | String representing a Client certificate. |
| uint32_t | client_cert_size |
| | Size associated with Client certificate. |
| const char * | p_client_private_key |
| | String representing Client Private Key. |
| uint32_t | private_key_size |
| | Size associated with Client Private Key. |
| const char * | p_will_topic |
| | String representing Will Topic. |

| | |
|---|--|
| const char * | p_will_msg |
| | String representing Will Message. |
| const char * | p_sni_name |
| | Server Name Indication. |
| mqtt_onchip_da16xxx_qos_t | will_qos_level |
| | Will Topic QoS level. |
| mqtt_onchip_da16xxx_tls_cipher_suites_t | p_tls_cipher_suites [MQTT_ONCHIP_DA16XXX_TLS_CIPHER_MAX_CNT] |
| | TLS Cipher suites supported. |

◆ [mqtt_onchip_da16xxx_instance_ctrl_t](#)

| | | |
|--|---|--|
| struct mqtt_onchip_da16xxx_instance_ctrl_t | | |
| MQTT_ONCHIP_DA16XXX private control block. DO NOT MODIFY. | | |
| Data Fields | | |
| uint8_t | cmd_tx_buff [MQTT_ONCHIP_DA16XXX_CFG_CMD_TX_BUF_SIZE] | Command send buffer. |
| uint8_t | cmd_rx_buff [MQTT_ONCHIP_DA16XXX_CFG_CMD_RX_BUF_SIZE] | Command receive buffer. |
| uint32_t | open | Flag to indicate if MQTT has been opened. |
| bool | is_mqtt_connected | Flag to track MQTT connection status. |
| mqtt_onchip_da16xxx_cfg_t const * | p_cfg | Pointer to p_cfg for MQTT. |

Enumeration Type Documentation

◆ **mqtt_onchip_da16xxx_qos_t**

| enum mqtt_onchip_da16xxx_qos_t | |
|--------------------------------------|-------------------------|
| MQTT Quality-of-service (QoS) levels | |
| Enumerator | |
| MQTT_ONCHIP_DA16XXX_QOS_0 | Delivery at most once. |
| MQTT_ONCHIP_DA16XXX_QOS_1 | Delivery at least once. |
| MQTT_ONCHIP_DA16XXX_QOS_2 | Delivery exactly once. |

◆ mqtt_onchip_da16xxx_tls_cipher_suites_t

| enum mqtt_onchip_da16xxx_tls_cipher_suites_t | |
|--|---|
| MQTT TLS Cipher Suites | |
| Enumerator | |
| TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA | TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA protocol. |
| TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA | TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA protocol. |
| TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256 | TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256 protocol. |
| TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384 | TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384 protocol. |
| TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256 | TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256 protocol. |
| TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384 | TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384 protocol. |
| TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA | TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA protocol. |
| TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA | TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA protocol. |
| TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA256 | TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA256 protocol. |
| TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA384 | TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA384 protocol. |
| TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256 | TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256 protocol. |
| TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384 | TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384 protocol. |

Function Documentation

◆ **RM_MQTT_DA16XXX_Open()**

```
fsp_err_t RM_MQTT_DA16XXX_Open ( mqtt_onchip_da16xxx_instance_ctrl_t * p_ctrl,
mqtt_onchip_da16xxx_cfg_t const *const p_cfg )
```

Initialize the DA16XXX on-chip MQTT Client service.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | Pointer to MQTT Client instance control structure. |
| [in] | p_cfg | Pointer to MQTT Client configuration structure. |

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | The p_cfg instance is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Data size is too large or NULL. |
| FSP_ERR_ALREADY_OPEN | The instance has already been opened. |

◆ **RM_MQTT_DA16XXX_Disconnect()**

```
fsp_err_t RM_MQTT_DA16XXX_Disconnect ( mqtt_onchip_da16xxx_instance_ctrl_t * p_ctrl)
```

Disconnect from DA16XXX MQTT Client service.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | Pointer to MQTT Client instance control structure. |
|------|--------|--|

Return values

| | |
|---------------------|--|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | The p_ctrl instance is NULL. |
| FSP_ERR_NOT_OPEN | The instance has not been opened or the client is not connected. |

◆ **RM_MQTT_DA16XXX_Connect()**

```
fsp_err_t RM_MQTT_DA16XXX_Connect ( mqtt_onchip_da16xxx_instance_ctrl_t * p_ctrl, uint32_t
timeout_ms )
```

Configure and connect the DA16XXX MQTT Client service.

Parameters

| | | |
|------|------------|--|
| [in] | p_ctrl | Pointer to MQTT Client instance control structure. |
| [in] | timeout_ms | Timeout in milliseconds. |

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | The p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_IN_USE | The MQTT client is already connected. |
| FSP_ERR_INVALID_DATA | Response does not contain Connect status. |

◆ **RM_MQTT_DA16XXX_Publish()**

```
fsp_err_t RM_MQTT_DA16XXX_Publish ( mqtt_onchip_da16xxx_instance_ctrl_t* p_ctrl,
mqtt_onchip_da16xxx_pub_info_t*const p_pub_info )
```

Publish a message for a given MQTT topic.

Parameters

| | | |
|------|------------|--|
| [in] | p_ctrl | Pointer to MQTT Client instance control structure. |
| [in] | p_pub_info | MQTT Publish packet parameters. |

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | The p_ctrl, p_pub_info is NULL. |
| FSP_ERR_NOT_OPEN | The instance has not been opened or the client is not connected. |
| FSP_ERR_INVALID_DATA | Data size is too large. |

◆ **RM_MQTT_DA16XXX_Subscribe()**

```
fsp_err_t RM_MQTT_DA16XXX_Subscribe ( mqtt_onchip_da16xxx_instance_ctrl_t* p_ctrl,
mqtt_onchip_da16xxx_sub_info_t*const p_sub_info, size_t subscription_count )
```

Subscribe to DA16XXX MQTT topics.

Parameters

| | | |
|------|--------------------|--|
| [in] | p_ctrl | Pointer to MQTT Client instance control structure. |
| [in] | p_sub_info | List of MQTT subscription info. |
| [in] | subscription_count | Number of topics to subscribe to. |

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | The p_ctrl, p_sub_info is NULL or subscription_count is 0. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_INVALID_DATA | Data size is too large. |

◆ **RM_MQTT_DA16XXX_UnSubscribe()**

```
fsp_err_t RM_MQTT_DA16XXX_UnSubscribe ( mqtt_onchip_da16xxx_instance_ctrl_t * p_ctrl,
mqtt_onchip_da16xxx_sub_info_t *const p_sub_info )
```

Unsubscribe from DA16XXX MQTT topics.

Parameters

| | | |
|------|------------|--|
| [in] | p_ctrl | Pointer to MQTT Client instance control structure. |
| [in] | p_sub_info | List of MQTT subscription info. |

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | The p_ctrl, p_sub_info is NULL. |
| FSP_ERR_NOT_OPEN | The instance has not been opened or the client is not connected. |
| FSP_ERR_INVALID_DATA | Data size is too large. |

◆ **RM_MQTT_DA16XXX_Receive()**

```
fsp_err_t RM_MQTT_DA16XXX_Receive ( mqtt_onchip_da16xxx_instance_ctrl_t * p_ctrl,
mqtt_onchip_da16xxx_cfg_t const *const p_cfg )
```

Receive data subscribed to on DA16XXX MQTT Client service.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | Pointer to MQTT Client instance control structure. |
| [in] | p_cfg | Pointer to MQTT Client configuration structure. |

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_ASSERTION | The p_ctrl, p_textstring, p_ip_addr is NULL. |
| FSP_ERR_NOT_OPEN | The instance has not been opened or the client is not connected. |
| FSP_ERR_INVALID_DATA | Receive function did not receive valid publish data. |

◆ **RM_MQTT_DA16XXX_Close()**

```
fsp_err_t RM_MQTT_DA16XXX_Close ( mqtt_onchip_da16xxx_instance_ctrl_t * p_ctrl)
```

Close the DA16XXX MQTT Client service.

Parameters

| | | |
|------|--------|--|
| [in] | p_ctrl | Pointer to MQTT Client instance control structure. |
|------|--------|--|

Return values

| | |
|-------------------|--|
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_ASSERTION | The p_ctrl, p_textstring, p_ip_addr is NULL. |

Detailed Description

Driver for the PTP peripheral on RA MCUs. This module implements the [PTP Interface](#).

Overview

PTP allows for multiple devices on a network to synchronize their clocks with very high precision. The PTP peripheral generates and processes PTP messages automatically. In slave mode, it also corrects the local time in order to adjust for any offset from the master clock time.

Features

- Ordinary clock
 - Master mode
 - Slave mode
- Peer-to-peer
- End-to-end
- Frame formats
 - Ethernet II frames
 - IEEE802.3 + LLC + SNAP frames
 - IPv4 + UDP
- Clock correction modes
 - Mode 1: Add the offsetFromMaster value to the local time whenever it is updated.
 - Mode 2: Calculate a clock gradient and continuously adjust the local time in order to minimize the offsetFromMaster value.

Configuration

Build Time Configurations for r_ptp

The following build time configurations are defined in fsp_cfg/r_ptp_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Networking > PTP (r_ptp)

This module can be added to the Stacks tab via New Stack > Networking > PTP (r_ptp).

| Configuration | Options | Default | Description |
|---------------------------------|------------------------------------|-------------------|--|
| Clock Properties | | | |
| Priority 1 | Value must in the range [0,255]. | 128 | Priority1 field advertised in generated announce packets. |
| Class | Value must in the range [0,255]. | 248 | Class field advertised in generated announce packets. |
| Accuracy | Value must in the range [0,255]. | 0xFE | Accuracy field advertised in generated announce packets. |
| Variance | Value must in the range [0,65535]. | 0xFFFF | Variance field advertised in generated announce packets. |
| Priority 2 | Value must in the range [0,255]. | 128 | Priority2 field advertised in generated announce packets. |
| Time Source | Value must in the range [0,255]. | 160 | Time Source field advertised in generated announce packets. |
| Ethernet | | | |
| Multicast Filter MAC address | Must be a valid MAC address | 01:1B:19:00:00:00 | In Multicast Filtered mode, only multicast addresses that match this address are received by the ETHERC EDMAC. |
| Primary Destination MAC address | Must be a valid MAC address | 01:1B:19:00:00:00 | The destination MAC address for primary PTP messages. |
| PDelay Destination MAC address | Must be a valid MAC address | 01:80:C2:00:00:0E | The destination MAC address for PDelay messages. |

| IP | | | |
|--------------------------------|---------------------------------------|-------------|---|
| Primary Destination IP address | Must be a valid IP address | 224.0.1.129 | The destination IPv4 address for primary messages. |
| PDelay Destination IP address | Must be a valid IP address | 224.0.0.107 | The destination IPv4 address for PDelay messages. |
| Event Message TOS | Value must be in the range [0,255]. | 0 | The IP packet TOS for event messages. |
| General Message TOS | Value must be in the range [0,255]. | 0 | The IP packet TOS for general messages. |
| Primary Message TTL | Value must be in the range [0,255]. | 1 | The IP packet TTL for primary messages. |
| PDelay Message TTL | Value must be in the range [0,255]. | 1 | The IP packet TTL for p_delay messages. |
| Event Port | Value must be in the range [0,65535]. | 319 | The UDP port for event messages. |
| General Port | Value must be in the range [0,65535]. | 320 | The UDP port for general messages. |
| Synchronization Detection | | | |
| Threshold (Nanoseconds) | Value must be greater than 0. | 1000000 | The minimum <code>offsetFromMaster</code> value required in order to synchronize with the master clock. |
| Count | Value must be in the range [0,15]. | 5 | The number of times the calculated <code>offsetFromMaster</code> value must be less than the threshold in order to synchronize with the master clock. |
| Synchronization Lost Detection | | | |
| Threshold (Nanoseconds) | Value must be greater than 0. | 10000000 | The minimum <code>offsetFromMaster</code> value required in order to lose synchronization with the master clock. |
| Count | Value must be in the range [0,15]. | 5 | The number of times the calculated <code>offsetFromMaster</code> value must be greater than the threshold in order to lose synchronization with the master. |

Interrupts

| | | | |
|--------------------------------|--|--------------------|--|
| Callback | Name must be a valid C symbol | ptp0_user_callback | Called when a STCA/SYNFP event occurs, a PTP message is received, or if a Pulse Timer event occurs. |
| MINT Interrupt priority | MCU Specific Options | | Select the EPTPC MINT interrupt priority. |
| Pulse Timer Interrupt priority | MCU Specific Options | | Select the EPTPC IPLS priority. |
| Name | Name must be a valid C symbol | g_ptp0 | Module name. |
| Ethernet PHY Interface Type | <ul style="list-style-type: none"> MII RMII | RMII | The interface type used to communicate with the Ethernet PHY. |
| Frame Filter | <ul style="list-style-type: none"> Extended Promiscuous Mode Unicast and Multicast Unicast and Multicast Filtered Unicast | Unicast | Selects how packets are filtered based on their destination MAC address. Packets that pass the filter are transferred to the ETHERC EDMAC. |
| Frame Format | <ul style="list-style-type: none"> Ethernet II Ethernet II IPv4 UDP IEEE802.3 LLC SNAP IEEE802.3 LLC SNAP IPv4 UDP | Ethernet II | The format of the frames that encapsulate the PTP messages. |
| Clock Domain | Value must in the range [0,255]. | 0 | The PTP clock will only respond to clocks in its domain. |
| Clock Domain Filter | <ul style="list-style-type: none"> Enable Disable | Enable | Filter out PTP messages from other clock domains. |
| Buffer Size | Value must in the range [64,1536]. | 1536 | The maximum Ethernet packet size that can be transmitted or received by the application from the EDMAC. |
| Number of transmit buffers | Value must in the range [1,16]. | 4 | The number of transmit buffers in the packet queue. |
| Number of receive | Value must in the | 4 | The number of receive |

| | | | |
|-----------------------------|--|-------------------------|--|
| buffers | range [1,16]. | | buffers in the packet queue. |
| Announce message interval. | MCU Specific Options | | The period of time between generated announce messages. |
| Sync message interval. | MCU Specific Options | | The period of time between generated sync messages. |
| Delay_req message interval. | MCU Specific Options | | The period of time between generated delay_req messages. |
| Message timeout | Value must be greater than 0. | 4000 | The time in milliseconds needed to generate timeout events after not receiving a sync or delay_resp message. |
| Clock Source | <ul style="list-style-type: none"> • PCLKA / 1 • PCLKA / 2 • PCLKA / 3 • PCLKA / 4 • PCLKA / 5 • PCLKA / 6 • REF50CK0 | PCLKA / 6 | The STCA clock source must be 20Mhz, 25Mhz, 50Mhz, or 100Mhz. When REF50CK0 is selected, the STCA frequency is 25Mhz. |
| Clock Correction Mode | <ul style="list-style-type: none"> • Clock Correction Mode 1 • Clock Correction Mode 2 | Clock Correction Mode 1 | Clock correction mode 1 corrects the local clock using the current offsetFromMaster value. Clock correction mode 2 calculates a clock gradient in order to continuously correct the local clock. |
| Gradient Worst10 Interval | Value must in the range [0,255]. | 32 | The number of sync messages to use when calculating the worst10 gradient values (Only applies to clock correction mode 2). |

Clock Configuration

The STCA input clock can be the following clock sources:

- PCLKA / 1
- PCLKA / 2
- PCLKA / 3
- PCLKA / 4
- PCLKA / 5
- PCLKA / 6
- REF50CK0

The STCA input clock is restricted to the following frequencies:

- 20 Mhz
- 25 Mhz
- 50 Mhz
- 100 Mhz

When REF50CK0 is selected, the input clock frequency is 25 Mhz.

Pin Configuration

The PTP module requires the [Ethernet \(r_ether\)](#) instance in order to initialize the Ethernet PHY. This means that the ETHERC pins must be configured.

Usage Notes

PTP Port State

The current PTP port state determines which messages need to be generated and processed by the PTP peripheral. It is the application's responsibility to determine what the current state of the PTP port should be.

The following messages can be generated by the PTP peripheral:

- Announce
- Sync
- Delay_req
- Delay_resp
- PDelay_req
- PDelay_resp

The following messages can be processed by the PTP peripheral:

- Sync
- Follow_up
- Delay_req
- Delay_resp
- PDelay_req
- PDelay_resp
- PDelay_resp_follow_up

The application must receive the following messages in order to determine the current state of its PTP port:

- Announce
- Management
- Signaling

The following messages can only be sent manually:

- Management
- Signaling

The PTP API defines the following states:

| State | Generated Messages | Processed Messages | Received Messages |
|----------------|--|---|---------------------------------|
| Disabled | N/A | N/A | N/A |
| Passive | N/A | N/A | Announce, Signaling, Management |
| E2E/P2P Slave | Delay_req/(PDelay_req, PDelay_resp) | Sync, Follow_up, Delay_resp/(PDelay_req, PDelay_resp) | Announce, Signaling, Management |
| E2E/P2P Master | Announce, Sync, Delay_resp/(PDelay_req, PDelay_resp) | delay_req/(PDelay_req, PDelay_resp) | Announce, Signaling, Management |

Pulse Timers

Pulse Timers are configurable timers used to generate interrupts and ELC events. Each pulse timer has a configurable start time, pulse, and period. At the start of each timer period, a rising edge occurs. After the pulse time has elapsed, a falling edge occurs. ELC events and IRQs can be generated on rising and/or falling edges for each Pulse Timer. There are two types of interrupts generated by each Pulse Timer; MINT and IPLS.

ELC Events

Pulse timers may be configured to generate the following ELC events:

- EPTPC_TIMERn_RISE - Generated on the rising edge of pulse timer channel n¹.
- EPTPC_TIMERn_FALL - Generated on the falling edge of pulse timer channel n¹.

Note

1. n = [0,5] corresponds to the channel of the pulse timer.

MINT Interrupts

MINT IRQs are only generated on the rising edge of a Pulse Timer channel. The callback will provide the channel number of the pulse timer that caused the interrupt.

IPLS Interrupts

Each Pulse Timer channel can be configured as a source for generating IPLS IRQs. All of the pulse timers that are selected as IPLS sources are OR'd together and rising and falling edge IRQs can be generated from the resulting signal. Below is an example of a resulting signal from two IPLS sources. Unlike MINT interrupts, IPLS interrupts do not provide any information about which Pulse Timer caused the IRQ because the IRQs from all the Pulse Timers are OR'd together.

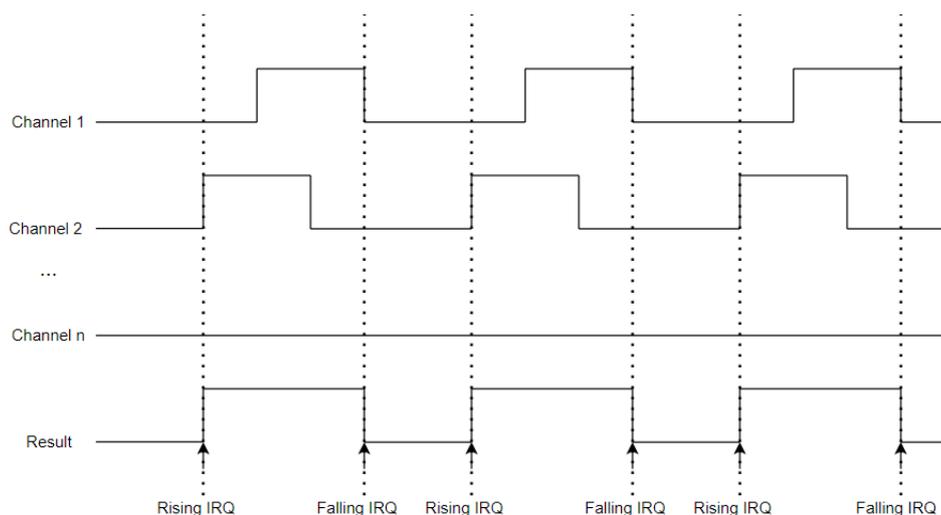

Figure 286: IPLS IRQ Generation

Ethernet Frame Filter

The PTP driver can filter Ethernet frames that are received by [Ethernet \(r_ether\)](#). There are four different filtering modes:

- Extended Promiscuous - All Ethernet frames are received by [Ethernet \(r_ether\)](#).
- Unicast and Multicast - All Unicast frames destined for the PTP and Multicast frames are received by [Ethernet \(r_ether\)](#).
- Unicast and Multicast Filtered - All Unicast frames destined for the PTP are received by [Ethernet \(r_ether\)](#). All multicast frames that match [ptp_synfp_cfg_t::p_multicast_addr_filter](#) are received by [Ethernet \(r_ether\)](#).
- Unicast - Only Unicast frames destined for the PTP are received by [Ethernet \(r_ether\)](#).

Limitations

Developers should be aware of the following limitations when using the PTP:

- PTP will not automatically initialize [Ethernet \(r_ether\)](#). This provides flexibility by allowing PTP to be used alongside 3rd party IP stacks (Eg. [FreeRTOS+TCP Wrapper to r_ether \(rm_freertos_plus_tcp\)](#)), however this means the application must execute the [Ethernet \(r_ether\)](#) link process in order to use PTP.
- The driver will not detect announce message timeouts. This functionality must be handled by the application.
- When IP + UDP frame format is selected, the driver will not automatically join the multicast group. This must be done by the application.
- In order to call PTP API functions from ISRs, the MINT and IPLS interrupt priorities must be configured to be lower than `BSP_CFG_IRQ_MASK_LEVEL_FOR_CRITICAL_SECTION`. This is to guarantee that PTP register accesses are atomic.

Examples

Slave Mode

This is a basic example of minimal use of PTP in slave mode.

```
volatile bool g_first_announce_message_received = false;
volatile bool g_sync_acquired = false;
void slave_mode_basic_example (void)
{
    /* The PTP Instance must be opened before R_ETHER is opened. */
    fsp_err_t err = R_PTP_Open(&g_ptp_ctrl, &g_ptp_cfg);
    assert(FSP_SUCCESS == err);
    /* Configure the PTP MAC address. */
    err = R_PTP_MacAddrSet(&g_ptp_ctrl, g_ptp_mac_address);
    assert(FSP_SUCCESS == err);
    /* Configure the PTP Local Clock ID (Usually generated from MAC address). */
    err = R_PTP_LocalClockIdSet(&g_ptp_ctrl, g_ptp_clock_id);
    assert(FSP_SUCCESS == err);
    /* Open the r_ether_api instance. */
    err = R_ETHER_Open(&g_ether_ctrl, &g_ether_cfg);
    assert(FSP_SUCCESS == err);
    /* Wait for the link to be established. */
    do
    {
        err = R_ETHER_LinkProcess(&g_ether_ctrl);
    } while (FSP_SUCCESS != err);
    /* Set the PTP instance to passive state and listen for announce message. */
    err = R_PTP_PortStateSet(&g_ptp_ctrl, PTP_PORT_STATE_PASSIVE);
    assert(FSP_SUCCESS == err);
    /* Wait for the first announce message (This will provide the master clock ID). */
    uint32_t timeout = EXAMPLE_TIMEOUT;
    while (!g_first_announce_message_received && --timeout)
    {
        R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_SECONDS);
    }
    assert(0U != timeout);
    /* When a master clock is found, change to the slave state to start synchronizing
    * the local clock to the master clock. */
    err = R_PTP_PortStateSet(&g_ptp_ctrl, PTP_PORT_STATE_E2E_SLAVE);
```

```
    assert(FSP_SUCCESS == err);

    /* Wait for local clock to be synchronized with the master clock. */
    timeout = EXAMPLE_TIMEOUT;
    while (!g_sync_acquired && --timeout)
    {
        R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_SECONDS);
    }
    assert(0U != timeout);

    /* The local clock is now synchronized with the grand master clock. */
}

/* Callback called whenever a PTP event occurs. */
void g_ptp_slave_callback_example (ptp_callback_args_t * p_args)
{
    switch (p_args->event)
    {
        case PTP_EVENT_SYNC_ACQUIRED:
            {
                /* The offsetFromMaster value is now within the configured threshold to be
                 * synchronized with the master clock.
                 */
                g_sync_acquired = true;
            }
            break;
        case PTP_EVENT_MESSAGE_RECEIVED:
            {
                static ptp_message_t g_current_master_announce_message;
                switch (p_args->p_message->header.message_type)
                {
                    case PTP_MESSAGE_TYPE_ANNOUNCE:
                        {
                            int8_t comparison = 0;
                            if (!g_first_announce_message_received)
                                {
                                    /* If this is the first announce packet, immediately switch to this master clock. */
                                }
                        }
                    }
            }
        }
    }
}
```

```
        comparison = 1;
        g_first_announce_message_received = true;
    }
else
    {
    /*
     * Run the "Best Master Clock Algorithm" to determine if the clock defined in this
announce
     * packet is better than the current master clock.
     */
fsp_err_t err = R_PTP_BestMasterClock(&g_current_master_announce_message,
                                        p_args->p_message,
                                        &comparison);

        assert(FSP_SUCCESS == err);
    }
if (1 == comparison)
    {
    /* Save the message as the new master announce message. */
        g_current_master_announce_message = *p_args->p_message;
    /* Set the master clock ID and sourcePortID in the PTP instance so that it
     * synchronizes with the new best master clock.
     */
fsp_err_t err = R_PTP_MasterClockIdSet(&g_ptp_ctrl,
                                        g_current_master_annou
nce_message.header.clock_id,
                                        g_current_master_annou
nce_message.header.source_port_id);

        assert(FSP_SUCCESS == err);
    }
break;
    }
default:
    {
break;
```

```
    }
    }
break;
    }
default:
    {
break;
    }
    }
}
```

Master Mode

This is a basic example of minimal use of PTP in master mode.

```
#define PTP_EXAMPLE_CURRENT_UTC_OFFSET (37)
void master_mode_basic_example (void)
{
    /* The PTP Instance must be opened before R_ETHER is opened. */
    fsp_err_t err = R_PTP_Open(&g_ptp_ctrl, &g_ptp_cfg);
    assert(FSP_SUCCESS == err);
    /* Configure the PTP MAC address. */
    err = R_PTP_MacAddrSet(&g_ptp_ctrl, g_ptp_mac_address);
    assert(FSP_SUCCESS == err);
    /* Configure the PTP Local Clock ID (Usually generated from MAC address). */
    err = R_PTP_LocalClockIdSet(&g_ptp_ctrl, g_ptp_clock_id);
    assert(FSP_SUCCESS == err);
    /* Get the current time from an external time source (Eg. RTC). */
    ptp_time_t current_time;
    get_current_time_example(&current_time);
    /* Set the PTP local time to the current time. */
    err = R_PTP_LocalClockValueSet(&g_ptp_ctrl, &current_time);
    assert(FSP_SUCCESS == err);
    /* Set the currentUtcOffset field in announce messages. */
    err = R_PTP_CurrentUtcOffsetSet(&g_ptp_ctrl, PTP_EXAMPLE_CURRENT_UTC_OFFSET);
```

```
    assert(FSP_SUCCESS == err);

    /* Set message flags in announce messages to indicate that the current UTC offset is
    valid and that the PTP timescale is used. */
    ptp_message_flags_t flags;

    flags.value = 0;

    flags.value_b.currentUtcOffsetValid = 1;

    flags.value_b.ptpTimescale          = 1;

    err = R_PTP_MessageFlagsSet(&g_ptp_ctrl, PTP_MESSAGE_TYPE_ANNOUNCE, flags);
    assert(FSP_SUCCESS == err);

    /* Open the r_ether_api instance. */
    err = R_ETHER_Open(&g_ether_ctrl, &g_ether_cfg);
    assert(FSP_SUCCESS == err);

    /* Wait for the link to be established. */
    do
    {
        err = R_ETHER_LinkProcess(&g_ether_ctrl);
    } while (FSP_SUCCESS != err);

    /* Set the PTP instance to passive state and listen for announce message. */
    err = R_PTP_PortStateSet(&g_ptp_ctrl, PTP_PORT_STATE_E2E_MASTER);
    assert(FSP_SUCCESS == err);

    /*
     * The master clock is now operational and will automatically generate announce and
    sync messages
     * as well as respond to delay_req messages.
     */
}
```

Send PTP Messages

This is a basic example of how to send PTP messages.

```
#define PTP_MANAGEMENT_ACTION_GET (0U)
#define PTP_TLV_TYPE_MANAGEMENT (1U)
#define PTP_TLV_MANAGEMENT_ID_CLOCK_DESCRIPTION (1U)

static uint32_t g_transmit_complete = 0U;
```

```
void send_message_example (void)
{
    static ptp_message_t message;
    static uint8_t      p_tlv_data[6];
    memset(&message, 0, sizeof(ptp_message_t));
    /* Fill in the required fields for the message header (Note that appropriate fields
will be endian swapped). */
    message.header.message_type = PTP_MESSAGE_TYPE_MANAGEMENT;
    message.header.version      = 2;
    /* The message length is the total number of bytes in the PTP message (Including the
message header). */
    message.header.message_length = (uint16_t) (sizeof(ptp_message_header_t) +
sizeof(ptp_message_management_t) +
sizeof(p_tlv_data));
    memcpy(message.header.clock_id, g_ptp_clock_id, sizeof(g_ptp_clock_id));
    message.header.control_field = PTP_CTRL_FIELD_MANAGEMENT;
    /* Fill in the required fields for the management message. */
    memcpy(message.management.target_clock_id, g_target_clock_id, sizeof
(g_target_clock_id));
    message.management.target_port_id      = 1;
    message.management.starting_boundary_hops = 1;
    message.management.boundary_hops       = 1;
    message.management.action               = PTP_MANAGEMENT_ACTION_GET;
    /*
    * Fill in TLV data (Note that TLV data is big endian).
    *
    * Type (Management)
    */
    p_tlv_data[0] = 0;
    p_tlv_data[1] = PTP_TLV_TYPE_MANAGEMENT;
    /* Length */
    p_tlv_data[2] = 0;
    p_tlv_data[3] = 2;
    /* Management ID (Clock Description) */
```

```
p_tlv_data[4] = 0;
p_tlv_data[5] = PTP_TLV_MANAGEMENT_ID_CLOCK_DESCRIPTION;
/* Send the message. */
fsp_err_t err = R_PTP_MessageSend(&g_ptp_ctrl, &message, p_tlv_data, sizeof
(p_tlv_data));
assert(FSP_SUCCESS == err);
uint32_t timeout = EXAMPLE_TIMEOUT;
while (0U == g_transmit_complete && --timeout)
{
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MICROSECONDS);
}
}
/* Callback called whenever a PTP event occurs. */
void g_ptp_send_message_callback_example (ptp_callback_args_t * p_args)
{
switch (p_args->event)
{
case PTP_EVENT_MESSAGE_TRANSMIT_COMPLETE:
{
g_transmit_complete = 1U;
break;
}
case PTP_EVENT_MESSAGE_RECEIVED:
{
switch (p_args->p_message->header.message_type)
{
case PTP_MESSAGE_TYPE_MANAGEMENT:
{
/* Handle the response message. */
break;
}
default:
{
break;
}
```

```

    }
    }
    }
default:
    {
break;
    }
    }
}

```

Data Structures

```
struct ptp_instance_ctrl_t
```

Data Structure Documentation

◆ ptp_instance_ctrl_t

| struct ptp_instance_ctrl_t | | |
|-----------------------------------|--------------------------|--|
| PTP instance control block. | | |
| Data Fields | | |
| uint32_t | open | Marks if the instance has been opened. |
| uint32_t | tx_buffer_write_index | Index into the descriptor list to write the next packet. |
| uint32_t | tx_buffer_complete_index | Index into the descriptor list of the last transmitted packet. |
| uint32_t | rx_buffer_index | Index into the descriptor of the last received packet. |
| uint32_t | tslatr | Keep track of whether tslatr was set. |
| ptp_cfg_t const * | p_cfg | Pointer to the configuration structure. |

Function Documentation

◆ **R_PTP_Open()**

```
fsp_err_t R_PTP_Open ( ptp_ctrl_t *const p_ctrl, ptp_cfg_t const *const p_cfg )
```

This function initializes PTP. Implements `ptp_api_t::open`.

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Configures the peripheral registers according to the configuration.
- Initialize the control structure for use in other [PTP Interface](#) functions.

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | The instance has been successfully configured. |
| FSP_ERR_ALREADY_OPEN | Instance was already initialized. |
| FSP_ERR_NOT_OPEN | The EDMAC instance was not opened correctly. |
| FSP_ERR_ASSERTION | An invalid argument was given in the configuration structure. |

◆ **R_PTP_MacAddrSet()**

```
fsp_err_t R_PTP_MacAddrSet ( ptp_ctrl_t *const p_ctrl, uint8_t const *const p_mac_addr )
```

This function sets the MAC address for the PTP instance. Implements `ptp_api_t::macAddrSet`.

Note

This function may only be called while the PTP instance is in `ptp_port_state_t::PTP_PORT_STATE_DISABLE`.

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | The MAC address has been set. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL |
| FSP_ERR_INVALID_MODE | The instance is not in the correct state. |

◆ **R_PTP_IpAddrSet()**

```
fsp_err_t R_PTP_IpAddrSet ( ptp_ctrl_t *const p_ctrl, uint32_t ip_addr )
```

This function sets the IP address for the PTP instance. Implements [ptp_api_t::ipAddrSet](#).

Note

This function may only be called while the PTP instance is in [ptp_port_state_t::PTP_PORT_STATE_DISABLE](#).

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | The IP address has been set. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL. |
| FSP_ERR_INVALID_MODE | The configured ptp_synfp_cfg_t::frame_format is not configured to use IP packets, or the instance is not in the correct state. |

◆ **R_PTP_LocalClockIdSet()**

```
fsp_err_t R_PTP_LocalClockIdSet ( ptp_ctrl_t *const p_ctrl, uint8_t const *const p_clock_id )
```

This function sets the local clock ID for the PTP instance. Implements [ptp_api_t::localClockIdSet](#).

Note

This function may only be called while the PTP instance is in [ptp_port_state_t::PTP_PORT_STATE_DISABLE](#). Typically the clock ID is derived from the MAC address (E.g. {b1,b2,b3,0xFF,0xFE,b4,b5,b6}).

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | The local clock ID has been set. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL |
| FSP_ERR_INVALID_MODE | The instance is not in the correct state. |

◆ **R_PTP_MasterClockIdSet()**

```
fsp_err_t R_PTP_MasterClockIdSet ( ptp_ctrl_t *const p_ctrl, uint8_t const *const p_clock_id,
uint16_t port_id )
```

This function sets the master clock ID and port ID that the local clock will synchronize with. Implements [ptp_api_t::masterClockIdSet](#).

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | The master clock ID and port ID have been set. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL |

◆ **R_PTP_MessageFlagsSet()**

```
fsp_err_t R_PTP_MessageFlagsSet ( ptp_ctrl_t *const p_ctrl, ptp_message_type_t message_type,
ptp_message_flags_t flags )
```

This function sets the flags field for the given message type. Implements [ptp_api_t::messageFlagsSet](#).

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | The master clock ID and port ID have been set. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL or invalid. |

◆ **R_PTP_CurrentUtcOffsetSet()**

```
fsp_err_t R_PTP_CurrentUtcOffsetSet ( ptp_ctrl_t *const p_ctrl, uint16_t offset )
```

This function sets the currentUtcOffset value in announce messages. [ptp_api_t::currentUtcOffsetSet](#).

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | The currentUtcOffset has been updated. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL or invalid. |

◆ **R_PTP_PortStateSet()**

```
fsp_err_t R_PTP_PortStateSet ( ptp_ctrl_t *const p_ctrl, uint32_t state )
```

This function changes the current state of the PTP instance. Implements [ptp_api_t::portStateSet](#).

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | The instance will transition to the new state. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL |

◆ **R_PTP_MessageSend()**

```
fsp_err_t R_PTP_MessageSend ( ptp_ctrl_t *const p_ctrl, ptp_message_t const *const p_message,
uint8_t const *const p_tlv_data, uint16_t tlv_data_size )
```

This function sends a PTP message. [ptp_api_t::messageSend](#).

Return values

| | |
|--|---|
| FSP_SUCCESS | The packet has been written to the transmit descriptor. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL or invalid. |
| FSP_ERR_ETHER_ERROR_TRANSMIT_BUFFER_FULL | There is no space for the packet in the transmit queue. |

◆ **R_PTP_LocalClockValueSet()**

```
fsp_err_t R_PTP_LocalClockValueSet ( ptp_ctrl_t *const p_ctrl, ptp_time_t const *const p_time )
```

This function sets the local clock value. Implements [ptp_api_t::localClockValueSet](#).

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | The local clock value has been set. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL or invalid. |

◆ **R_PTP_LocalClockValueGet()**

```
fsp_err_t R_PTP_LocalClockValueGet ( ptp_ctrl_t *const p_ctrl, ptp_time_t *const p_time )
```

This function gets the local clock value. Implements `ptp_api_t::localClockValueGet`.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | The local clock value has been written in <code>p_time</code> . |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL |

◆ **R_PTP_PulseTimerCommonConfig()**

```
fsp_err_t R_PTP_PulseTimerCommonConfig ( ptp_ctrl_t *const p_ctrl,
ptp_pulse_timer_common_cfg_t *const p_timer_cfg )
```

This function configures IPLS IRQ settings that are common to all pulse timer channels. Implements `ptp_api_t::pulseTimerCommonConfig`.

Return values

| | |
|-------------------|-----------------------------------|
| FSP_SUCCESS | The pulse timer has been enabled. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL or invalid. |

◆ **R_PTP_PulseTimerEnable()**

```
fsp_err_t R_PTP_PulseTimerEnable ( ptp_ctrl_t *const p_ctrl, uint32_t channel,
ptp_pulse_timer_cfg_t *const p_timer_cfg )
```

This function enables a pulse timer channel. Implements `ptp_api_t::pulseTimerEnable`.

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | The pulse timer has been enabled. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL or invalid. |
| FSP_ERR_INVALID_ARGUMENT | The start time must be set to a value that is later than current time. |

◆ **R_PTP_PulseTimerDisable()**

```
fsp_err_t R_PTP_PulseTimerDisable ( ptp_ctrl_t *const p_ctrl, uint32_t channel )
```

This function disables a pulse timer channel. Implements `ptp_api_t::pulseTimerDisable`.

Return values

| | |
|-------------------|------------------------------------|
| FSP_SUCCESS | The pulse timer has been disabled. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL or invalid. |

◆ **R_PTP_Close()**

```
fsp_err_t R_PTP_Close ( ptp_ctrl_t *const p_ctrl)
```

Disable the PTP instance. Implements `ptp_api_t::close`.

Return values

| | |
|-------------------|------------------------------------|
| FSP_SUCCESS | The pulse timer has been disabled. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL or invalid. |

◆ **R_PTP_BestMasterClock()**

```
fsp_err_t R_PTP_BestMasterClock ( ptp_message_t const *const p_announce1, ptp_message_t const *const p_announce2, int8_t *const p_comparison )
```

This function compares two clocks to determine which one is the better master clock.

`p_comparison`:

- Set to -1 if `p_announce1` defines the best master clock.
- Set to 1 if `p_announce2` defines the best master clock.
- Set to 0 if `p_announce1` and `p_announce2` define the same clock.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | The valid result has been written to <code>p_use_announce_clock</code> . |
| FSP_ERR_ASSERTION | An argument was NULL. |

5.2.12.23 SPP BLE Abstraction (rm_ble_abs_spp)

[Modules](#) » [Networking](#)

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the [BLE ABS Interface](#).

Overview

This module provides BLE GAP functionality that complies with the Bluetooth Core Specification version 5.0 specified by the Bluetooth SIG. This module is configured via the [QE for BLE](#). QE for BLE provides standard and custom services defined by the user.

The module supports the Renesas Electronics RYZ012 Bluetooth® Low Energy 5 Module. The rm_ble_abs_spp driver interfaces with the RYZ012 module over UART or SPI.

Features

The Bluetooth Low Energy (BLE) Abstraction module with SPP supports the following features:

- Common functionality
 - Open/Close the BLE protocol stack.
 - Setting Transmit Power Level.
- The following GAP Role support
 - Peripheral: The device that accepts a connection request from Central and establishes a connection.
- GAP functionality
 - Initialize the Host stack.
 - Setting address.
 - Start/Stop Advertising.
 - Connect/Disconnect a link.
- GATT Common functionality
 - Get MTU Size.
- GATT Server functionality
 - Initialization of GATT Server.
 - Loading of Profile definition.
 - Notification of characteristics modification.
 - Read/Write of GATT Profile from host.
- Selectable Communication Interfaces
 - [SPI Interface](#)
 - [UART Interface](#)

Target Devices

The BLE Abstraction module supports the following devices.

- RA6 line of devices using the RYZ012 module
- RA4 Line of devices using the RYZ012 module

Configuration

Build Time Configurations for rm_ble_abs_spp

The following build time configurations are defined in fsp_cfg/rm_ble_abs_spp_cfg.h:

| Configuration | Options | Default | Description |
|-------------------------------|--|---------------|--|
| Parameter Checking | <ul style="list-style-type: none"> Default (BSP) Enable Disable | Default (BSP) | Specify whether to include code for API parameter checking. |
| Reset Port | Refer to the RA Configuration tool for available options. | 03 | Specify the module reset pin port for the MCU. |
| Reset Pin | Refer to the RA Configuration tool for available options. | 10 | Specify the module reset pin for the MCU. |
| UART/SPI Select Port (PB5) | Refer to the RA Configuration tool for available options. | 03 | Specify the module PB5 (UART/SPI select) port for the MCU. |
| UART/SPI Select Pin (PB5) | Refer to the RA Configuration tool for available options. | 11 | Specify the module PB5 (UART/SPI select) pin for the MCU. |
| SPI Software SSL Port | Refer to the RA Configuration tool for available options. | Disabled | Specify the port to use for controlling SSL using the ioport module. |
| SPI Software SSL Pin | Refer to the RA Configuration tool for available options. | Disabled | Specify the pin to use for controlling SSL using the ioport module. |
| Transmit Power Level (in dBm) | Refer to the RA Configuration tool for available options. | 4.57 | Specify the module transmit power in dBm. |

Configurations for Networking > SPP BLE Abstraction (rm_ble_abs_spp)

This module can be added to the Stacks tab via New Stack > Networking > SPP BLE Abstraction (rm_ble_abs_spp).

| Configuration | Options | Default | Description |
|--------------------------------|-------------------------------|-----------------------|--|
| General | | | |
| Name | Name must be a valid C symbol | g_ble_abs0 | Module name. |
| GAP callback | Name must be a valid C symbol | gap_cb | If QE is used, set to "gap_cb". |
| Vendor specific callback | Name must be a valid C symbol | vs_cb | If QE is used, set to "vs_cb". |
| GATT server callback parameter | Name must be a valid C symbol | gs_abs_gatts_cb_param | If QE is used, set to "gs_abs_gattc_cb_param". |
| GATT server callback number | Must be a valid number | 2 | The number of GATT Server callback functions. |

| | | | |
|--------------------------------|-------------------------------|-----------------------|--|
| GATT client callback parameter | Name must be a valid C symbol | gs_abs_gattc_cb_param | Set GATT client callback parameter. If QE is used, set to "gs_abs_gattc_cb_param". |
| GATT client callback number | Must be a valid number | 2 | The number of GATT Server callback functions. |

Pin Configuration

Pins used by the BLE driver to control the RYZ012 module:

- Reset Pin : Active low reset line for RYZ012 module
- UART/SPI Select Pin : Allows selection between UART or SPI for module communication. UART is selected with output low and SPI with output high.
- [UART Interface](#) : RX/TX Pins
- [SPI Interface](#) : MOSI/MISO/SCK/SSL Pins
 - Data Ready Pin : When the [SPI Interface](#) is selected as the communication interface, the Data Ready pin is asserted in order to notify the MCU that there is data ready to be read.
 - Software SSL Pin : Can be optionally configured in order to drive the SSL Pin using software instead of hardware¹.

Note

1. The software SSL Pin is required when using the [SPI \(r_sci_spi\)](#) driver.
2. When using software SSL, the pin must be configured as "Output mode (Initial High)" in the pin configuration editor in addition to being configured in the "stacks" tab.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the BLE_ABS:

Currently supported rm_ble_abs_spp interface functions:

- RM_BLE_ABS_Open
- RM_BLE_ABS_Close
- RM_BLE_ABS_StartLegacyAdvertising

Currently supported r_ble_spp_api interface functions:

- R_BLE_Open
- R_BLE_Close
- R_BLE_SetEvent
- R_BLE_GAP_Init
- R_BLE_GAP_StopAdv
- R_BLE_GAP_SetAdvSresData
- R_BLE_GAP_StartAdv
- R_BLE_GAP_SetAdvParam
- R_BLE_GATT_GetMtu
- R_BLE_GATTS_SetDbInst
- R_BLE_GATTS_Init
- R_BLE_GATTS_GetAttr

- R_BLE_GATTS_SetAttr
- R_BLE_GATTS_Notification
- R_BLE_GATTS_Indication
- R_BLE_GATTS_RegisterCb
- R_BLE_GATTC_Init
- R_BLE_GATTC_RegisterCb
- R_BLE_VS_SetBdAddr
- R_BLE_VS_SetTxPower

Currently supported callback events:

- BLE_GAP_EVENT_CONN_IND
- BLE_GAP_EVENT_DISCONN_IND
- BLE_GAP_EVENT_ADV_ON
- BLE_GAP_EVENT_ADV_OFF
- BLE_GATTC_EVENT_CONN_IND
- BLE_GATTS_EVENT_CONN_IND
- BLE_GATTC_EVENT_DISCONN_IND
- BLE_GATTS_EVENT_DISCONN_IND
- BLE_GATTS_EVENT_WRITE_RSP_COMP

Transmit Power

Specific Operational Use Conditions for RYZ012 BLE module:

Please consult the laws and regulations of the region(s) in which the device will be used to verify the information below before using this device.

North America (FCC) The module must not be operated at power levels above 10.0 dBm. Host devices that need higher output power may not be marketed without prior re-certification.

Europe (RED) The module must not be operated at power levels above 8.4 dBm. Host devices that need higher output power may not be marketed in regions covered by RED regulation without prior re-certification.

Japan (MIC) The module must be operated at power level 4.5 dBm. Host devices that need to change output power may not be marketed without prior re-certification.

The current default level used in the e² studio Configurator is 4.57 dBm for the transmit power level.

Examples

BLE_ABS_SPP Basic Example

This is a basic example of minimal use of the BLE_ABS_SPP in an application.

```
/* The callback is called when peripheral event occurs. */
void gap_peripheral_cb (uint16_t type, ble_status_t result, st_ble_evt_data_t *
p_data)
{
    FSP_PARAMETER_NOT_USED(result);
}
```

```
FSP_PARAMETER_NOT_USED(p_data);

switch (type)
{
case BLE_GAP_EVENT_STACK_ON:
{
    g_ble_event_flag = g_ble_event_flag | BLE_ABS_EVENT_FLAG_STACK_ON;
break;
}

case BLE_GAP_EVENT_ADV_ON:
{
    st_ble_gap_adv_set_evt_t * p_gap_adv_set_evt_param = (st_ble_gap_adv_set_evt_t *)
p_data->p_param;

    g_advertising_handle = p_gap_adv_set_evt_param->adv_hdl;
    g_ble_event_flag |= BLE_ABS_EVENT_FLAG_ADV_ON;

break;
}

case BLE_GAP_EVENT_ADV_OFF:
{
    g_ble_event_flag |= BLE_ABS_EVENT_FLAG_ADV_OFF;

break;
}

case BLE_GAP_EVENT_CONN_IND:
{
    g_ble_event_flag |= BLE_ABS_EVENT_FLAG_CONN_IND;

break;
}

{
/* Do nothing. */
break;
}

default:
break;
}
}
```

```
#define BLE_ABS_EVENT_FLAG_STACK_ON (0x01 << 0)
#define BLE_ABS_EVENT_FLAG_CONN_IND (0x01 << 1)
#define BLE_ABS_EVENT_FLAG_ADV_ON (0x01 << 2)
#define BLE_ABS_EVENT_FLAG_ADV_OFF (0x01 << 3)
#define BLE_ABS_EVENT_FLAG_DISCONNECT_IND (0x01 << 4)
#define BLE_ABS_EVENT_FLAG_RSLV_LIST_CONF_COMP (0x01 << 5)
#define BLE_ABS_EXAMPLE_SHORTENED_LOCAL_NAME 'E', 'x', 'a', 'm', 'p', 'l', 'e'
#define BLE_ABS_EXAMPLE_COMPLETE_LOCAL_NAME 'T', 'E', 'S', 'T', '_', 'E', 'x', 'a',

}
```

BLE_ABS_SPP Firmware Update Example

This is a basic example of performing a firmware update.

```
void ble_abs_firmware_update_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Open the module. */
    err = RM_BLE_ABS_Open(&g_ble_abs0_ctrl, &g_ble_abs0_cfg);
    assert(FSP_SUCCESS == err);
    /* Complete the firmware update (This function blocks until the procedure has
    completed). */
    ble_status_t status = R_BLE_VS_UpdateModuleFirmware(g_firmware_image,
    g_firmware_image_size);
    assert(BLE_SUCCESS == status);
}
```

```
/* Close the module. */
err = RM_BLE_ABS_Close(&g_ble_abs0_ctrl);
assert(FSP_SUCCESS == err);

/* The RYZ012 is now using the updated firmware. Call open to re-initialize the
module using the new firmware. */
}
```

BLE_ABS_SPP Firmware Update Asynchronous Example

This is an example of performing a firmware update using the asynchronous API.

```
volatile uint32_t g_firmware_update_complete = 0;
void vs_cb (uint16_t type, ble_status_t result, st_ble_vs_evt_data_t * p_data)
{
    FSP_PARAMETER_NOT_USED(p_data);
    if (BLE_SUCCESS != result)
    {
        /* Stop the firmware update process if there was an error. */
        return;
    }
    static uint16_t index = 0;
    switch (type)
    {
        /* The response to the START_FW_UPDATE command was received (Fall through to send
the next data frame). */
        case BLE_VS_EVENT_START_FW_UPDATE_COMP:
            /* The response to the SEND_FW_DATA command was received. */
            case BLE_VS_EVENT_SEND_FW_DATA_COMP:
                {
                    if (BLE_VS_EVENT_START_FW_UPDATE_COMP == index)
                    {
                        index = 0;
                    }
                    uint16_t length = 0;
                    uint8_t * p_firmware_data = NULL;
                }
    }
}
```

```
/*
 * Get next firmware data frame.
 * Note that app_data_frame_get() is an application defined function.
 */
    app_data_frame_get(index, &p_firmware_data, &length);
if (length > 0)
    {
/* Send the firmware data frame. */
R_BLE_VS_SendFirmwareData(index, length, p_firmware_data);
        index++;
    }
else
    {
/* The previously completed data frame was the last data frame. Send the firmware
update end command. */
R_BLE_VS_EndFirmwareUpdate(index - 1);
    }
break;
    }
/* The response to the END_FW_UPDATE command was received. */
case BLE_VS_EVENT_END_FW_UPDATE_COMP:
    {
/* After the BLE_VS_EVENT_END_FW_UPDATE_COMP command is sent, send the restart
command. */
R_BLE_VS_RestartModule();
break;
    }
/* The module has finished restarting and the MODULE_READY event has been received.
*/
case BLE_VS_EVENT_MODULE_READY_COMP:
    {
/* Firmware update process has completed. */
        g_firmware_update_complete = 1;
break;
    }
```

```
    }
default:
    {
break;
    }
}
}
void ble_abs_firmware_update_async_example (void)

Detailed Description

Wifi and Socket implementation using the da16xxx WiFi module on RA MCUs.

Overview

This Middleware module supplies an implementation for the [FreeRTOS WiFi interface](#) using the DA16XXX module. The DA16XXX Wi-Fi module only supports FreeRTOS currently (Microsoft Azure support expected in future release).

DA16XXX is a low power Wi-Fi networking SoC that delivers a dramatic breakthrough in battery life even for devices that are continuously connected to the Wi-Fi network. The module comes readily equipped with radio certification for Japan, North America and Europe. More information about this module can be found at the [DA16XXX Web Site](#)

The DA16XXX module supports the following modules:

- DA16200
- DA16600 (currently Wi-Fi features only)

Features

The WiFi Onchip da16xxx Middleware driver supplies these features:

- Supports connect/disconnect to a b/g/n (2.4GHz) WiFi Access Point using Open, WPA, and WPA2 security. Encryption types can be either TKIP, or CCMP(AES).
- Supports retrieval of the module device MAC address.
- Once connected you can acquire the assigned module device IP.
- Supports a WiFi network scan capability to get a list of local Access Points.
- Supports a Ping function to test network connectivity.
- Supports a DNS Query call to retrieve the IPv4 address of a supplied URL.
- Supports TCP client sockets.
- Drive supports 1 UART for interfacing with the DA16XXX module.

Configuration

Build Time Configurations for `rm_wifi_da16xxx`

The following build time configurations are defined in `fsp_cfg/rm_wifi_da16xxx_cfg.h`:

| Configuration | Options | Default | Description |
|---|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Enable DA16600 Support | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Enabled if using the DA16600 module |
| Number of supported socket instances (not used with on-chip APIs) | 1 | 1 | Enable number of socket instances |
| Size of RX buffer for socket (not used with on-chip APIs) | Manual Entry | 8192 | |
| Size of TX buffer for CMD Port | Manual Entry | 1500 | |
| Size of RX buffer for CMD Port | Manual Entry | 3000 | |
| Enable SNTP Client | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Should the SNTP client of the module be enabled |

Configurations for Networking > WiFi DA16XXX Framework Driver (rm_wifi_da16xxx)

| Configuration | Options | Default | Description |
|---|---|---------|-------------------------------|
| Country code in ISO 3166-1 alpha-2 standard | Manual Entry | US | |
| SNTP server IPv4 address | Must be a valid IPv4 address | 0.0.0.0 | |
| SNTP Timezone UTC Offset in Hours | Refer to the RA Configuration tool for available options. | 0 | Value in hours from 12 to -12 |

Note: It is suggested that when using the da16xxx Module that DTC and FIFO are enabled in the UART configuration to facilitate a more reliable data transfer between module and MCU.

Note: If you wish to use flow control then you must enable flow control in the RA Configuration editor. This can be found in the UART setting. It is advantageous to use flow control all the time since it allows the hardware to gate the flow of data across the serial bus. Without hardware flow control for faster data rate you will most likely see an overflow condition between MCU and the module device.

Note: Higher baud rates are supported in the RA Configuration editor and should be changed in the first UART configuration. There is no need to change the second UART baud rate since it is only used as an AT command channel.

Note: It is a good idea to also enable the FIFO in the UART configuration settings if you plan to use higher baud rates.

Interrupt Configuration

Refer to [UART \(r_sci_uart\)](#). [R_SCI_UART_Open\(\)](#) is called by [WiFi Onchip DA16XXX Framework Driver \(rm_wifi_da16xxx\)](#).

Clock Configuration

Refer to [UART \(r_sci_uart\)](#).

Pin Configuration

Refer to [UART \(r_sci_uart\)](#). [R_SCI_UART_Open\(\)](#) is called by [WiFi Onchip DA16XXX Framework Driver \(rm_wifi_da16xxx\)](#)

Usage Notes

- When the DA16XXX Wi-Fi configures the UART baud rate on the DA16XXX module based on the user settings in the UART driver configuration properties, the UART Baud rate settings will be stored in the NVM memory of the DA16XXX. After reboot, the DA16XXX comes up with the previously updated UART baud rate settings.
- When using the DA16600 Pmod module, make sure that the SDK has been updated to the latest version that supports AT commands. The default SDK that comes from the factory doesn't support the AT command interface, which will cause the [WIFI_On\(\)](#) API to fail. This is not required for the DA16200 Pmod module.

Limitations

- WiFi AP connections do not currently support WEP security.
- The default UART baud rate supported by v3.2.1 Wi-Fi SDK is 115200 and v3.2.4 Wi-Fi SDK is 230400. User needs to explicitly configure the default UART baud settings in the UART driver configurator properties based on the version of Wi-Fi SDK used in their testing.
- In v3.2.1 Wi-Fi SDK, the daylight savings time setting is disabled by default. The user needs to mandatorily set the following parameters such as minutes = 0, daylight savings to disable when calling [RM_WIFI_DA16XXX_SntpTimeZoneSet\(\)](#) API.
- Network connection parameters SSID and Passphrase for the Access Point can not contain any commas. This is a current limitation of the da16xxx module firmware. The [rm_wifi_da16xxx_connect\(\)](#) function will return an error if a comma is detected.
- Wi-Fi AP Scanning is currently limited to max of 10 Access Points.

Examples

Basic Example

This is a basic example of minimal use of WiFi Middleware in an application.

```
void wifi_basic_example (void)
{
    WIFIReturnCode_t wifi_err;

    /* Setup Access Point connection parameters */

    WIFINetworkParams_t net_params =
```

```
{
    .ucChannel                = 0,
    .xPassword.xWPA.cPassphrase = "password",
    .ucSSID                   = "access_point_ssid",
    .xPassword.xWPA.ucLength = 8,
    .ucSSIDLength             = 17,
    .xSecurity                 = eWiFiSecurityWPA2,
};

memset(scan_data, 0, sizeof(WIFI_ScanResult_t) * MAX_WIFI_SCAN_RESULTS);
memset(g_socket_recv_buffer, 0, sizeof(uint8_t) * SX_WIFI_SOCKET_RX_BUFFER_SIZE);
/* Open connection to the Wifi Module */
wifi_err = WIFI_On();
assert(eWiFiSuccess == wifi_err);
/* Connect to the Access Point */
wifi_err = WIFI_ConnectAP(&net_params);
assert(eWiFiSuccess == wifi_err);
/* Get address assigned by AP */
WIFI_IPConfiguration_t ipInfo;
wifi_err = WIFI_GetIPInfo(&ipInfo);
assert(eWiFiSuccess == wifi_err);
/* Ping an address accessible on the network */
uint8_t ip_address[4] = {216, 58, 194, 174}; // NOLINT
const uint16_t ping_count = 3;
const uint32_t intervalMS = 100;
wifi_err = WIFI_Ping(&ip_address[0], ping_count, intervalMS);
assert(eWiFiSuccess == wifi_err);
/* Scan the local Wifi network for other APs */
wifi_err = WIFI_Scan(&scan_data[0], MAX_WIFI_SCAN_RESULTS);
assert(eWiFiSuccess == wifi_err);
/* Shutdown the WIFI */
WIFI_Off();
}
```

SNTP example

An example of using Simple Network Time Protocol (SNTP) on WiFi in an application.

```
#define RM_WIFI_DA16XXX_TEMP_BUFFER_SIZE (64)
/*
 * Example of the use of SNTP with Wifi. Example gets the epoch time and local
 * system time strings. It is also demonstrated how the user will need to disconnect
 * from the access point to make changes to the SNTP configuration during runtime.
 *
 * Function assumes that the SNTP has been enabled and configured with proper
 * SNTP server address. For brevity error checking has not been implemented.
 */
void wifi_sntp_example (void)
{
    /* Setup Access Point connection parameters */
    WIFINetworkParams_t net_params =
    {
        .ucSSID                = "access_point_ssid",
        .ucSSIDLength          = 17,
        .xPassword.xWPA.cPassphrase = "password",
        .xPassword.xWPA.ucLength   = 8,
        .ucChannel              = 0,
        .xSecurity               = eWiFiSecurityWPA2
    };

    uint8_t local_time[RM_WIFI_DA16XXX_TEMP_BUFFER_SIZE];
    time_t current_sys_time = 0;

    // SNTP IP address
    uint8_t ip_address_sntp_server_valid[4] = {216, 239, 35, 0}; // NOLINT : Static
IP address
    memset(local_time, 0, sizeof(local_time));

    /* Open connection to the Wifi Module */
    WIFI_On();

    /* Connect to the Access Point */
    WIFI_ConnectAP(&net_params);

    /* Get the local time string */
```

```

RM_WIFI_DA16XXX_LocalTimeGet((uint8_t *) local_time, sizeof(local_time));
/* Disconnect from the access point to make changes to the SNTP configuration */
WIFI_Disconnect();
/* Change the IP address of the server */
RM_WIFI_DA16XXX_SntpServerIpAddressSet((uint8_t *) ip_address_sntp_server_valid);
/* Change the timezone to PST with daylight saving enabled */
RM_WIFI_DA16XXX_SntpTimeZoneSet(-8, 0, WIFI_DA16XXX_Sntp_DAYLIGHT_SAVINGS_DISABLE);
/* Connect back to the access point */
WIFI_ConnectAP(&net_params);
/* Get the local time string in format [DayOfWeek Month DayOfMonth Year
Hour:Minute:Second] */
RM_WIFI_DA16XXX_LocalTimeGet((uint8_t *) local_time, sizeof(local_time));
/* Disconnect from the Access Point and shutdown the WIFI module*/
WIFI_Disconnect();
WIFI_Off();
}

```

Function Documentation

◆ **RM_WIFI_DA16XXX_SntpServerIpAddressSet()**

fsp_err_t RM_WIFI_DA16XXX_SntpServerIpAddressSet (uint8_t * p_server_ip_addr)

Set the SNTP Client Server IP Address

Parameters

| | | |
|------|------------------|--|
| [in] | p_server_ip_addr | Pointer to IP address of SNTP server in byte array format. |
|------|------------------|--|

Return values

| | |
|---------------------|---|
| FSP_SUCCESS | Successfully set the value. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_ASSERTION | The parameter p_server_ip_addr is NULL. |

Update the SNTP Server IP Address

◆ **RM_WIFI_DA16XXX_SntpEnableSet()**

fsp_err_t RM_WIFI_DA16XXX_SntpEnableSet (wifi_da16xxx_sntp_enable_t enable)

Set the SNTP Client to Enable or Disable

Parameters

| | | |
|------|--------|---|
| [in] | enable | Flag to indicate enable/disable for SNTP support. |
|------|--------|---|

Return values

| | |
|---------------------|---|
| FSP_SUCCESS | Successfully set the value. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Enable or Disable the SNTP Client Service

◆ **RM_WIFI_DA16XXX_SntpTimeZoneSet()**

```
fsp_err_t RM_WIFI_DA16XXX_SntpTimeZoneSet ( int utc_offset_in_hours, uint32_t minutes,
wifi_da16xxx_sntp_daylight_savings_enable_t daylightSavingsEnable )
```

Set the SNTP Client Timezone

Parameters

| | | |
|------|-----------------------|---|
| [in] | utc_offset_in_hours | Timezone in UTC offset in hours |
| [in] | minutes | Number of minutes used for timezone offset from GMT. |
| [in] | daylightSavingsEnable | Enable/Disable daylight saving in the timezone calculation. |

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Successfully set the value. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Parameter passed into function was invalid. |

Update the SNTP Timezone

◆ RM_WIFI_DA16XXX_LocalTimeGet()

`fsp_err_t RM_WIFI_DA16XXX_LocalTimeGet (uint8_t * p_local_time, uint32_t size_string)`

Get the current local time based on current timezone in a string . Exp: YYYY-MM-DD,HOUR:MIN:SECS

Parameters

| | | |
|-------|--------------|--|
| [out] | p_local_time | Returns local time in string format. |
| [in] | size_string | Size of p_local_time string buffer.The size of this string needs to be at least 25 bytes |

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Successfully returned the local time string. |
| FSP_ERR_ASSERTION | The parameter local_time or p_instance_ctrl is NULL. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_SIZE | String size value passed in exceeds maximum. |

Get the current local time based on current timezone in a string format

daylightSavingsEnable)

Detailed Description

Wifi and Socket implementation using the Silex SX-ULPGN WiFi module on RA MCUs.

Overview

This Middleware module supplies an implementation for the [FreeRTOS WiFi interface](#) and [AzureRTOS NetxDuo WiFi interface](#) using the Silex SX-ULPGN module.

You can find specifics about the WiFi and Secure Socket interface APIs supported by this module at these web sites: [Wifi API](#).

The SX-ULPGN is a low-power, compact IEEE 802.11b/g/n 2.4GHz 1x1 Wireless LAN module equipped with the Qualcomm® QCA4010 Wireless SOC. The module comes readily equipped with radio certification for Japan, North America and Europe. More information about this module can be found at the [Silex Web Site](#)

Features

The WiFi Onchip Silex Middleware driver supplies these features:

- Supports connect/disconnect to a b/g/n (2.4GHz) WiFi Access Point using Open, WPA, and WPA2 security. Encryption types can be either TKIP, or CCMP(AES).
- Supports retrieval of the module device MAC address.
- Once connected you can acquire the assigned module device IP.
- Supports a WiFi network scan capability to get a list of local Access Points.
- Supports a Ping function to test network connectivity.
- Supports a DNS Query call to retrieve the IPv4 address of a supplied URL.
- Supports both TCP and UDP client sockets.
- Drive supports 1 or 2 UARTs for interfacing with the SX-ULPGN module. The second UART is considered optional.

Configuration

Build Time Configurations for rm_wifi_onchip_silex

The following build time configurations are defined in fsp_cfg/rm_wifi_onchip_silex_cfg.h:

| Configuration | Options | Default | Description |
|--------------------------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Number of supported socket instances | Refer to the RA Configuration tool for available options. | 1 | Enable number of socket instances |
| Size of RX buffer for socket | Manual Entry | 4096 | |
| Size of TX buffer for | Manual Entry | 1500 | |

CMD Port

| | | | |
|-----------------------------------|---|----------|---|
| Size of RX buffer for CMD Port | Manual Entry | 3000 | |
| Semaphore maximum timeout | Manual Entry | 10000 | |
| Number of retries for AT commands | Manual Entry | 10 | |
| Module Reset Port | Refer to the RA Configuration tool for available options. | 06 | Specify the module reset pin port for the MCU. |
| Module Reset Pin | Refer to the RA Configuration tool for available options. | 03 | Specify the module reset pin for the MCU. |
| Enable SNTP Client | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Should the SNTP client of the module be enabled |

Configurations for Networking > WiFi Onchip Silex Driver using r_sci_uart (rm_wifi_onchip_silex)

| Configuration | Options | Default | Description |
|---------------------------------------|---|----------|--|
| SNTP server IPv4 address | Must be a valid IPv4 address | 0.0.0.0 | |
| SNTP Timezone Offset from UTC Hours | Must be between 12 and -12 hours | 0 | Value in hours from 12 to -12 |
| SNTP Timezone Offset from UTC Minutes | Must be between 0 and 59 minutes | 0 | Value in minutes from 0 to 59 |
| Use Daylight Savings Time | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Specify if daytime savings should be used for local time calculation |

Note: It is suggested that when using the Silex Module that DTC and FIFO are enabled in the UART configuration to facilitate a more reliable data transfer between module and MCU.

Note: If you wish to use flow control then you must enable flow control in the RA Configuration editor. This can be found in the UART setting. It is advantageous to use flow control all the time since it allows the hardware to gate the flow of data across the serial bus. Without hardware flow control for faster data rate you will most likely see an overflow condition between MCU and the module device.

Note: Higher baud rates are supported in the RA Configuration editor and should be changed in the first UART configuration. There is no need to change the second UART baud rate since it is only used as an AT command channel.

Note: It is a good idea to also enable the FIFO in the UART configuration settings if you plan to use higher baud rates.

Interrupt Configuration

Refer to [UART \(r_sci_uart\)](#). `R_SCI_UART_Open()` is called by WiFi Onchip Sillex Driver using `r_sci_uart (rm_wifi_onchip_sillex)`.

Clock Configuration

Refer to [UART \(r_sci_uart\)](#).

Pin Configuration

Refer to [UART \(r_sci_uart\)](#). `R_SCI_UART_Open()` is called by WiFi Onchip Sillex Driver using `r_sci_uart (rm_wifi_onchip_sillex)`

Usage Notes

Limitations

- WiFi AP connections do not currently support WEP security.
- When operating with a single UART only single socket connections are possible. To support multiple sockets two UART channels must be connected to the module. When using the Renesas-provided SX-ULPGN PMOD board the second UART channel is on pins 9 and 10 of the PMOD header.
- Network connection parameters SSID and Passphrase for the Access Point can not contain any commas. This is a current limitation of the Sillex module firmware. The `rm_wifi_onchip_sillex_connect()` function will return an error if a comma is detected.
- When operating with a single UART and there is an active socket connection you cannot call `WIFI_Scan()`, `WIFI_Ping()`, `WIFI_GetMAC()`, or `WIFI_GetIPInfo()`. Calling one of these function will return an error code in this situation. These commands are blocked in the one UART case during an active socket connection because they could cause data loss. To avoid this limitation please configure the hardware to use both UARTs.
- The Sillex WiFi modules SNTP support requires all configuration changes to made when the WiFi is disconnected from an Access Point. This is a limitation of the Sillex module firmware. If changes to the default SNTP settings are required then the application will have to close the current AP connection, make the necessary SNTP changes, and then re-establish the original connection.

Examples

Basic Example

This is a basic example of minimal use of WiFi Middleware in an application.

```
void wifi_onchip_basic_example (void)
{
    WIFIReturnCode_t wifi_err;

    /* Setup Access Point connection parameters */
    WIFINetworkParams_t net_params =
    {
        .ucChannel                = 0,
        .xPassword.xWPA.cPassphrase = "password",
    }
}
```

```

        .ucSSID                                = "access_point_ssid",
        .xPassword.xWPA.ucLength = 8,
        .ucSSIDLength                       = 17,
        .xSecurity                            = eWiFiSecurityWPA2,
    };
    memset(scan_data, 0, sizeof(WIFI_ScanResult_t) * MAX_WIFI_SCAN_RESULTS);
    memset(g_socket_recv_buffer, 0, sizeof(uint8_t) * SX_WIFI_SOCKET_RX_BUFFER_SIZE);
/* Open connection to the Wifi Module */
    wifi_err = WIFI_On();
    assert(eWiFiSuccess == wifi_err);
/* Connect to the Access Point */

    const uint16_t ping_count = 3;
    const uint32_t intervalMS = 100;
    wifi_err = WIFI_Ping(&ip_address[0], ping_count, intervalMS);
    assert(eWiFiSuccess == wifi_err);
/* Scan the local Wifi network for other APs */
    wifi_err = WIFI_Scan(&scan_data[0], MAX_WIFI_SCAN_RESULTS);
    assert(eWiFiSuccess == wifi_err);
/* Shutdown the WIFI */
    WIFI_Off();
}

```

SNTP example

An example of using Simple Network Time Protocol (SNTP) on WiFi in an application.

```
#define RM_WIFI_ONCHIP_SILEX_TEMP_BUFFER_SIZE (64)
```

```
/*
 * Example of the use of SNTP with Wifi. Example gets the epoch time and local
 * system time strings. It is also demonstrated how the user will need to disconnect
 * from the access point to make changes to the SNTP configuration during runtime.
 *
 * Function assumes that the SNTP has been enabled and configured with proper
 * SNTP server address. For brevity error checking has not been implemented.
 */
void wifi_onchip_sntp_example (void)
{
    /* Setup Access Point connection parameters */
    WIFINetworkParams_t net_params =
    {
        .ucSSID                = "access_point_ssid",
        .ucSSIDLength          = 17,
        .xPassword.xWPA.cPassphrase = "password",
        .xPassword.xWPA.ucLength   = 8,
        .ucChannel              = 0,
        .xSecurity               = eWiFiSecurityWPA2
    };

    uint8_t local_time[RM_WIFI_ONCHIP_SILEX_TEMP_BUFFER_SIZE];
    time_t current_sys_time = 0;

    // SNTP IP address
    uint8_t ip_address_sntp_server_valid[4] = {216, 239, 35, 0}; // NOLINT : Static
IP address
    memset(local_time, 0, sizeof(local_time));

    /* Open connection to the Wifi Module */
    WIFI_On();

    /* Connect to the Access Point */
    WIFI_ConnectAP(&net_params);

    /* Get the Epoch time in seconds since Jan 1, 1970 UTC */

Function Documentation

◆ **RM_WIFI_ONCHIP_SILEX_EpochTimeGet()**

`fsp_err_t RM_WIFI_ONCHIP_SILEX_EpochTimeGet (time_t * p_utc_time)`

This will retrieve time info from an NTP server at the address entered via an during configuration. If the server isn't set or the client isn't enabled, then it will return an error. The date/time is retrieved as the number of seconds since 00:00:00 UTC January 1, 1970

Parameters

| | | |
|-------|------------|------------------------------------|
| [out] | p_utc_time | Returns the epoch time in seconds. |
|-------|------------|------------------------------------|

Return values

| | |
|---------------------|---|
| FSP_SUCCESS | Successfully retrieved the system time from module. |
| FSP_ERR_ASSERTION | The parameter utc_time or p_instance_ctrl is NULL. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Get the current system time as the number of seconds since epoch 1970-01-01 00:00:00 UTC

◆ **RM_WIFI_ONCHIP_SILEX_LocalTimeGet()**

```
fsp_err_t RM_WIFI_ONCHIP_SILEX_LocalTimeGet ( uint8_t * p_local_time, uint32_t size_string )
```

Get the current local time based on current timezone in a string . Exp: Wed Oct 15 1975 07:06:00

Parameters

| | | |
|-------|--------------|--|
| [out] | p_local_time | Returns local time in string format. |
| [in] | size_string | Size of p_local_time string buffer.The size of this string needs to be at least 25 bytes |

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Successfully returned the local time string. |
| FSP_ERR_ASSERTION | The parameter local_time or p_instance_ctrl is NULL. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_SIZE | String size value passed in exceeds maximum. |

Get the current local time based on current timezone in a string format

◆ **RM_WIFI_ONCHIP_SILEX_SntpEnableSet()**

```
fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpEnableSet ( wifi_onchip_silex_sntp_enable_t enable)
```

Set the SNTP Client to Enable or Disable

Parameters

| | | |
|------|--------|--|
| [in] | enable | Can be set to enable/disable for SNTP support. |
|------|--------|--|

Return values

| | |
|---------------------|---|
| FSP_SUCCESS | Successfully set the value. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Enable or Disable the SNTP Client Service

◆ **RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet()**

fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet (uint8_t * p_ip_address)

Set the SNTP Client Server IP Address

Parameters

| | | |
|------|--------------|--|
| [in] | p_ip_address | Pointer to IP address of SNTP server in byte array format. |
|------|--------------|--|

Return values

| | |
|---------------------|--|
| FSP_SUCCESS | Successfully set the value. |
| FSP_ERR_ASSERTION | The parameter p_ip_address or p_instance_ctrl is NULL. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Update the SNTP Server IP Address

◆ RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet()

```
fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet ( int32_t hours, uint32_t minutes,
wifi_onchip_silex_sntp_daylight_savings_enable_t daylightSavingsEnable )
```

Set the SNTP Client Timezone

Parameters

| | | |
|------|-----------------------|---|
| [in] | hours | Number of hours (+/-) used for timezone offset from GMT. |
| [in] | minutes | Number of minutes used for timezone offset from GMT. |
| [in] | daylightSavingsEnable | Enable/Disable daylight saving in the timezone calculation. |

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Successfully set the value. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Parameter passed into function was invalid. |

Update the SNTP Timezone

5.2.13 Power

Modules

Detailed Description

Power Modules.

Modules

Low Power Modes (r_lpm)

Driver for the LPM peripheral on RA MCUs. This module implements the [Low Power Modes Interface](#).

5.2.13.1 Low Power Modes (r_lpm)

Modules » Power

Functions

fsp_err_t R_LPM_Open (lpm_ctrl_t *const p_api_ctrl, lpm_cfg_t const *const p_cfg)

fsp_err_t R_LPM_LowPowerReconfigure (lpm_ctrl_t *const p_api_ctrl, lpm_cfg_t const *const p_cfg)

fsp_err_t R_LPM_LowPowerModeEnter (lpm_ctrl_t *const p_api_ctrl)

fsp_err_t R_LPM_IoKeepClear (lpm_ctrl_t *const p_api_ctrl)

fsp_err_t R_LPM_Close (lpm_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the LPM peripheral on RA MCUs. This module implements the [Low Power Modes Interface](#).

Overview

The low power modes driver is used to configure and place the device into the desired low power mode. Various sources can be configured to wake from standby, request snooze mode, end snooze mode or end deep standby mode.

Features

The LPM HAL module has the following key features:

- Supports the following low power modes:
 - Deep Software Standby mode (On supported MCUs)
 - Deep Sleep (On supported MCUs)
 - Software Standby mode
 - Sleep mode
 - Snooze mode (On supported MCUs)
- Supports reducing power consumption when in deep software standby mode through internal power supply control and by resetting the states of I/O ports.
- Supports disabling and enabling the MCU's other hardware peripherals

Configuration

Build Time Configurations for r_lpm

The following build time configurations are defined in fsp_cfg/r_lpm_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|-----------------|---------------|----------------------|
| Parameter Checking | • Default (BSP) | Default (BSP) | If selected code for |

| | | | |
|---------------|---|----------|--|
| | <ul style="list-style-type: none"> • Enabled • Disabled | | parameter checking is included in the build. |
| Standby Limit | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | If enabled, standby configuration only applies in R_LPM_LowPowerModeEnter. Otherwise, standby configuration applies to any WFI call. |

Configurations for Power > Low Power Modes (r_lpm)

This module can be added to the Stacks tab via New Stack > Power > Low Power Modes (r_lpm). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|--|-------------------------------|---------|--|
| General | | | |
| Name | Name must be a valid C symbol | g_lpm0 | Module name. |
| Low Power Mode | MCU Specific Options | | Power mode to be entered. |
| Output port state in standby and deep standby | MCU Specific Options | | Select the state of output pins during standby. Applies to address output, data output, and other bus control output pins. |
| Deep Sleep and Standby Options | | | |
| Deep Sleep and Standby Options > Snooze Options (Not available on every MCU) | | | |
| Snooze Request Source | MCU Specific Options | | Select the event that will enter snooze. |
| Snooze End Sources | MCU Specific Options | | Enable wake from snooze from these sources. |
| DTC state in Snooze Mode | MCU Specific Options | | Enable wake from snooze from this source. |
| Snooze Cancel Source | MCU Specific Options | | Select an interrupt source to cancel snooze. |
| Wake Sources | MCU Specific Options | | Enable wake from deep sleep and standby from these Sources. |
| RAM Retention Control (Not available on every MCU) | | | |
| RAM retention in | MCU Specific Options | | Select the memory |

| | | |
|---|----------------------|--|
| Standby mode | | regions that are retained in standby mode. |
| TCM retention in Deep Sleep and Standby modes | MCU Specific Options | Select if Tightly Coupled Memory (TCM) is retained in deep sleep and standby modes. |
| Standby RAM retention in Standby and Deep Standby modes | MCU Specific Options | Select if Standby RAM is retained in standby and deep standby modes. |
| Oscillator LDO Control (Not available on every MCU) | | |
| PLL1 LDO State in standby mode | MCU Specific Options | Select the state PLL1 LDO state in standby mode. |
| PLL2 LDO State in standby mode | MCU Specific Options | Select the state PLL2 LDO state in standby mode. |
| HOCO LDO State in standby mode | MCU Specific Options | Select the state HOCO LDO state in standby mode. |
| Deep Standby Options | | |
| I/O Port Retention | MCU Specific Options | Select the state of the IO Pins after exiting deep standby mode. |
| Power-Supply Control | MCU Specific Options | Select the state of the internal power supply in deep standby mode. |
| Cancel Sources | MCU Specific Options | Enable wake from deep standby using these sources. |
| Cancel Edges | MCU Specific Options | Falling edge trigger is default. Select sources to enable wake from deep standby with rising edge. |

Clock Configuration

This module does not have any selectable clock sources.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Sleep Mode

At power on, by default sleep is set as the low-power mode. Sleep mode is the most convenient low-power mode available, as it does not require any special configuration (other than configuring and enabling a suitable interrupt or event to wake the MCU from sleep) to return to normal program-execution mode. The states of the SRAM, the processor registers, and the hardware peripherals are all maintained in sleep mode, and the time needed to enter and wake from sleep is minimal. Any interrupt causes the MCU device to wake from sleep mode, including the SysTick interrupt used by the RTOS scheduler.

Deep Sleep Mode

Deep sleep mode is similar to sleep mode with the exception that DTC and DMAC are stopped, access to TCM memory is not available, and only a subset of interrupts are available for waking the CPU.

Software Standby Mode

In software-standby mode, the CPU, as well as most of the on-chip peripheral functions and all of the internal oscillators, are stopped. The contents of the CPU internal registers and SRAM data, the states of on-chip peripheral functions, and I/O Ports are all retained. Software-standby mode allows significant reduction in power consumption, because most of the oscillators are stopped in this mode. Like sleep mode, standby mode requires an interrupt or event be configured and enabled to wake up.

Snooze Mode

Snooze mode can be used with some MCU peripherals to execute basic tasks while keeping the MCU in a low-power state. Many core peripherals and all clocks can be selected to run during Snooze, allowing for more flexible low-power configuration than Software Standby mode. To enable Snooze, select "Software Standby mode with Snooze mode enabled" for the "Low Power Mode" configuration option. Snooze mode settings (including entry/exit sources) are available under "Standby Options".

Deep Software Standby Mode

The MCU always wakes from Deep Software Standby Mode by going through reset, either by the negation of the reset pin or by one of the wakeup sources configurable in the "Deep Standby Options" configuration group.

The Reset Status Registers can be used to determine if the reset occurred after coming out of deep software standby. For example, R_SYSTEM->RSTSR0_b.DPSRSTF is set to 1 after a deep software standby reset.

I/O Port Retention can be enabled to maintain I/O port configuration across a deep software standby reset. Retention can be cancelled through the [R_LPM_IoKeepClear](#) API.

Limitations

Developers should be aware of the following limitations when using the LPM:

- Flash stop (code flash disable) is not supported. See the section "Flash Operation Control Register (FLSTOP)" of the RA2/RA4 Family Hardware User's Manual.

- Reduced SRAM retention area in software standby mode is not supported. See the section "Power Save Memory Control Register (PSMCR)" of the RA4 Hardware User's Manual.
- Only one Snooze Request Source can be used at a time.
- When using Snooze mode with SCI0 RXD as the snooze source the system clock must be HOCO and the MOCO, Main Oscillator and PLL clocks must be turned off.
- If the main oscillator or PLL with main oscillator source is used for the system clock, the wake time from standby mode can be affected by the Main Oscillator Wait Time Setting in the MOSCWTCR register. This register setting is available to be changed through the Main Oscillator Wait Time setting in the CGC module properties. See the "Wakeup Timing and Duration" table in Electrical Characteristics for more information.
- When using the DC-DC regulator (where available), the MCU will temporarily switch to the LDO if Software Standby or Snooze is requested and back again when it is cancelled. Switching to the LDO incurs a 60 microsecond critical section wherein all interrupts AND peripherals are stopped. Switching back to DCDC from the LDO incurs an additional 22 microsecond critical section (peripherals running).
- On RA8, there are delays inserted before and after switching to a lower power mode based on BSP configuration options and current CPUCLK speed. These delays do not disable interrupts for the entire delay as required by the RA8 Hardware Manual. Interrupts should be disabled by the application when possible before sleeping to meet the requirements, or the control of interrupts and the delay should be managed by the user to ensure the requirement is fully met.

Examples

LPM Sleep Example

This is a basic example of minimal use of the LPM in an application. The LPM instance is opened and the configured low-power mode is entered.

```
void r_lpm_sleep (void)
{
    fsp_err_t err = R_LPM_Open(&g_lpm_ctrl, &g_lpm_cfg_sleep);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    err = R_LPM_LowPowerModeEnter(&g_lpm_ctrl);
    assert(FSP_SUCCESS == err);
}
```

LPM Deep Software Standby Example

```
void r_lpm_deep_software_standby (void)
{
    fsp_err_t err;
    /* Check the Deep Software Standby Reset Flag. If it is set, then the MCU is exiting
    * Deep Software Standby mode. */
```

```
if (1U == R_SYSTEM->RSTSR0_b.DPSRSTF)
{
/* Clear the IOKEEP bit to allow I/O Port use.
* Note that this function should be called before opening the LPM driver. */
err = R_LPM_IoKeepClear(&g_lpm_ctrl);
assert(FSP_SUCCESS == err);
}
err = R_LPM_Open(&g_lpm_ctrl, &g_lpm_cfg_deep_software_standby);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
/* Add user code here. */
/* Reconfigure the module to set the IOKEEP bit before entering deep software
standby. */
err = R_LPM_LowPowerReconfigure(&g_lpm_ctrl, &g_lpm_cfg_deep_software_standby);
assert(FSP_SUCCESS == err);
err = R_LPM_LowPowerModeEnter(&g_lpm_ctrl);
/* Code after R_LPM_LowPowerModeEnter when using Deep Software Standby never be
executed.
* Deep software standby exits by resetting the MCU. */
assert(FSP_SUCCESS == err);
}
```

Data Structures

struct [lpm_instance_ctrl_t](#)

Data Structure Documentation

◆ lpm_instance_ctrl_t

struct lpm_instance_ctrl_t

LPM private control block. DO NOT MODIFY. Initialization occurs when [R_LPM_Open\(\)](#) is called.

Function Documentation

◆ **R_LPM_Open()**

```
fsp_err_t R_LPM_Open ( lpm_ctrl_t *const p_api_ctrl, lpm_cfg_t const *const p_cfg )
```

Perform any necessary initialization

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | LPM instance opened |
| FSP_ERR_ASSERTION | Null Pointer |
| FSP_ERR_ALREADY_OPEN | LPM instance is already open |
| FSP_ERR_UNSUPPORTED | This MCU does not support Deep Software Standby |
| FSP_ERR_INVALID_ARGUMENT | One of the following: <ul style="list-style-type: none"> • Invalid snooze entry source • Invalid snooze end sources |
| FSP_ERR_INVALID_MODE | One of the following: <ul style="list-style-type: none"> • Invalid low power mode • Invalid DTC option for snooze mode • Invalid deep standby end sources • Invalid deep standby end sources edges • Invalid power supply option for deep standby • Invalid IO port option for deep standby • Invalid output port state setting for standby or deep standby • Invalid sources for wake from standby mode • Invalid power supply option for standby • Invalid IO port option for standby • Invalid standby end sources • Invalid standby end sources edges |

◆ R_LPM_LowPowerReconfigure()

```
fsp_err_t R_LPM_LowPowerReconfigure ( lpm_ctrl_t *const p_api_ctrl, lpm_cfg_t const *const p_cfg )
```

Configure a low power mode

NOTE: This function does not enter the low power mode, it only configures parameters of the mode. Execution of the WFI instruction is what causes the low power mode to be entered.

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Low power mode successfully applied |
| FSP_ERR_ASSERTION | Null Pointer |
| FSP_ERR_NOT_OPEN | LPM instance is not open |
| FSP_ERR_UNSUPPORTED | This MCU does not support Deep Software Standby |
| FSP_ERR_INVALID_ARGUMENT | One of the following: <ul style="list-style-type: none"> Invalid snooze entry source Invalid snooze end sources |
| FSP_ERR_INVALID_MODE | One of the following: <ul style="list-style-type: none"> Invalid low power mode Invalid DTC option for snooze mode Invalid deep standby end sources Invalid deep standby end sources edges Invalid power supply option for deep standby Invalid IO port option for deep standby Invalid output port state setting for standby or deep standby Invalid sources for wake from standby mode Invalid power supply option for standby Invalid IO port option for standby Invalid standby end sources Invalid standby end sources edges |

◆ **R_LPM_LowPowerModeEnter()**

```
fsp_err_t R_LPM_LowPowerModeEnter ( lpm_ctrl_t *const p_api_ctrl)
```

Enter low power mode (sleep/deep sleep/standby/deep standby) using WFI macro.

Function will return after waking from low power mode.

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | Successful. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | LPM instance is not open |
| FSP_ERR_INVALID_MODE | One of the following: <ul style="list-style-type: none"> • HOCO was not system clock when using snooze mode with SCIO/RXD0. • HOCO was not stable when using snooze mode with SCIO/RXD0. • MOCO was running when using snooze mode with SCIO/RXD0. • MAIN OSCILLATOR was running when using snooze mode with SCIO/RXD0. • PLL was running when using snooze mode with SCIO/RXD0. • Unable to disable oscillator stop detect when using standby or deep standby. |

◆ **R_LPM_IoKeepClear()**

```
fsp_err_t R_LPM_IoKeepClear ( lpm_ctrl_t *const p_api_ctrl)
```

Clear the IOKEEP bit after deep software standby

Return values

| | |
|---------------------|--|
| FSP_SUCCESS | DPSBYCR_b.IOKEEP bit cleared Successfully. |
| FSP_ERR_UNSUPPORTED | Deep standby mode not supported on this MCU. |

◆ R_LPM_Close()

`fsp_err_t R_LPM_Close (lpm_ctrl_t *const p_api_ctrl)`

Close the LPM Instance

Return values

| | |
|-------------------|--------------------------|
| FSP_SUCCESS | LPM driver closed |
| FSP_ERR_NOT_OPEN | LPM instance is not open |
| FSP_ERR_ASSERTION | Null Pointer |

5.2.14 RTOS

Modules

Detailed Description

RTOS Modules.

Modules

[Azure RTOS ThreadX Port \(rm_threadx_port\)](#)

ThreadX port for RA MCUs.

[FreeRTOS Port \(rm_freertos_port\)](#)

FreeRTOS port for RA MCUs.

5.2.14.1 Azure RTOS ThreadX Port (rm_threadx_port)

Modules » RTOS

ThreadX port for RA MCUs.

Overview

Note

The ThreadX Port does not provide any interfaces to the user. Consult the ThreadX documentation at <https://docs.microsoft.com/en-us/azure/rtos/threadx/> for further information.

Features

The RA ThreadX port supports the following features:

- Standard ThreadX configurations
- Hardware stack monitor

Configuration

Build Time Configurations for ThreadX

The following build time configurations are defined in fsp_cfg/azure/tx/tx_user.h:

| Configuration | Options | Default | Description |
|------------------|---|---------|--|
| General | | | |
| Custom tx_user.h | Manual Entry | | Add a path to your custom tx_user.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations. |
| Error Checking | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | The ThreadX basic API error checking can be bypassed by compiling with the symbol TX_DISABLE_ERROR_CHECKING defined. |
| Max Priorities | Value must be a multiple of 32 and in range 32 to 1024 or empty | 32 | Define the priority levels for ThreadX. Legal values range from 32 to 1024 and MUST be evenly divisible by 32. |
| Minimum Stack | Value must be greater than 0 or empty | 200 | Define the minimum stack for a ThreadX thread on this processor. If the size supplied during thread creation is less than this value, the thread create call will return an error. |
| Stack Filling | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | Determine if stack filling is enabled. By default, ThreadX stack filling is enabled, which places an 0xEF pattern in each byte of each |

| | | | |
|------------------------------|---|----------|---|
| Preemption Threshold | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | <p>thread's stack. This is used by debuggers with ThreadX-awareness and by the ThreadX run-time stack checking feature.</p> |
| Notify Callbacks | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | <p>Determine if preemption-threshold should be disabled. By default, preemption-threshold is disabled. If the application does not use preemption-threshold, it may be disabled to reduce code size and improve performance.</p> |
| Inline Thread Resume Suspend | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | <p>Determine if the notify callback option should be disabled. By default, notify callbacks are disabled. If the application does not use notify callbacks, they may be disabled to reduce code size and improve performance.</p> |
| Not Interruptable | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | <p>Determine if the tx_thread_resume and tx_thread_suspend services should have their internal code in-line. This results in a larger image, but improves the performance of the thread resume and suspend services.</p> |
| IAR Library Support | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | <p>Determine if the internal ThreadX code is non-interruptable. This results in smaller code size and less processing overhead, but increases the interrupt lockout time.</p> |
| | | | <p>Enable IAR library support (IAR compiler only). When IAR Library Support is Enabled, enable the linker option</p> |

| | | | |
|-------------------------|---|----------|--|
| | | | --threaded_lib. In the IAR IDE, this can be enabled in Project > Options > General Options > Library Configuration > Enable thread support in library. |
| BSD Support | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Defines TX_THREAD_EXTENSION_1 to bsd_err_no in order to support NXD BSD. |
| FileX Pointer | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | Determine if there is a FileX pointer in the thread control block. By default, the pointer is there for legacy/backwards compatibility. The pointer must also be there for applications using FileX. Disable this to save space in the thread control block. |
| Timer | | | |
| Timer Ticks Per Second | Value must be greater than 0 or empty | 100 | Define the number of times the system timer runs per second. Default is 100 ticks per second, which results in a tick every 10ms. |
| Timer Thread Stack Size | Value must be greater than 0 or empty | 1024 | Define the system timer thread's default stack size and priority. These are only applicable if TX_TIMER_PROCESS_IN_ISR is disabled. |
| Timer Thread Priority | Value must be greater than 0 or empty | 0 | Define the system timer thread's default stack size and priority. These are only applicable if TX_TIMER_PROCESS_IN_ISR is disabled. |
| Timer Process In ISR | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | Determine if timer expirations (application timers, timeouts, and tx_thread_sleep calls should be processed within the a system |

timer thread or directly in the timer ISR. When disabled, the timer thread is used. When enabled, timer expiration processing is done directly from the timer ISR, thereby eliminating the timer thread control block, stack, and context switching to activate it.

Determine if in-line timer reactivation should be used within the timer expiration processing. By default, this is disabled and a function call is used. When enabled, reactivating is performed in-line resulting in faster timer processing but slightly larger code size.

Determine if no timer processing is required. This option will help eliminate the timer processing when not needed.

Determine if the trace event logging code should be enabled. This causes slight increases in code size and overhead, but provides the ability to generate system trace information which is available for viewing in TraceX.

Name of trace buffer symbol, only used if Event Trace is enabled.

Specify the memory section where the Trace Buffer will be allocated, only used if Event Trace is enabled.

RA

Hardware Thread Stack Monitoring MCU Specific Options

Use RA Hardware Stack Monitors to monitor thread stacks for overflow. Not available on MCUs that support PSPLIM.

Interrupts

SysTick Interrupt Priority MCU Specific Options

Select the SysTick interrupt priority.

Maximum Interrupt Priority MCU Specific Options

The maximum priority (lowest numerical value) an interrupt can have and use scheduler services. Interrupts with higher priority can interrupt most scheduler critical sections. Setting this to Priority 0 (highest) disables this feature. This feature is not available on MCUs that do not have the BASEPRI register.

Clock Configuration

The ThreadX port uses the SysTick timer as the system clock. The timer rate is configured in the ThreadX component under General > Timer Ticks Per Second.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Interrupt Priorities

When no threads are ready to run, the ThreadX port spins in the PendSV_Handler, which is fixed at the lowest interrupt priority. The MCU does not service any other interrupts of the lowest priority while no threads are ready to run.

To get around this limitation, the application can create an idle thread that is always ready to run. If the idle thread enters a lower power mode, make sure all interrupts that are required to resume the scheduler can wake the MCU in the configured power mode. If the application expects to wake after a certain number of ticks, the idle thread should not enter standby mode because the SysTick cannot wake the MCU from standby mode. See [Low Power Modes \(r_lpm\)](#) for more information regarding low power modes.

Warning

Do not attempt to wake a thread from an interrupt with the lowest available interrupt

priority unless the application has created an idle thread.

Hardware Stack Monitor

The hardware stack monitor generates an NMI if the PSP goes out of the memory area for the stack allocated for the current thread. A callback can be registered using `R_BSP_GroupIrqWrite()` to be called whenever a stack overflow or underflow of the PSP for a particular thread is detected.

Low Power Modes

The idle processing executes `WFI()` when no thread is ready to run. If the MCU is configured to enter software standby mode or deep software standby mode when the idle processing executes `WFI()`, the RA ThreadX port changes the low power mode to sleep mode so the idle processing can wake from `SysTick`. The low power mode settings are restored when the MCU wakes from sleep mode.

TrustZone Integration

When using an RTOS in a TrustZone project, Arm recommends keeping the RTOS in the non-secure project. Tasks may call non-secure callable functions if the thread has allocated a secure context (using `tx_thread_secure_stack_allocate`).

The secure context can be freed by deleting the thread or calling `tx_thread_secure_stack_free`.

Examples

Stack Monitor Example

This is an example of using the stack monitor in an application.

```
#if BSP_FEATURE_BSP_HAS_SP_MON
void stack_monitor_callback(bsp_grp_irq_t irq);
void stack_monitor_callback (bsp_grp_irq_t irq)
{
    FSP_PARAMETER_NOT_USED(irq);

    if (1U == R_MPU_SPMON->SP[0].CTL_b.ERROR)
    {
        /* Handle main stack monitor error here. */
    }

    if (1U == R_MPU_SPMON->SP[1].CTL_b.ERROR)
    {
        /* Handle process stack monitor error here. */
    }
}

void rm_threadx_port_stack_monitor_example (void)
{
```

```
/* Register a callback to be called when the stack goes outside the allocated stack
area. */
R_BSP_GroupIrqWrite(BSP_GRP_IRQ_MPU_STACK, stack_monitor_callback);
}
#else
/* Allocate stack space to return from UsageFault. */
uint32_t g_stack_overflow_exception_stack[8] BSP_ALIGN_VARIABLE(BSP_STACK_ALIGNMENT)
BSP_PLACE_IN_SECTION(
    BSP_SECTION_STACK);
/* MCUs that do not have an SPMON stack monitor use PSPLIM to detect stack overflows.
When a stack overflow error
* occurs, the UsageFault_Handler fires if it has been enabled. */
void UsageFault_Handler (void)
{
    register uint32_t cfsr = SCB->CFSR;
    if (cfsr & SCB_CFSR_STKOF_Msk)
    {
        /* Update PSP and PSPLIM to point to an exception stack frame allocated for stack
overflows. */
        register uint32_t * p_exception_stack_frame = (uint32_t *)
(&g_stack_overflow_exception_stack);
        __set_PSP((uint32_t) p_exception_stack_frame);
        __set_PSPLIM((uint32_t) p_exception_stack_frame);
        /* Clear XPSR, only set T-bit. */
        p_exception_stack_frame[7] = 1U << 24;
        /* Set PC to stack overflow error while loop. When execution returns from the
UsageFault, it will go to the
* stack_overflow_error_occurred function. It cannot return to the location where
the fault occurred because
* the MCU does not save the exception stack frame to the stack when a stack
overflow error occurs. */
        p_exception_stack_frame[6] = (uint32_t) stack_overflow_error_occurred;
    }
}
/* Clear flags. */
```

```
    SCB->CFSR = cfsr;
}
/* This function is called from UsageFault_Handler after a stack overflow occurs. */
void stack_overflow_error_occurred (void)
{
    /* When recovering from a stack overflow, move the thread to a while(1) loop. */
    while (1)
    {
        /* Do nothing. */
    }
}
void rm_threadx_port_stack_monitor_example (void)
{
    /* Enable usage fault. */
    SCB->SHCSR |= SCB_SHCSR_USGFAULTENA_Msk;
}
#endif
```

TrustZone Example

This is an example of calling `tx_thread_secure_stack_allocate` before calling any non-secure callable functions in a thread.

```
extern TX_THREAD * _tx_thread_current_ptr;
void rm_threadx_port_trustzone_thread_example (void)
{
    /* When ThreadX is used in a non-secure TrustZone application,
    tx_thread_secure_stack_allocate must be called prior
    * to calling any non-secure callable function in a thread. The first parameter is a
    pointer to the thread control block.
    * This function can be called when the thread is created or in the thread before an
    non-secure callable function is
    * called. The second parameter is unused in the FSP implementation. */
    UINT status = tx_thread_secure_stack_allocate(_tx_thread_current_ptr, 0);
    assert(TX_SUCCESS == status);
}
```

```

rm_threadx_port_nsc_function();
}

```

5.2.14.2 FreeRTOS Port (rm_freertos_port)

Modules » RTOS

FreeRTOS port for RA MCUs.

Overview

Note

The FreeRTOS Port does not provide any interfaces to the user. Consult the FreeRTOS documentation at <https://www.freertos.org/Documentation> for further information.

Features

The RA FreeRTOS port supports the following features:

- Standard FreeRTOS configurations
- Hardware stack monitor

Configuration

Note

The FreeRTOS Port and libraries use printf by default when logging is enabled. printf requires a heap (BSP Tab -> Properties -> RA Common -> Heap size (bytes)).

Build Time Configurations for all

The following build time configurations are defined in aws/FreeRTOSConfig.h:

| Configuration | Options | Default | Description |
|----------------------------|---|---------|--|
| General | | | |
| Custom FreeRTOSConfig.h | Manual Entry | | Add a path to your custom FreeRTOSConfig.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations. |
| Use Preemption | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | Set to Enabled to use the preemptive RTOS scheduler, or Disabled |

| | | | |
|-----------------------------------|---|----------|--|
| Use Port Optimised Task Selection | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | <p>to use the cooperative RTOS scheduler.</p> <p>Some FreeRTOS ports have two methods of selecting the next task to execute - a generic method, and a method that is specific to that port.</p> <p>The Generic method: Is used when Use Port Optimized Task Selection is set to 0, or when a port specific method is not implemented. Can be used with all FreeRTOS ports. Is completely written in C, making it less efficient than a port specific method. Does not impose a limit on the maximum number of available priorities.</p> <p>A port specific method: Is not available for all ports. Is used when Use Port Optimized Task Selection is Enabled. Relies on one or more architecture specific assembly instructions (typically a Count Leading Zeros [CLZ] or equivalent instruction) so can only be used with the architecture for which it was specifically written. Is more efficient than the generic method. Typically imposes a limit of 32 on the maximum number of available priorities.</p> |
| Use Tickless Idle | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | <p>Set Use Tickless Idle to Enabled to use the low power tickless mode, or Disabled to keep the</p> |

| | | | |
|--------------|---------------------------------------|-----------------|---|
| Cpu Clock Hz | Manual Entry | SystemCoreClock | <p>tick interrupt running at all times. Low power tickless implementations are not provided for all FreeRTOS ports.</p> <p>Enter the frequency in Hz at which the internal clock that drives the peripheral used to generate the tick interrupt will be executing - this is normally the same clock that drives the internal CPU clock. This value is required in order to correctly configure timer peripherals.</p> |
| Tick Rate Hz | Must be an integer and greater than 0 | 1000 | <p>The frequency of the RTOS tick interrupt. The tick interrupt is used to measure time. Therefore a higher tick frequency means time can be measured to a higher resolution. However, a high tick frequency also means that the RTOS kernel will use more CPU time so be less efficient. The RTOS demo applications all use a tick rate of 1000Hz. This is used to test the RTOS kernel and is higher than would normally be required.</p> <p>More than one task can share the same priority. The RTOS scheduler will share processor time between tasks of the same priority by switching between the tasks during each RTOS tick. A high tick rate frequency will therefore also have the effect of reducing the</p> |

| | | | |
|--------------------|---------------------------------------|----------|---|
| Max Priorities | Must be an integer and greater than 0 | 5 | 'time slice' given to each task. The number of priorities available to the application tasks. Any number of tasks can share the same priority. Each available priority consumes RAM within the RTOS kernel so this value should not be set any higher than actually required by your application. |
| Minimal Stack Size | Must be an integer and greater than 0 | 128 | The size of the stack used by the idle task. Generally this should not be reduced from the value set in the FreeRTOSConfig.h file provided with the demo application for the port you are using. Like the stack size parameter to the xTaskCreate() and xTaskCreateStatic() functions, the stack size is specified in words, not bytes. If each item placed on the stack is 32-bits, then a stack size of 100 means 400 bytes (each 32-bit stack item consuming 4 bytes). |
| Max Task Name Len | Must be an integer and greater than 0 | 16 | The maximum permissible length of the descriptive name given to a task when the task is created. The length is specified in the number of characters including the NULL termination byte. |
| Use 16-bit Ticks | Disabled | Disabled | Time is measured in 'ticks' - which is the number of times the tick interrupt has executed since the |

RTOS kernel was started. The tick count is held in a variable of type `TickType_t`. Defining `configUSE_16_BIT_TICKS` as 1 causes `TickType_t` to be defined (typedef'ed) as an unsigned 16bit type. Defining `configUSE_16_BIT_TICKS` as 0 causes `TickType_t` to be defined (typedef'ed) as an unsigned 32bit type.

Using a 16-bit type will greatly improve performance on 8- and 16-bit architectures, but limits the maximum specifiable time period to 65535 'ticks'. Therefore, assuming a tick frequency of 250Hz, the maximum time a task can delay or block when a 16bit counter is used is 262 seconds, compared to 17179869 seconds when using a 32-bit counter.

This parameter controls the behaviour of tasks at the idle priority. It only has an effect if: The preemptive scheduler is being used. The application creates tasks that run at the idle priority. If Use Time Slicing is Enabled then tasks that share the same priority will time slice. If none of the tasks get preempted then it might be assumed that each task at a given priority will be

Idle Should Yield

- Enabled
- Disabled

Enabled

allocated an equal amount of processing time - and if the priority is above the idle priority then this is indeed the case. When tasks share the idle priority the behaviour can be slightly different. If Idle Should Yield is Enabled then the idle task will yield immediately if any other task at the idle priority is ready to run. This ensures the minimum amount of time is spent in the idle task when application tasks are available for scheduling. This behaviour can however have undesirable effects (depending on the needs of your application) as depicted below:

The diagram above shows the execution pattern of four tasks that are all running at the idle priority. Tasks A, B and C are application tasks. Task I is the idle task. A context switch occurs with regular period at times T_0, T_1, \dots, T_6 . When the idle task yields task A starts to execute - but the idle task has already consumed some of the current time slice. This results in task I and task A effectively sharing the same time slice. The application tasks B and C therefore get more processing time than the application task A.

This situation can be avoided by:

If appropriate, using an idle hook in place of separate tasks at the idle priority.

Creating all application tasks at a priority greater than the idle priority.

Setting Idle Should Yield to Disabled.

Setting Idle Should Yield to Disabled prevents the idle task from yielding processing time until the end of its time slice. This ensure all tasks at the idle priority are allocated an equal amount of processing time (if none of the tasks get pre-empted) - but at the cost of a greater proportion of the total processing time being allocated to the idle task.

Setting Use Task Notifications to Enabled will include direct to task notification functionality and its associated API in the build.

Setting Use Task Notifications to Disabled will exclude direct to task notification functionality and its associated API from the build.

Each task consumes 8 additional bytes of RAM when direct to task notifications are included in the build.

Set to Enabled to include mutex

Use Task Notifications

- Enabled
- Disabled

Enabled

Use Mutexes

- Enabled
- Disabled

Disabled

functionality in the build, or Disabled to omit mutex functionality from the build. Readers should familiarise themselves with the differences between mutexes and binary semaphores in relation to the FreeRTOS functionality.

Use Recursive Mutexes • Enabled Disabled
 • Disabled

Set to Enabled to include recursive mutex functionality in the build, or Disabled to omit recursive mutex functionality from the build.

Use Counting Semaphores • Enabled Enabled
 • Disabled

Set to Enabled to include counting semaphore functionality in the build, or Disabled to omit counting semaphore functionality from the build.

Queue Registry Size Must be an integer and greater than 0 10

The queue registry has two purposes, both of which are associated with RTOS kernel aware debugging: It allows a textual name to be associated with a queue for easy queue identification within a debugging GUI. It contains the information required by a debugger to locate each registered queue and semaphore. The queue registry has no purpose unless you are using a RTOS kernel aware debugger. Registry Size defines the maximum number of queues and semaphores that can be registered. Only

those queues and semaphores that you want to view using a RTOS kernel aware debugger need be registered. See the API reference documentation for `vQueueAddToRegistry()` and `vQueueUnregisterQueue()` for more information.

Set to Enabled to include queue set functionality (the ability to block, or pend, on multiple queues and semaphores), or Disabled to omit queue set functionality.

If Use Time Slicing is Enabled, FreeRTOS uses prioritised preemptive scheduling with time slicing. That means the RTOS scheduler will always run the highest priority task that is in the Ready state, and will switch between tasks of equal priority on every RTOS tick interrupt. If Use Time Slicing is Disabled then the RTOS scheduler will still run the highest priority task that is in the Ready state, but will not switch between tasks of equal priority just because a tick interrupt has occurred.

If Use Newlib Reentrant is Enabled then a newlib reent structure will be allocated for each created task. Note Newlib support has been included by popular demand, but is not used by the

Use Queue Sets

- Disabled

Disabled

Use Time Slicing

- Enabled
- Disabled

Disabled

Use Newlib Reentrant

- Enabled
- Disabled

Disabled

FreeRTOS maintainers themselves. FreeRTOS is not responsible for resulting newlib operation. User must be familiar with newlib and must provide system-wide implementations of the necessary stubs. Be warned that (at the time of writing) the current newlib design implements a system-wide malloc() that must be provided with locks.

The FreeRTOS.h header file includes a set of #define macros that map the names of data types used in versions of FreeRTOS prior to version 8.0.0 to the names used in FreeRTOS version 8.0.0. The macros allow application code to update the version of FreeRTOS they are built against from a pre 8.0.0 version to a post 8.0.0 version without modification. Setting Enable Backward Compatibility to Disabled in FreeRTOSConfig.h excludes the macros from the build, and in so doing allowing validation that no pre version 8.0.0 names are being used.

Sets the number of indexes in each task's thread local storage array.

Sets the type used to specify the stack depth in calls to xTaskCreate(), and various other places stack sizes are used

| | | |
|----------------------------------|---|----------|
| Enable Backward Compatibility | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled |
|----------------------------------|---|----------|

| | | |
|--------------------------------------|--|---|
| Num Thread Local Storage Pointers | Must be an integer and greater than 0 | 5 |
|--------------------------------------|--|---|

| | | |
|------------------|--------------|----------|
| Stack Depth Type | Manual Entry | uint32_t |
|------------------|--------------|----------|

(for example, when returning the stack high water mark). Older versions of FreeRTOS specified stack sizes using variables of type `UBaseType_t`, but that was found to be too restrictive on 8-bit microcontrollers. Stack Depth Type removes that restriction by enabling application developers to specify the type to use.

FreeRTOS Message buffers use variables of type Message Buffer Length Type to store the length of each message. If Message Buffer Length Type is not defined then it will default to `size_t`. If the messages stored in a message buffer will never be larger than 255 bytes then defining Message Buffer Length Type to `uint8_t` will save 3 bytes per message on a 32-bit microcontroller. Likewise if the messages stored in a message buffer will never be larger than 65535 bytes then defining Message Buffer Length Type to `uint16_t` will save 2 bytes per message on a 32-bit microcontroller.

The highest interrupt priority that can be used by any interrupt service routine that makes calls to interrupt safe FreeRTOS API functions. **DO NOT CALL INTERRUPT SAFE FREERTOS API**

Message Buffer Length Type Manual Entry `size_t`

Library Max Syscall Interrupt Priority MCU Specific Options

FUNCTIONS FROM ANY INTERRUPT THAT HAS A HIGHER PRIORITY THAN THIS! (higher priorities are lower numeric values)

Below is explanation for macros that are set based on this value from FreeRTOS website.

In the RA port, configKERNEL_INTERRUPT_PRIORITY is not used and the kernel runs at the lowest priority.

Note in the following discussion that only API functions that end in "FromISR" can be called from within an interrupt service routine.

configMAX_SYSCALL_INTERRUPT_PRIORITY sets the highest interrupt priority from which interrupt safe FreeRTOS API functions can be called.

A full interrupt nesting model is achieved by setting configMAX_SYSCALL_INTERRUPT_PRIORITY above (that is, at a higher priority level) than configKERNEL_INTERRUPT_PRIORITY. This means the FreeRTOS kernel does not completely disable interrupts, even inside critical sections. Further, this is achieved without the disadvantages of a segmented kernel architecture.

Interrupts that do not

call API functions can execute at priorities above `configMAX_SYSCALL_INTERRUPT_PRIORITY` and therefore never be delayed by the RTOS kernel execution.

A special note for Arm Cortex-M users: Please read the page dedicated to interrupt priority settings on Arm Cortex-M devices. As a minimum, remember that Arm Cortex-M cores use numerically low priority numbers to represent HIGH priority interrupts, which can seem counter-intuitive and is easy to forget! If you wish to assign an interrupt a low priority do NOT assign it a priority of 0 (or other low numeric value) as this can result in the interrupt actually having the highest priority in the system - and therefore potentially make your system crash if this priority is above `configMAX_SYSCALL_INTERRUPT_PRIORITY`.

The lowest priority on a Arm Cortex-M core is in fact 255 - however different Arm Cortex-M vendors implement a different number of priority bits and supply library functions that expect priorities to be specified in different ways. For example, on the RA6M3 the lowest priority you can specify is 15 - and the highest priority you can specify is 0.

Assert

Manual Entry

assert(x)

The semantics of the `configASSERT()` macro are the same as the standard C `assert()` macro. An assertion is triggered if the parameter passed into `configASSERT()` is zero. `configASSERT()` is called throughout the FreeRTOS source files to check how the application is using FreeRTOS. It is highly recommended to develop FreeRTOS applications with `configASSERT()` defined.

The example definition (shown at the top of the file and replicated below) calls `vAssertCalled()`, passing in the file name and line number of the triggering `configASSERT()` call (`__FILE__` and `__LINE__` are standard macros provided by most compilers). This is just for demonstration as `vAssertCalled()` is not a FreeRTOS function, `configASSERT()` can be defined to take whatever action the application writer deems appropriate.

It is normal to define `configASSERT()` in such a way that it will prevent the application from executing any further. This is for two reasons; stopping the application at the point of the assertion allows the cause of the assertion to be debugged, and executing past a

triggered assertion will probably result in a crash anyway.

Note defining `configASSERT()` will increase both the application code size and execution time. When the application is stable the additional overhead can be removed by simply commenting out the `configASSERT()` definition in `FreeRTOSConfig.h`.

```
/* Define
configASSERT() to call
vAssertCalled() if the
assertion fails. The
assertion
has failed if the value
of the parameter
passed into
configASSERT() equals
zero. */
#define configASSERT(
(x) ) if ( ( x ) == 0 )
vAssertCalled( __FILE__,
__LINE__ )
If running FreeRTOS
under the control of a
debugger, then
configASSERT() can be
defined to just disable
interrupts and sit in a
loop, as demonstrated
below. That will have
the effect of stopping
the code on the line
that failed the assert
test - pausing the
debugger will then
immediately take you
to the offending line so
you can see why it
failed.
```

```
/* Define
configASSERT() to
disable interrupts and
sit in a loop. */
#define configASSERT(
```

```
( x ) ) if( ( x ) == 0 ) { t
askDISABLE_INTERRUPTS(); for( ;; ); }
```

Include Application
Defined Privileged
Functions

- Enabled
- Disabled

Disabled

Include Application Defined Privileged Functions is only used by FreeRTOS MPU. If Include Application Defined Privileged Functions is Enabled then the application writer must provide a header file called "application_defined_privileged_functions.h", in which functions the application writer needs to execute in privileged mode can be implemented. Note that, despite having a .h extension, the header file should contain the implementation of the C functions, not just the functions' prototypes.

Functions implemented in "application_defined_privileged_functions.h" must save and restore the processor's privilege state using the prvRaisePrivilege() function and portRESET_PRIVILEGE() macro respectively. For example, if a library provided print function accesses RAM that is outside of the control of the application writer, and therefore cannot be allocated to a memory protected user mode task, then the print function can be encapsulated in a privileged function using the following code:

```

void MPU_debug_printf(
const char *pcMessage
)
{
/* State the privilege
level of the processor
when the function was
called. */
 BaseType_t
 xRunningPrivileged =
 prvRaisePrivilege();

/* Call the library
function, which now
has access to all RAM.
*/
 debug_printf(
 pcMessage );

/* Reset the processor
privilege level to its
original value. */
 portRESET_PRIVILEGE(
 xRunningPrivileged );
}

```

This technique should only be use during development, and not deployment, as it circumvents the memory protection.

Hooks

| | | | |
|------------------------|---|----------|--|
| Use Idle Hook | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | Set to Enabled if you wish to use an idle hook, or Disabled to omit an idle hook. |
| Use Malloc Failed Hook | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | The kernel uses a call to pvPortMalloc() to allocate memory from the heap each time a task, queue or semaphore is created. The official FreeRTOS download includes four sample memory allocation schemes for this purpose. The schemes are implemented in the heap_1.c, heap_2.c, heap_3.c, heap_4.c and heap_5.c source files respectively. Use |

Malloc Failed Hook is only relevant when one of these three sample schemes is being used. The malloc() failed hook function is a hook (or callback) function that, if defined and configured, will be called if pvPortMalloc() ever returns NULL. NULL will be returned only if there is insufficient FreeRTOS heap memory remaining for the requested allocation to succeed.

If Use Malloc Failed Hook is Enabled then the application must define a malloc() failed hook function. If Use Malloc Failed Hook is set to Disabled then the malloc() failed hook function will not be called, even if one is defined. Malloc() failed hook functions must have the name and prototype shown below.

```
void vApplicationMallocFailedHook( void );
```

If Use Timers and Use Daemon Task Startup Hook are both Enabled then the application must define a hook function that has the exact name and prototype as shown below. The hook function will be called exactly once when the RTOS daemon task (also known as the timer service task) executes for the first time. Any application initialisation code that

Use Daemon Task

| Check For Stack Overflow | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | The stack overflow detection page describes the use of this parameter. This is not recommended for RA MCUs with hardware stack monitor support. RA MCU designs should enable the RA hardware stack monitor instead. |
| Stats | | | |
| Use Trace Facility | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Set to Enabled if you wish to include additional structure members and functions to assist with execution visualisation and tracing. |
| Use Stats Formatting Functions | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Set Use Trace Facility and Use Stats Formatting Functions to Enabled to include the vTaskList() and vTaskGetRunTimeStats() functions in the build. Setting either to Disabled will omit vTaskList() and vTaskGetRunTimeStats() from the build. |
| Generate Run Time Stats | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | The Run Time Stats page describes the use of this parameter. |
| Memory Allocation | | | |
| Clear Memory on Free | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | If set to 1, then blocks of memory allocated using pvPortMalloc() will be cleared when freed using vPortFree() |

Support Static Allocation

- Enabled
- Disabled

Enabled

If Support Static Allocation is Enabled then RTOS objects can be created using RAM provided by the application writer. If Support Static Allocation is Disabled then RTOS objects can only be created using RAM allocated from the FreeRTOS heap.

If Support Static Allocation is left undefined it will default to 0.

If Support Static Allocation is Enabled then the application writer must also provide two callback functions: vApplicationGetIdleTaskMemory() to provide the memory for use by the RTOS Idle task, and (if Use Timers is Enabled) vApplicationGetTimerTaskMemory() to provide memory for use by the RTOS Daemon/Timer Service task. Examples are provided below.

```
/* Support Static Allocation is Enabled, so the application must provide an implementation of vApplicationGetIdleTaskMemory() to provide the memory that is used by the Idle task. */
void vApplicationGetIdleTaskMemory(
    StaticTask_t **ppxIdleTaskTCBBuffer, <br>
    StackType_t **ppxIdleTaskStackBuffer, <br>
    uint32_t *puxIdleTaskStackSize )
{
```

```
/* If the buffers to be
provided to the Idle
task are declared
inside this
function then they
must be declared static
- otherwise they will be
allocated on
the stack and so not
exists after this
function exits. */
static StaticTask_t
xIdleTaskTCB;
static StackType_t
uxIdleTaskStack[ config
MINIMAL_STACK_SIZE ];
```

```
/* Pass out a pointer to
the StaticTask_t
structure in which the
Idle task's
state will be stored. */
*ppxIdleTaskTCBBuffer
=
```

```
/* Pass out the array
that will be used as the
Idle task's stack. */
*ppxIdleTaskStackBuffer
= uxIdleTaskStack;
```

```
/* Pass out the size of
the array pointed to by
*ppxIdleTaskStackBuffer.
Note that, as the array
is necessarily of type
StackType_t,
configMINIMAL_STACK_
SIZE is specified in
words, not bytes. */
*pullIdleTaskStackSize
= configMINIMAL_STAC
K_SIZE;
}
/*-----
-----*/
```

```
/* Support Static
Allocation and Use
Timers are both
Enabled, so the
application must
provide an
implementation of vAp
```

```
plicationGetTimerTaskMemory()
to provide the memory that is used by the
Timer service task. */
void vApplicationGetTimerTaskMemory(
StaticTask_t **ppxTimerTaskTCBBuffer,<br>
StackType_t **ppxTimerTaskStackBuffer,<br>
uint32_t *pulTimerTaskStackSize )
{
/* If the buffers to be provided to the Timer
task are declared inside this
function then they must be declared static
- otherwise they will be allocated on
the stack and so not exists after this
function exits. */
static StaticTask_t xTimerTaskTCB;
static StackType_t uxTimerTaskStack[ configTIMER_TASK_STACK_DEPTH ];

/* Pass out a pointer to the StaticTask_t
structure in which the Timer
task's state will be stored. */
*ppxTimerTaskTCBBuffer =

/* Pass out the array that will be used as the
Timer task's stack. */
*ppxTimerTaskStackBuffer =
uxTimerTaskStack;

/* Pass out the size of the array pointed to by
*ppxTimerTaskStackBuffer.
Note that, as the array is necessarily of type
```

```
StackType_t,
configTIMER_TASK_STACK_DEPTH is specified
in words, not bytes. */
*puTimerTaskStackSize = configTIMER_TASK_STACK_DEPTH;
}
```

Examples of the callback functions that must be provided by the application to supply the RAM used by the Idle and Timer Service tasks if Support Static Allocation is Enabled.

See the Static Vs Dynamic Memory Allocation page for more information.

If Support Dynamic Allocation is Enabled then RTOS objects can be created using RAM that is automatically allocated from the FreeRTOS heap. If Support Dynamic Allocation is set to 0 then RTOS objects can only be created using RAM provided by the application writer.

See the Static Vs Dynamic Memory Allocation page for more information.

The total amount of RAM available in the FreeRTOS heap. This value will only be used if Support Dynamic Allocation is Enabled and the application makes use of one of the sample memory allocation schemes provided in the FreeRTOS source code download. See

Clock Configuration

The FreeRTOS port uses the SysTick timer as the system clock. The timer rate is configured in the FreeRTOS component under General > Tick Rate Hz.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Hardware Stack Monitor (PSPLIM)

A UsageFault is generated if PSP goes out of the memory area for the stack allocated for the current task. If UsageFault is not enabled, it is escalated to HardFault.

Hardware Stack Monitor (SPMON)

The hardware stack monitor generates an NMI if the PSP goes out of the memory area for the stack allocated for the current task. A callback can be registered using `R_BSP_GroupIrqWrite()` to be called whenever a stack overflow or underflow of the PSP for a particular thread is detected.

Stack Monitor Underflow Detection

By default the hardware stack monitor only checks for overflow of the process stack. To check for underflow define `configRECORD_STACK_HIGH_ADDRESS` as 1 on the command line.

Low Power Modes

When FreeRTOS is configured to use tickless idle, the idle task executes `WFI()` when no task is ready to run. If the MCU is configured to enter software standby mode or deep software standby mode when the idle task executes `WFI()`, the RA FreeRTOS port changes the low power mode to sleep mode so the idle task can wake from `SysTick`. The low power mode settings are restored when the MCU wakes from sleep mode.

TrustZone Integration

When using an RTOS in a TrustZone project, Arm recommends keeping the RTOS in the non-secure project. Tasks may call non-secure callable functions if the task has allocated a secure context (using `portALLOCATE_SECURE_CONTEXT`).

The secure context can be freed by deleting the thread or using the `portCLEAN_UP_TCB(pxTCB)` macro.

Examples

Stack Monitor Example

This is an example of using the stack monitor in an application.

```
#if BSP_FEATURE_BSP_HAS_SP_MON
void stack_monitor_callback (bsp_grp_irq_t irq)
{
    FSP_PARAMETER_NOT_USED(irq);

    if (1U == R_MPU_SPMON->SP[0].CTL_b.ERROR)
    {
        /* Handle main stack monitor error here. */
    }

    if (1U == R_MPU_SPMON->SP[1].CTL_b.ERROR)
```

```
{
/* Handle process stack monitor error here. */
}
}
void rm_freertos_port_stack_monitor_example (void)
{
/* Register a callback to be called when the stack goes outside the allocated stack
area. */
R_BSP_GroupIrqWrite(BSP_GRP_IRQ_MPU_STACK, stack_monitor_callback);
}
#else
/* Allocate stack space to return from UsageFault. */
uint32_t g_stack_overflow_exception_stack[8] BSP_ALIGN_VARIABLE(BSP_STACK_ALIGNMENT)
BSP_PLACE_IN_SECTION(
    BSP_SECTION_STACK);
/* MCUs that do not have an SPMON stack monitor use PSPLIM to detect stack overflows.
When a stack overflow error
* occurs, the UsageFault_Handler fires if it has been enabled. */
void UsageFault_Handler (void)
{
register uint32_t cfsr = SCB->CFSR;
if (cfsr & SCB_CFSR_STKOF_Msk)
{
/* Update PSP and PSPLIM to point to an exception stack frame allocated for stack
overflows. */
register uint32_t * p_exception_stack_frame = (uint32_t *)
(&g_stack_overflow_exception_stack);
__set_PSP((uint32_t) p_exception_stack_frame);
__set_PSPLIM((uint32_t) p_exception_stack_frame);
/* Clear XPSR, only set T-bit. */
p_exception_stack_frame[7] = 1U << 24;
/* Set PC to stack overflow error while loop. When execution returns from the
UsageFault, it will go to the
* stack_overflow_error_occurred function. It cannot return to the location where
```

```
the fault occurred because
 * the MCU does not save the exception stack frame to the stack when a stack
overflow error occurs. */
    p_exception_stack_frame[6] = (uint32_t) stack_overflow_error_occurred;
}
/* Clear flags. */
SCB->CFSR = cfsr;
}
/* This function is called from UsageFault_Handler after a stack overflow occurs. */
void stack_overflow_error_occurred (void)
{
    /* When recovering from a stack overflow, move the task to a while(1) loop. */
    while (1)
    {
        /* Do nothing. */
    }
}
void rm_freertos_port_stack_monitor_example (void)
{
    /* Enable usage fault. */
    SCB->SHCSR |= SCB_SHCSR_USGFAULTENA_Msk;
}
#endif
```

TrustZone Example

This is an example of calling portALLOCATE_SECURE_CONTEXT before calling any non-secure callable functions in a task.

```
void rm_freertos_port_trustzone_task_example (void)
{
    /* When FreeRTOS is used in a non-secure TrustZone application,
portALLOCATE_SECURE_CONTEXT must be called prior
 * to calling any non-secure callable function in a task. The parameter is unused in
the FSP implementation. */
```

```
portALLOCATE_SECURE_CONTEXT(0);  
rm_freertos_port_nsc_function();  
}
```

5.2.15 Security

Modules

Detailed Description

Security Modules.

Modules

[AWS Device Provisioning](#)

AWS Device Provisioning example software.

[Azure RTOS NetX Crypto HW Acceleration \(rm_netx_secure_crypto\)](#)

Hardware acceleration for the Netx Crypto implementation of the Microsoft Azure RTOS NetX Crypto API.

[Mbed Crypto H/W Acceleration \(rm_psa_crypto\)](#)

Hardware acceleration for the mbedCrypto implementation of the Arm PSA Crypto API.

[RSIP Protected Mode \(r_rsip_protected\)](#)

Driver for the Renesas Secure IP (RSIP) peripheral on RA MCUs.

[SCE Protected Mode](#)

Driver for the Secure Crypto Engine (SCE9) on RA MCUs.

[Secure Crypto Engine \(r_sce_protected_cavp\)](#)

Driver for the CAVP Certified Secure Crypto Engine (SCE) on RA MCUs.

[Secure Key Injection \(r_rsip_key_injection\)](#)

Driver for the Secure Key Injection on RA MCUs.

[Secure Key Injection \(r_sce_key_injection\)](#)

Driver for the Secure Key Injection on RA MCUs.

[TinyCrypt H/W Acceleration \(rm_tinycrypt_port\)](#)

AES128 Hardware acceleration for TinyCrypt on the RA2 family.

5.2.15.1 AWS Device Provisioning

[Modules](#) » [Security](#)

AWS Device Provisioning example software.

Overview

Terminology

The terminology defined below will be used in the following sections.

| Term | Description |
|---------------------|--|
| Service Provider | Entity that provides the cloud infrastructure and associated services, for example, AWS/Azure. |
| Device Manufacturer | Entity that provides the MCU, for example, Renesas. |
| OEM | Entity that uses the MCU to create a product. |
| Customer | End user of OEM product. |

Device ID

For systems that intend to use Public Key Certificate (PKC), the Device ID is in the form of a key pair (RSA or ECC). A PKC comprises of a **public key**, metadata, and finally a signature over all that. This signature is generated by the entity that issues the certificate and is known as a CA (Certificate Authority). The most common format for a public certificate is the [X.509 format](#) which is typically PEM (base 64) encoded such that the certificate is human-readable. It can also be DER encoded which is binary encoding and thus not human readable. The **public key** portion of the Device ID is used for the Device Certificate.

Provisioning

Device Provisioning refers to the process by which a service provider links a certificate to a Device ID and thus a device. Depending on the provisioning model, an existing certificate from the device may be used or a new one will be issued at this stage. Provisioning (also referred to as Registration) occurs with respect to a particular service provider, for example, AWS or Azure. It is necessary that the certificate is issued by the service provider or a CA known to those providers. When a device is

provisioned with AWS for example, the AWS IoT service associates the Device ID (and thus the device) with a specific certificate. The certificate will be programmed into the device and for all future transactions with AWS, the certificate will be used as the means of identifying the device. The public and private key are also stored on the MCU.

Provisioning Models

Provisioning services vary between [service providers](#). There are essentially three general provisioning models.

1. Provisioning happens on the production line. This requires the provisioning Infrastructure to be present on the production line. This is the most secure model, but is expensive.
2. Devices are programmed with a shared credential that is linked into the code at build time and the provisioning occurs when a customer uses the device for the first time. The shared credential and a unique device serial number are used to uniquely identify the device during the provisioning process. So long as the product only has the shared credential, it will only operate with limited (as defined by certificate policy) functionality. Once the provisioning is done, then the device will be fully functional. This is the most common use case for consumer products where no sensitive information is being transmitted. AWS provides an [example](#) of this model.
3. Devices have no identity programmed in the factory; provisioning occurs through some other device like a smartphone which is already trusted by the service provider.

In all these cases, the Device Identity

1. Is unique to the device
2. Must have restricted access within the device
3. Can be used to issue more than one certificate and the certificates themselves have to be updatable in the field.

AWS uses the PKCS11 API to erase, store and retrieve certificates. These PKCS11 functions (Write, Read and Erase) are separated out into a Physical Abstraction Layer (PAL) which the OEM/Device Manufacturer is expected to implement for the type of memory that they intend to use. The internal `rm_aws_pkcs11_pal_littlefs` module implements these requirements on RA MCU data flash.

AWS Provisioning Example

AWS provides an **example** implementation to support device provisioning. This implementation uses the PKCS11 API to store device credentials into the PKCS11 defined memory. The implementation (`aws_dev_mode_key_provisioning.c`) exposes:

1. `vAlternateKeyProvisioning()`

This function requires that the device credentials be provided in PEM format. Using this example function as is in production is not recommended.

Note **`vDevModeKeyProvisioning()`** is no longer supported.

Credentials can be created as follows: [*Create your own CA](#) and use that to generate the device certificate. This CA will have to be registered with the service provider with which the product will be used, for example [Register your CA with AWS](#).

- Use [AWS](#) to generate the device certificate.

Examples

Basic Example

This is a basic example of provisioning a device using the AWS demo implementation.

```

Limitations

The provisioning code is an example provided by AWS. It must be modified to meet product requirements.

5.2.15.2 Azure RTOS NetX Crypto HW Acceleration (rm_netx_secure_crypto)

[Modules](#) » [Security](#)

Detailed Description

Hardware acceleration for the Netx Crypto implementation of the Microsoft Azure RTOS NetX Crypto API.

Overview

Please refer to the [NetXDuo - NetX Crypto documentation](#) for further details.

HW Overview

| Crypto Peripheral version | Devices |
|---------------------------|----------------------------|
| SCE9 | RA6M4, RA4M3, RA4M2, RA6M5 |
| SCE7 | RA6M3, RA6M2, RA6M1, RA6T1 |
| SCE5 | RA4W1, RA4M1 |
| SCE5B | RA6T2 |
| AES Engine | RA2A1, RA2E1, RA2E2, RA2L1 |
| RSIP7 | RA8M1 |

Note

NetX Crypto hardware acceleration is unsupported on 'SCE5' and 'AES Engine' crypto peripherals listed above.

Features

This module provides SCE9 hardware support for the following NetX Crypto operations

- SHA256 calculation
- SHA224 calculation
- MAC Operations
 - HMAC with SHA224
 - HMAC with SHA256
- AES
 - Keybits - 128, 192, 256
 - Encryption and Decryption.
 - Chaining Modes: CBC, CTR, GCM mode

| AES Chaining Mode | HW Acceleration |
|-------------------|--|
| CBC | Fully accelerated |
| CTR | Fully accelerated |
| GCM | Encrypt - Fully accelerated; Decrypt - Only GHASH and block cipher unit is HW accelerated |
| CCM | Only block cipher unit is HW accelerated |

- Random number generation
- ECC
 - ECDSA: Supported Curves - SECP384R1, SECP256R1.
 - ECDH: Supported Curves - SECP384R1, SECP256R1.
- RSA
 - Signature Generation - RSA 2048 (Plain or Wrapped private) key. (This can be used for decryption)
 - Signature Verification - RSA 2048, RSA 3072 and RSA 4096 keys. (This can be used for encryption)
 - Supported encoding scheme: PKCS1V15

This module provides SCE7 hardware support for the following NetX Crypto operations

- SHA256 calculation
- SHA224 calculation
- AES
 - Keybits - 128, 192, 256
 - Encryption and Decryption.
 - Chaining Modes: CBC, CTR, GCM mode

| AES Chaining Mode | HW Acceleration |
|-------------------|--|
| CBC | Fully accelerated |
| CTR | Fully accelerated |
| GCM | Only block cipher unit is HW accelerated |
| CCM | Only block cipher unit is HW accelerated |

- ECC
 - ECDSA: Supported Curves - SECP384R1, SECP256R1.
 - ECDH: Supported Curves - SECP384R1, SECP256R1.
- RSA
 - Signature Generation - RSA 2048 (Plain or Wrapped private) key. (This can be used

- for decryption)
- Signature Verification - RSA 2048. (This can be used for encryption)
- Supported encoding scheme: PKCS1V15

Configuration

Build Time Configurations for rm_netx_secure_crypto_sw_port

The following build time configurations are defined in fsp_cfg/middleware/rm_netx_secure_crypto_cfg.h:

| Configuration | Options | Default | Description |
|---------------------------------|--|----------------------------|--------------------------------------|
| Standalone Usage | <ul style="list-style-type: none"> • Use Standalone Crypto Only • Use with TLS | Use Standalone Crypto Only | Defines NX_CRYPTO_STANDALONE_ENABLE. |
| Maximum RSA Modulus size (bits) | <ul style="list-style-type: none"> • 1024 • 2048 • 3072 • 4096 | 4096 | |

Build Time Configurations for rm_netx_secure_crypto

The following build time configurations are defined in fsp_cfg/middleware/rm_netx_secure_crypto_cfg.h:

| Configuration | Options | Default | Description |
|---|--------------------------|---------|--|
| Hardware Acceleration | | | |
| Hardware Acceleration > Hash | | | |
| SHA256/224 | MCU Specific Options | | Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_SHA256_ALT. |
| Hardware Acceleration > Cipher | | | |
| AES | MCU Specific Options | | Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_AES_ALT |
| Hardware Acceleration > Public Key Cryptography (PKC) | | | |
| Hardware Acceleration > Public Key Cryptography (PKC) > ECC | | | |
| ECC | MCU Specific Options | | Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_ECC_ALT |
| ECDSA Scratch Buffer Size (Bytes) | Value must be an integer | 3016 | Sets value of NX_CRYPT_TO_ECDSA_SCRATCH_BUFFER_SIZE |
| ECDH Scratch Buffer Size (Bytes) | Value must be an integer | 2464 | Sets value of NX_CRYPT_TO_ECDH_SCRATCH_BUFFER_SIZE |

Hardware Acceleration > Public Key Cryptography (PKC) > RSA

| | | | |
|---------------------------------|--|----------------------------|---|
| RSA | MCU Specific Options | | Enables/Disables RSA HW support |
| RSA 2048 (HW) | MCU Specific Options | | Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_2048_ALT to allow HW support |
| RSA 3072 Verify/Encryption (HW) | MCU Specific Options | | Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_3072_ALT to allow HW support |
| RSA 4096 Verify/Encryption (HW) | MCU Specific Options | | Enables RSA NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_4096_ALT to allow HW support |
| RSA Scratch Buffer Size (Bytes) | MCU Specific Options | | Sets value of NX_CRYPTO_RSA_SCRATCH_BUFFER_SIZE |
| TRNG | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_TRNG_ALT. |
| Standalone Usage | <ul style="list-style-type: none"> • Use Standalone Crypto Only • Use with TLS | Use Standalone Crypto Only | Defines NX_CRYPTO_STANDALONE_ENABLE. |

Random Number Generator Configuration

To enable hardware acceleration for the TRNG, the macro `NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_TRNG_ALT` must be defined in the configuration file. By default TRNG is enabled which can be disabled using the RA Configuration editor.

Once enabled 'rand' function will be mapped to HW TRNG; the 'srand' function is not supported, any calls to this function will have no effect. Functionality to re-seed the HW TRNG is not supported by the existing implementation.

If disabled, both 'rand' and 'srand' will be mapped to the C Standard Library. This would require setting up the heap as 'rand' implementation calls 'malloc'.

SHA256 Configuration

To enable hardware acceleration for the SHA256/224 calculation, the macro `NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_SHA256_ALT` must be defined in the configuration file. By default SHA256 is enabled which can be disabled using the RA Configuration editor.

AES Configuration

To enable hardware acceleration for the AES128/192/256 operation, the macro `NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_AES_ALT` must be defined in the configuration file. By default AES is enabled which can be disabled using the RA Configuration editor.

ECC Configuration

To enable hardware acceleration for the ECDSA and ECDH for curves SECP384R1 and SECP256R1, the macro `NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_ECC_ALT` must be defined in the configuration file. By default ECC operations are enabled which can be disabled using the RA Configuration editor.

RSA Configuration

To enable hardware acceleration for the RSA Encrypt/Decrypt (or Sign/Verify) operation(s), the macro(s) below must be defined in the configuration file:

| Configuration Macro | Feature / Operation |
|--|---|
| <code>NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_2048_ALT</code> | Signature Generation / Signature Verification (Encryption / Decryption) |
| <code>NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_3072_ALT</code> | Signature Verification (Encryption Only) |
| <code>NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_4096_ALT</code> | Signature Verification (Encryption Only) |

By default RSA 2048 is enabled which can be disabled using the RA Configuration editor.

RSA software implementation is completely disabled when any of the above macros are enabled.

Usage Notes

Memory Alignment

Use 32bit aligned buffer pointers as arguments to APIs for best performance.

Hardware Initialization

`_nx_crypto_initialize()` must be invoked before using the NetX Crypto APIs to ensure that the SCE peripheral is initialized.

Memory Usage

Sufficient memory must be allocated to be used as 'crypto_metadata' for the chosen crypto operation(s). Refer [Azure RTOS NetX Crypto API description](#) for recommended 'crypto_metadata_size' based on selected crypto operations. Sufficient amount of memory must be allocated for the thread stack to support low level crypto operations when using this module in the standalone mode or through NetX Secure (TLS). A minimum stack of 0x1000 is required to use ECC and RSA. This is either the main stack in a bare metal application or the specific thread stack for an RTOS based application.

AES Usage

GCM mode

The first byte of the IV must indicate the length of the subsequent IV. For example if the IV is {0x00, 0x00, 0x00}, then the IV pointer passed to the `_nx_crypto_method_aes_operation` must store the IV as {0x03, 0x00, 0x00, 0x00}. Refer to the example code for actual usage.

CTR mode

For CTR mode the IV pointer must be as defined in [Using Advanced Encryption Standard \(AES\) Counter Mode With IPsec Encapsulating Security Payload \(ESP\)](#) under 'Figure 2. Counter Block Format'. The IV must be 8 bytes in length. The Nonce field in the reference above must be 4 bytes and should be passed to `_nx_crypto_method_aes_operation` through the key pointer stored after the actual AES key. For Example, if the AES 128-bit Plain Key is {0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00} and the Nonce is {0x01, 0x07, 0xBD, 0xFD}, the key passed to the `_nx_crypto_method_aes_operation` during Encryption/Decryption should be set as {0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x01, 0x07, 0xBD, 0xFD}. This format would also be valid for Wrapped keys where the Nonce is appended at the end of the actual Wrapped key. Refer to the example code for actual usage.

The 'Block Counter' field in the above reference is fixed to {0x00, 0x00, 0x00, 0x01} at the beginning and increments internally after every subsequent AES block is processed. Test vectors that have the initial Block Counter not set to {0x00, 0x00, 0x00, 0x01} cannot be used in this implementation.

ECC Usage

ECC operations include ECDH and ECDSA. As a part of ECDSA operation the input message can be hashed before signing or verification, or the message digest can be provided directly. ECC Scratch buffer size can be optionally reduced as supported ECC computations are now done by the HW. This is controlled by `NX_CRYPT0_ECDSA_SCRATCH_BUFFER_SIZE` and `NX_CRYPT0_ECDH_SCRATCH_BUFFER_SIZE` macros for ECDSA and ECDH respectively.

| Operation | Key Format |
|--|---|
| ECDSA Signature | Plain private key; Wrapped private key |
| ECDSA Signature-Verify | Uncompressed public key |
| Key Generation using ECDSA operation API | Wrapped private key; Uncompressed public key |
| ECDH private key import | Plain private key; Wrapped private key (Allows for Uncompressed and Formatted public key) |
| ECDH public key export | Uncompressed public key |
| ECDH setup | Uncompressed public key |
| ECDH shared secret calculate | Uncompressed public key |
| Key Generation using ECDH operation API | Wrapped private key; Uncompressed public key |

Note:

- Uncompressed public key is of the form (0x04 || Qx || Qy). Refer Section 2.2. Subject Public Key under [RFC5480](#)
- Formatted public key is of the form (Key Info (4 bytes) || Qx || Qy || Key Info (16 bytes)). This is the key which is used internally by SCE peripheral.

RSA Usage

Wrapped Key Usage

To use the NetX Crypto stack with wrapped private keys (for signature generation/decryption), a dummy pointer (non-NULL) should be passed to the 'key' parameter during

`_nx_crypto_method_rsa_init` API call. However, the 'key_size_in_bits' parameter should be equal to the intended RSA modulus length in bits. The actual wrapped key must be passed as the 'key' parameter to the `_nx_crypto_method_rsa_operation` API call with its length in bits passed through the 'key_size_in_bits' parameter.

For PKCS1V15 operation 'key' and 'key_size_in_bits' parameters of `_nx_crypto_method_pkcs1_v1_5_init` are unused. These can be passed as NULL and 0 respectively. The actual wrapped key must be passed as the 'key' parameter to the `_nx_crypto_method_pkcs1_v1_5_operation` API call and the intended modulus length in bits must be passed through the 'key_size_in_bits' parameter.

Software Implementation

The plaintext data passed in to the RSA encryption API must be 4-byte aligned. If it is not aligned then when the resultant encrypted data is decrypted using the decryption API, the unaligned data will be endian-swapped. For instance, if {0x01, 0x02, 0x03, 0x04, 0x05} is passed as input data for encryption, when decrypted, the result will be {0x01, 0x02, 0x03, 0x04, 0x00, 0x00, 0x00, 0x05}. Note that this alignment of input data need not be taken care while using Hardware accelerated RSA.

Limitations

- Only little endian mode is supported.
- RSA CRT keys are not supported.
- ECJPAKE related operations are unsupported for NIST 224, 256 and 384 bit curves when HW ECC is enabled.

Examples

Initialization Example

This example shows how to initialize the HW crypto engine. This step must be performed before any crypto algorithm is used.

```
/* Setup the platform; initialize the SCE and the TRNG */
err = nx_crypto_initialize();
assert(NX_CRYPTOSUCCESS == err);
```

Hash Example

This is an example on calculating the SHA256 hash using the NetX Crypto API.

```
extern NX_CRYPTOMETHOD crypto_method_sha256;
const uint8_t NIST_SHA256ShortMsgLen200[] =
{
    0x2e, 0x7e, 0xa8, 0x4d, 0xa4, 0xbc, 0x4d, 0x7c, 0xfb, 0x46, 0x3e, 0x3f, 0x2c,
    0x86, 0x47, 0x05,
    0x7a, 0xff, 0xf3, 0xfb, 0xec, 0xec, 0xa1, 0xd2, 00
```

```
};  
  
const uint8_t NIST_SHA256ShortMsgLen200_expected[] =  
{  
    0x76, 0xe3, 0xac, 0xbc, 0x71, 0x88, 0x36, 0xf2, 0xdf, 0x8a, 0xd2, 0xd0, 0xd2,  
    0xd7, 0x6f, 0x0c,  
    0xfa, 0x5f, 0xea, 0x09, 0x86, 0xbe, 0x91, 0x8f, 0x10, 0xbc, 0xee, 0x73, 0x0d,  
    0xf4, 0x41, 0xb9  
};  
  
void netx_secure_crypto_sha256_example (void)  
{  
    size_t    actual_hash_len = RM_NETX_SECURE_CRYPTO_EXAMPLE_SHA256_HASH_SIZE_BYTES;  
    uint8_t  actual_hash[RM_NETX_SECURE_CRYPTO_EXAMPLE_SHA256_HASH_SIZE_BYTES];  
    uint8_t  metadata[sizeof(NX_CRYPTO_SHA256)];  
    uint32_t metadata_size = sizeof(NX_CRYPTO_SHA256);  
  
    void * handler          = NX_CRYPTO_NULL;  
    uint32_t err            = NX_CRYPTO_SUCCESS;  
  
    /* Setup the platform; initialize the SCE and the TRNG */  
    err = nx_crypto_initialize();  
    assert(NX_CRYPTO_SUCCESS == err);  
  
    /* Nx Crypto SHA256 init */  
    err = _nx_crypto_method_sha256_init(&crypto_method_sha256, NX_CRYPTO_NULL, 0,  
&handler, metadata, metadata_size);  
    assert(NX_CRYPTO_SUCCESS == err);  
  
    /* Nx Crypto SHA256 operation - NX_CRYPTO_HASH_INITIALIZE */  
    err = _nx_crypto_method_sha256_operation(NX_CRYPTO_HASH_INITIALIZE,  
                                              handler,  
                                              &crypto_method_sha256,  
                                              NX_CRYPTO_NULL,  
                                              0,  
                                              NX_CRYPTO_NULL,  
                                              0,  
                                              NX_CRYPTO_NULL,  
                                              NX_CRYPTO_NULL,  
                                              0,
```

```
        metadata,  
        metadata_size,  
        NX_CRYPTO_NULL,  
        NX_CRYPTO_NULL);  
  
    assert(NX_CRYPTO_SUCCESS == err);  
/* Nx Crypto SHA256 operation - NX_CRYPTO_HASH_UPDATE,  
 * call this multiple times if needed to hash multiple data batches */  
err =  
    _nx_crypto_method_sha256_operation(NX_CRYPTO_HASH_UPDATE,  
        handler,  
        &crypto_method_sha256,  
        NX_CRYPTO_NULL,  
        0,  
        (uint8_t *) NIST_SHA256ShortMsgLen200,  
        sizeof(NIST_SHA256ShortMsgLen200),  
        NX_CRYPTO_NULL,  
        NX_CRYPTO_NULL,  
        0,  
        metadata,  
        metadata_size,  
        NX_CRYPTO_NULL,  
        NX_CRYPTO_NULL);  
  
    assert(NX_CRYPTO_SUCCESS == err);  
/* Nx Crypto SHA256 operation - NX_CRYPTO_HASH_CALCULATE */  
err = _nx_crypto_method_sha256_operation(NX_CRYPTO_HASH_CALCULATE,  
        handler,  
        &crypto_method_sha256,  
        NX_CRYPTO_NULL,  
        0,  
        NX_CRYPTO_NULL,  
        0,  
        NX_CRYPTO_NULL,  
        (uint8_t *) actual_hash,  
        actual_hash_len,
```

```
        metadata,  
        metadata_size,  
        NX_CRYPTONULL,  
        NX_CRYPTONULL);  
  
    assert(NX_CRYPTOSUCCESS == err);  
  
    /* Ensure generated SHA256 hash matches the expected digest */  
    err = (uint32_t) memcmp(&actual_hash[0], &NIST_SHA256ShortMsgLen200_expected[0],  
actual_hash_len);  
    assert(0 == err);  
}
```

AES Example

This is an example on using the NetX Crypto API to encrypt and decrypt multi-block data.

AES CBC Example

```
extern NX_CRYPTOMETHOD crypto_method_aes_cbc_256;  
  
/* fe8901fec3ccd2ec5fdc7c7a0b50519c245b42d611a5ef9e90268d59f3edf33 */  
const uint8_t NIST_AES256_CBC_key[] =  
{  
    0xfe, 0x89, 0x01, 0xfe, 0xcd, 0x3c, 0xcd, 0x2e, 0xc5, 0xfd, 0xc7, 0xc7, 0xa0,  
0xb5, 0x05, 0x19,  
    0xc2, 0x45, 0xb4, 0x2d, 0x61, 0x1a, 0x5e, 0xf9, 0xe9, 0x02, 0x68, 0xd5, 0x9f,  
0x3e, 0xdf, 0x33  
};  
  
/* 851e8764776e6796aab722dbb644ace8 */  
const uint8_t NIST_AES256_CBC_iv[] =  
{  
    0xbd, 0x41, 0x6c, 0xb3, 0xb9, 0x89, 0x22, 0x28, 0xd8, 0xf1, 0xdf, 0x57, 0x56,  
0x92, 0xe4, 0xd0

ECDH Example

This is an example on using the NetX Crypto API to generate a shared secret using ECDH. A shared secret is computed using known public key (from peer) and generated private key. Another shared secret is computed using the generated public key and known private key (imported to mimic peer). Both the shared secrets are checked to be the same.

```
extern NX_CRYPT_METHOD crypto_method_ecdh;
/*Private key 59137e38152350b195c9718d39673d519838055ad908dd4757152fd8255c09bf */

```

RSA PKCS1V1.5 Example

This is an example on using the NetX Crypto API to sign and verify input message data. The plain input message is PKCS1V1.5 encoded before signature generation.

PKCS1V15 Example

HMAC SHA256 Example

This is an example on using the HMAC with SHA256 hash using the NetX Crypto API.

```

5.2.15.3 Mbed Crypto H/W Acceleration (rm_psa_crypto)

[Modules](#) » [Security](#)

Functions

int `mbedtls_platform_setup` (`mbedtls_platform_context *ctx`)

void `mbedtls_platform_teardown` (`mbedtls_platform_context *ctx`)

`fsp_err_t` `RM_PSA_CRYPTO_TRNG_Read` (`uint8_t *const p_rngbuf`, `uint32_t num_req_bytes`, `uint32_t *p_num_gen_bytes`)

Reads requested length of random data from the TRNG. Generate nbytes of random bytes and store them in `p_rngbuf` buffer. [More...](#)

Detailed Description

Hardware acceleration for the mbedCrypto implementation of the Arm PSA Crypto API.

Overview

Note

The PSA Crypto module does not provide any interfaces to the user. This release uses the mbedTLS version 3.4.0 which conforms to the PSA Crypto API 1.0 specification. Consult the Arm documentation at <https://armmbed.github.io/mbed-crypto/psa/#application-programming-interface> for further information. FSP 3.0 onward adopts a change by Arm where mbedCrypto has been integrated back to MbedTLS and the term mbedCrypto has been deprecated. The mbedCrypto term in FSP now refers to the crypto portion of the MbedTLS module.

HW Overview

| Crypto Peripheral version | Devices |
|---------------------------|--|
| SCE9 | RA6M4, RA4M3, RA4M2, RA6M5 |
| SCE7 | RA6M3, RA6M2, RA6M1, RA6T1 |
| SCE5 | RA4W1, RA4M1 |
| SCE5B | RA6T2 |
| AES Engine | RA2A1, RA2E1, RA2E2, RA2L1 |
| TRNG | RA4E1, RA4E2, RA4T1, RA6E1, RA6E2, RA6T3 |
| RSIP-E51A | RA8M1, RA8D1, RA8T1 |

Features

The PSA_Crypto module provides hardware support for the following PSA Crypto operations

- SHA256 calculation
- SHA224 calculation
- SHA512 calculation (Available only on RSIP7)
- SHA384 calculation (Available only on RSIP7)
- MAC Operations
- AES
 - Keybits - 128, 192, 256

- Plain-Text Key Generation
- Wrapped Key Generation
- Encryption and Decryption with no padding and with PKCS7 padding.
- CBC, CTR, CCM , XTS and GCM modes
- MAC operations
- Export and Import of Plaintext and Wrapped keys
- ECC
 - Curves:
 - SECP256R1
 - SECP256K1
 - Brainpool256R1
 - SECP384R1
 - Brainpool384R1
 - Plain-Text Key Generation (Unavailable on SCE9 and RSIP7)
 - Wrapped Key Generation (Available only on RSIP7)
 - Signing and Verification
 - Export and Import of Plaintext keys
 - Export and Import of Wrapped keys generated by PSA.
 - ECDH Support
- RSA
 - Plain-Text Key Generation for RSA-2048. (Unavailable on SCE9 and RSIP7)
 - Wrapped Key Generation for RSA-2048. RSA-3072 on RSIP7 only.
 - Signature Generation for RSA-2048. RSA-3072 on RSIP7 only.
 - Verification for RSA-2048. RSA-3072 and 4096 on SCE9 and RSIP7 only.
 - Encryption and Decryption with PKCS1V15 and OAEP padding
 - Export and Import of Plaintext keys
 - Export and Import of Wrapped keys generated by PSA.
- Random number generation
- Persistent Key Storage

Configuration

Build Time Configurations for mbedCrypto

The following build time configurations are defined in arm/mbedtls/config.h:

| Configuration | Options | Default | Description |
|------------------------------------|----------------------|---------|--|
| Hardware Acceleration | | | |
| Hardware Acceleration > Key Format | | | |
| AES | MCU Specific Options | | Select AES key formats used |
| ECC | MCU Specific Options | | Select ECC key formats used |
| RSA | MCU Specific Options | | Select RSA key formats used |
| Hardware Acceleration > Hash | | | |
| SHA256/224 | MCU Specific Options | | Defines MBEDTLS_SHA256_ALT and MBEDTLS_SHA256_PROCESS_ALT. |

| | | | |
|--|----------------------|---------|--|
| SHA512/384 | MCU Specific Options | | Defines MBEDTLS_SHA512_ALT and MBEDTLS_SHA512_PROCESS_ALT. |
| Hardware Acceleration > Cipher | | | |
| AES | MCU Specific Options | | Defines MBEDTLS_AES_ALT, MBEDTLS_AES_SETKEY_ENC_ALT, MBEDTLS_AES_SETKEY_DEC_ALT, MBEDTLS_AES_ENCRYPT_ALT and MBEDTLS_AES_DECRYPT_ALT |
| Hardware Acceleration > Public Key Cryptography (PKC) | | | |
| Hardware Acceleration > Public Key Cryptography (PKC) > RSA 3072 | | | |
| RSA 3072 > Key Generation | MCU Specific Options | | Enables RSA 3072 Key Generation. |
| RSA 3072 > Signing | MCU Specific Options | | Enables RSA 3072 Key Signing. |
| RSA 3072 > Verification | MCU Specific Options | | Enables RSA 3072 Verify. |
| Hardware Acceleration > Public Key Cryptography (PKC) > RSA 4096 | | | |
| RSA 4096 > Verification | MCU Specific Options | | Enables RSA 4096 Verify. |
| ECC | MCU Specific Options | | Defines MBEDTLS_ECP_ALT |
| ECDSA | MCU Specific Options | | Defines MBEDTLS_ECDSA_SIGN_ALT and MBEDTLS_ECDSA_VERIFY_ALT |
| ECDH | MCU Specific Options | | Defines MBEDTLS_ECDH_ALT |
| RSA | MCU Specific Options | | Defines MBEDTLS_RSA_ALT. RSA 2048 Key Generation, Signing and Verification are also enabled. |
| TRNG | Enabled | Enabled | Defines MBEDTLS_ENTROPY_HARDWARE_ALT. |
| Crypto Engine Initialization | Enabled | Enabled | MBEDTLS_PLATFORM_SETUP_TEAR_DOWN_ALT |
| Platform | | | |
| Platform > Alternate | | | |

SHA256 Configuration

To enable hardware acceleration for the SHA256/224 calculation, the macro `MBEDTLS_SHA256_ALT` and `MBEDTLS_SHA256_PROCESS_ALT` must be defined in the configuration file. By default SHA256 is enabled. SHA256 can be disabled, but SHA512 then needs to be enabled (software version) because the PSA implementation uses it for the entropy accumulator. This can be done using the RA Configuration editor.

AES Configuration

To enable hardware acceleration for the AES128/256 operation, the macro `MBEDTLS_AES_SETKEY_ENC_ALT`, `MBEDTLS_AES_SETKEY_DEC_ALT`, `MBEDTLS_AES_ENCRYPT_ALT` and `MBEDTLS_AES_DECRYPT_ALT` must be defined in the configuration file. By default AES is enabled. AES cannot be disabled because the PSA implementation requires it for the `CTR_DRBG` random number generator. This can be done using the RA Configuration editor.

Note

Only AES XTS 128 is currently supported. RA2 devices support acceleration for ECB part alone, while other devices support full AES XTS hardware acceleration.

ECC Configuration

To enable hardware acceleration for the ECC Key Generation operation, the macro `MBEDTLS_ECP_ALT` must be defined in the configuration file. For ECDSA, the macros `MBEDTLS_ECDSA_SIGN_ALT` and `MBEDTLS_ECDSA_VERIFY_ALT` must be defined. By default ECC, ECDSA and ECDHE are enabled. To disable ECC, undefine `MBEDTLS_ECP_C`, `MBEDTLS_ECDSA_C` and `MBEDTLS_ECDH_C`. This can be done using the RA Configuration editor.

RSA Configuration

To enable hardware acceleration for the RSA2048 operation, the macro `MBEDTLS_RSA_ALT` must be defined in the configuration file. By default RSA is enabled. To disable RSA, undefine `MBEDTLS_RSA_C`, `MBEDTLS_PK_C`, `MBEDTLS_PK_PARSE_C`, `MBEDTLS_PK_WRITE_C`. This can be done using the RA Configuration editor.

Wrapped Key Usage

To use the Secure Crypto Engine to generate and use wrapped keys, use `PSA_KEY_TYPE_AES_WRAPPED` or `PSA_KEY_TYPE_ECC_KEY_PAIR_WRAPPED(curve)` or `PSA_KEY_TYPE_RSA_KEY_PAIR` when setting the key type attribute. Setting the key's type attribute using this value will cause the SCE to use wrapped key mode for all operations related to that key. The user can use the export functionality to save the wrapped keys to user ROM and import it later.

for usage. This mode requires that Wrapped Key functionality for the algorithm is enabled in the project configuration.

Note

On the SCE9 devices, only the RSA public key can be exported. A file system must be used to store the internally generated private key.

Persistent Key Storage

Persistent key storage can be enabled by defining `MBEDTLS_FS_IO`, `MBEDTLS_PSA_CRYPTOSTORAGE_C`, and `MBEDTLS_PSA_ITS_FILE_C`. The key lifetime must also be specified as `PSA_KEY_LIFETIME_PERSISTENT`. A lower level storage module must be added in the RA Configuration editor and initialized in the code before generating persistent keys. Persistent storage supports the use of plaintext and vendor keys. Refer to the lower level storage module documentation for information on how it should be initialized. To generate a persistent key the key must be assigned a unique id prior to calling generate using the `psa_set_key_id` api.

```
if (PSA_KEY_LIFETIME_IS_PERSISTENT(lifetime))
{
/* Set the id to a positive integer. */
    psa_set_key_id(&attributes, (psa_key_id_t) 5);
}
```

Platform Configuration

To run the mbedCrypto implementation of the PSA Crypto API on the MCU, the macro `MBEDTLS_PLATFORM_SETUP_TEAR_DOWN_ALT` must be defined in the configuration file. This enables code that will initialize the SCE. Parameter checking (`General|MBEDTLS_CHECK_PARAMS`) is enabled by default. To reduce code size, disable parameter checking.

Random Number Configuration

To run the mbedCrypto implementation of the PSA Crypto API on the MCU, the macro `MBEDTLS_ENTROPY_HARDWARE_ALT` must be defined in the configuration file. This enables using the TRNG as an entropy source. None of the other cryptographic operations (even in software only mode) will work without this feature.

Usage Notes

Hardware Initialization

`mbedtls_platform_setup()` must be invoked before using the PSA Crypto API to ensure that the SCE peripheral is initialized.

Memory Usage

In general, depending on the mbedCrypto features being used a heap size of 0x1000 to 0x5000 bytes is required. The total allocated heap should be the **sum** of the heap requirements of the individual algorithms:

| Algorithm | Required Heap (bytes) |
|--------------|-----------------------|
| SHA256/224 | None |
| AES | 0x200 |
| Hardware ECC | 0x400 |
| Software ECC | 0x1800 |
| RSA | 0x1500 |

A minimum stack of 0x1000 is required where the module is used. This is either the main stack in a bare metal application or the task stack of the task used for crypto operations.

Limitations

- Only little endian mode is supported.

Stdio Buffering

The MBEDTLS_PLATFORM_SETBUF_MACRO was introduced in mbedTLS 3.2.1 to prevent stdio read/write functions from buffering stream data to reduce the likelihood of key leakage by setting the buffer argument in setbuf() to NULL. FSP uses a dummy_setbuf() function in rm_psa_crypto.c to prevent build errors; since FSP uses LittleFS by default (where the usage of a buffer is mandatory) this function does not perform any action. Setting the cache size in LittleFS to the minimum supported by the Data Flash (4) can minimize but not remove the likelihood of key data leakage. The dummy function can be replaced with a user-defined function by defining a different value for MBEDTLS_PLATFORM_SETBUF_MACRO_value in the FSP configurator.

SCE9 Usage

The SCE9 is used in Compatibility Mode for mbedCrypto acceleration. The crypto capabilities in this mode on the SCE9 are different which results in the below usage limitations with mbedCrypto:

- The module includes **both** wrapped and plaintext keys code irrespective of whether the application requires it.
- Plaintext key generation is not supported for RSA and ECC; only wrapped keys can be generated.
- If ECDH is used, only wrapped key will be generated on SCE9 and will not return an error even if the user context is somehow set for plain key. This may be relevant only if the psa_key_agreement() function with plaintext key on SCE9 is attempted.

Note

For a detailed description of the different SCE9 operating modes, refer to Application Note R11AN0498.

Using PSA Crypto with TrustZone

Unlike FSP drivers, PSA Crypto cannot be configured as Non-secure callable in the RA Configurator for a secure project. The reason for this is that in order to achieve the security objective of controlling access to protected keys, both the PSA Crypto code as well as the keys must be placed in the secure region. Since the PSA Crypto API requires access to the keys directly during initialization and later via a key handle, allowing non-secure code to use the API by making it Non-secure callable will require the keys to be stored in non-secure memory.

This section will provide a short explanation of how to add PSA Crypto to a secure project and have it usable by the non-secure project without exposing the keys. In this example the secure project will

contain an RSA private key and the non-secure project is expected to be able to perform sign and verify operations using that key.

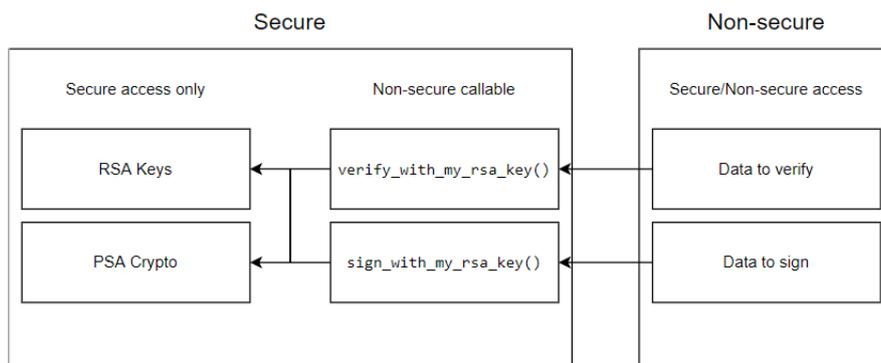

Figure 287: PSA Crypto Non-secure callable example

- Secure project
 - During secure project boot-up, `psa_crypto_init()` is called.
 - The RSA private key is programmed into secure flash either at the factory or by calling `psa_generate_key()` in persistent mode. Note that the data-flash area used by the LittleFS will have to be in the secure region if the key is generated as a persistent.
 - `psa_import_key()/psa_open_key()` are called with the resultant handle held in secure RAM.
 - The Non-secure callable section contains the following **user-defined** functions
 - `verify_with_my_rsa_key(input_signature, input_hash, verification_result)`
 - The implementation of this function in secure region will call `psa_verify_hash()` and return the result via `verification_result`.
 - `sign_with_my_rsa_key(input_hash, output_signature)`
 - The implementation of this function in secure region will call `psa_sign_hash()` and return the signature via `output_signature`.

- Non-secure project
 - Calls `verify_with_my_rsa_key()` to verify a signature. The implementation will use the public key that is present in the secure project.
 - Calls `sign_with_my_rsa_key()` to generate a signature. The implementation will use the private key that is present on the secure project.

For more details on how to add user-code to the Non-secure callable region refer to the "Security Design with Arm TrustZone - IP Protection (R11AN0467EU0100)" Application Note.

Examples

Hash Example

This is an example on calculating the SHA256 hash using the PSA Crypto API.

```
const uint8_t NIST_SHA256ShortMsgLen200[] =
```

```
{
    0x2e, 0x7e, 0xa8, 0x4d, 0xa4, 0xbc, 0x4d, 0x7c, 0xfb, 0x46, 0x3e, 0x3f, 0x2c,
0x86, 0x47, 0x05,
    0x7a, 0xff, 0xf3, 0xfb, 0xec, 0xec, 0xa1, 0xd2, 00
};
const uint8_t NIST_SHA256ShortMsgLen200_expected[] =
{
    0x76, 0xe3, 0xac, 0xbc, 0x71, 0x88, 0x36, 0xf2, 0xdf, 0x8a, 0xd2, 0xd0, 0xd2,
0xd7, 0x6f, 0x0c,
    0xfa, 0x5f, 0xea, 0x09, 0x86, 0xbe, 0x91, 0x8f, 0x10, 0xbc, 0xee, 0x73, 0x0d,
0xf4, 0x41, 0xb9
};
void psa_crypto_sha256_example (void)
{
    psa_algorithm_t      alg                = PSA_ALG_SHA_256;
    psa_hash_operation_t operation         = {0};
    size_t               expected_hash_len = PSA_HASH_LENGTH(alg);
    uint8_t              actual_hash[PSA_HASH_MAX_SIZE];
    size_t               actual_hash_len;
    mbedtls_platform_context ctx = {0};
    /* Setup the platform; initialize the SCE and the TRNG */
    if (PSA_SUCCESS != mbedtls_platform_setup(&ctx))
    {
        /* Platform initialization failed */
        debugger_break();
    }
    else if (PSA_SUCCESS != psa_hash_setup(&operation, alg))
    {
        /* Hash setup failed */
        debugger_break();
    }
    else if (PSA_SUCCESS != psa_hash_update(&operation, NIST_SHA256ShortMsgLen200,
sizeof(NIST_SHA256ShortMsgLen200)))
    {
```

```
/* Hash calculation failed */
    debugger_break();
}
else if (PSA_SUCCESS != psa_hash_finish(&operation, &actual_hash[0], sizeof
(actual_hash), &actual_hash_len))
{
/* Reading calculated hash failed */
    debugger_break();
}
else if (0 != memcmp(&actual_hash[0], &NIST_SHA256ShortMsgLen200_expected[0],
actual_hash_len))
{
/* Hash compare of calculated value with expected value failed */
    debugger_break();
}
else if (0 != memcmp(&expected_hash_len, &actual_hash_len, sizeof
(expected_hash_len)))
{
/* Hash size compare of calculated value with expected value failed */
    debugger_break();
}
else
{
/* SHA256 calculation succeeded */
    debugger_break();
}

/* De-initialize the platform. This is currently a placeholder function which does
not do anything. */
mbedtls_platform_teardown(&ctx);
}
```

AES Example

This is an example on using the PSA Crypto API to generate an AES256 key, encrypting and decrypting multi-block data and using PKCS7 padding.

```
static psa_status_t cipher_operation (psa_cipher_operation_t * operation,
    const uint8_t      * input,
    size_t             input_size,
    size_t             part_size,
                                uint8_t      * output,
    size_t             output_size,
    size_t             * output_len)
{
    psa_status_t status;
    size_t      bytes_to_write = 0;
    size_t      bytes_written = 0;

    if (PSA_SUCCESS != psa_mac_verify_setup(&verify_operation, key_handle, alg))
    {
        /* MAC verification setup failure */
        debugger_break();
    }
    else if (PSA_SUCCESS != psa_mac_update(&verify_operation, input, input_size))
    {
        /* MAC update failure */
        debugger_break();
    }
    else if (PSA_SUCCESS != psa_mac_verify_finish(&verify_operation, AES_CMAC_mac,
mac_ret))
    {
        /* MAC verification failed */
        debugger_break();
    }
    else
    {
        /* All the operations succeeded for MAC verification */
    }
}
```

ECC Example

This is an example on using the PSA Crypto API to generate an ECC-P256R1 key, signing and verifying data after hashing it first using SHA256.

Note

Unlike RSA, ECDSA does not have any padding schemes. Thus the hash argument for the ECC sign operation MUST have a size larger than or equal to the curve size; i.e. for PSA_ECC_CURVE_SECP256R1 the payload size must be at least 256/8 bytes. nist.fips.186-4: "A hash function that provides a lower security strength than the security strength associated with the bit length of 'n' ordinarily should not be used, since this would reduce the security strength of the digital signature process to a level no greater than that provided by the hash function."

```
#define ECC_256_BIT_LENGTH 256
#define ECC_256_EXPORTED_SIZE 500
uint8_t exportedECC_SECP256R1Key[ECC_256_EXPORTED_SIZE];
size_t exportedECC_SECP256R1Keylength = 0;
void psa_ecc256r1_example (void)
{
/* This example generates an ECC-P256R1 keypair, performs signing and verification
operations.
* It then exports the generated key into ASN1 DER format to a RAM array which can
then be programmed to flash.
* It then re-imports that key, and performs signing and verification operations. */
