

Renesas Flexible Software Package (FSP) v5.2.0

User's Manual

Renesas RA Family

All information contained in these materials, including products and product specifications, represents information on the product at the time of publication and is subject to change by Renesas Electronics Corp. without notice. Please review the latest information published by Renesas Electronics Corp. through various means, including the Renesas Electronics Corp. website (<http://www.renesas.com>).

Table of Contents

| | |
|--|----|
| Chapter 1 Introduction | 12 |
| 1.1 Overview | 12 |
| 1.2 Using this Manual | 12 |
| 1.3 Documentation Standard | 12 |
| 1.4 Introduction to FSP | 12 |
| 1.4.1 Purpose | 13 |
| 1.4.2 Quality | 13 |
| 1.4.3 Ease of Use | 13 |
| 1.4.4 Scalability | 13 |
| 1.4.5 Build Time Configurations | 13 |
| 1.4.6 e ² studio IDE | 13 |
| Chapter 2 Reference Materials | 14 |
| 2.1 Using Registers Directly | 14 |
| 2.1.1 Overview | 14 |
| 2.1.2 What's in an | 14 |
| 2.1.3 Where are iodefines files located? | 14 |
| 2.1.4 Using the register definitions | 14 |
| 2.1.5 Tips for writing hardware drivers | 16 |
| 2.2 FSP v4.0.0 FreeRTOS Stack Migration Guide | 17 |
| 2.2.1 Overview | 17 |
| 2.2.2 Stack Migration Steps | 17 |
| 2.2.3 List of Code Change Highlights | 19 |
| Chapter 3 Starting Development | 20 |
| 3.1 Starting Development Introduction | 20 |
| 3.2 e ² studio User Guide | 21 |
| 3.2.1 What is e ² studio? | 21 |
| 3.2.2 e ² studio Prerequisites | 23 |
| 3.2.2.1 Obtaining an RA MCU Kit | 23 |
| 3.2.2.2 PC Requirements | 23 |
| 3.2.2.3 Installing e ² studio, platform installer and the FSP package | 23 |
| 3.2.2.4 Choosing a Toolchain | 23 |
| 3.2.2.5 Licensing | 24 |
| 3.2.3 What is a Project? | 24 |
| 3.2.4 Creating a Project | 26 |
| 3.2.4.1 Creating a New Project | 26 |
| 3.2.4.2 Selecting a Board and Toolchain | 27 |
| 3.2.4.3 Selecting Flat or Arm TrustZone Project | 28 |
| 3.2.4.4 Selecting a Project Template | 29 |
| 3.2.5 Configuring a Project | 32 |
| 3.2.5.1 Summary Tab | 32 |
| 3.2.5.2 Configuring the BSP | 33 |
| 3.2.5.3 Configuring Clocks | 34 |
| 3.2.5.4 Configuring Pins | 35 |
| 3.2.5.5 Configuring Interrupts from the Stacks Tab | 37 |
| 3.2.5.6 Viewing Event Links | 40 |
| 3.2.6 Adding Threads and Drivers | 40 |
| 3.2.6.1 Adding and Configuring HAL Drivers | 41 |
| 3.2.6.2 Adding Drivers to a Thread and Configuring the Drivers | 43 |
| 3.2.6.3 Configuring Threads | 47 |
| 3.2.7 Reviewing and Adding Components | 48 |
| 3.2.8 Writing the Application | 49 |

| | |
|---|-----------|
| 3.2.8.1 Coding Features | 49 |
| 3.2.8.2 HAL Modules in FSP: A Practical Description | 55 |
| 3.2.8.3 RTOS-Independent Applications | 56 |
| 3.2.8.4 RTOS Applications | 57 |
| 3.2.8.5 Additional Resources for Application Development | 59 |
| 3.2.9 Debugging the Project | 60 |
| 3.2.10 Modifying Toolchain Settings | 60 |
| 3.2.11 Creating RA project with Arm Compiler 6 in e ² studio | 62 |
| 3.2.12 Importing an Existing Project into e ² studio | 65 |
| 3.2.13 Using Semihosting in a Project | 69 |
| 3.3 Tutorial: Your First RA MCU Project - Blinky | 70 |
| 3.3.1 Tutorial Blinky | 70 |
| 3.3.2 What Does Blinky Do? | 70 |
| 3.3.3 Prerequisites | 70 |
| 3.3.4 Create a New Project for Blinky | 70 |
| 3.3.4.1 Details about the Blinky Configuration | 73 |
| 3.3.4.2 Configuring the Blinky Clocks | 74 |
| 3.3.4.3 Configuring the Blinky Pins | 74 |
| 3.3.4.4 Configuring the Parameters for Blinky Components | 74 |
| 3.3.4.5 Where is main()? | 74 |
| 3.3.4.6 Blinky Example Code | 74 |
| 3.3.5 Build the Blinky Project | 74 |
| 3.3.6 Debug the Blinky Project | 75 |
| 3.3.6.1 Debug prerequisites | 75 |
| 3.3.6.2 Debug steps | 76 |
| 3.3.6.3 Details about the Debug Process | 77 |
| 3.3.7 Run the Blinky Project | 78 |
| 3.4 Tutorial: Using HAL Drivers - Programming the WDT | 78 |
| 3.4.1 Application WDT | 78 |
| 3.4.2 Creating a WDT Application Using the RA MCU FSP and e ² studio | 78 |
| 3.4.2.1 Using FSP and e ² studio | 78 |
| 3.4.2.2 The WDT Application | 78 |
| 3.4.2.3 WDT Application flow | 79 |
| 3.4.3 Creating the Project with e ² studio | 79 |
| 3.4.4 Configuring the Project with e ² studio | 83 |
| 3.4.4.1 BSP Tab | 84 |
| 3.4.4.2 Clocks Tab | 84 |
| 3.4.4.3 Interrupts Tab | 85 |
| 3.4.4.4 Event Links Tab | 85 |
| 3.4.4.5 Pins Tab | 85 |
| 3.4.4.6 Stacks Tab | 85 |
| 3.4.4.7 Components Tab | 88 |
| 3.4.5 WDT Generated Project Files | 89 |
| 3.4.5.1 WDT hal_data.h | 91 |
| 3.4.5.2 WDT hal_data.c | 92 |
| 3.4.5.3 WDT main.c | 93 |
| 3.4.5.4 WDT hal_entry.c | 93 |
| 3.4.6 Building and Testing the Project | 96 |
| 3.5 Primer: Arm TrustZone Project Development | 97 |
| 3.5.1 Target Device | 98 |
| 3.5.2 Renesas Implementation of Arm TrustZone Technology | 98 |
| 3.5.2.1 Calling from Non-Secure to Secure | 99 |
| 3.5.2.2 Calling from Secure to Non-Secure | 99 |
| 3.5.3 Workflow | 100 |
| 3.5.3.1 Secure Project | 100 |

| | |
|--|-----|
| 3.5.3.2 Non-Secure Project | 100 |
| 3.5.3.3 Flat Project | 100 |
| 3.5.4 RA Project Generator (PG) | 101 |
| 3.5.4.1 Secure Project Set Up | 102 |
| 3.5.4.2 RTOS Support in TrustZone Project | 103 |
| 3.5.4.3 Peripheral Security Attribution | 104 |
| 3.5.4.4 Non-Secure | 105 |
| 3.5.4.5 Flat Project Type | 105 |
| 3.5.4.6 Secure Connection to Non-Secure Project | 105 |
| 3.5.4.7 Debug Configurations | 106 |
| 3.5.5 Secure Projects | 107 |
| 3.5.5.1 Secure Clock | 107 |
| 3.5.5.2 Setting Drivers as NSC | 107 |
| 3.5.5.3 Guard Functions | 108 |
| 3.5.6 Non-Secure projects | 109 |
| 3.5.6.1 Clock Set Up | 109 |
| 3.5.6.2 Selecting NSC Drivers | 109 |
| 3.5.6.3 Locked Resources | 110 |
| 3.5.6.4 Locked Channels | 110 |
| 3.5.7 IDAU registers | 110 |
| 3.5.7.1 SCI Boot Mode | 112 |
| 3.5.7.2 DLM States | 113 |
| 3.5.7.3 Devices with Alternate DLM States | 114 |
| 3.5.7.4 Devices without DLM | 116 |
| 3.5.8 Debug | 116 |
| 3.5.8.1 Non-Secure Debug | 116 |
| 3.5.9 Debugger support | 117 |
| 3.5.10 Third-Party IDEs | 118 |
| 3.5.11 Renesas Flash Programmer (RFP) | 118 |
| 3.5.12 Glossary | 119 |
| 3.5.12.1 Configurator Icon Glossary | 120 |
| 3.6 RASC User Guide for MDK and IAR | 120 |
| 3.6.1 What is RASC? | 120 |
| 3.6.2 Using RA Smart Configurator with Keil MDK | 120 |
| 3.6.2.1 Prerequisites | 120 |
| 3.6.2.2 Create new RA project | 121 |
| 3.6.2.3 Modify existing RA project | 122 |
| 3.6.2.4 Build and Debug RA project | 123 |
| 3.6.2.5 Notes and Restrictions | 124 |
| 3.6.3 Using RA Smart Configurator with IAR EWARM | 124 |
| 3.6.3.1 Prerequisites | 124 |
| 3.6.3.2 Create new RA project | 124 |
| 3.6.3.3 Notes and Restrictions | 126 |
| Chapter 4 FSP Architecture | 127 |
| 4.1 FSP Architecture Overview | 127 |
| 4.1.1 C99 Use | 127 |
| 4.1.2 Doxygen | 127 |
| 4.1.3 Weak Symbols | 127 |
| 4.1.4 Memory Allocation | 127 |
| 4.1.5 FSP Terms | 127 |
| 4.2 FSP Modules | 129 |
| 4.2.1 Module Sources | 130 |
| 4.2.2 Module Distribution | 130 |
| 4.2.3 Module Versioning | 130 |

| | |
|--|-----|
| 4.3 FSP Stacks | 130 |
| 4.4 FSP Interfaces | 131 |
| 4.4.1 FSP Interface Enumerations | 132 |
| 4.4.2 FSP Interface Callback Functions | 132 |
| 4.4.3 FSP Interface Data Structures | 134 |
| 4.4.3.1 FSP Interface Configuration Structure | 134 |
| 4.4.3.2 FSP Interface API Structure | 135 |
| 4.4.3.3 FSP Interface Instance Structure | 137 |
| 4.5 FSP Instances | 138 |
| 4.5.1 FSP Instance Control Structure | 138 |
| 4.5.2 FSP Interface Extensions | 139 |
| 4.5.2.1 FSP Extended Configuration Structure | 139 |
| 4.5.3 FSP Instance API | 139 |
| 4.6 FSP API Standards | 139 |
| 4.6.1 FSP Function Names | 139 |
| 4.6.2 Use of const in API parameters | 140 |
| 4.6.3 FSP Version Information | 140 |
| 4.7 FSP Build Time Configurations | 140 |
| 4.8 FSP File Structure | 141 |
| 4.9 FSP TrustZone Support | 141 |
| 4.9.1 FSP TrustZone Projects | 141 |
| 4.9.2 Non-Secure Callable Guard Functions | 141 |
| 4.9.3 Callbacks in Non-Secure from Non-Secure Callable Modules | 142 |
| 4.9.4 Migrating TrustZone Project to newer FSP Version | 142 |
| 4.9.5 Additional TrustZone Information | 142 |
| 4.10 FSP Architecture in Practice | 142 |
| 4.10.1 FSP Connecting Layers | 142 |
| 4.10.2 Using FSP Modules in an Application | 143 |
| 4.10.2.1 Create a Module Instance in the RA Configuration Editor | 143 |
| 4.10.2.2 Use the Instance API in the Application | 143 |
| Chapter 5 API Reference | 145 |
| 5.1 BSP | 146 |
| 5.1.1 BSP I/O access | 148 |
| 5.1.2 Common Error Codes | 162 |
| 5.1.3 MCU Board Support Package | 173 |
| 5.1.3.1 RA0E1 | 212 |
| 5.1.3.2 RA2A1 | 216 |
| 5.1.3.3 RA2A2 | 222 |
| 5.1.3.4 RA2E1 | 228 |
| 5.1.3.5 RA2E2 | 234 |
| 5.1.3.6 RA2E3 | 239 |
| 5.1.3.7 RA2L1 | 245 |
| 5.1.3.8 RA4E1 | 253 |
| 5.1.3.9 RA4E2 | 261 |
| 5.1.3.10 RA4M1 | 269 |
| 5.1.3.11 RA4M2 | 275 |
| 5.1.3.12 RA4M3 | 283 |
| 5.1.3.13 RA4T1 | 292 |
| 5.1.3.14 RA4W1 | 300 |
| 5.1.3.15 RA6E1 | 305 |
| 5.1.3.16 RA6E2 | 315 |
| 5.1.3.17 RA6M1 | 323 |
| 5.1.3.18 RA6M2 | 329 |
| 5.1.3.19 RA6M3 | 335 |
| 5.1.3.20 RA6M4 | 341 |

| | |
|---|------------|
| 5.1.3.21 RA6M5 | 350 |
| 5.1.3.22 RA6T1 | 359 |
| 5.1.3.23 RA6T2 | 365 |
| 5.1.3.24 RA6T3 | 374 |
| 5.1.3.25 RA8D1 | 382 |
| 5.1.3.26 RA8M1 | 394 |
| 5.1.3.27 RA8T1 | 406 |
| 5.2 Modules | 418 |
| 5.2.1 Analog | 421 |
| 5.2.1.1 ADC (r_adc) | 422 |
| 5.2.1.2 ADC (r_adc_b) | 457 |
| 5.2.1.3 ADC (r_adc_d) | 496 |
| 5.2.1.4 Comparator, High-Speed (r_acmphs) | 516 |
| 5.2.1.5 Comparator, Low-Power (r_acmplp) | 523 |
| 5.2.1.6 DAC (r_dac) | 531 |
| 5.2.1.7 DAC8 (r_dac8) | 537 |
| 5.2.1.8 Operational Amplifier (r_opamp) | 543 |
| 5.2.1.9 SDADC Channel Configuration (r_sdadc) | 561 |
| 5.2.1.10 SDADC_B Channel Configuration (r_sdadc_b) | 583 |
| 5.2.2 AI | 600 |
| 5.2.2.1 Reality AI Data Collector (rm_rai_data_collector) | 601 |
| 5.2.2.2 Reality AI Data Shipper (rm_rai_data_shipper) | 611 |
| 5.2.3 Audio | 616 |
| 5.2.3.1 ADPCM Decoder (rm_adpcm_decoder) | 616 |
| 5.2.3.2 Audio Playback PWM (rm_audio_playback_pwm) | 620 |
| 5.2.4 Bootloader | 632 |
| 5.2.4.1 MCUboot Port (rm_mcuboot_port) | 632 |
| 5.2.5 CapTouch | 651 |
| 5.2.5.1 CTSU (r_ctsu) | 652 |
| 5.2.5.2 Touch (rm_touch) | 690 |
| 5.2.6 Connectivity | 711 |
| 5.2.6.1 Azure RTOS USBX Port (rm_usbx_port) | 715 |
| 5.2.6.2 CAN (r_can) | 813 |
| 5.2.6.3 CAN FD (r_canfd) | 851 |
| 5.2.6.4 CEC (r_cec) | 887 |
| 5.2.6.5 I2C Communication Device (rm_comms_i2c) | 898 |
| 5.2.6.6 I2C Master (r_iic_b_master) | 906 |
| 5.2.6.7 I2C Master (r_iic_master) | 919 |
| 5.2.6.8 I2C Master (r_sau_i2c) | 932 |
| 5.2.6.9 I2C Master (r_sci_b_i2c) | 948 |
| 5.2.6.10 I2C Master (r_sci_i2c) | 961 |
| 5.2.6.11 I2C Slave (r_iic_b_slave) | 973 |
| 5.2.6.12 I2C Slave (r_iic_slave) | 985 |
| 5.2.6.13 I2S (r_ssi) | 996 |
| 5.2.6.14 I3C (r_i3c) | 1012 |
| 5.2.6.15 LIN (r_sci_b_lin) | 1052 |
| 5.2.6.16 SMCI (r_sci_smci) | 1083 |
| 5.2.6.17 SPI (r_sau_spi) | 1096 |
| 5.2.6.18 SPI (r_sci_b_spi) | 1109 |
| 5.2.6.19 SPI (r_sci_spi) | 1120 |
| 5.2.6.20 SPI (r_spi) | 1132 |
| 5.2.6.21 SPI (r_spi_b) | 1150 |
| 5.2.6.22 UART (r_sau_uart) | 1167 |
| 5.2.6.23 UART (r_sci_b_uart) | 1182 |
| 5.2.6.24 UART (r_sci_uart) | 1201 |

| | |
|---|------|
| 5.2.6.25 UART (r_uarta) | 1221 |
| 5.2.6.26 UART Communication Device (rm_comms_uart) | 1235 |
| 5.2.6.27 USB (r_usb_basic) | 1242 |
| 5.2.6.28 USB Composite (r_usb_composite) | 1303 |
| 5.2.6.29 USB HCDC (r_usb_hcdc) | 1333 |
| 5.2.6.30 USB HHID (r_usb_hhid) | 1382 |
| 5.2.6.31 USB HMSC (r_usb_hmsc) | 1392 |
| 5.2.6.32 USB Host Vendor class (r_usb_hvnd) | 1402 |
| 5.2.6.33 USB PCDC (r_usb_pcdc) | 1415 |
| 5.2.6.34 USB PHID (r_usb_phid) | 1425 |
| 5.2.6.35 USB PMSC (r_usb_pmsc) | 1436 |
| 5.2.6.36 USB PPRN (r_usb_pprn) | 1442 |
| 5.2.6.37 USB Peripheral Vendor class (r_usb_pvnd) | 1450 |
| 5.2.7 DSP | 1461 |
| 5.2.7.1 CMSIS DSP H/W Acceleration (rm_cmsis_dsp) | 1461 |
| 5.2.7.2 IIR Filter Accelerator (r_iirfa) | 1463 |
| 5.2.8 Graphics | 1471 |
| 5.2.8.1 Azure RTOS GUIX Port (rm_guix_port) | 1472 |
| 5.2.8.2 Capture Engine Unit (r_ceu) | 1480 |
| 5.2.8.3 D/AVE 2D Port Interface (r_drw) | 1493 |
| 5.2.8.4 Graphics LCD (r_glcdc) | 1495 |
| 5.2.8.5 JPEG Codec (r_jpeg) | 1536 |
| 5.2.8.6 MIPI Display Serial Interface (r_mipi_dsi) | 1563 |
| 5.2.8.7 Parallel Data Capture (r_pdc) | 1582 |
| 5.2.8.8 SEGGER emWin RA Port (rm_emwin_port) | 1593 |
| 5.2.8.9 Segment LCD (r_slcdc) | 1601 |
| 5.2.9 Input | 1610 |
| 5.2.9.1 External IRQ (r_icu) | 1610 |
| 5.2.9.2 Key Matrix (r_kint) | 1617 |
| 5.2.10 Monitoring | 1621 |
| 5.2.10.1 CRC (r_crc) | 1622 |
| 5.2.10.2 Clock Accuracy Circuit (r_cac) | 1628 |
| 5.2.10.3 Data Operation Circuit (r_doc) | 1634 |
| 5.2.10.4 Independent Watchdog (r_iwdt) | 1640 |
| 5.2.10.5 Low/Programmable Voltage Detection (r_lvd) | 1650 |
| 5.2.10.6 Watchdog (r_wdt) | 1655 |
| 5.2.11 Motor | 1666 |
| 5.2.11.1 120-degree conduction control sensorless (rm_motor_120_control_sensorless) | 1668 |
| 5.2.11.2 120-degree conduction control with Hall sensors (rm_motor_120_control_hall) | 1686 |
| 5.2.11.3 ADC and PWM Modulation (rm_motor_driver) | 1701 |
| 5.2.11.4 ADC and PWM modulation (rm_motor_120_driver) | 1711 |
| 5.2.11.5 Motor 120 degree control (rm_motor_120_degree) | 1726 |
| 5.2.11.6 Motor Angle (rm_motor_estimate) | 1747 |
| 5.2.11.7 Motor Angle (rm_motor_sense_encoder) | 1757 |
| 5.2.11.8 Motor Angle and Speed Calculation with Hall sensors (rm_motor_sense_hall) | 1768 |
| 5.2.11.9 Motor Angle and Speed Calculation with induction sensor (rm_motor_sense_induction) | 1779 |
| 5.2.11.10 Motor Current Controller (rm_motor_current) | 1791 |
| 5.2.11.11 Motor Encoder Vector Control (rm_motor_encoder) | 1802 |
| 5.2.11.12 Motor Inertia estimate (rm_motor_inertia_estimate) | 1824 |
| 5.2.11.13 Motor Position Controller (rm_motor_position) | 1834 |
| 5.2.11.14 Motor Sensorless Vector Control (rm_motor_sensorless) | 1845 |
| 5.2.11.15 Motor Speed Controller (rm_motor_speed) | 1863 |
| 5.2.11.16 Motor Vector Control with hall sensors (rm_motor_hall) | 1875 |
| 5.2.11.17 Motor return origin (rm_motor_return_origin) | 1892 |
| 5.2.11.18 Motor vector control with induction sensor (rm_motor_induction) | 1901 |

Chapter 1 Introduction

1.1 Overview

This manual describes how to use the Renesas Flexible Software Package (FSP) for writing applications for the RA microcontroller series.

1.2 Using this Manual

This manual provides a wide variety of information, so it can be helpful to know where to start. Here is a short description of each main section and how they can be used.

Starting Development - Provides a step by step guide on how to use e² studio and FSP to develop a project for RA MCUs. This is a good place to start to get up to speed quickly and efficiently.

FSP Architecture - Provides useful background material on key FSP concepts such as Modules, Stacks, and API standards. Reference this section to extend or refresh your knowledge of FSP concepts.

API Reference - Provides detailed information on each module and interface including features, API functions, configuration settings, usage notes, function prototypes and code examples. Board Support Package (BSP) related API functions are also included.

Note

Much of the information in the API Reference section is available from within the e² studio tool via the [Developer Assistance](#) feature. The information here can be referenced for additional details on API features.

1.3 Documentation Standard

Each **Modules** section user guide outlines the following:

- **Features:** A bullet list of high level features provided by the module.
- **Configuration:** A description of module specific configurations available in the RA Configuration editor.
- **Usage Notes:** Module specific documentation and limitations.
- **Examples:** Example code provided to help the user get started.
- **API Reference:** Usage notes for each API in the module, including the function prototype and hyperlinks to the interface documentation for parameter definitions.

Each **Interfaces** section user guide outlines the following:

- **Detailed Description:** A short description and summary of the interface functionality.
- **Data Structures:** A list and definition of each data structure used by the interface including the structure of the pointers that define the API and are shared by all modules that implement the interface.
- **Typedefs:** A list and description of the typedefs used by the interface.
- **Enumerations:** A list and description of the enumerations used by the interface.

1.4 Introduction to FSP

1.4.1 Purpose

The Renesas Flexible Software Package (FSP) is an optimized software package designed to provide easy to use, scalable, high quality software for embedded system design. The primary goal is to provide lightweight, efficient drivers that meet common use cases in embedded systems.

1.4.2 Quality

FSP code quality is enforced by peer reviews, automated requirements-based testing, and automated static analysis.

1.4.3 Ease of Use

FSP provides uniform and intuitive APIs that are well documented. Each module is supported with detailed user documentation including example code.

1.4.4 Scalability

FSP modules can be used on any MCU in the RA family, provided the MCU has any peripherals required by the module.

1.4.5 Build Time Configurations

FSP modules also have build time configurations that can be used to optimize the size of the module for the feature set required by the application.

1.4.6 e² studio IDE

FSP provides a host of efficiency enhancing tools for developing projects targeting the Renesas RA series of MCU devices. The e² studio IDE provides a familiar development cockpit from which the key steps of project creation, module selection and configuration, code development, code generation, and debugging are all managed.

Chapter 2 Reference Materials

This section contains miscellaneous reference materials.

| Document | Summary |
|---|--|
| Using Registers Directly | Overview of register definition files and their use. |
| FSP v4.0.0 FreeRTOS Stack Migration Guide | Migration guide for FreeRTOS Network stack users moving to FSP v4.0.0. |

2.1 Using Registers Directly

2.1.1 Overview

In some cases users may wish to utilize chip functionality that is not supported yet by FSP. While we encourage contacting us when new feature requests arise it takes time before any updates are made. In the meantime, it is recommended to use the register definition files accessed via `renesas.h` to add custom functionality as needed. Official ARM CMSIS documentation refers to this format of related register definition files as [device header files](#). Within Renesas, these files are often referred to as an **IO define** or more commonly **iodefine**.

2.1.2 What's in an "iodefine"?

Iodefine files contain definitions for all the I/O registers on a device. For RA FSP, one iodefine header is provided per device group (RA6M3, RA2A1 etc.) that contains all the register definitions provided in the hardware manual for that group. These headers are accessed via `renesas.h`, which selects the appropriate file based on the MCU configured in the project.

Note

Prior to FSP 4.0.0 `renesas.h` contained a superset of all register definitions for RA MCUs. This became unsustainable as new device families were added and was confusing for users, so headers for each device were created and `renesas.h` was updated to serve as a selector.

2.1.3 Where are iodefine files located?

In RA FSP, iodefine files are stored in `ra/bsp/src/bsp/cmsis/Device/RENESAS/Include`. This includes both `renesas.h` as well as the device group specific iodefine headers.

2.1.4 Using the register definitions

Each peripheral register set is provided as a struct. In general, the template to follow is:

```
R_ + peripheral abbreviation + channel number + -> + register name [ + _b. + bitfield name ]
```

Basic register access

Registers are most commonly accessed whole. For example, say we want to read the counter on GPT channel 3:

```
uint32_t count = R_GPT3->GTCNT;
```

As shown in the template, the iodefines can also be used to access bitfields. For example, to start GPT channel 3:

```
R_GPT3->GTCR_b.CST = 1;
```

Bitfield macros

It is worth noting that each bitfield access will cause a full read-modify-write which cannot be combined by the compiler because the register definitions are by necessity volatile. This can be very size and speed inefficient, particularly when the peripheral is on a very slow clock. It is recommended to write whole registers wherever possible. This is made easier by macros that are provided alongside the register definitions.

Every bitfield has two associated macros: `_Msk` (bitfield mask) and `_Pos` (bit position). These macros can be used to manipulate whole registers instead of using bitfield access when multiple bitfields are modified simultaneously. For example, setting both GPT3 output pins to 100% duty cycle:

```
uint32_t gtuddtyc = R_GPT3->GTUDDTYC
gtuddtyc          &= ~(R_GPT0_GTUDDTYC_OADTY_Msk |
R_GPT0_GTUDDTYC_OBDTY_MSK)          // Mask off bits to clear
gtuddtyc          |= (3 << R_GPT0_GTUDDTYC_OADTY_Pos) | (3 <<
R_GPT0_GTUDDTYC_OBDTY_Pos); // Shift values to bitfield positions
R_GPT3->GTUDDTYC = gtuddtyc;
```

Note

The macros are all named with channel 0 due to internal process requirements; they can be used with all channels.

Arrays and clusters

Some registers are part of an array. These are typically listed in the manual using indexes like "n" or "m", but may occasionally be listed with individual numbers or letters. Accessing register arrays is just like accessing a regular array. For example, the GPT duty cycle registers are GTCCRA through

GTCCRF. In the iodefinition, they are accessed via the GTCCR array:

```
/* Set GTCCRB */  
R_GPT3->GTCCR[1] = duty_cycle_b;
```

Note

Not all indices may be available in every array. Be sure to check the hardware manual to verify which registers are provided on the device in use.

Sometimes there are groups of registers that are repeated multiple times. These groups are called a **cluster**. Clusters are accessed similarly to arrays, except the actual registers are elements of the array values instead. For example, mailboxes in the CAN peripheral have several registers each:

```
/* Get data from mailbox 3 */  
uint32_t mailbox = 3;  
/* Get the frame data length code */  
uint32_t data_length = R_CAN0->MB[mailbox].DL_b.DLC;  
/* Get message data */  
uint8_t data[8];  
for (uint32_t i = 0U; i < data_length; i++)  
{  
    data[i] = p_reg->MB[mailbox].D[i]; // Copy receive data to buffer  
}
```

2.1.5 Tips for writing hardware drivers

Channel register access

FSP drivers often calculate a register offset in the Open function. This is typically done by multiplying the channel by the offset between channels 0 and 1. For example, here is the calculation for GPT:

```
/* Save register base address. */  
uint32_t base_address = (uint32_t) R_GPT0 + (p_cfg->channel * ((uint32_t) R_GPT1 -  
(uint32_t) R_GPT0));  
p_instance_ctrl->p_reg = (R_GPT0_Type *) base_address;
```

When drivers need to support multiple channels of a peripheral it can be helpful to save the offset in a persistent variable or structure so that it only needs to be calculated once.

2.2 FSP v4.0.0 FreeRTOS Stack Migration Guide

Note

This guide only applies to users converting e² studio projects created with FSP v3.8.0 or earlier. Migration is only possible for network stacks using CoreMQTT and CoreHTTP modules. Stacks using deprecated MQTT Client and HTTP Client modules will not be able to be migrated over to FSP v4.0.0 and up. See the following guide for migrating code from the deprecated Client libraries: https://aws.github.io/aws-iot-device-sdk-embedded-C/202103.00/docs/doxygen/output/html/mqtt_migration.html

2.2.1 Overview

This migration guide is for moving to the new FreeRTOS Network stacks introduced in FSP v4.0.0. It will describe steps for moving over stacks as well as changes to make code compile correctly.

2.2.2 Stack Migration Steps

Note

Perform all of the following steps before attempting to save the project. Failure to do so may cause unexpected errors in the configuration.xml.

1. Open project to be migrated in e² studio using FSP v4.0.0 or greater. The existing CoreMQTT/HTTP stack should still exist. Many of the stack components will have No Longer Supported in the display and have permanent constraint error messages on them:

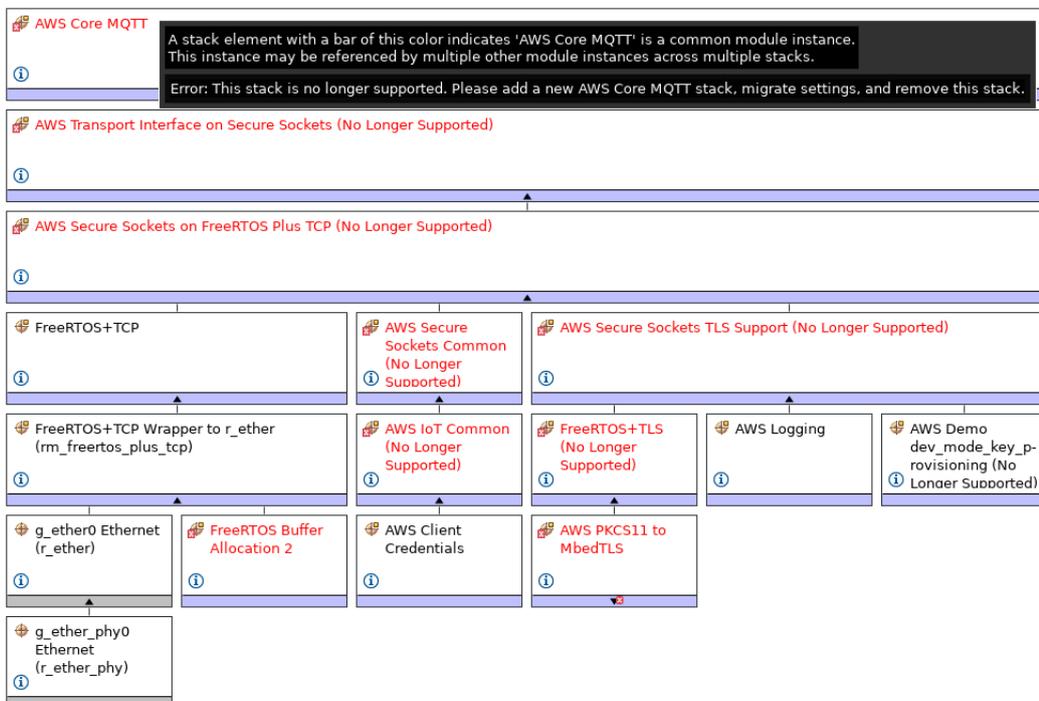

Figure 1: Old MQTT Stack

2. Add a new network stack (New Stack->Networking->AWS CoreHTTP or AWS CoreMQTT):

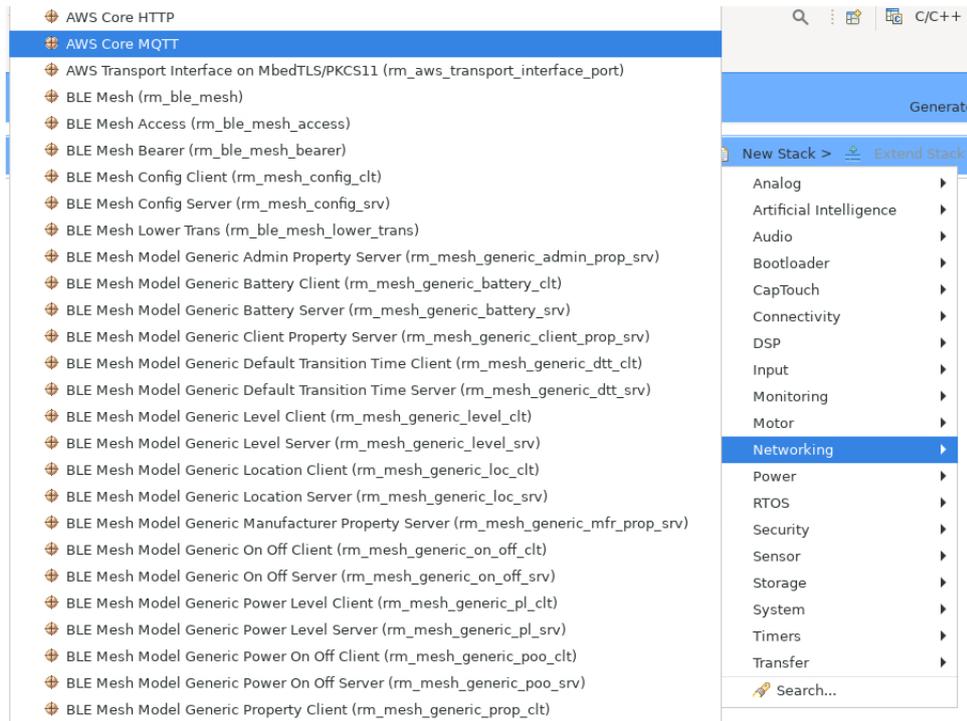

Figure 2: Add a New MQTT Stack

3. Choose a sockets wrapper for the new stack (Add Sockets Wrapper).

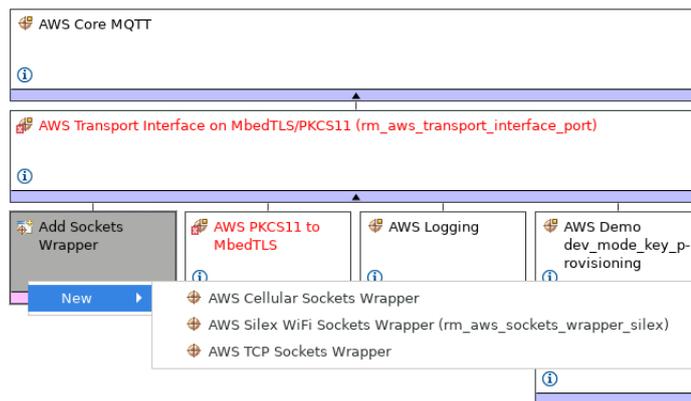

Figure 3: Add a Sockets Wrapper

4. The submodule for AWS PKCS11 to MbedTLS will likely be missing. Click Add FreeRTOS MbedTLS Port and use the existing instance:

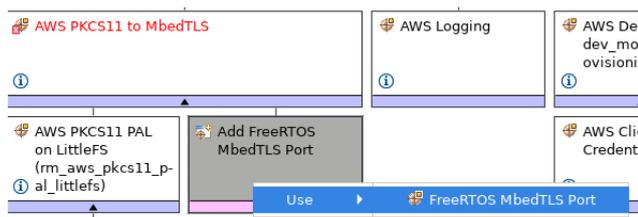

Figure 4: FreeRTOS MbedTLS Port

- Got to the components tab and see if AWS MbedTLS FreeRTOS Port (AWS|Abstractions|FreeRTOS_Plus|utilities|mbedtls) is checked. If this component is not checked then check it so that appears like so:

Figure 5: FreeRTOS MbedTLS Port Component

- Check that settings/properties are correct on the new stack. Common stack elements between the old and new stacks should already have previous settings.
- Remove the old stack.
- Save project and generate project content. See the next section for things to change in the code for successful compilation.

2.2.3 List of Code Change Highlights

This is a list of important changes from pre-4.0 code. For more detailed examples see CoreMQTT/HTTP examples and devassist.

- Any calls to `SYSTEM_Init()` should be removed. `mbedtls_platform_setup()` now does initialization that this IoT library function originally did.
- `xLoggingTaskInitialize` should no longer be called. Logging libraries which create a logging task no longer exist. Logging by default uses `printf` when enabled. The user can redefine `vLoggingPrintf(const char * pcFormat, ...)` and `vLoggingPrint(const char * pcFormat)` to change this behavior.
- The transport interface for CoreMQTT/HTTP will now need to be setup directly by creating a transport interface and setting the send and receive pointers to `TLS_FreeRTOS_rcv` and `TLS_FreeRTOS_send`. See the examples and devassist for more info.
- The user will need to call `TLS_FreeRTOS_Connect` to connect to a server/endpoint before using CoreMQTT/HTTP APIs to communicate. `TLS_FreeRTOS_Disconnect` can be used to disconnect from a server/endpoint.

Chapter 3 Starting Development

3.1 Starting Development Introduction

The wealth of resources available to learn about and use e² studio and FSP can be overwhelming on first inspection, so this section provides a Starting Development Guide with a list of the most important initial steps. Following these highly recommended first 11 steps will bring you up to speed on the development environment in record time. Even experienced developers can benefit from the use of this guide, to learn the terminology that might be unfamiliar or different from previous environments.

1. Read the section [What is e² studio?](#), up to but not including [e² studio Prerequisites](#). This will provide a description of the various windows and views to use e² studio to create a project, add modules and threads, configure module properties, add code, and debug a project. It also describes how to use key coding 'accelerators' like Developer Assist (to drag and drop parameter populated API function calls right into your code), a context aware Autocomplete (to easily find and select from suggested enumerations, functions, types, and many other coding elements), and many other similar productivity enhancers.
2. Read the [FSP Architecture](#), [FSP Modules](#) and [FSP Stacks](#) sections. These provide the basic background on how FSP modules and stacks are used to construct your application. Understanding their definitions and the theory behind how they combine will make it easier to develop with FSP.
3. Read a few [Modules](#) sections to see how to use API function calls, structures, enumerations, types and callbacks. These module guides provide the information you will use to implement your project code.
4. After you have a Kit and you have downloaded and installed e² studio and FSP, you can build and debug a simple project to test your installation, tool flow, and the kit. (If you do not have a Kit or have not yet installed the development software, use the links included in the [e² studio Prerequisites](#) for more information.) The simple [Tutorial: Your First RA MCU Project - Blinky](#) will Blink an LED on and off. Follow the instructions for importing and running this project in section [Create a New Project for Blinky](#). It will use some of the key steps for managing projects within e² studio and is a good way to learn the basics.
5. Once you have successfully run Blinky you have a good starting point for using FSP for more complex projects. The Using HAL Drivers Tutorial, available at [Tutorial: Using HAL Drivers - Programming the WDT](#), shows how to create a project from scratch, using FSP API functions. Do this next.
6. Several Hands-on Quick FSP Labs are available that cover key development topics with short 15-minute Do it Yourself (DIY) activities targeting the EK-RA6M3. Topics covered include code development accelerators like Developer Assistance, Autocomplete, Help, Visual Expressions and using Example Projects. The complete list of available Quick FSP Labs can be found here: <https://en-support.renesas.com/knowledgeBase/category/31087/subcategory/31090>. Doing a couple of these labs provides further details on using FSP, and is also good practice. Running these labs is highly recommended.
7. The balance of the [FSP Architecture](#) sections (that is, those not called out in step 2 above) contain additional reference material that may be helpful in the future. Scan them so you know what they contain, in case you need them.
8. The balance of the e² studio User Guide, starting with the [What is a Project?](#) section up to, but not including, [Writing the Application](#) section, provides a detailed description of each of

the key steps, windows, and entries used to create, manage, configure, build and debug a project. Much of this may be familiar after running through the tutorials and Quick Labs. However, it is important to have a good grasp of what each of the configuration tabs are used for as that is where the bulk of the project preparation work takes place prior to writing code. Skim over this section as it may help with any questions in the future.

9. Read the [Writing the Application](#) section to get a short introduction to the steps used when creating application code with FSP. It covers both RTOS-independent and RTOS-dependent applications. It also includes a short description for several of the code accelerators you should be familiar with by now. Using additional Quick FSP Labs is a good way to become familiar with the application development process and links to them are included in the appropriate places in this section. You can find the complete list of available Quick FSP Labs here: <https://en-support.renesas.com/knowledgeBase/19308277>.
10. Scan the [Debugging the Project](#) section to see the steps required to download and start a debug session.
11. Explore the additional material available on the following web pages and bookmark the resources that look most valuable to you:
 - a. RA Landing Page: <https://www.renesas.com/ra>
 - b. FSP Landing Page: <https://www.renesas.com/fsp>
 - c. Example Projects on GitHub: <https://github.com/renesas/ra-fsp-examples>

3.2 e² studio User Guide

3.2.1 What is e² studio?

Renesas e² studio is a development tool encompassing code development, build, and debug. e² studio is based on the open-source Eclipse IDE and the associated C/C++ Development Tooling (CDT).

When developing for RA MCUs, e² studio hosts the Renesas Flexible Software Package (FSP). FSP provides a wide range of time saving tools to simplify the selection, configuration, and management of modules and threads, to easily implement complex applications. The time saving tools available in e² studio and FSP include the following:

- A Graphical User Interface (GUI) (see [Adding Threads and Drivers](#)) with numerous wizards for configuring and auto-generating code
- A context sensitive Autocomplete (see [Tutorial: Using HAL Drivers - Programming the WDT](#)) feature that provides intelligent options for completing a programming element
- A [Developer Assistance](#) tool for selection of and drag and drop placement of API functions directly in application code
- A [Welcome Window](#) with links to example projects, application notes and a variety of other self-help support resources
- An [Information Icon](#) from each module is provided in the graphic configuration viewer that links to specific design resources, including code 'cheat sheets' that provide useful starting points for common application implementations.

Figure 6: e² studio Splash Screen

e² studio organizes project work based on Perspectives, Views, Windows, Panes, and Pages (sometimes called Tabs). A window is a section of the e² studio GUI that presents information on a key topic. Windows often use tabs to select sub-topics. For example, an editor window might have a tab available for each open file, so it is easy to switch back and forth between them. A window Pane is a section of a window. Within a window, multiple Panes can be opened and viewed simultaneously, as opposed to a tabbed window, where only individual content is displayed. A memory-display Window, for example, might have multiple Panes that allow the data to be displayed in different formats, simultaneously. A Perspective is a collection of Views and Windows typical for a specific stage of development. The default perspectives are a C/C++ Perspective, an FSP Configuration Perspective and a Debug Perspective. These provide specific Views, Windows, Tabs, and Panes tailored for the common tasks needed during the specific development stage.

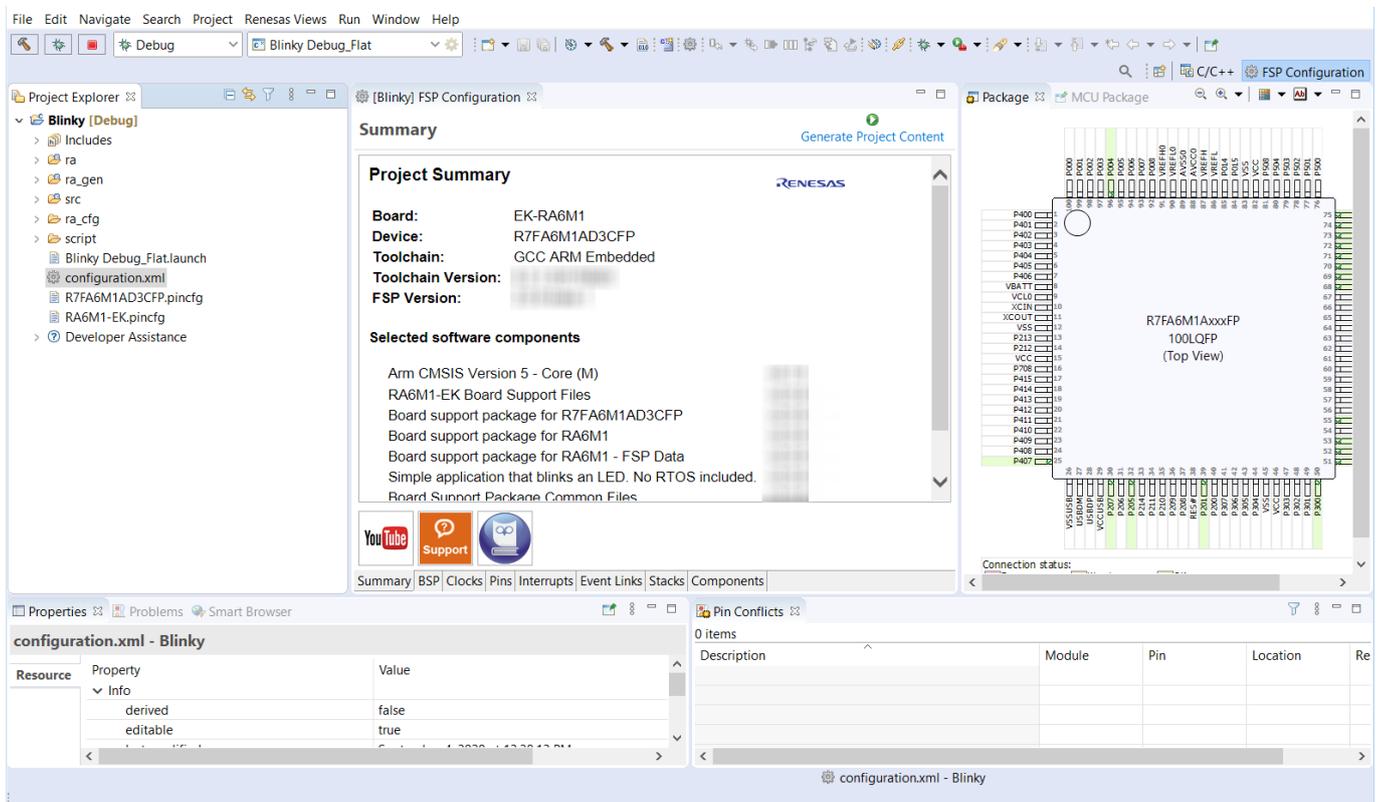

Figure 7: Default Perspective

In addition to managing project development, selecting modules, configuring them and simplifying code development, e² studio also hosts the engine for automatically generating code based on module selections and configurations. The engine continually checks for dependencies and automatically adds any needed lower level modules to the module stack. It also identifies any lower level modules that require configuration (for example, an interrupt that needs to have a priority assigned). It also provides a guide for selecting between multiple choices or options to make it easy to complete a fully functional module stack.

The Generate Project Content function takes the selected and configured modules and automatically generates the complete and correct configuration code. The code is added to the folders visible in the **Project Explorer** window in e² studio. The configuration.xml file in the project folder holds all the generated configuration settings. This file can be opened in the GUI-based RA Configuration editor to make further edits and changes. Once a project has been generated, you can go back and reconfigure any of the modules and settings if required using this editor.

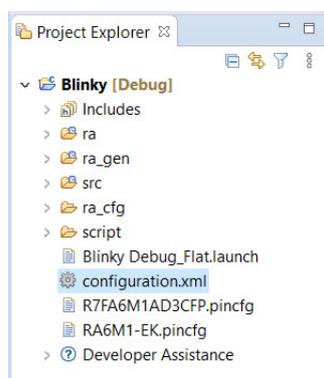

Figure 8: Project Explorer Window showing generated folders and configuration.xml file

3.2.2 e² studio Prerequisites

3.2.2.1 Obtaining an RA MCU Kit

To develop applications with FSP, start with one of the Renesas RA MCU Evaluation Kits. The Renesas RA MCU Evaluation Kits are designed to seamlessly integrate with e² studio.

Ordering information, Quick Start Guides, User Manuals, and other related documents for all RA MCU Evaluation Kits are available at <https://www.renesas.com/ra>.

3.2.2.2 PC Requirements

The following are the minimum PC requirements to use e² studio:

- Windows 10 with Intel i5 or i7, or AMD A10-7850K or FX
- Memory: 8-GB DDR3 or DDR4 DRAM (16-GB DDR4/2400-MHz RAM is preferred)
- Minimum 250-GB hard disk

3.2.2.3 Installing e² studio, platform installer and the FSP package

Detailed installation instructions for e² studio and FSP are available on the Renesas website <https://www.renesas.com/fsp>. Review the release notes for e² studio to ensure that the e² studio version supports the selected FSP version. The starting version of the installer includes all features of the RA MCUs.

3.2.2.4 Choosing a Toolchain

e² studio can work with several toolchains and toolchain versions such as the GNU Arm compiler, Arm AC6, and LLVM Embedded Toolchain for Arm. Versions of the GNU Arm and LLVM compilers verified for use with FSP are included in the e² studio installer.

3.2.2.5 Licensing

FSP licensing includes full source code, limited to Renesas hardware only.

3.2.3 What is a Project?

In e² studio, all FSP applications are organized in RA MCU projects. Setting up an RA MCU project involves:

1. Creating a Project
2. Configuring a Project

These steps are described in detail in the next two sections. When you have existing projects already, after you launch e² studio and select a workspace, all projects previously saved in the selected workspace are loaded and displayed in the **Project Explorer** window. Each project has an associated configuration file named `configuration.xml`, which is located in the project's root directory.

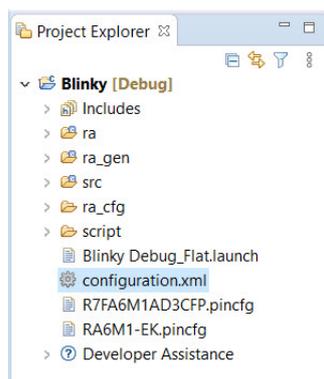

Figure 9: e² studio Project Configuration file

Double-click on the `configuration.xml` file to open the RA MCU Project Editor. To edit the project configuration, make sure that the **FSP Configuration** perspective is selected in the upper right hand corner of the e² studio window. Once selected, you can use the editor to view or modify the configuration settings associated with this project.

Figure 10: e² studio FSP Configuration Perspective

Note

Whenever the RA project configuration (that is, the `configuration.xml` file) is saved, a verbose RA Project Report file (`ra_cfg.txt`) with all the project settings is generated. The format allows differences to be easily viewed using a text comparison tool. The generated file is located in the project root directory.

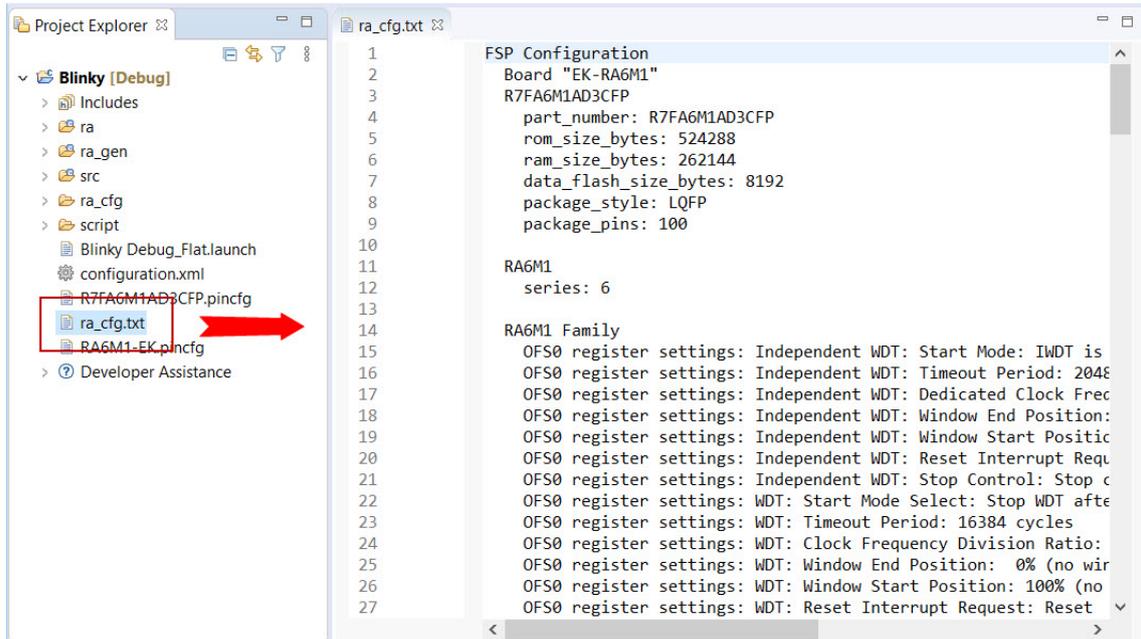

Figure 11: RA Project Report

The RA Project Editor has a number of tabs. The configuration steps and options for individual tabs are discussed in the following sections.

Note

The tabs available in the RA Project Editor depend on the e² studio version and the layout may vary slightly, however the functionality should be easy to follow..

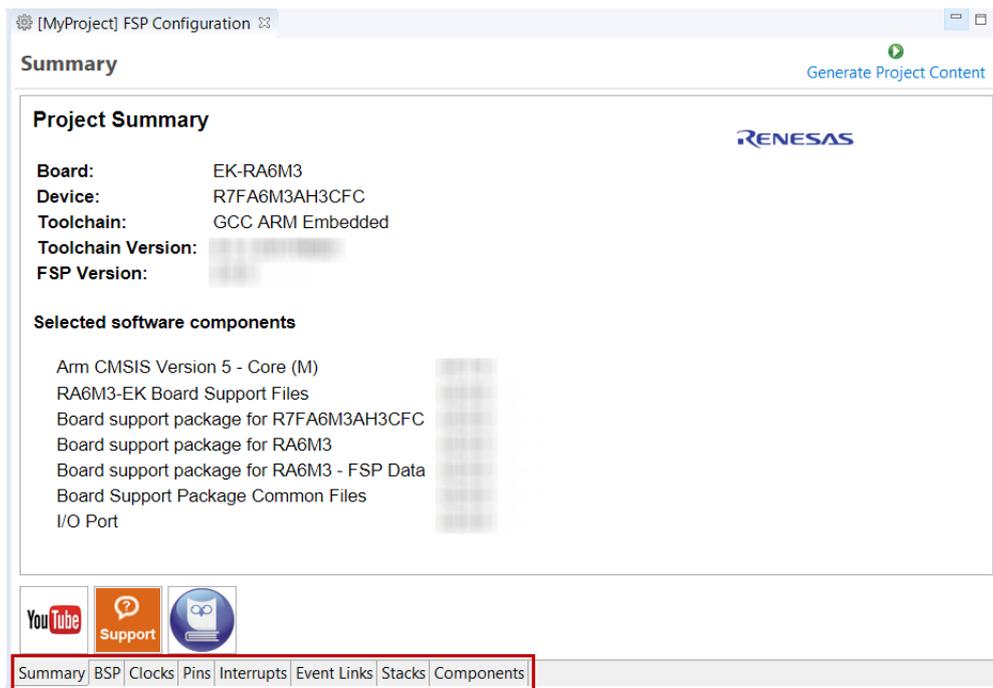

Figure 12: RA Project Editor tabs

- Click on the YouTube icon to visit the Renesas FSP playlist on YouTube
- Click on the Support icon to visit RA support pages at Renesas.com
- Click on the user manual (owl) icon to open the RA software package User's Manual

3.2.4 Creating a Project

During project creation, you specify the type of project, give it a project name and location, and configure the project settings for version, target board, whether an RTOS is included, the toolchain version, and the beginning template. This section includes easy-to-follow step-by-step instructions for all of the project creation tasks. Once you have created the project, you can move to configuring the project hardware (clocks, pins, interrupts) and the parameters of all the modules that are part of your application.

3.2.4.1 Creating a New Project

For RA MCU applications, generate a new project using the following steps:

1. Click on **File > New > RA C/C++ Project > Renesas RA**.

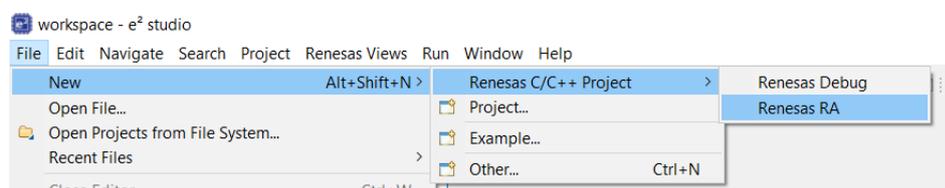

Figure 13: New RA MCU Project

Then click on the type of template for the type of project you are creating.

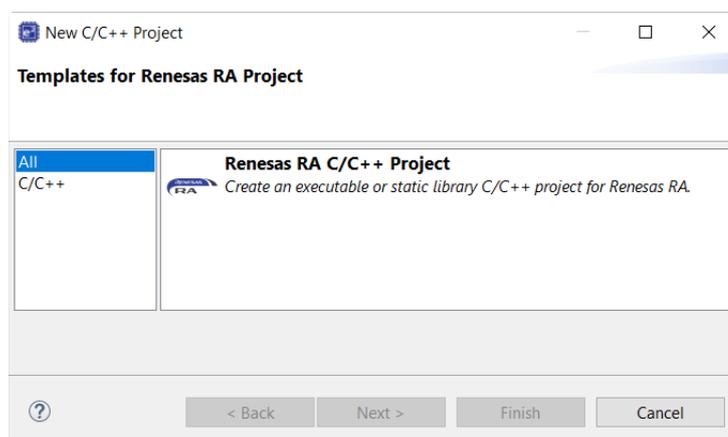

Figure 14: New Project Templates

2. Select a project name and location.

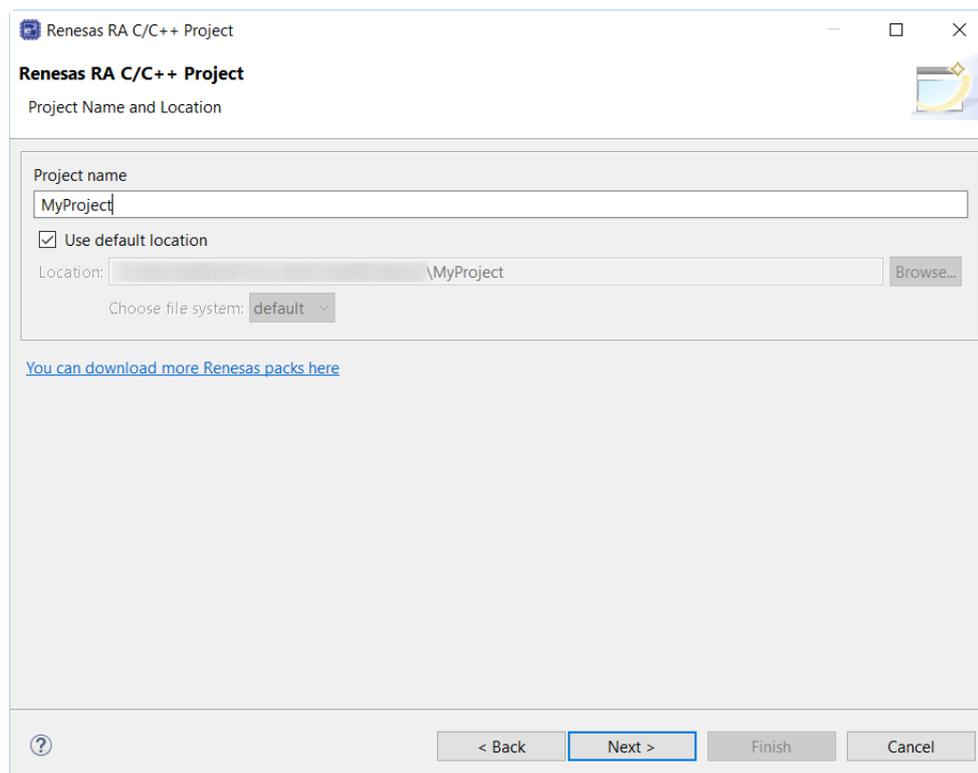

Figure 15: RA MCU Project Generator (Screen 1)

3. Click **Next**.

3.2.4.2 Selecting a Board and Toolchain

In the **Project Configuration** window select the hardware and software environment:

1. Select the **FSP version**.
2. Select the **Board** for your application. You can select an existing RA MCU Evaluation Kit or select **Custom User Board** for any of the RA MCU devices with your own BSP definition.
3. Select the **Device**. The **Device** is automatically populated based on the **Board** selection. Only change the **Device** when using the **Custom User Board (Any Device)** board selection.
4. To add threads, select **RTOS**, or **No RTOS** if an RTOS is not being used.
5. The **Toolchain** selection defaults to **GCC Arm Embedded**.
6. Select the **Toolchain version**. This should default to the installed toolchain version.
7. Select the **Debugger**. The J-Link Arm Debugger is preselected.

8. Click **Next**.

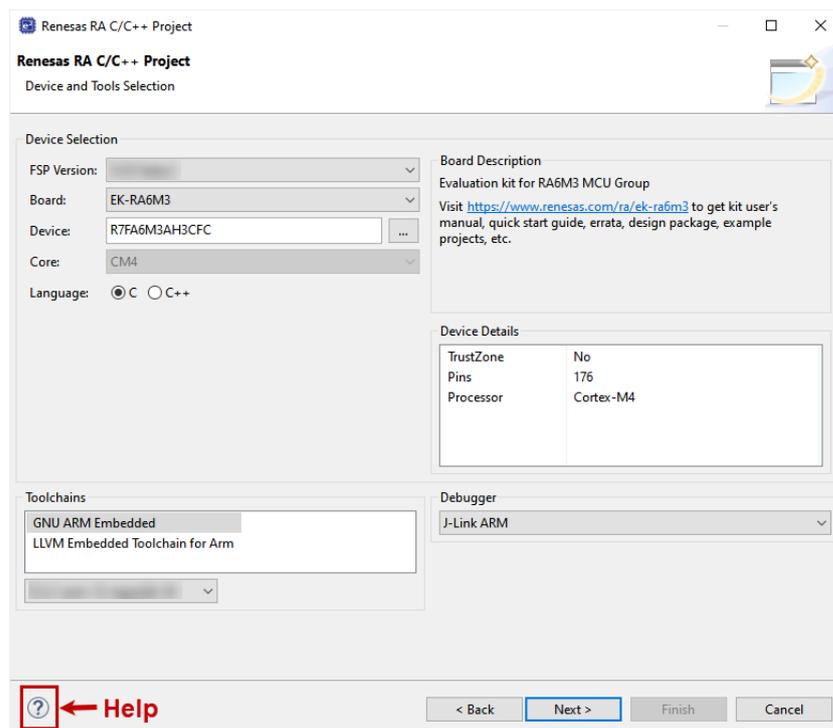

Figure 16: RA MCU Project Generator (Screen 2)

Note

Click on the **Help** icon (?) for user guides, RA contents, and other documents.

3.2.4.3 Selecting Flat or Arm TrustZone Project

If you selected a device or tool based on an Arm® Cortex®-M33, you next select whether to use Arm® TrustZone® technology in your project. For normal, non-TrustZone projects, select "Flat".

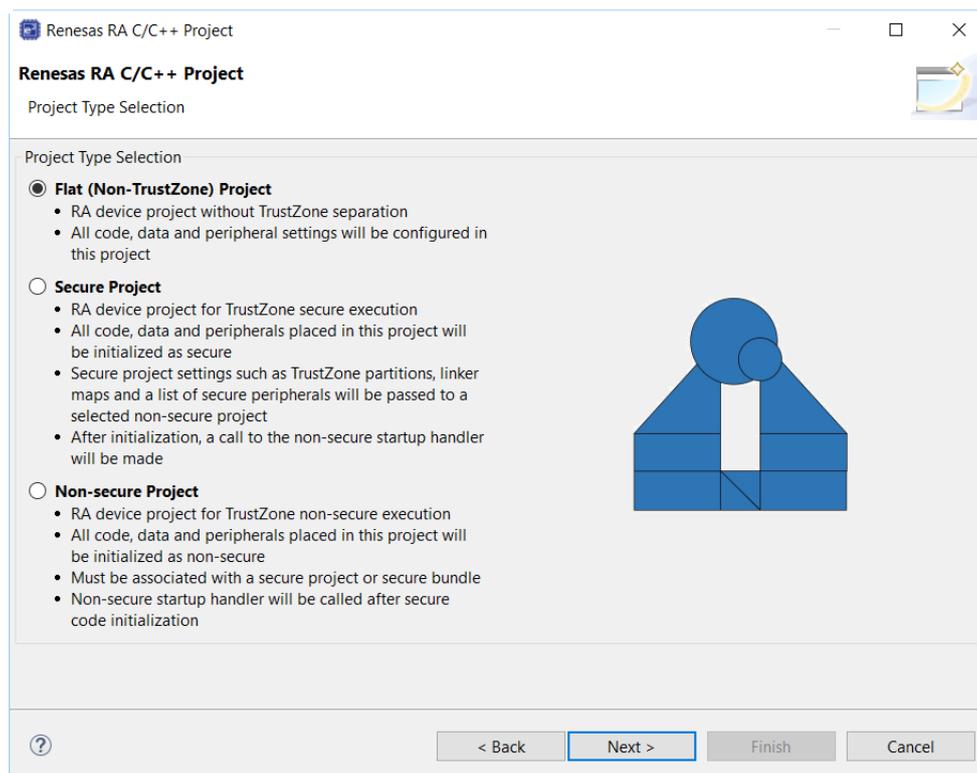

Figure 17: Flat, Secure, or Non-Secure Project

For more information on Arm TrustZone technology, see [Primer: Arm TrustZone Project Development](#).

3.2.4.4 Selecting a Project Template

In the next window, select the build artifact and RTOS.

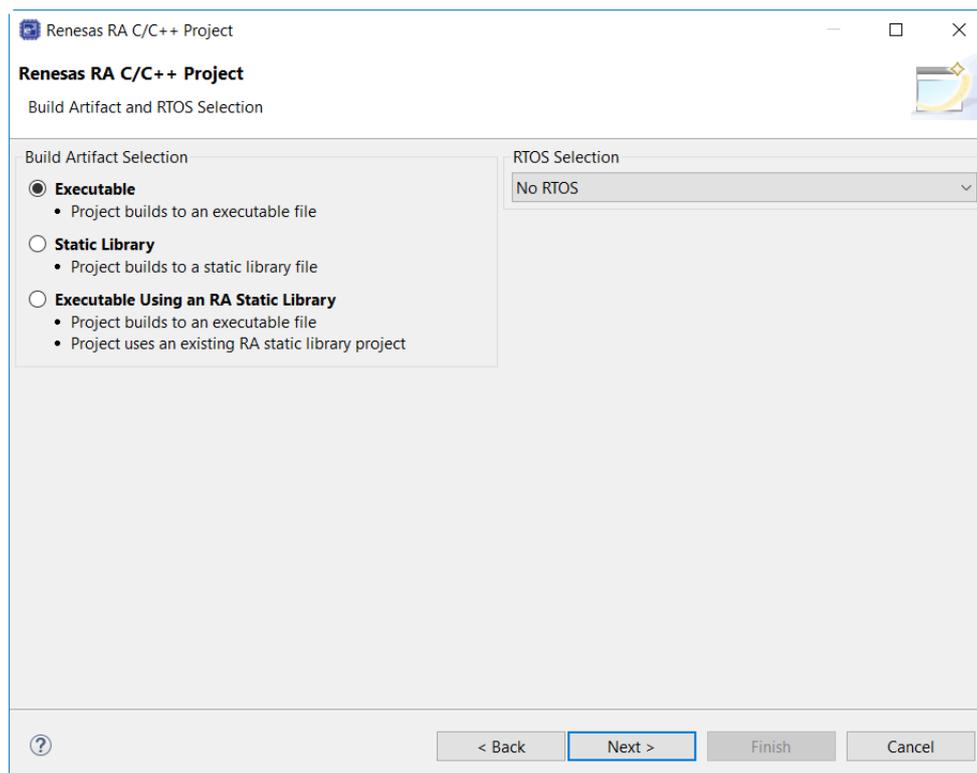

Figure 18: RA MCU Project Generator (Screen 3)

In the next window, select a project template from the list of available templates. By default, this screen shows the templates that are included in your current RA MCU pack. Once you have selected the appropriate template, click **Finish**.

Note

*If you want to develop your own application, select the basic template for your board, **Bare Metal - Minimal**.*

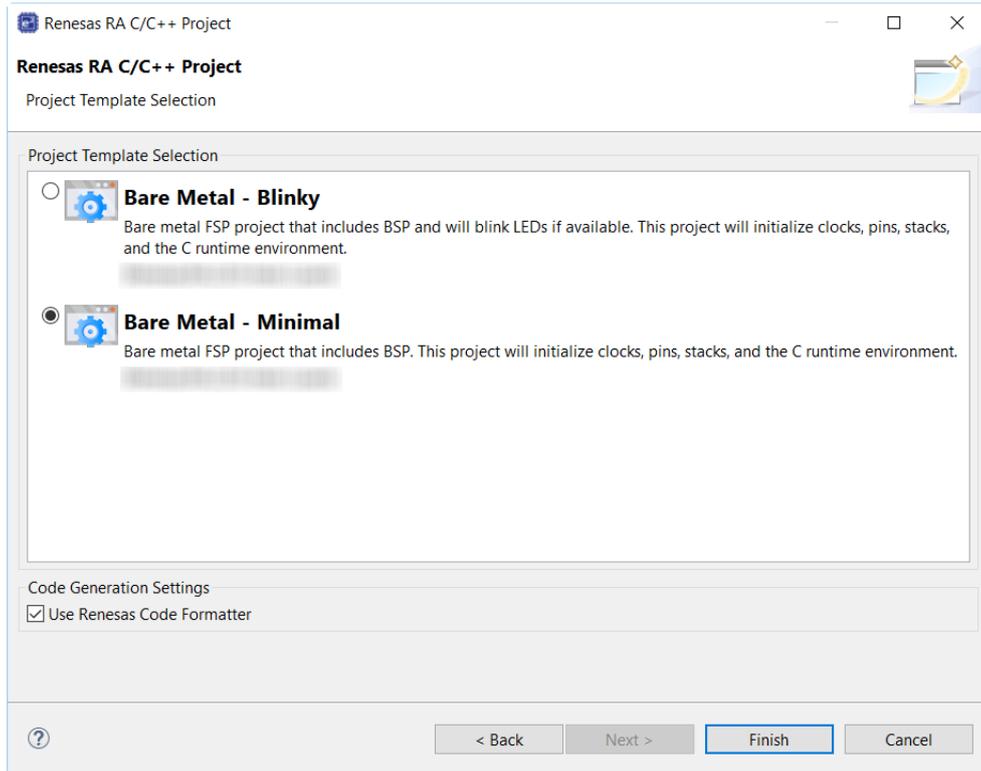

Figure 19: RA MCU Project Generator (Screen 4)

When the project is created, e² studio displays a summary of the current project configuration in the RA MCU Project Editor.

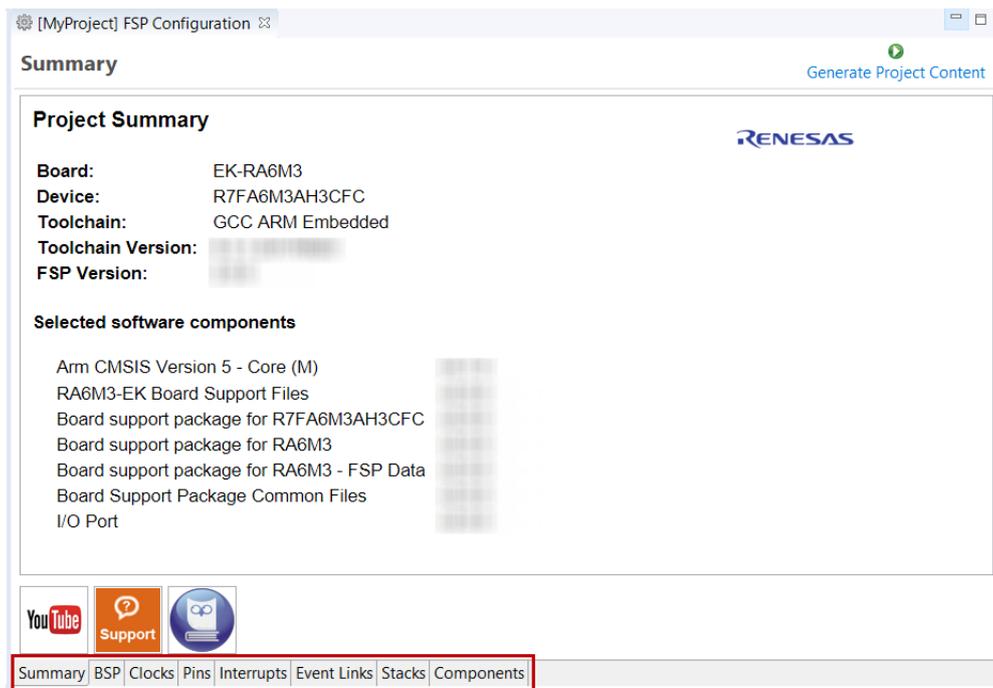

Figure 20: RA MCU Project Editor and available editor tabs

On the bottom of the RA MCU Project Editor view, you can find the tabs for configuring multiple aspects of your project:

- With the **Summary** tab, you can see all the key characteristics of the project: board, device, toolchain, and more.
- With the **BSP** tab, you can change board specific parameters from the initial project selection.
- With the **Clocks** tab, you can configure the MCU clock settings for your project.
- With the **Pins** tab, you can configure the electrical characteristics and functions of each port pin.
- With the **Interrupts** tab, you can add new user events/interrupts.
- With the **Event Links** tab, you can configure events used by the Event Link Controller.
- With the **Stacks** tab, you can add and configure FSP modules. For each module selected in this tab, the **Properties** window provides access to the configuration parameters, interrupt priorities, and pin selections.
- The **Components** tab provides an overview of the selected modules. Although you can also add drivers for specific FSP releases and application sample code here, this tab is normally only used for reference.

The functions and use of each of these tabs is explained in detail in the next section.

3.2.5 Configuring a Project

Each of the configurable elements in an FSP project can be edited using the appropriate tab in the RA Configuration editor window. Importantly, the initial configuration of the MCU after reset and before any user code is executed is set by the configuration settings in the **BSP**, **Clocks** and **Pins** tabs. When you select a project template during project creation, e² studio configures default values that are appropriate for the associated board. You can change those default values as needed. The following sections detail the process of configuring each of the project elements for each of the associated tabs.

3.2.5.1 Summary Tab

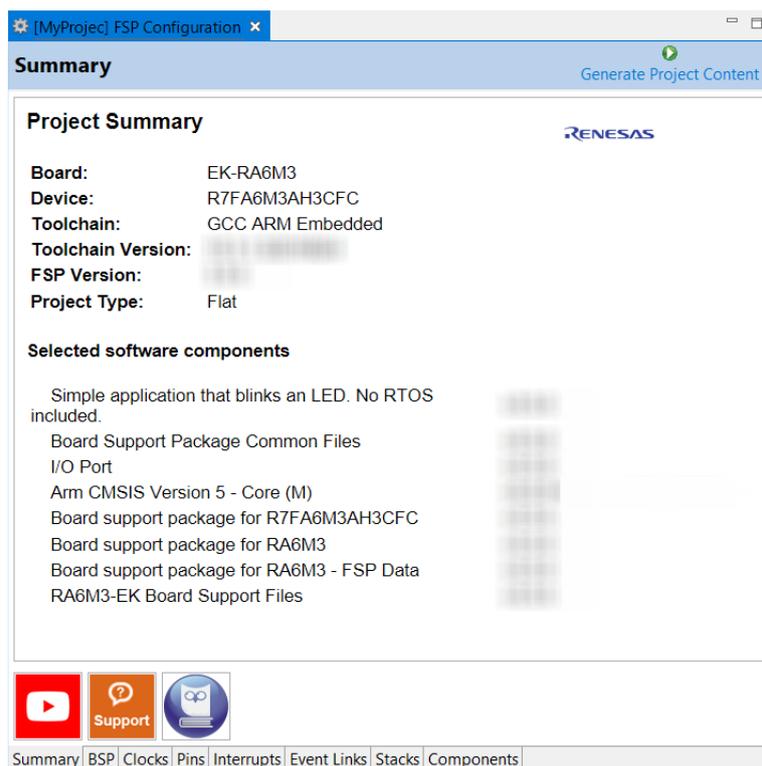

Figure 21: Configuration Summary tab

The **Summary** tab, seen in the above figure, identifies all the key elements and components of a project. It shows the target board, the device, toolchain and FSP version. Additionally, it provides a list of all the selected software components and modules used by the project. This is a more convenient summary view when compared to the **Components** tab.

The summary tab also includes handy icons with links to the Renesas YouTube channel, the Renesas support page and to the RA FSP User Manual that was downloaded during the installation process.

3.2.5.2 Configuring the BSP

The **BSP** tab shows the currently selected board (if any) and device. The Properties view is located in the lower left of the Project Configurations view as shown below.

Note

*If the Properties view is not visible, click **Window > Show View > Properties** in the top menu bar.*

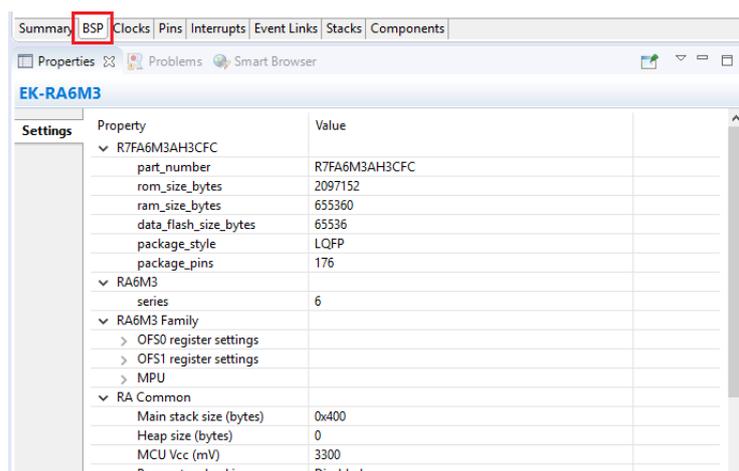

Figure 22: Configuration BSP tab

The **Properties** view shows the configurable options available for the BSP. These can be changed as required. The BSP is the FSP layer above the MCU hardware. e² studio checks the entry fields to flag invalid entries. For example, only valid numeric values can be entered for the stack size.

When you click the **Generate Project Content** button, the BSP configuration contents are written to `ra_cfg/fsp_cfg/bsp/bsp_cfg.h`

This file is created if it does not already exist.

Warning

Do not edit this file as it is overwritten whenever the **Generate Project Content** button is clicked.

3.2.5.3 Configuring Clocks

The **Clocks** tab presents a graphical view of the MCU's clock tree, allowing the various clock dividers and sources to be modified. If a clock setting is invalid, the offending clock value is highlighted in red. It is still possible to generate code with this setting, but correct operation cannot be guaranteed. In the figure below, the USB clock UCLK has been changed so the resulting clock frequency is 60 MHz instead of the required 48 MHz. This parameter is colored red.

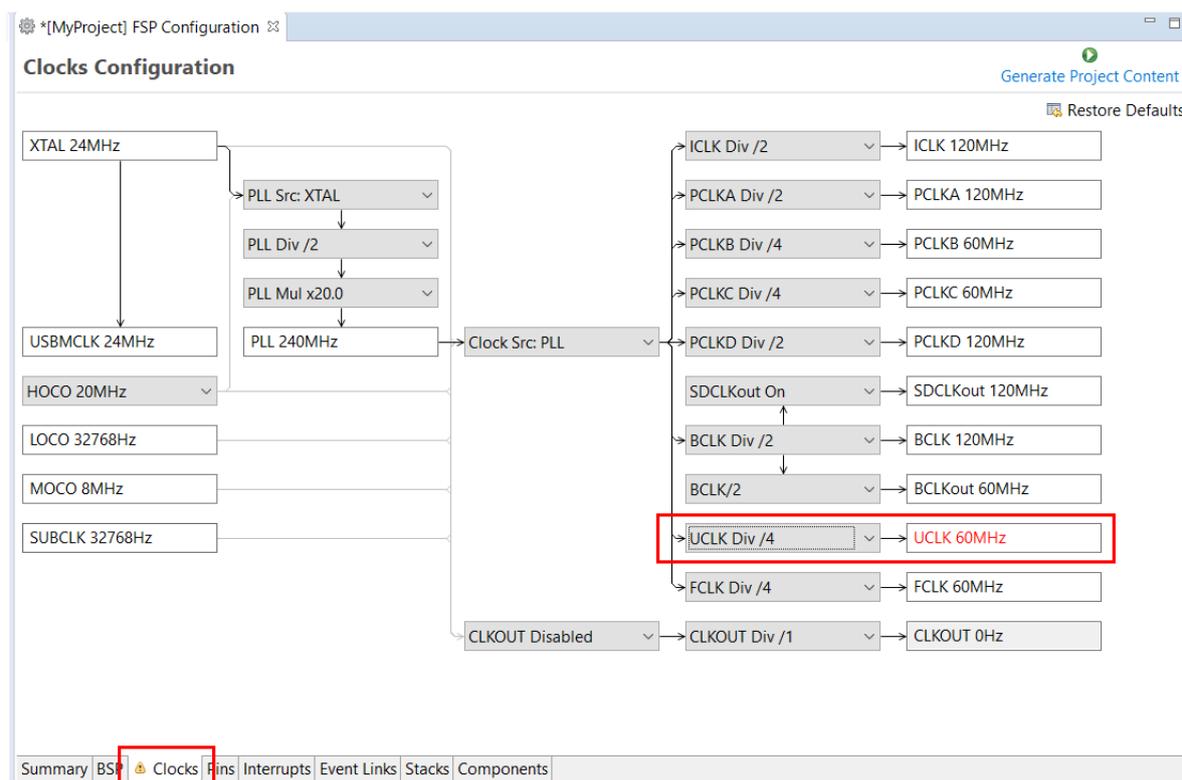

Figure 23: Configuration Clocks tab

When you click the **Generate Project Content** button, the clock configuration contents are written to: `ra_gen/bsp_clock_cfg.h`

This file will be created if it does not already exist.

Warning

Do not edit this file as it is overwritten whenever the **Generate Project Content** button is clicked.

3.2.5.4 Configuring Pins

The **Pins** tab provides flexible configuration of the MCU's pins. As many pins are able to provide multiple functions, they can be configured on a peripheral basis. For example, selecting a serial channel via the SCI peripheral offers multiple options for the location of the receive and transmit pins for that module and channel. Once a pin is configured, it is shown as green in the **Package** view.

Note

*If the **Package** view window is not open in e² studio, select **Window > Show View > Pin Configurator > Package** from the top menu bar to open it.*

The **Pins** tab simplifies the configuration of large packages with highly multiplexed pins by highlighting errors and presenting the options for each pin or for each peripheral. If you selected a project template for a specific board such as the EK-RA6M3, some peripherals connected on the board are preselected.

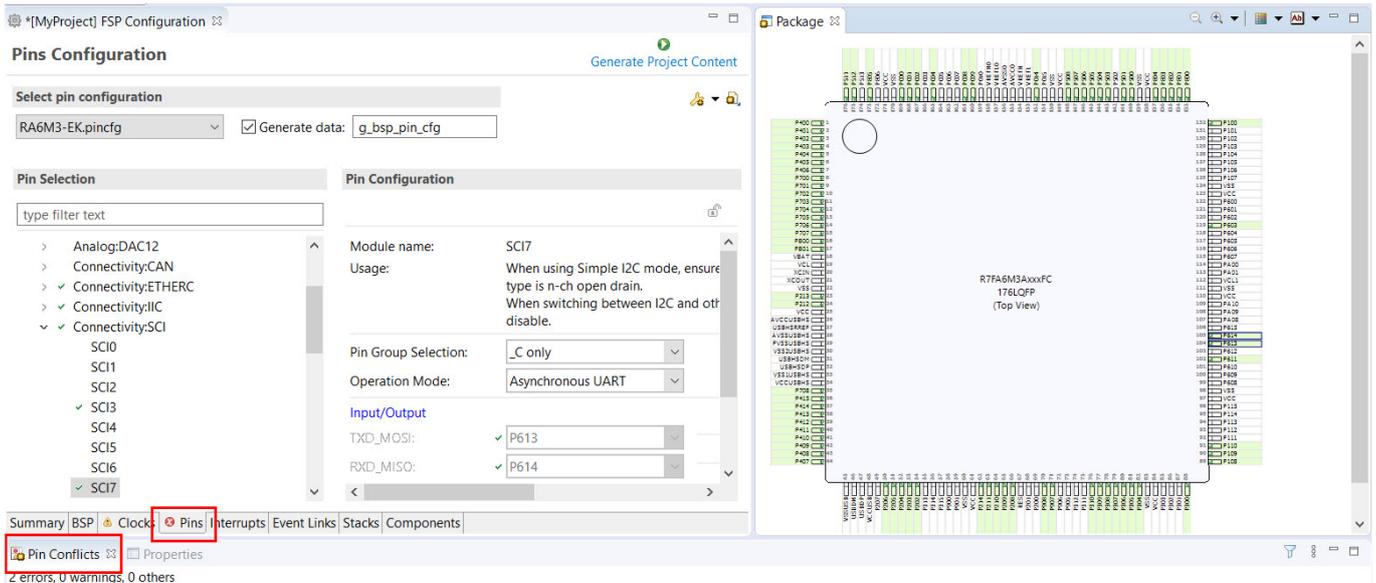

Figure 24: Pins Configuration

The pin configurator includes a built-in conflict checker, so if the same pin is allocated to another peripheral or I/O function the pin will be shown as red in the package view and also with white cross in a red square in the **Pin Selection** pane and **Pin Configuration** pane in the main **Pins** tab. The **Pin Conflicts** view provides a list of conflicts, so conflicts can be quickly identified and fixed.

In the example shown below, port P611 is already used by the CAC, and the attempt to connect this port to the Serial Communications Interface (SCI) results in a dangling connection error. To fix this error, select another port from the pin drop-down list or disable the CAC in the **Pin Selection** pane on the left side of the tab.

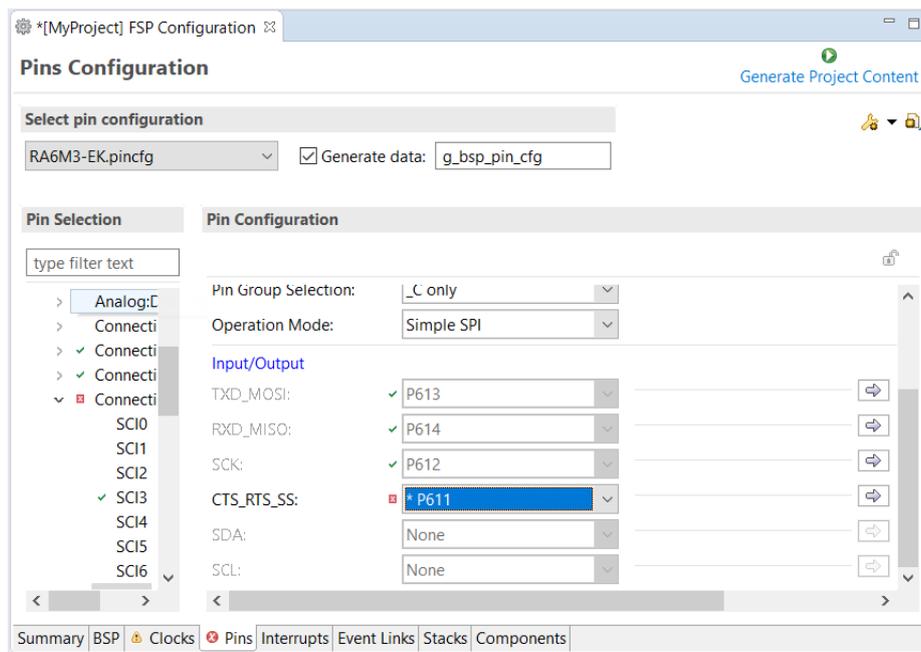

Figure 25: e² studio Pin configurator

The pin configurator also shows a package view and the selected electrical or functional characteristics of each pin.

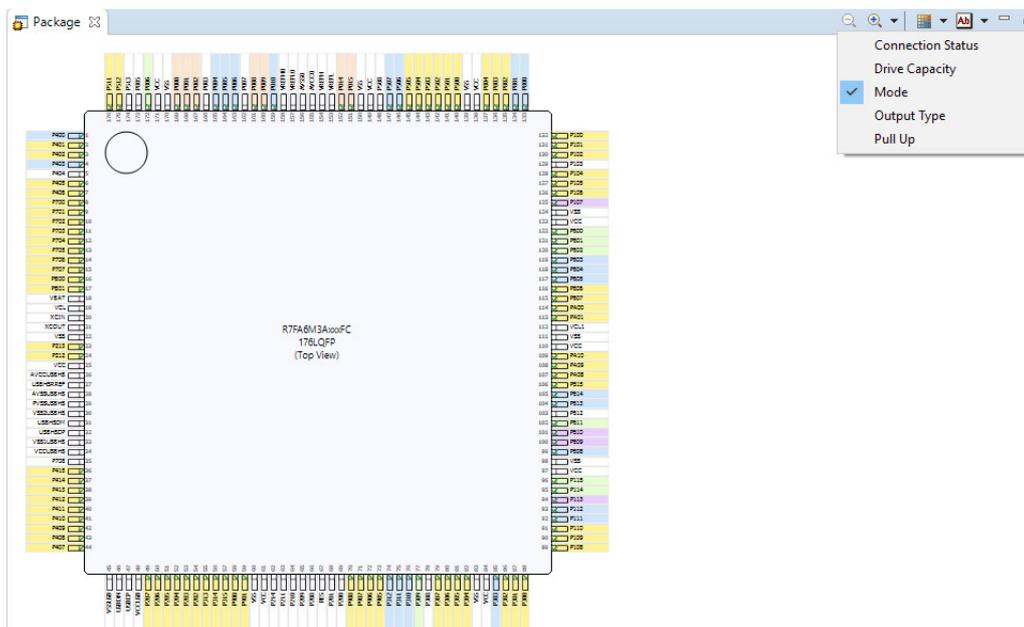

Figure 26: e² studio Pin configurator package view

When you click the **Generate Project Content** button, the pin configuration contents are written to: `ra_gen\bsp_pin_cfg.h`

This file will be created if it does not already exist.

Warning

Do not edit this file as it is overwritten whenever the **Generate Project Content** button is clicked.

To make it easy to share pinning information for your project, e² studio exports your pin configuration settings to a csv format and copies the csv file to `ra_gen/<MCU package>.csv`.

3.2.5.5 Configuring Interrupts from the Stacks Tab

You can use the **Properties** view in the **Stacks** tab to enable interrupts by setting the interrupt priority. Select the driver in the **Stacks** pane to view and edit its properties.

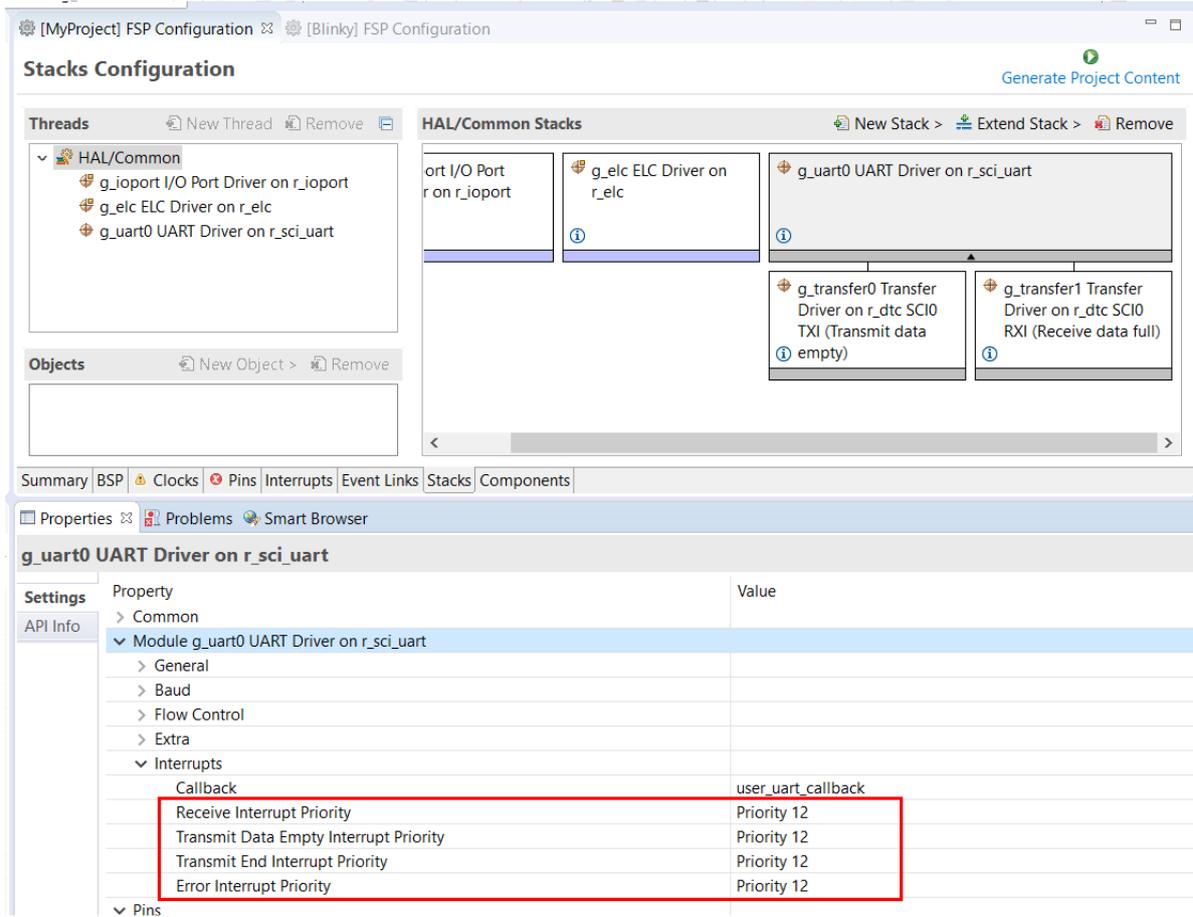

Figure 27: Configuring Interrupts in the Stacks tab

Creating Interrupts from the Interrupts Tab

On the **Interrupts** tab, the user can bypass a peripheral interrupt set by FSP by setting a user-defined ISR. This can be done by adding a new event via the **New User Event** button.

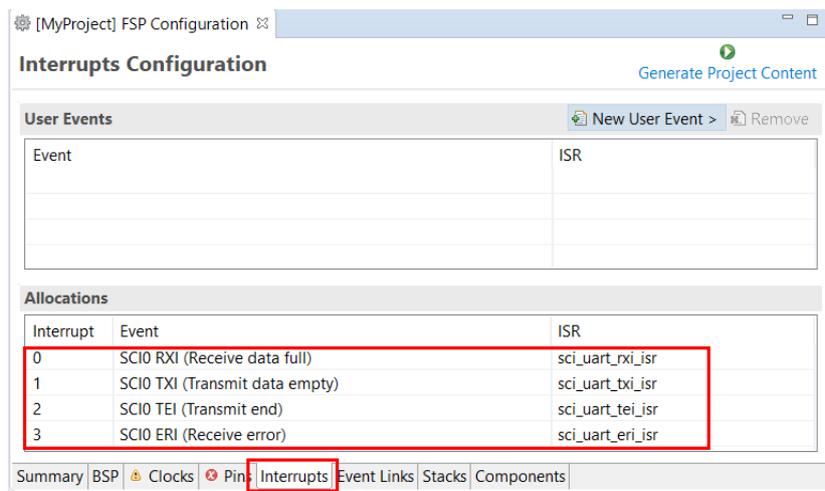

Figure 28: Configuring interrupt in Interrupt Tab

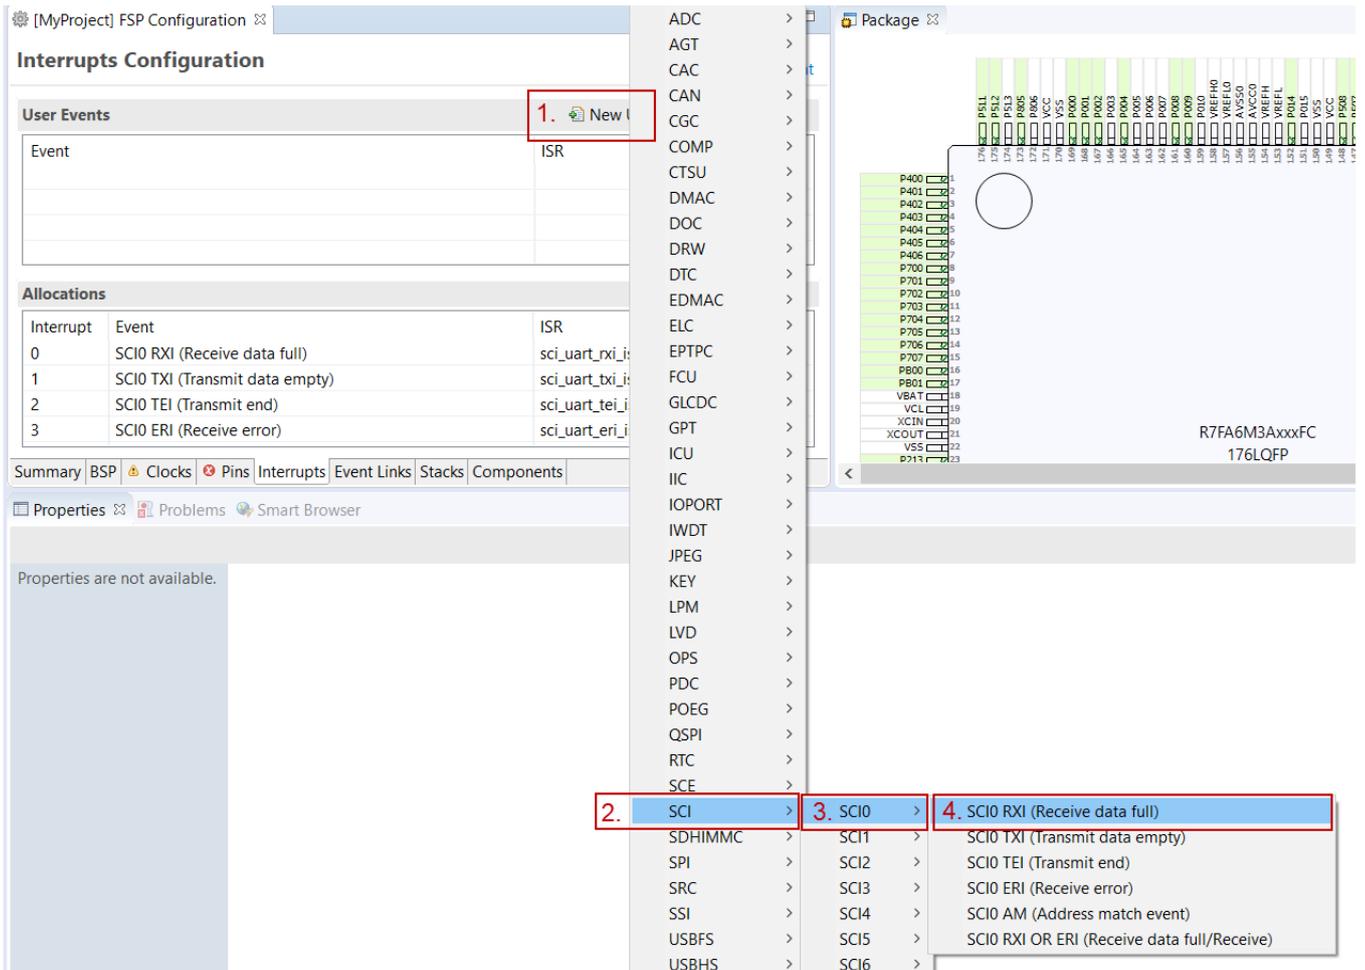

Figure 29: Adding user-defined event

Enter the name of ISR for the new user event.

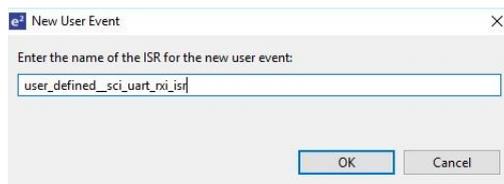

Figure 30: User-defined event ISR

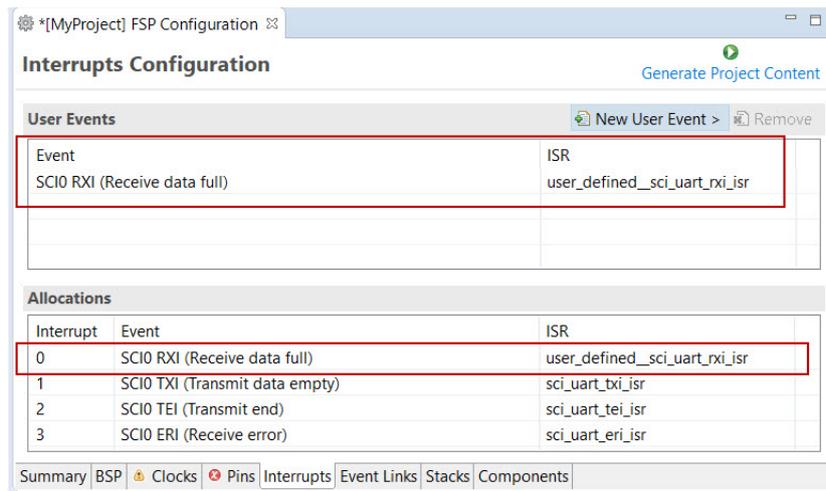

Figure 31: Using a user-defined event

3.2.5.6 Viewing Event Links

The Event Links tab can be used to view the Event Link Controller events. The events are sorted by peripheral to make it easy to find and verify them.

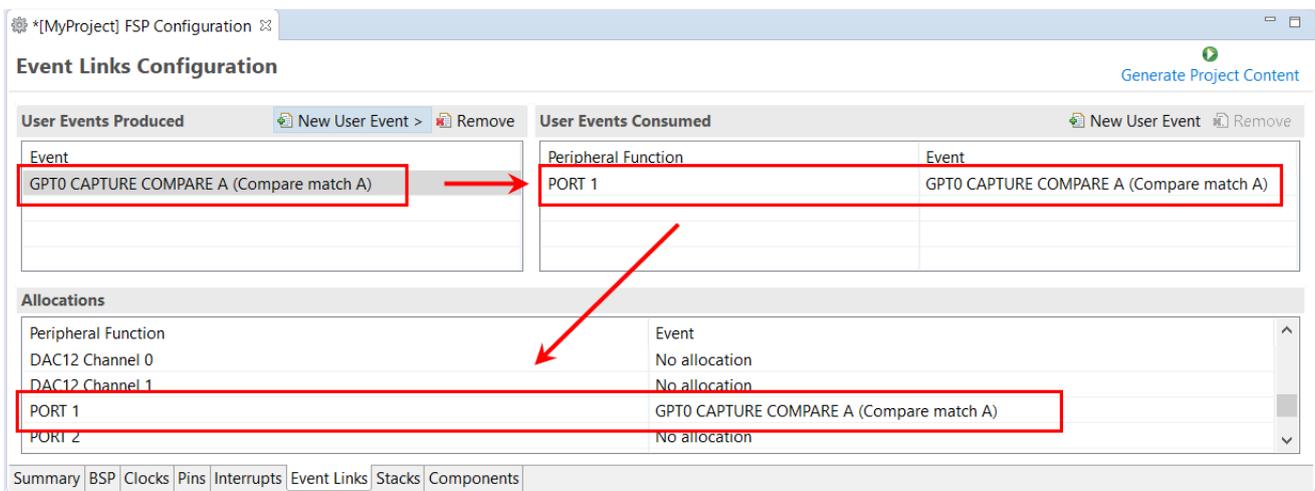

Figure 32: Viewing Event Links

Like the Interrupts tab, user-defined event sources and destinations (producers and consumers) can be defined by clicking the relevant **New User Event** button. Once a consumer is linked to a producer the link will appear in the **Allocations** section at the bottom.

Note

When selecting an ELC event to receive for a module (or when manually defining an event link), only the events that are made available by the modules configured in the project will be shown.

3.2.6 Adding Threads and Drivers

Every RTOS-based RA Project includes at least one RTOS Thread and a stack of FSP modules running

in that thread. The **Stacks** tab is a graphical user interface which helps you to add the right modules to a thread and configure the properties of both the threads and the modules associated with each thread. Once you have configured the thread, e² studio automatically generates the code reflecting your configuration choices.

For any driver, or, more generally, any module that you add to a thread, e² studio automatically resolves all dependencies with other modules and creates the appropriate stack. This stack is displayed in the Stacks pane, which e² studio populates with the selected modules and module options for the selected thread.

The default view of the **Stacks** tab includes a Common Thread called **HAL/Common**. This thread includes the driver for I/O control (IOPORT). The default stack is shown in the **HAL/Common Stacks** pane. The default modules added to the HAL/Common driver are special in that FSP only requires a single instance of each, which e² studio then includes in every user-defined thread by default.

In applications that do not use an RTOS or run outside of the RTOS, the HAL/Common thread becomes the default location where you can add additional drivers to your application.

For a detailed description on how to add and configure modules and stacks, see the following sections:

- [Adding and Configuring HAL Drivers](#)
- [Adding Drivers to a Thread and Configuring the Drivers](#)

Once you have added a module either to HAL/Common or to a new thread, you can access the driver's configuration options in the **Properties** view. If you added thread objects, you can access the objects configuration options in the **Properties** view in the same way.

You can find details about how to configure threads here: [Configuring Threads](#)

Note

Driver and module selections and configuration options are defined in the FSP pack and can therefore change when the FSP version changes.

3.2.6.1 Adding and Configuring HAL Drivers

For applications that run outside or without the RTOS, you can add additional HAL drivers to your application using the HAL/Common thread. To add drivers, follow these steps:

1. Click on the HAL/Common icon in the **Stacks** pane. The Modules pane changes to **HAL/Common Stacks**.

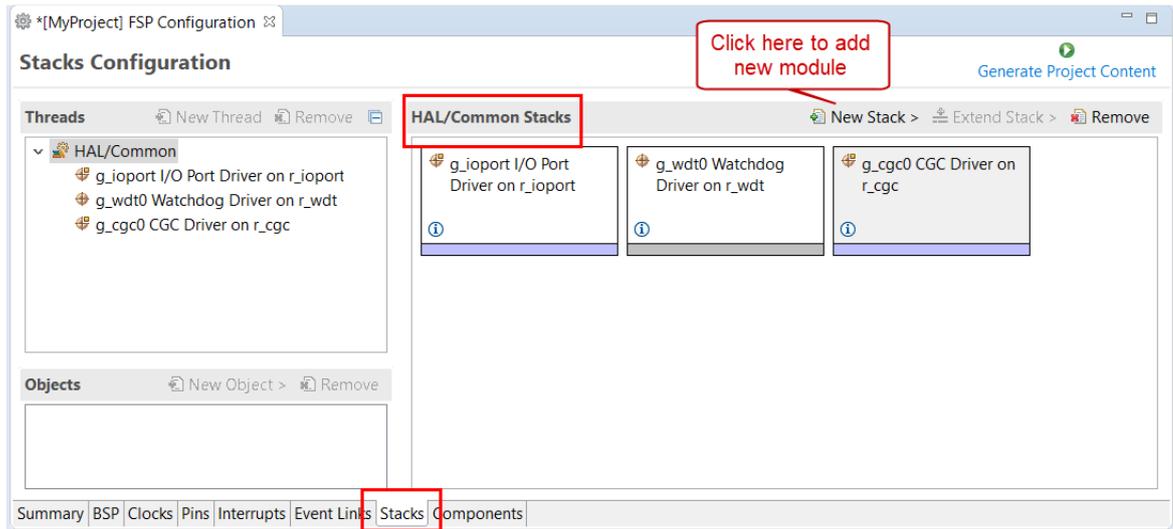

Figure 33: e² studio Project configurator - Adding drivers

2. Click **New Stack** to see a drop-down list of HAL level drivers available in FSP.
3. Select a driver from the menu **New Stack > Driver**.

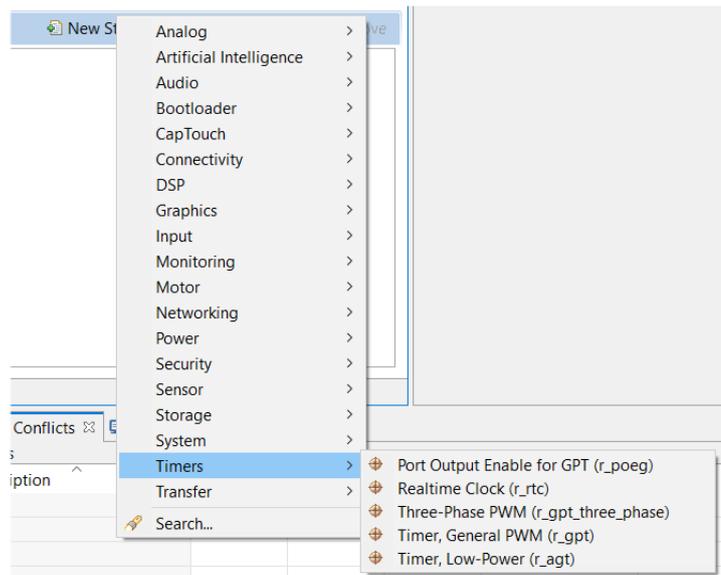

Figure 34: Select a driver

4. Select the driver module in the **HAL/Common Modules** pane and configure the driver properties in the **Properties** view.

e² studio adds the following files when you click the **Generate Project Content** button:

- The selected driver module and its files to the ra/fsp directory
- The main() function and configuration structures and header files for your application as shown in the table below.

| File | Contents | Overwritten by Generate Project Content? |
|-------------------|--|--|
| ra_gen/main.c | Contains main() calling generated and user code. When called, the BSP already has initialized the MCU. | Yes |
| ra_gen/hal_data.c | Configuration structures for HAL Driver only modules. | Yes |
| ra_gen/hal_data.h | Header file for HAL driver only modules. | Yes |
| src/hal_entry.c | User entry point for HAL Driver only code. Add your code here. | No |

The configuration header files for all included modules are created or overwritten in this folder:
ra_cfg/fsp_cfg

3.2.6.2 Adding Drivers to a Thread and Configuring the Drivers

For an application that uses the RTOS, you can add one or more threads, and for each thread at least one module that runs in the thread. You can select modules from the Driver dropdown menu. To add modules to a thread, follow these steps:

1. In the **Threads** pane, click **New Thread** to add a Thread.

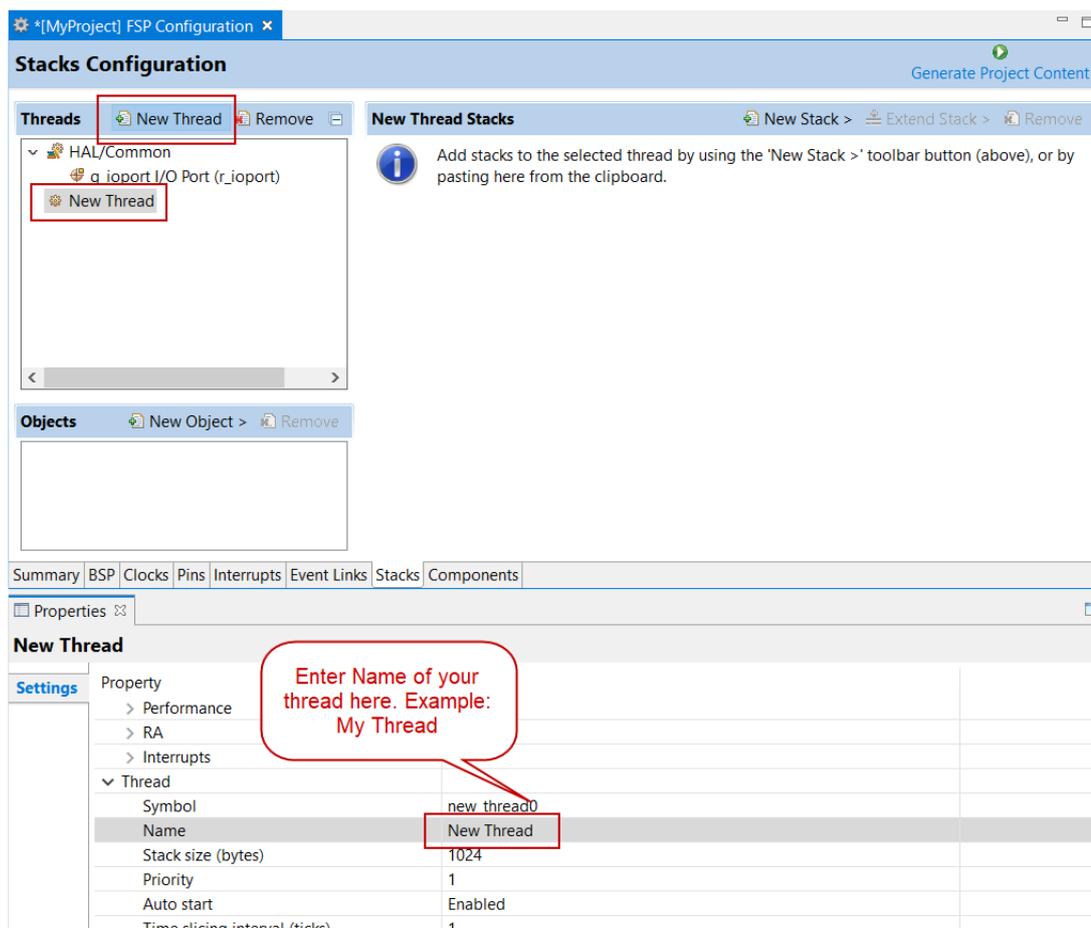

Figure 35: Adding a new RTOS Thread on the Stacks tab

2. In the **Properties** view, click on the **Name** and **Symbol** entries and enter a distinctive name and symbol for the new thread.

Note

*e² studio updates the name of the thread stacks pane to **My Thread Stacks**.*

3. In the **My Thread Stacks** pane, click on **New Stack** to see a list of modules and drivers. HAL-level drivers can be added here.

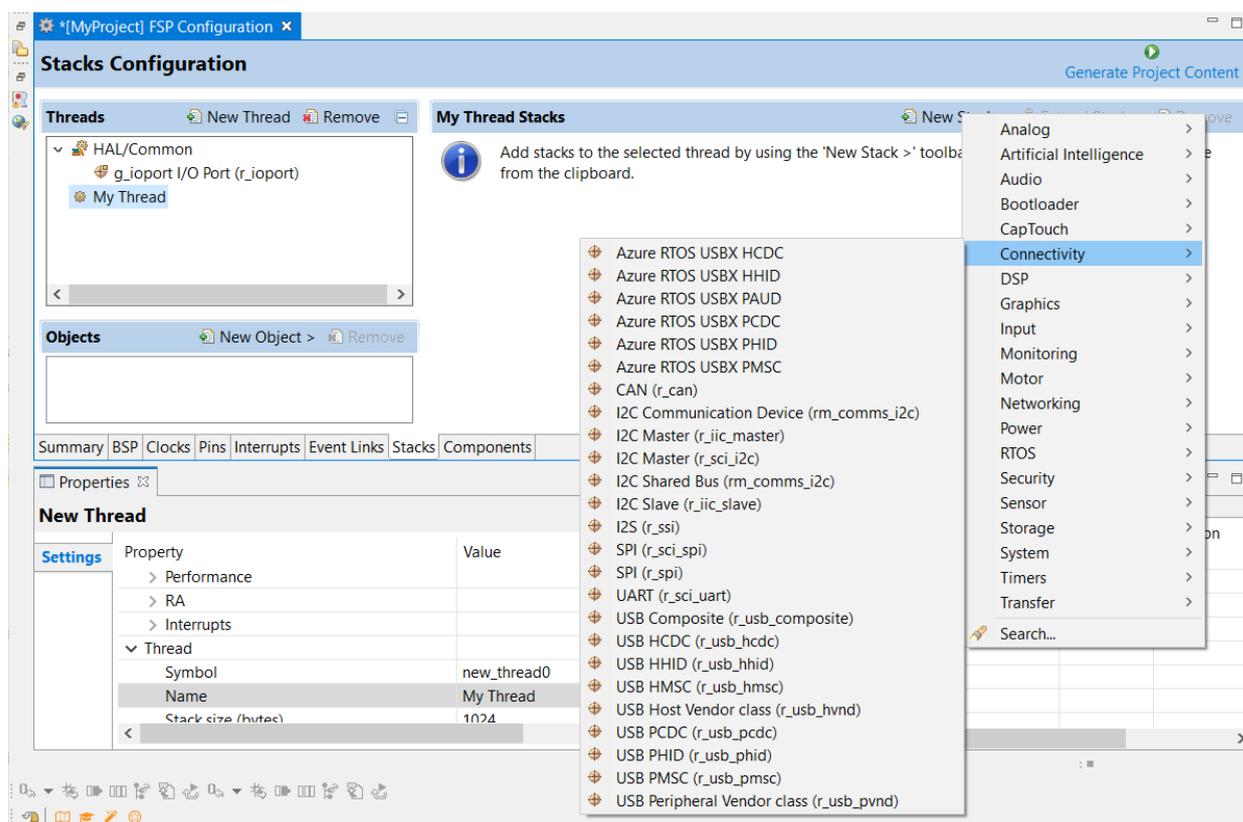

Figure 36: Adding Modules and Drivers to a thread

4. Select a module or driver from the list.
5. Click on the added driver and configure the driver as required by the application by updating the configuration parameters in the **Properties** view. To see the selected module or driver and be able to edit its properties, make sure the Thread containing the driver is highlighted in the **Threads** pane.

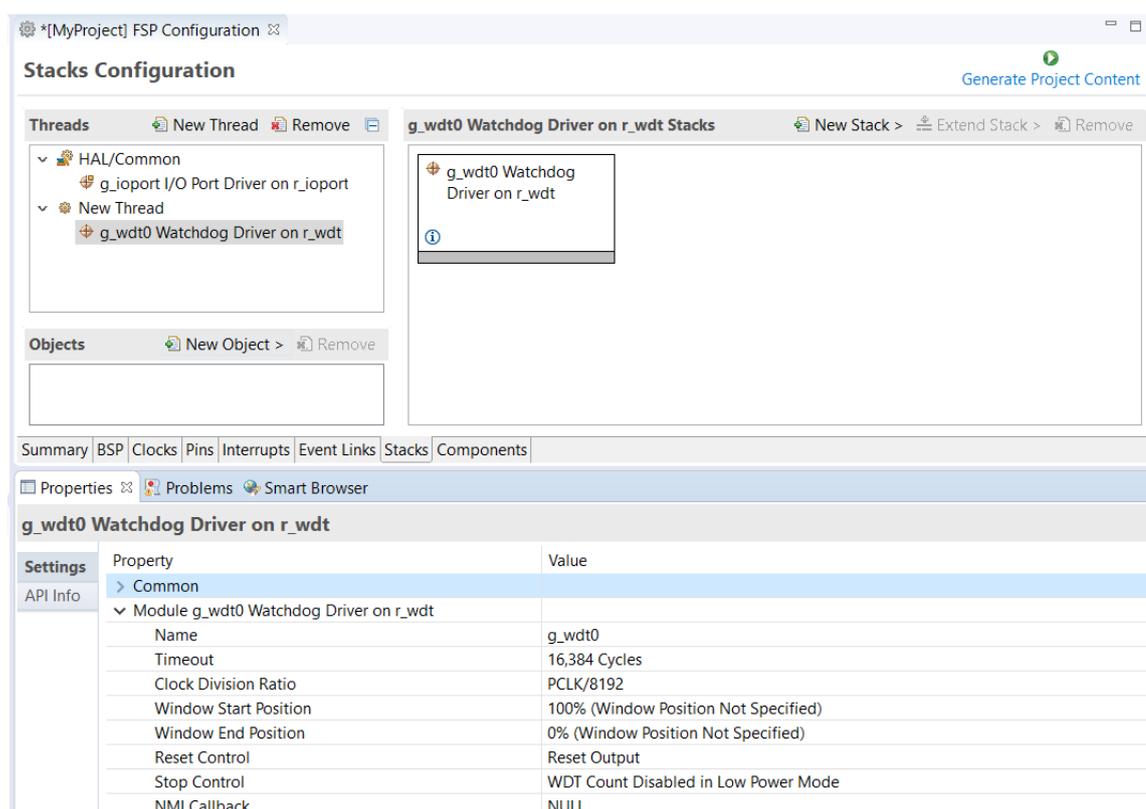

Figure 37: Configuring Module or Driver properties

6. If needed, add another thread by clicking **New Thread** in the **Threads** pane.

When you press the **Generate Project Content** button for the example above, e² studio creates the files as shown in the following table:

| File | Contents | Overwritten by Generate Project Content? |
|--------------------|---|--|
| ra_gen/main.c | Contains main() calling generated and user code. When called the BSP will have initialized the MCU. | Yes |
| ra_gen/my_thread.c | Generated thread "my_thread" and configuration structures for modules added to this thread. | Yes |
| ra_gen/my_thread.h | Header file for thread "my_thread" | Yes |
| ra_gen/hal_data.c | Configuration structures for HAL Driver only modules. | Yes |
| ra_gen/hal_data.h | Header file for HAL Driver only modules. | Yes |
| src/hal_entry.c | User entry point for HAL Driver only code. Add your code here. | No |

| | | |
|-----------------------|--|----|
| src/my_thread_entry.c | User entry point for thread "my_thread". Add your code here. | No |
|-----------------------|--|----|

The configuration header files for all included modules and drivers are created or overwritten in the following folders: ra_cfg/fsp_cfg/<header files>

3.2.6.3 Configuring Threads

If the application uses an RTOS, the **Stacks** tab can be used to simplify the creation of RTOS threads, semaphores, mutexes, and event flags.

The components of each thread can be configured from the **Properties** view as shown below.

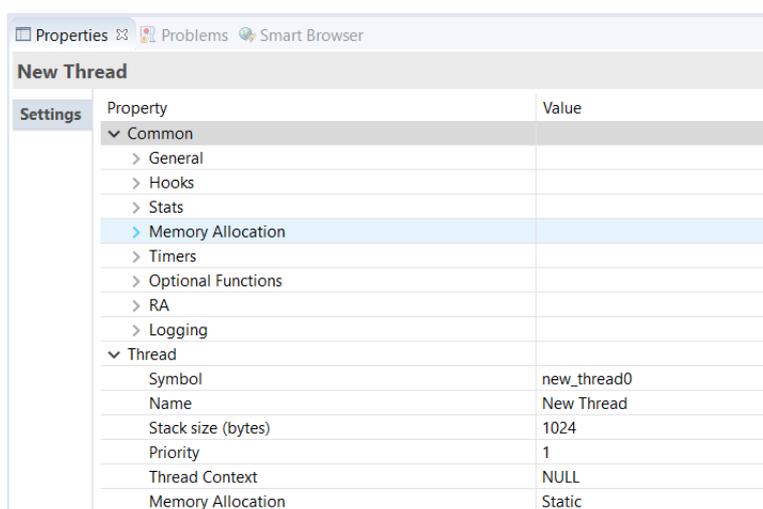

Figure 38: New Thread Properties

The **Properties** view contains settings common for all Threads (**Common**) and settings for this particular thread (**Thread**).

For this thread instance, the thread's name and properties (such as priority level or stack size) can be easily configured. e² studio checks that the entries in the property field are valid. For example, it will verify that the field **Priority**, which requires an integer value, only contains numeric values between 0 and 9.

To add RTOS resources to a Thread, select a thread and click on **New Object** in the Thread Objects pane. The pane takes on the name of the selected thread, in this case **My Thread Objects**.

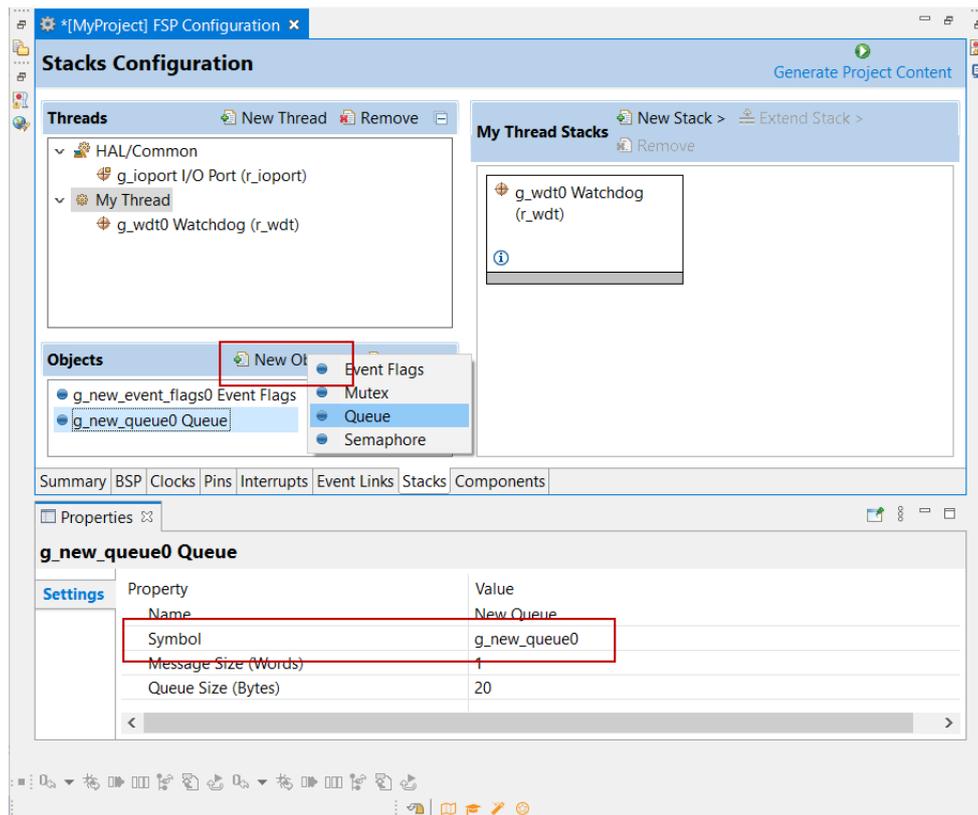

Figure 39: Configuring Thread Object Properties

Make sure to give each thread object a unique name and symbol by updating the **Name** and **Symbol** entries in the **Properties** view.

3.2.7 Reviewing and Adding Components

The **Components** tab enables the individual modules required by the application to be included or excluded. Modules common to all RA MCU projects are preselected (for example: **BSP > BSP > Board-specific BSP** and **HAL Drivers > all > r_cg**). All modules that are necessary for the modules selected in the **Stacks** tab are included automatically. You can include or exclude additional modules by ticking the box next to the required component.

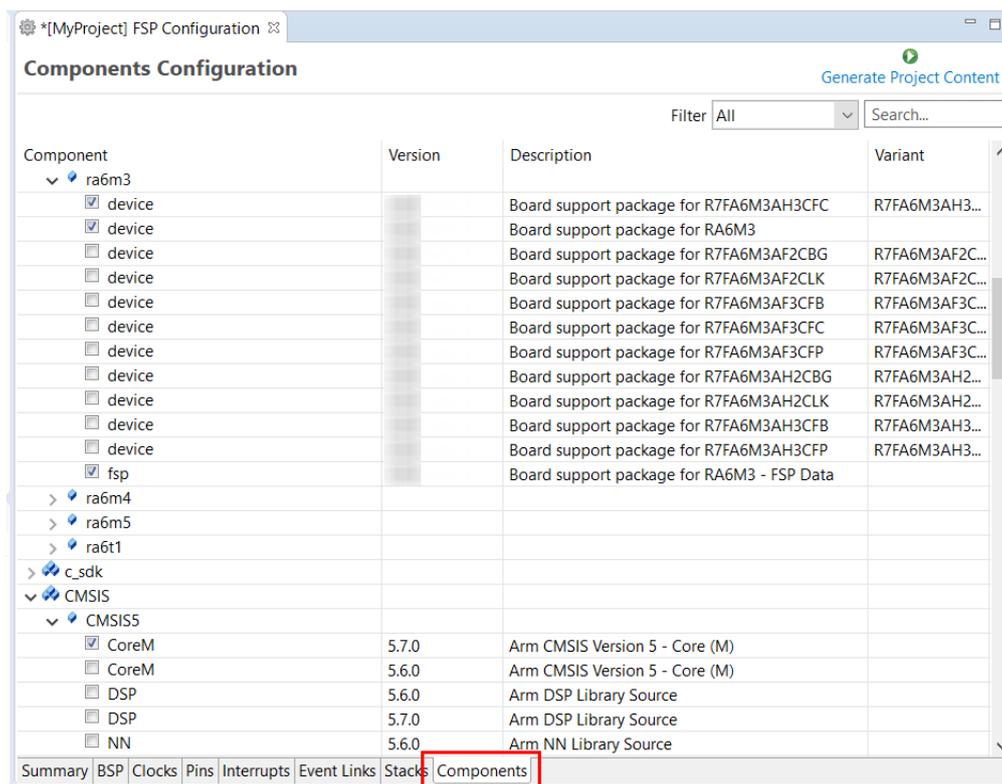

Figure 40: Components Tab

Clicking the **Generate Project Content** button copies the .c and .h files for each selected component into the following folders:

- ra/fsp/inc/api
- ra/fsp/inc/instances
- ra/fsp/src/bsp
- ra/fsp/src/<Driver_Name>

e² studio also creates configuration files in the ra_cfg/fsp_cfg folder with configuration options set in the **Stacks** tab.

3.2.8 Writing the Application

Once you have added Modules and drivers and set their configuration parameters in the **Stacks** tab, you can add the application code that calls the Modules and drivers.

Note

To check your configuration, build the project once without errors before adding any of your own application code.

3.2.8.1 Coding Features

e² studio provides several efficiency improving features that help write code. Review these features prior to digging into the code development step-by-step sections that follow.

Autocomplete

Autocomplete is a context aware coding accelerator that suggests possible completions for partially

typed-in code elements. If you can 'guess' the first part of a macro, for example, the Autocomplete function can suggest options for completing the rest of the macro.

In the following example, a macro related to a BSP_IO setting needs to be found. After typing BSP_IO_ in a source code file, pressing Ctrl + Space opens the Autocomplete list. This list shows a selection of context aware options for completing the macro. Scroll through the window to find the desired macro (in this case BSP_IO_LEVEL_HIGH) and click on it to add it to your code.

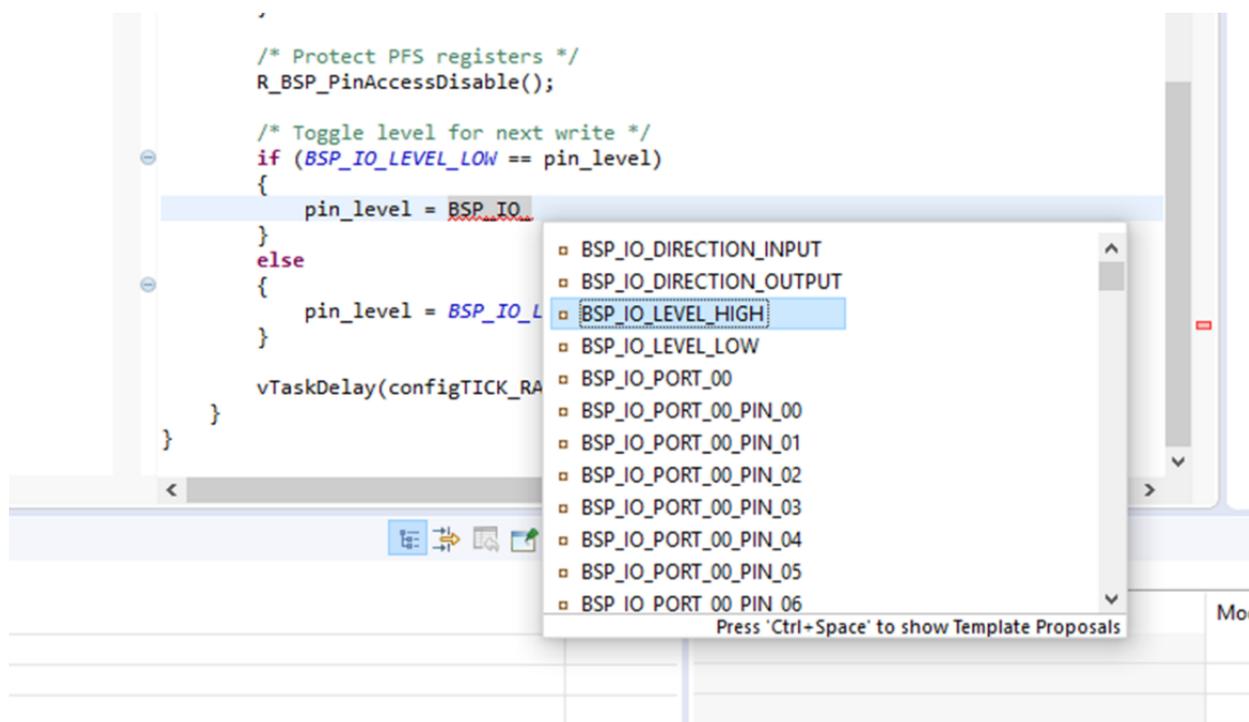

Figure 41: Autocomplete example

Other code elements can use autocomplete too. Some of the more common uses for Autocomplete include Enumerations, Types, and API functions - but try it in any situation you think the tool may have enough context to determine what you might be looking for.

For a hands-on experience using Autocomplete use the Quick FSP Labs for [Creating Blinky from Scratch](#) and [Creating an RTC Blinky from Scratch](#). These 15-minute Do it Yourself labs take you through the step-by-step process of using Autocomplete, Developer Assistance, and the Help system.

Welcome Window

The e² studio Welcome window displays useful information and common links to assist in development. Check out these resources to see what is available. They are updated with each release, so check back to see what has been added after a new release.

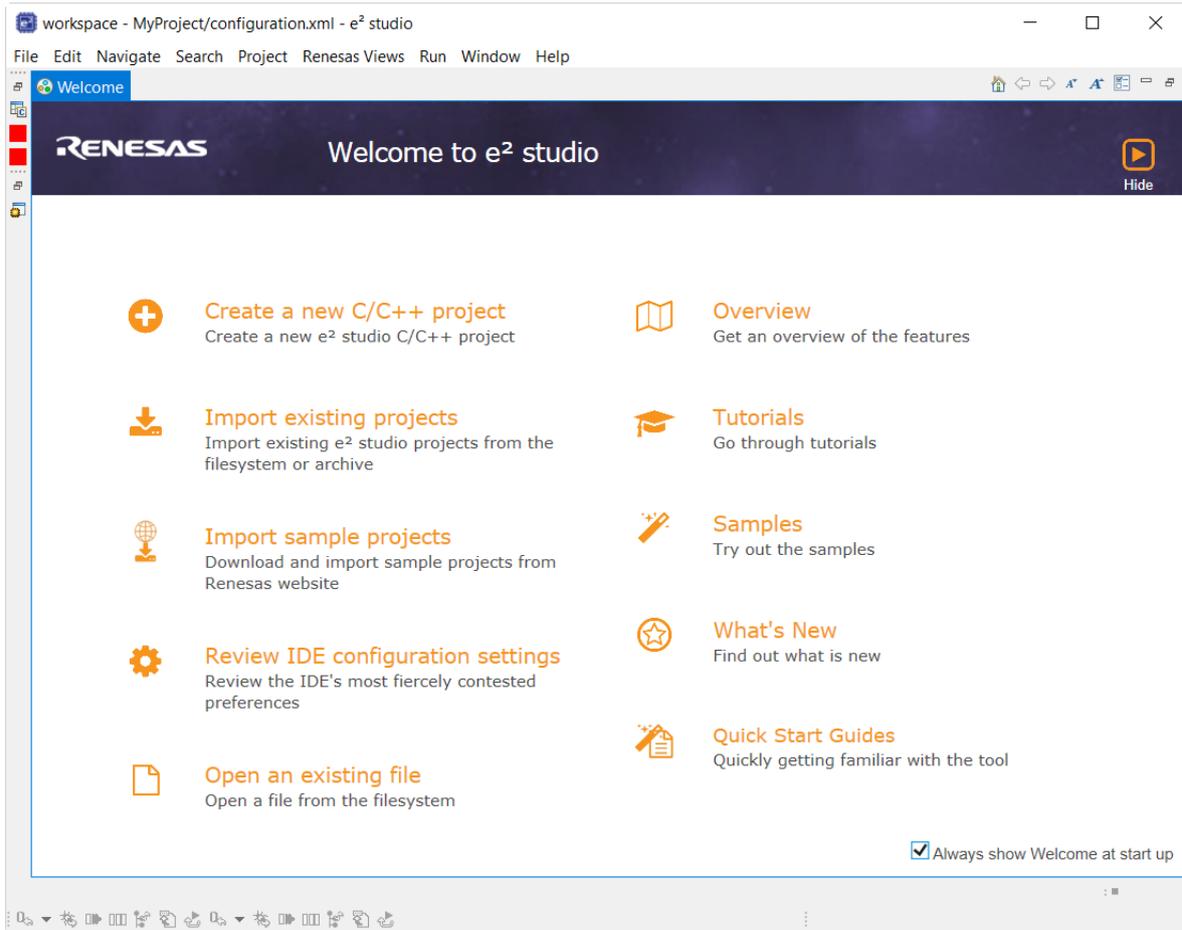

Figure 42: Welcome window

Cheat Sheets

Cheat sheets are macro driven illustrations of some common tasks. They show, step-by-step, what commands and menus are used. These will be populated with more examples on each release. Cheat Sheets are available from the **Help** menu.

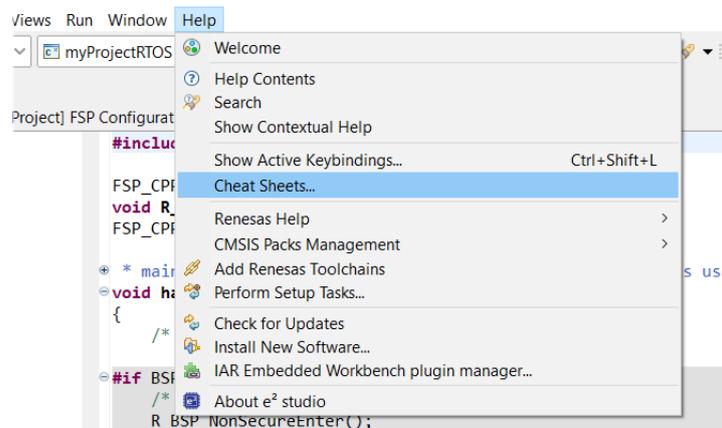

Figure 43: Cheat Sheets

Developer Assistance

FSP Developer Assistance provides developers with module and Application Programming Interface (API) reference documentation in e² studio. After configuring the threads and software stacks for an FSP project with the RA Configuration editor, Developer Assistance quickly helps you get started writing C/C++ application code for the project using the configured stack modules.

1. Expand the project explorer to view Developer Assistance

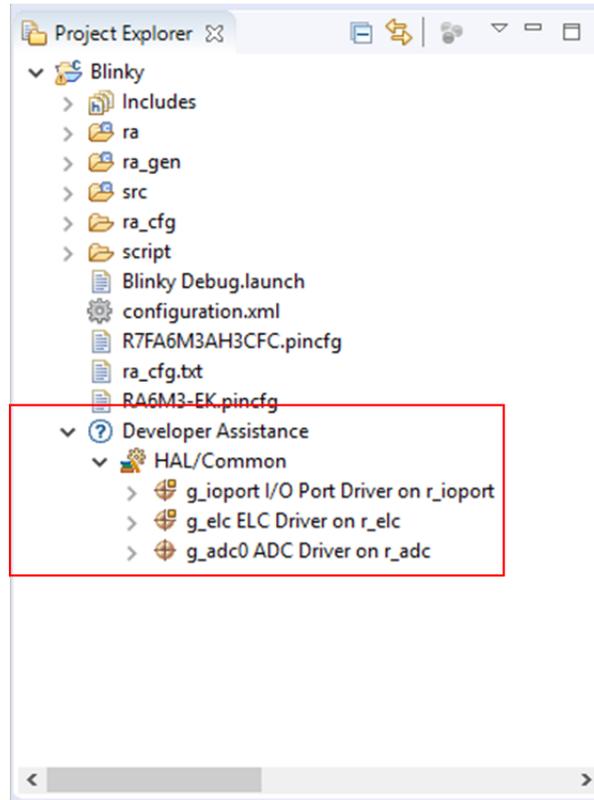

Figure 44: Developer Assistance

2. Expand a stack module to show its APIs

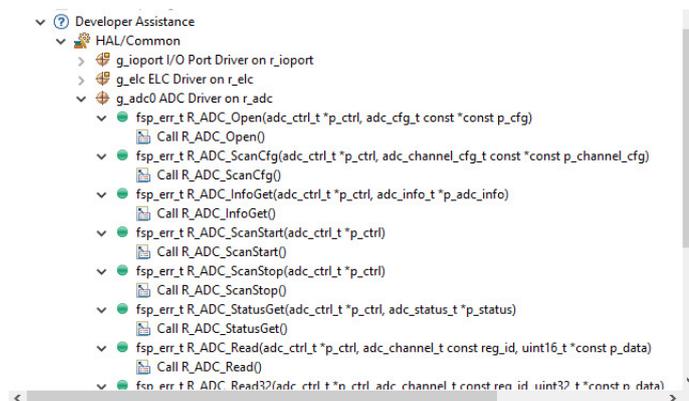

Figure 45: Developer Assistance APIs

3. Dragging and dropping an API from Developer Assistance to a source file helps to write source code quickly.

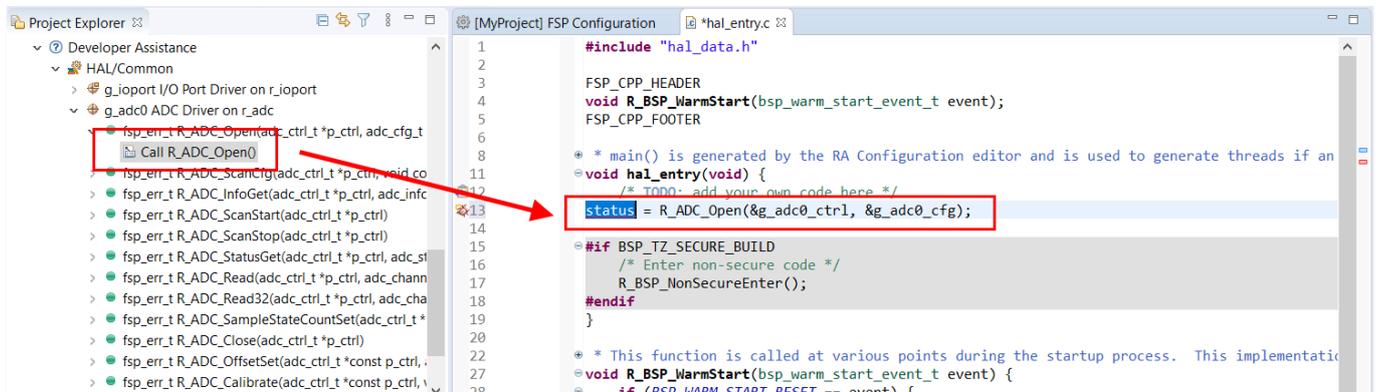

Figure 46: Dragging and Dropping an API in Developer Assistance

For a hands-on experience using Developer Assistance use the Quick FSP Labs for [An Introduction to Developer Assistance](#), [Creating Blinky from Scratch](#) and [Creating an RTC Blinky from Scratch](#). These 15-minute Do it Yourself labs take you through the step-by-step process of using Autocomplete, Developer Assistance, and the Help system.

Information Icon

Information icons are available on each module in the thread stack. Clicking on these icons opens a module folder on GitHub that contains additional information on the module. An example information icon is shown below:

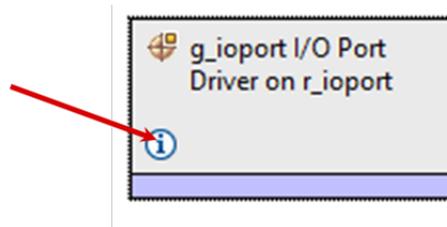

Figure 47: Information icon

IDE Help

A good source of additional information for many FSP topics is the Help system. To get to the Help system, click on **Help** and then select **Help Contents** as seen below.

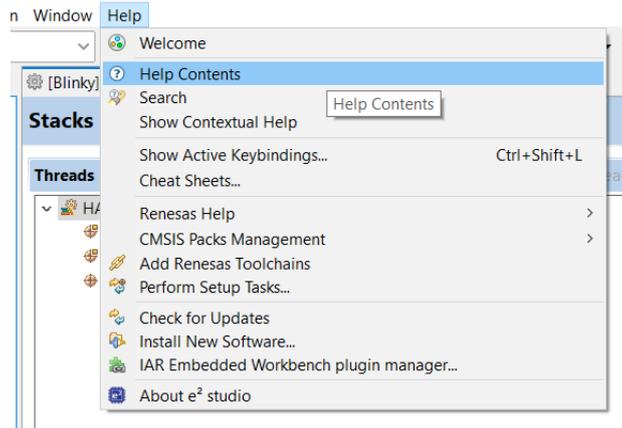

Figure 48: Opening the Help System

Once the Help system is open, select the **RA Contents** entry in the left side Guide-bar. Expand it to see the main RA Topics.

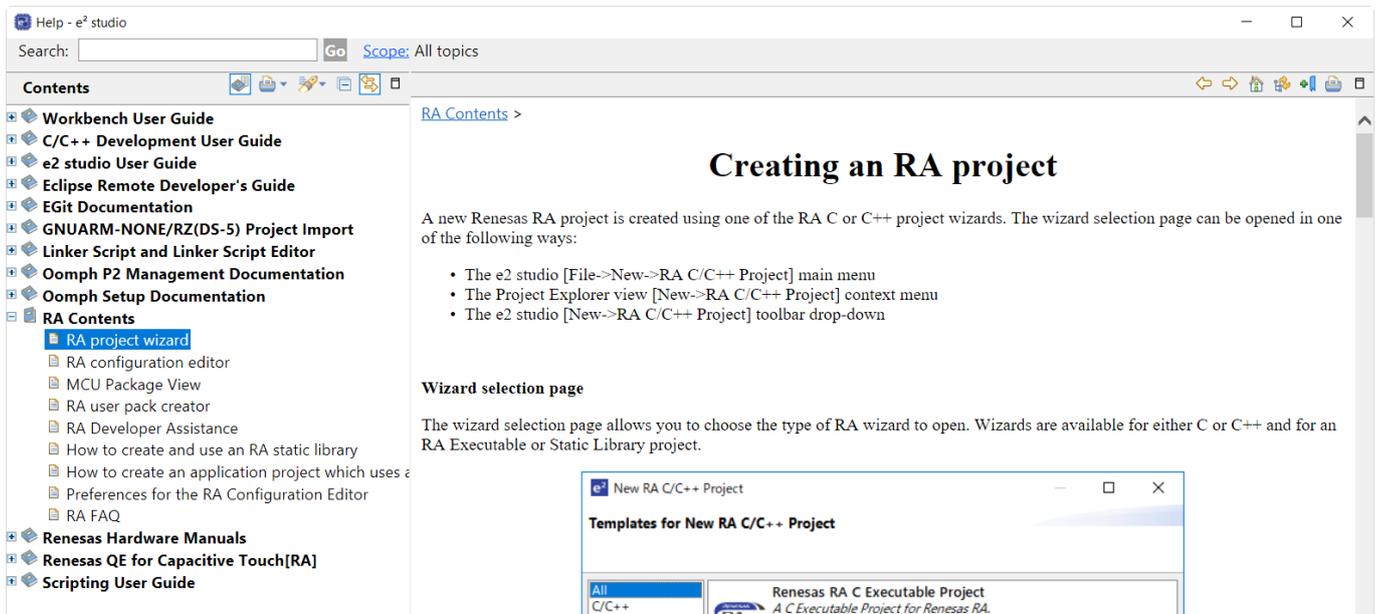

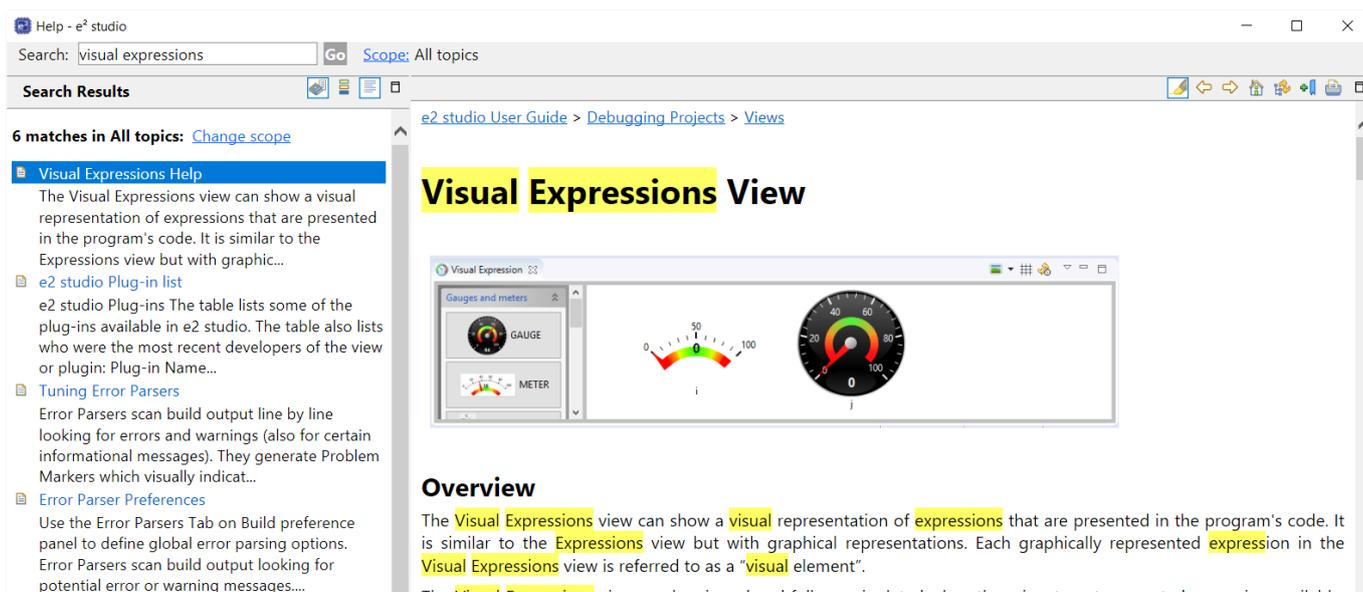

Figure 49: RA Content Help

You can also search for help topics by using the Search bar. Below is an example searching for Visual Expressions, a helpful feature in the e² studio debugger.

Figure 50: e² studio Help from the Search Bar

For a hands-on experience using the Help system use the Quick FSP Labs for [An Introduction to Developer Assistance](#), [Creating Blinky from Scratch](#) and [Creating an RTC Blinky from Scratch](#). These 15-minute Do it Yourself labs take you through the step-by-step process of using Autocomplete, Developer Assistance, and the Help system.

3.2.8.2 HAL Modules in FSP: A Practical Description

The [FSP Architecture](#) section describes FSP stacks, modules and interfaces in significant detail, providing an understanding of the theory behind them. The following sections provides a quick and practical introduction on how to use API functions when writing code and where in the API reference sections you can find useful API related information.

Introduction to HAL Modules

In FSP, HAL module drivers provide convenient API functions that access RA processor peripheral features. Module properties are defined in the RA GUI configurator, eliminating the tedious and error prone process of setting peripheral control registers. When configuration is complete, the generator automatically creates the code needed to implement the associated API functions. API functions are the main way a developer interacts with the target processor and peripherals.

HAL Driver API Function Call Formats

HAL driver API functions all have a similar format. They all start with "R_" to indicate they are HAL related functions. Next comes the module name followed by the function and any parameters. This format is illustrated below:

```
R_<module>_<function>( <parameters> );
```

Here are some examples:

```

status = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
status = R_GPT_Start(&g_timer0_ctrl);
status = R_GPT_PeriodSet(&g_timer0_ctrl, period);
status = R_ADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
status = R_ADC_InfoGet(&g_adc0_ctrl, &adc_info);

```

HAL Driver API Call Reference Information

Each HAL module has a useful API Reference section that includes key details on each function. The function prototype is presented first, showing the return type (usually `fsp_status_t` for HAL functions) and the function parameters. A short description and any warnings or notes follow the function definition. In some cases, a code snippet is included to illustrate use of the function. Finally, all possible return values are provided to assist in debugging and error management.

◆ R_GPT_PeriodSet()

```

fsp_err_t R_GPT_PeriodSet ( timer_ctrl_t *const p_ctrl,
                          uint32_t const   period_counts
                          )

```

Sets period value provided. If the timer is running, the period will be updated after the next counter overflow. If the timer is stopped, this function resets the counter and updates the period. Implements [timer_api_t::periodSet](#).

Warning
If periodic output is used, the duty cycle buffer registers are updated after the period buffer register. If this function is called while the timer is running and a GPT overflow occurs during processing, the duty cycle will not be the desired 50% duty cycle until the counter overflow after processing completes.

Example:

```

/* Get the source clock frequency (in Hz). There are 3 ways to do this in FSP:
 * - If the PCLKD frequency has not changed since reset, the source clock
 *   frequency is
 *   BSP_STARTUP_PCLKD_HZ >> timer_cfg_t::source_div
 * - Use the R_GPT_InfoGet function (it accounts for the divider).
 * - Calculate the current PCLKD frequency using R_FSP_SystemClockHzGet
 *   (FSP_PRIV_CLOCK_PCLKD) and right shift
 *   by timer_cfg_t::source_div.
 * This example uses the 3rd option (R_FSP_SystemClockHzGet).
 */
uint32_t pclkd_freq_hz = R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKD) >>
    g_timer0_cfg.source_div;

/* Calculate the desired period based on the current clock. Note that this
 * calculation could overflow if the
 * desired period is larger than UINT32_MAX / pclkd_freq_hz. A cast to uint64_t is
 * used to prevent this. */
uint32_t period_counts =
    (uint32_t) (((uint64_t) pclkd_freq_hz * GPT_EXAMPLE_DESIRED_PERIOD_MSEC) /
    GPT_EXAMPLE_MSEC_PER_SEC);

/* Set the calculated period. */
err = R_GPT_PeriodSet(&g_timer0_ctrl, period_counts);
handle_error(err);

```

Return values

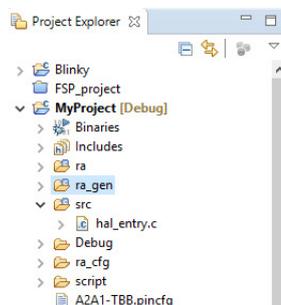

| | |
|-------------------|------------------------------------|
| FSP_SUCCESS | Period value written successfully. |
| FSP_ERR_ASSERTION | p_ctrl was NULL. |
| FSP_ERR_NOT_OPEN | The instance is not opened. |

Figure 51: Module Api Reference Section Example

3.2.8.3 RTOS-Independent Applications

To write application code:

1. Add all drivers and modules in the **Stacks** tab and resolve all dependencies flagged by e² studio such as missing interrupts or drivers.
2. Configure the drivers in the **Properties** view.
3. In the Project Configuration view, click the **Generate Project Content** button.
4. In the **Project Explorer** view, double-click on the src/hal_entry.c file to edit the source file.

*Note*

All configuration structures necessary for the driver to be called in the application are initialized in `ra_gen/hal_data.c`.

Warning

Do not modify the files in the directory `ra_gen`. These files are overwritten every time you push the **Generate Project Content** button.

5. Add your application code here:

Figure 52: Adding user code to hal_entry.c

6. Build the project without errors by clicking on **Project > Build Project**.

The following tutorial shows how execute the steps above and add application code: [Tutorial: Using HAL Drivers - Programming the WDT](#).

The WDT example is a HAL level application which does not use an RTOS. The user guides for each module also include basic application code that you can add to `hal_entry.c`.

3.2.8.4 RTOS Applications

To write RTOS-aware application code using RTOS, follow these steps:

1. Add a thread using the **Stacks** tab.
2. Provide a unique name for the thread in the **Properties** view for this thread.

3. Configure all drivers and resources for this thread and resolve all dependencies flagged by e² studio such as missing interrupts or drivers.
 4. Configure the thread objects.
 5. Provide unique names for each thread object in the **Properties** view for each object.
 6. Add more threads if needed and repeat steps 1 to 5.
 7. In the **RA Project Editor**, click the **Generate Project Content** button.
8. In the **Project Explorer** view, double-click on the src/my_thread_1_entry.c file to edit the source file.

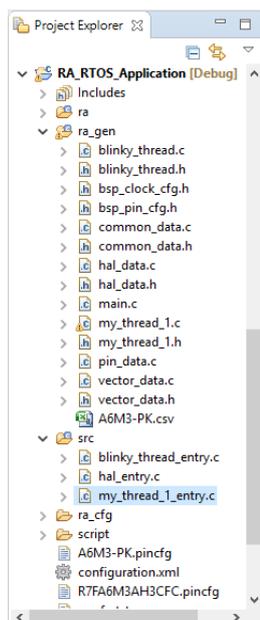

Figure 53: Generated files for an RTOS application

Note

All configuration structures necessary for the driver to be called in the application are initialized in ra_gen/my_thread_1.c and my_thread_2.c

Warning

Do not modify the files in the directory ra_gen. These files are overwritten every time you push the **Generate Project Content** button.

9. Add your application code here:

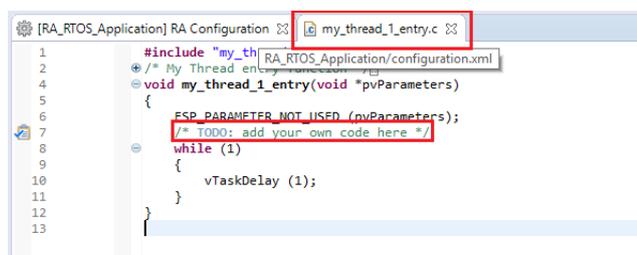

Figure 54: Adding user code to my_thread_1.entry

10. Repeat steps 1 to 9 for the next thread.

11. Build your project without errors by clicking on **Project > Build Project**.

3.2.8.5 Additional Resources for Application Development

Example Projects

A wide variety of Example Projects for FSP and RA MCUs is available on the GitHub site here: <https://github.com/renesas/ra-fsp-examples>. Example projects are organized by target kit so it is easy to find all the examples for your kit of choice.

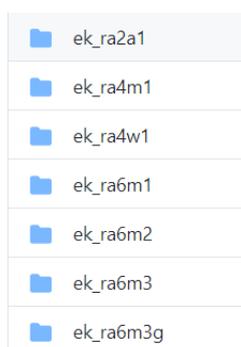

Figure 55: FSP Example Projects Organized by Kit

Projects are available as both downloadable zip files and as project source files. Typically, there is a project for each module. New example projects are being added periodically, so check back if a particular module isn't yet available.

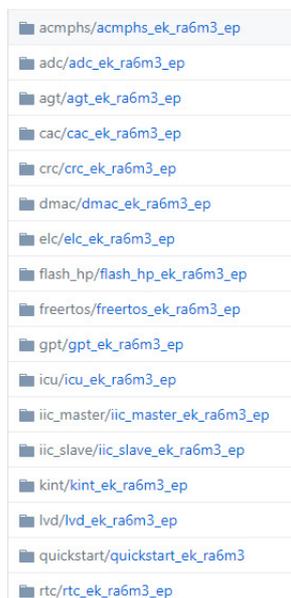

Figure 56: A Selection of Example Projects Available on GitHub

Quick Labs

A variety of Hands-on Do It Yourself labs are available on the Renesas RA and FSP Knowledge Base. Quick FSP Labs target the EK-RA6M3 kit and typically require only 15 minutes to complete. Each lab covers a couple related development tools and techniques like Autocomplete, Developer Assistance,

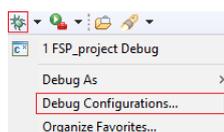

console I/O over RTT, and Visual Expressions, that can speed up the development process. A list of all available Quick Labs can be found here: <https://en-support.renesas.com/knowledgeBase/19450948>

3.2.9 Debugging the Project

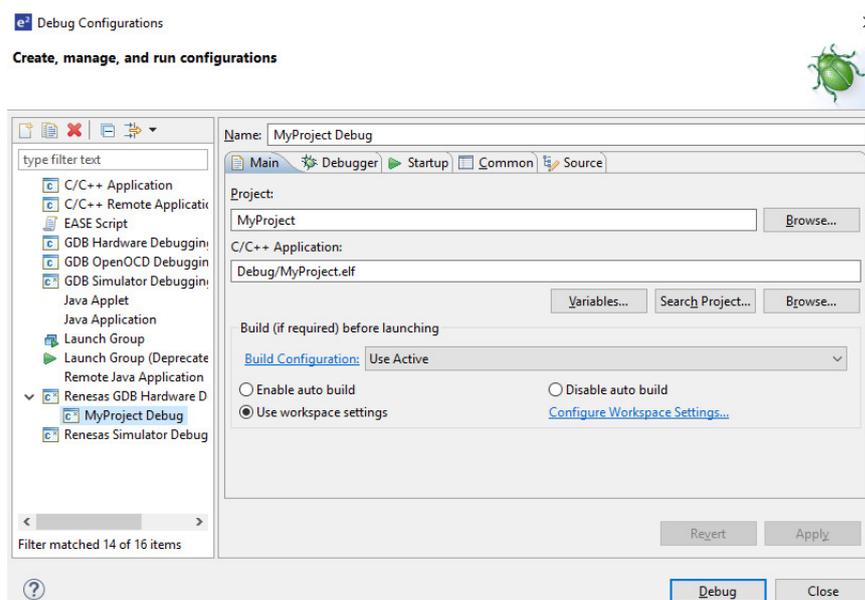

Once your project builds without errors, you can use the Debugger to download your application to the board and execute it.

To debug an application follow these steps:

1. On the drop-down list next to the debug icon, select **Debug Configurations**.

2. In the **Debug Configurations** view, click on your project listed as **MyProject Debug**.

3. Connect the board to your PC via either a standalone Segger J-Link debugger, a Segger J-Link On-Board (included on all RA EKs), or an E2 or E2 Lite and click **Debug**.

Note

For details on using J-Link and connecting the board to the PC, see the Quick Start Guide included in the RA MCU Kit.

3.2.10 Modifying Toolchain Settings

There are instances where it may be necessary to make changes to the toolchain being used (for example, to change optimization level of the compiler or add a library to the linker). Such modifications can be made from within e² studio through the menu **Project > Properties > C/C++ Build > Settings** when the project is selected. The following screenshots show the settings dialogs for the GNU Arm and LLVM toolchains. The dialog looks slightly different depending upon the toolchain being used.

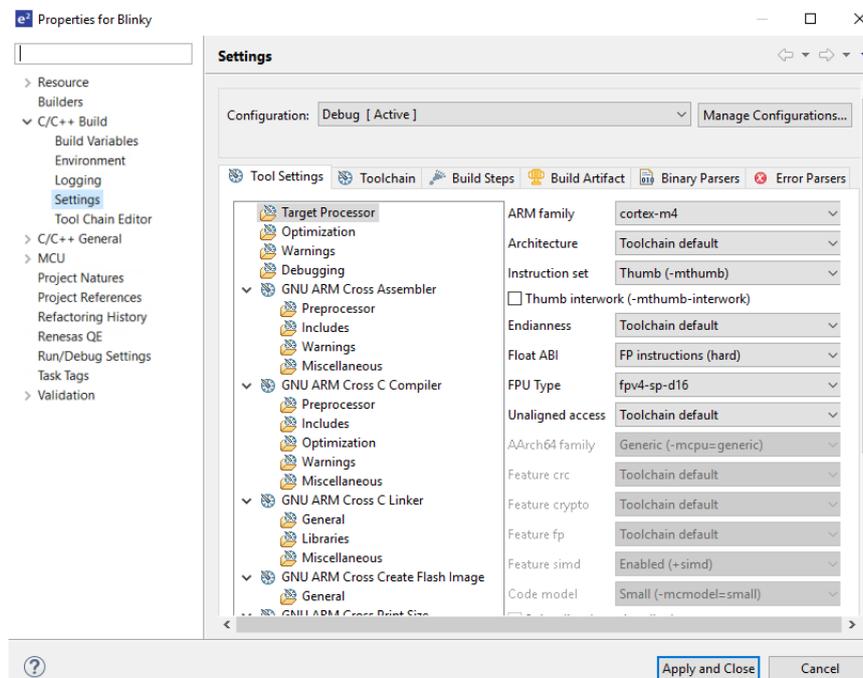

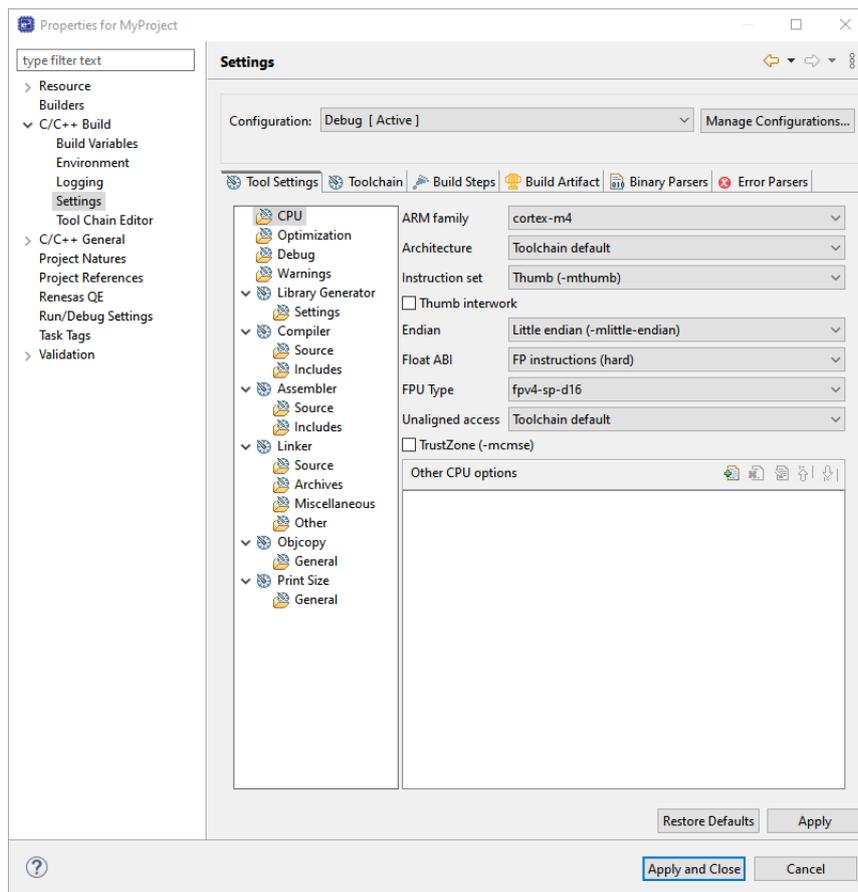

Figure 57: e² studio Project toolchain settings for GNU Arm

Figure 58: e² studio Project toolchain settings for LLVM

The scope for the settings is project scope which means that the settings are valid only for the project being modified.

The settings for the linker which control the location of the various memory sections are contained in a script file specific for the device being used. This script file is included in the project when it is created and is found in the script folder (for example, /script/a6m3.ld).

3.2.11 Creating RA project with Arm Compiler 6 in e² studio

e² studio does not include the Arm Compiler 6 (AC6) toolchain by default. Follow the steps below to integrate AC6 into e² studio and create an AC6 RA project.

Note

It is assumed that the user is already familiar with RA project creation in e² studio. e² studio does not include Arm Compiler 6 (AC6) toolchain by default.

Steps 1 through 8 describe the process for integrating Arm Compiler 6 into e² studio.

1. Download, install, and configure license for the AC6 toolchain (<https://developer.arm.com/tools-and-software/embedded/arm-compiler/downloads/version-6>).
2. Launch e² studio.
3. Go to **Window > Preferences > Toolchains**.

4. Click **Add**.

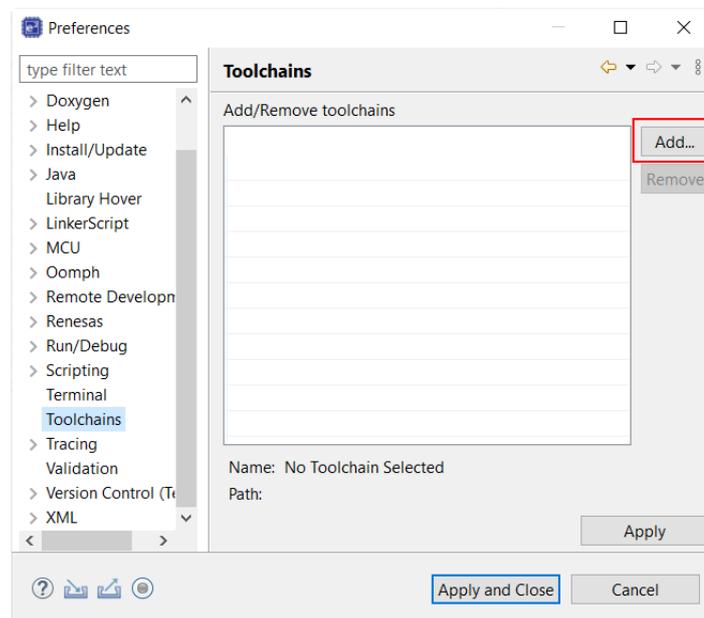

Figure 59: Add Toolchain

5. Browse to the path where AC6 toolchain is installed and select the \bin folder. Click **Next**.

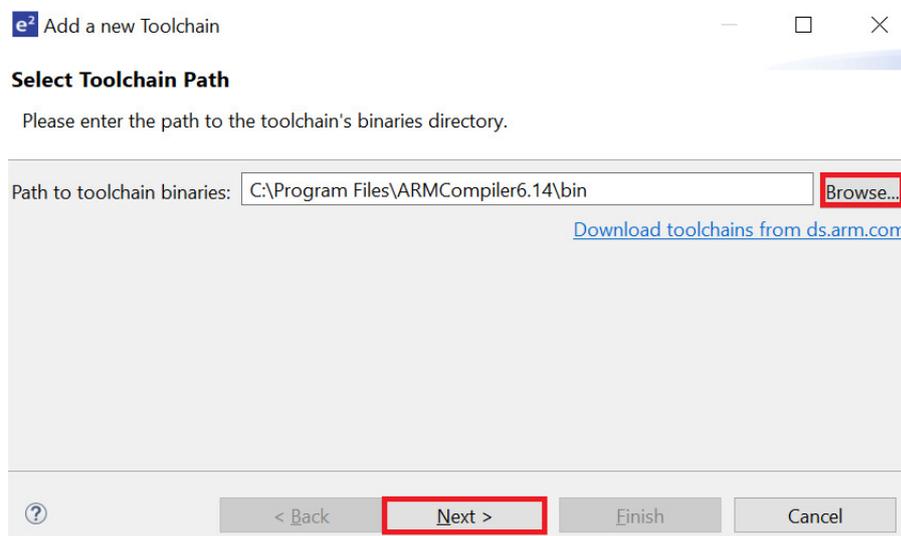

Figure 60: Browse to AC6 Compiler

6. Toolchain information is displayed. Click **Finish**.

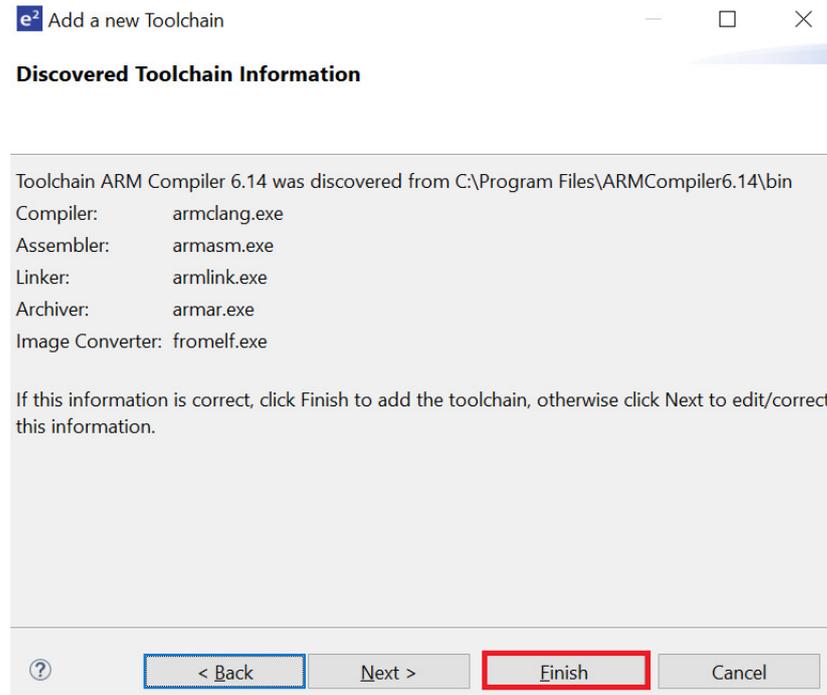

Figure 61: Toolchain Information

7. Click **Apply and Close**.

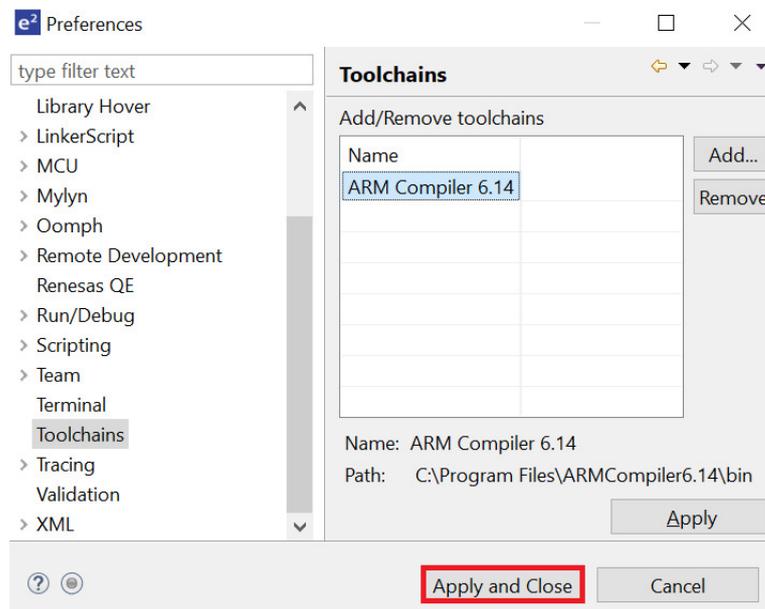

Figure 62: Apply and Close

8. Click **Restart Eclipse** when prompted.

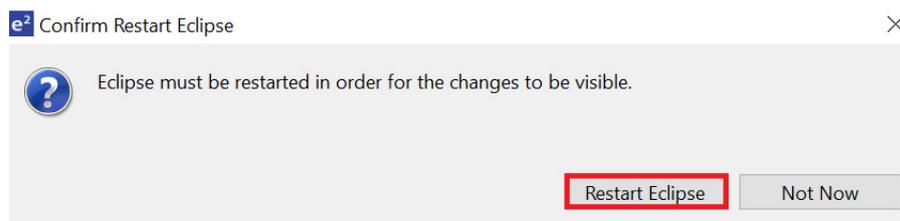

Figure 63: Restart Eclipse

9. When creating a new RA C/C++ project, select **ARM Compiler 6** included in the Toolchains section.

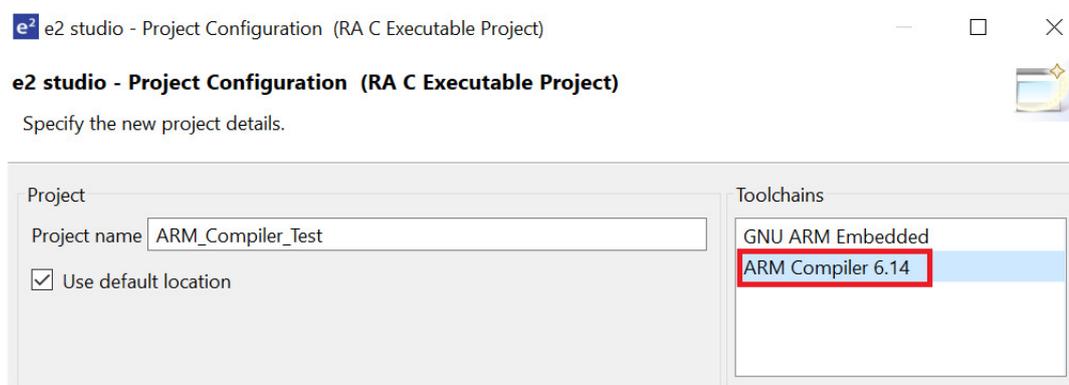

Figure 64: Select Arm Compiler

3.2.12 Importing an Existing Project into e² studio

1. Start by opening e² studio.
2. Open an existing Workspace to import the project and skip to step d. If the workspace doesn't exist, proceed with the following steps:
 - a. At the end of e² studio startup, you will see the Workspace Launcher Dialog box as shown in the following figure.

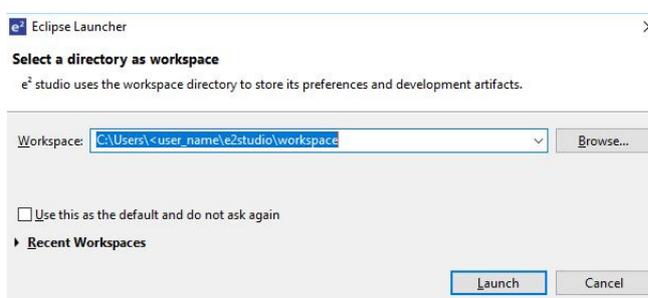

Figure 65: Workspace Launcher dialog

- b. Enter a new workspace name in the Workspace Launcher Dialog as shown in the following figure. e² studio creates a new workspace with this name.

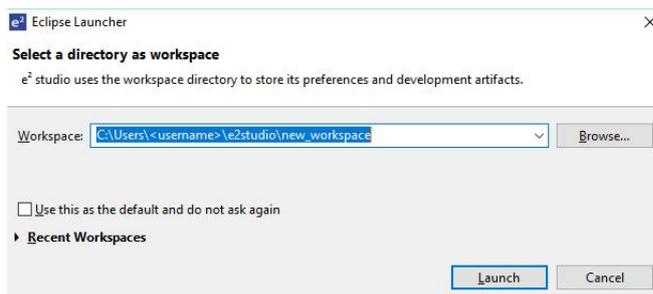

Figure 66: Workspace Launcher dialog - Select Workspace

- c. Click **Launch**.
- d. When the workspace is opened, you may see the Welcome Window. Click on the **Hide** arrow button to proceed past the Welcome Screen as seen in the following figure.

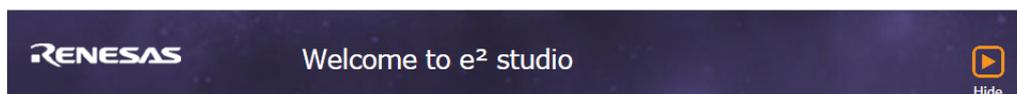

Figure 67: Workbench arrow button

3. You are now in the workspace that you want to import the project into. Click the **File** menu in the menu bar, as shown in the following figure.

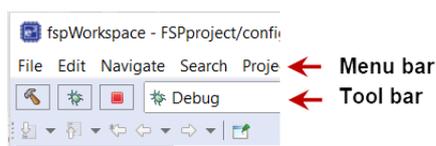

Figure 68: Menu and tool bar

4. Click **Import** on the **File** menu or in the menu bar, as shown in the following figure.

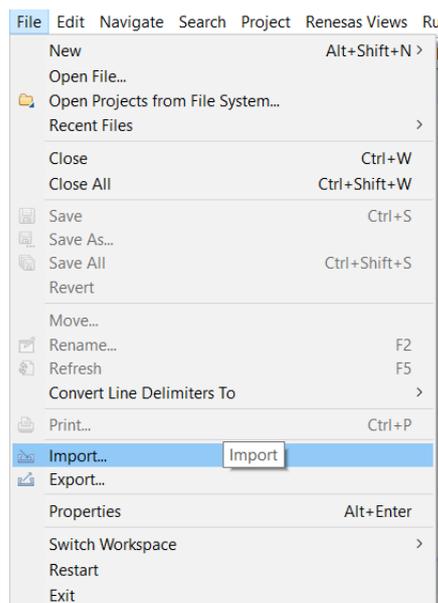

Figure 69: File drop-down menu

5. In the **Import** dialog box, as shown in the following figure, choose the **General** option, then **Existing Projects into Workspace**, to import the project into the current workspace.

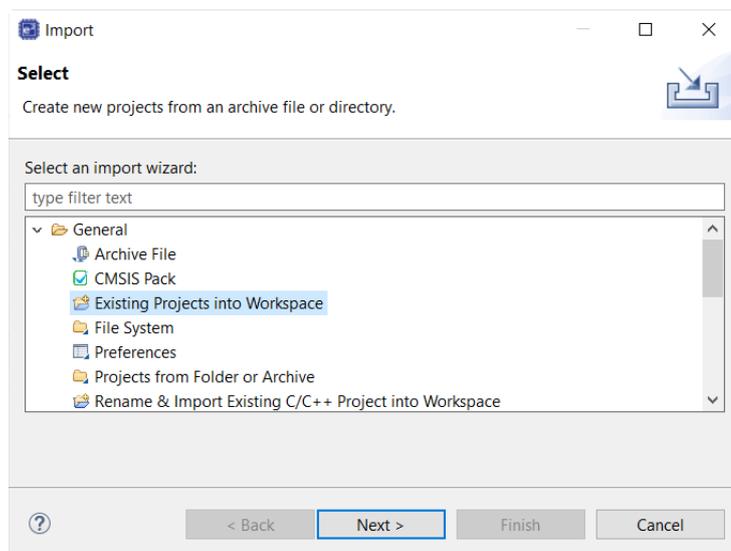

Figure 70: Project Import dialog with "Existing Projects into Workspace" option selected

6. Click **Next**.
7. To import the project, use either **Select archive file** or **Select root directory**.
 - a. Click **Select archive file** as shown in the following figure.

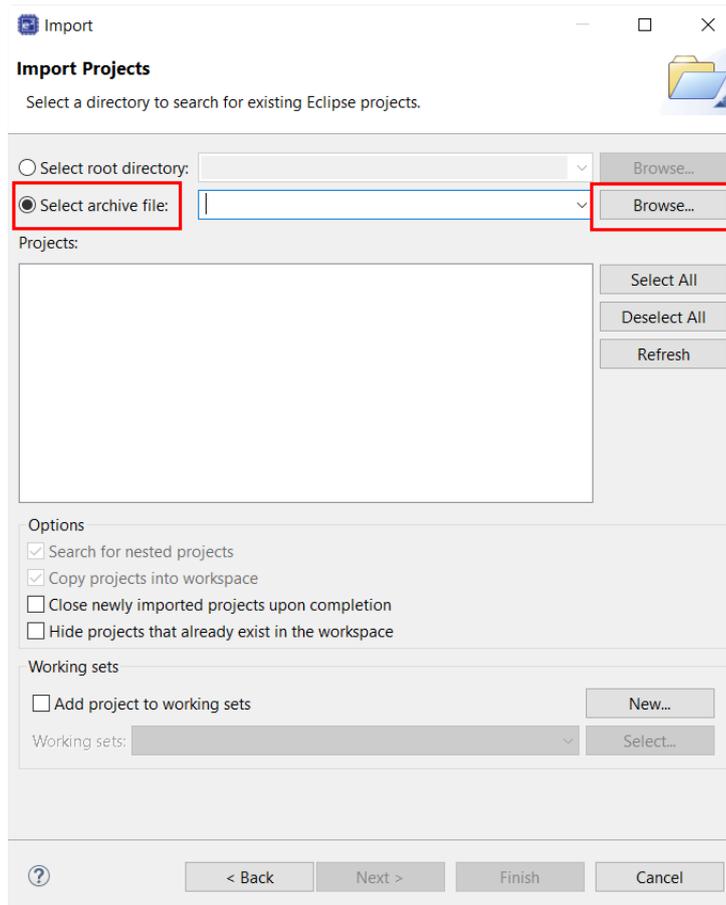

Figure 71: Import Existing Project dialog 1 - Select archive file

b. Click **Select root directory** as shown in the following figure.

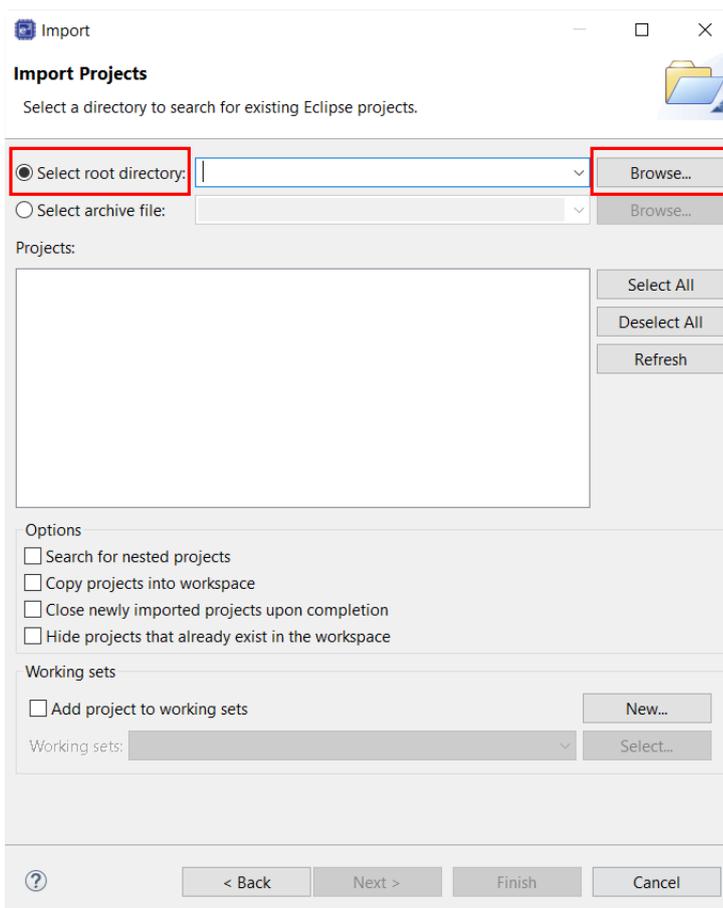

Figure 72: Import Existing Project dialog 1 - Select root directory

8. Click **Browse**.
9. For **Select archive file**, browse to the folder where the zip file for the project you want to import is located. For **Select root directory**, browse to the project folder that you want to import.
10. Select the file for import. In our example, it is CAN_HAL_MG_AP.zip or CAN_HAL_MG_AP.
11. Click **Open**.
12. Select the project to import from the list of **Projects**, as shown in the following figure.

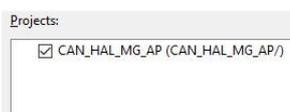

Figure 73: Import Existing Project dialog 2

13. Click **Finish** to import the project.

3.2.13 Using Semihosting in a Project

Note

printf requires use of the heap (BSP Tab -> Properties -> RA Common -> Heap size (bytes))

When using certain standard C I/O functions such as printf and scanf semihosting must be initialized

for them to work correctly with the **Renesas Debug Virtual Console**. In order to setup semihosting a call to `initialise_monitor_handles` should be added somewhere in your application before any semihosting related calls are made. Here is an example declaration and call:

```
extern void initialise_monitor_handles(void); /* Add this declaration before calling.
*/
initialise_monitor_handles(); /* Add this call to your application. */
```

3.3 Tutorial: Your First RA MCU Project - Blinky

3.3.1 Tutorial Blinky

The goal of this tutorial is to quickly get acquainted with the Flexible Platform by moving through the steps of creating a simple application using e² studio and running that application on an RA MCU board.

3.3.2 What Does Blinky Do?

The application used in this tutorial is Blinky, traditionally the first program run in a new embedded development environment.

Blinky is the "Hello World" of microcontrollers. If the LED blinks you know that:

- The toolchain is setup correctly and builds a working executable image for your chip.
- The debugger has installed with working drivers and is properly connected to the board.
- The board is powered up and its jumper and switch settings are probably correct.
- The microcontroller is alive, the clocks are running, and the memory is initialized.

The Blinky example application used in this tutorial is designed to run the same way on all boards offered by Renesas that hold the RA microcontroller. The code in Blinky is completely board independent. It does the work by calling into the BSP (board support package) for the particular board it is running on. This works because:

- Every board has at least one LED connected to a GPIO pin.
- That one LED is always labelled LED1 on the silk screen.
- Every BSP supports an API that returns a list of LEDs on a board, and their port and pin assignments.

3.3.3 Prerequisites

To follow this tutorial, you need:

- Windows based PC
- e² studio
- Flexible Software Package
- An RA MCU board kit

3.3.4 Create a New Project for Blinky

The creation and configuration of an RA MCU project is the first step in the creation of an application.

The base RA MCU pack includes a pre-written Blinky example application that is simple and works on all Renesas RA MCU boards.

Follow these steps to create an RA MCU project:

1. In e² studio, click **File > New > C/C++ Project > Renesas RA** and select **Renesas RA C/C++ Project**.
2. Assign a name to this new project. Blinky is a good name to use for this tutorial.
3. Click **Next**. The **Project Configuration** window shows your selection.

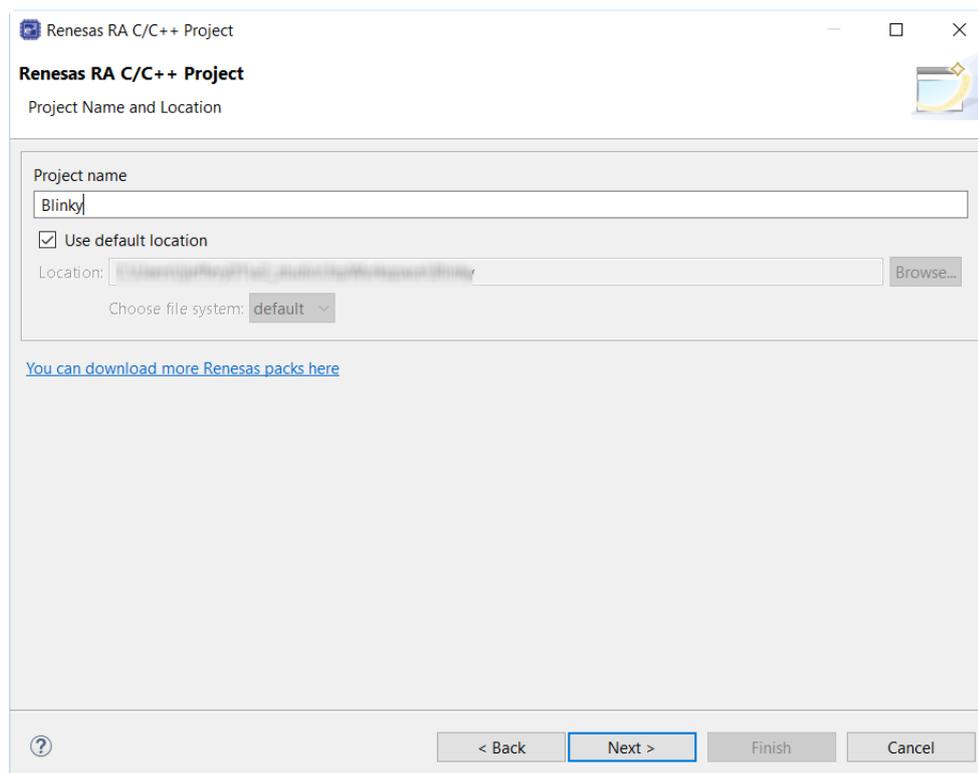

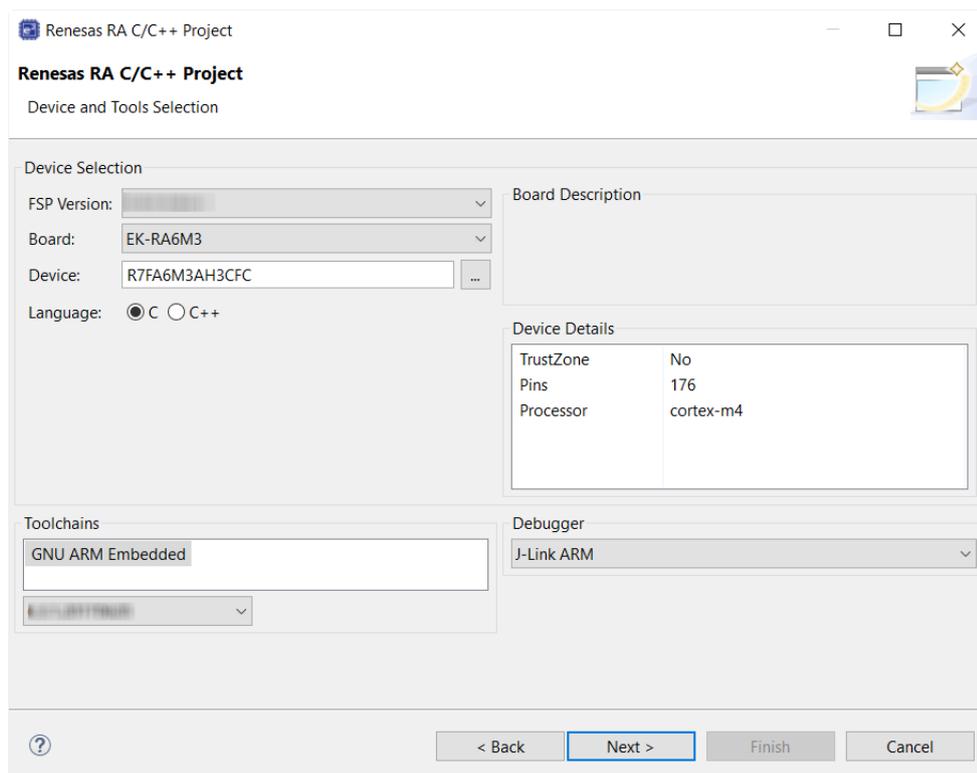

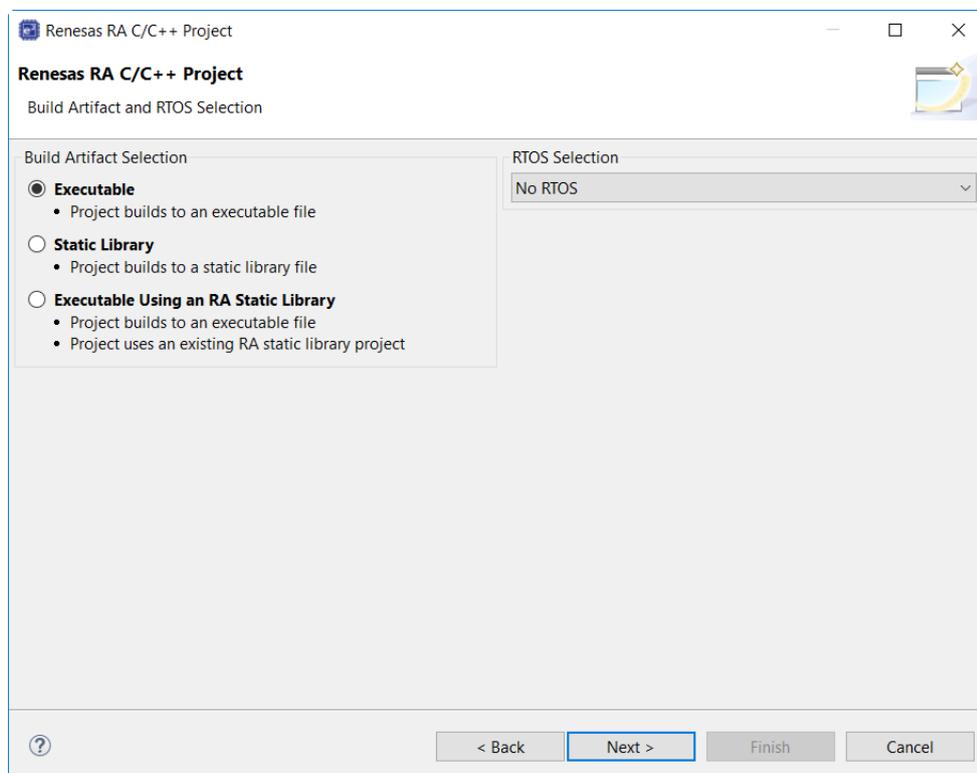

Figure 74: e² studio Project Configuration window (part 1)

4. Select the board support package by selecting the name of your board from the **Device Selection** drop-down list and click **Next**.

Figure 75: e² studio Project Configuration window (part 2)

5. Select the build artifact and RTOS.

Figure 76: e² studio Project Configuration window (part 3)

6. Select the Blinky template for your board and click **Finish**.

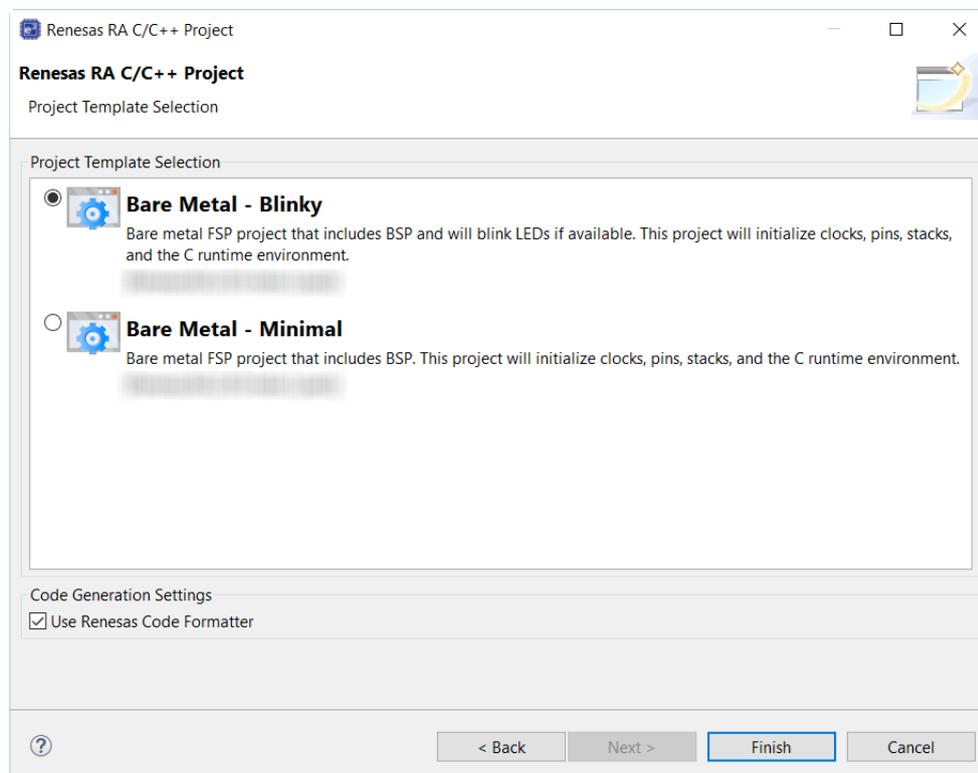

Figure 77: e² studio Project Configuration window (part 4)

Once the project has been created, the name of the project will show up in the **Project Explorer** window of e² studio. Now click the **Generate Project Content** button in the top right corner of the **Project Configuration** window to generate your board specific files.

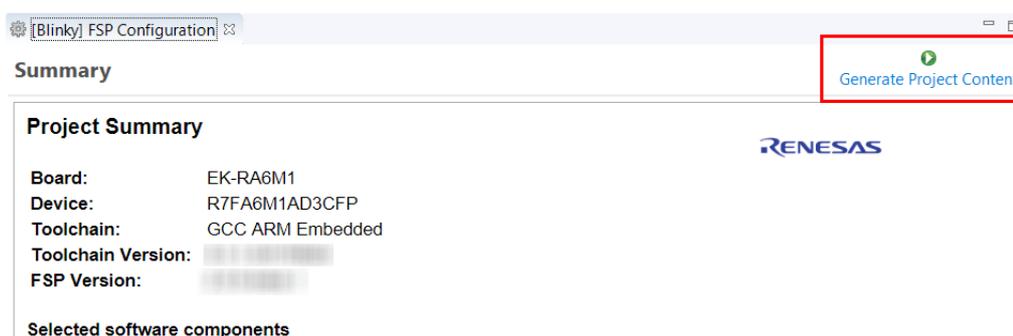

Figure 78: e² studio Project Configuration tab

Your new project is now created, configured, and ready to build.

3.3.4.1 Details about the Blinky Configuration

The **Generate Project Content** button creates configuration header files, copies source files from templates, and generally configures the project based on the state of the **Project Configuration** screen.

For example, if you check a box next to a module in the **Components** tab and click the **Generate Project Content** button, all the files necessary for the inclusion of that module into the project will be copied or created. If that same check box is then unchecked those files will be deleted.

3.3.4.2 Configuring the Blinky Clocks

By selecting the Blinky template, the clocks are configured by e² studio for the Blinky application. The clock configuration tab (see [Configuring Clocks](#)) shows the Blinky clock configuration. The Blinky clock configuration is stored in the BSP clock configuration file (see [BSP Clock Configuration](#)).

3.3.4.3 Configuring the Blinky Pins

By selecting the Blinky template, the GPIO pins used to toggle the LED1 are configured by e² studio for the Blinky application. The pin configuration tab shows the pin configuration for the Blinky application (see [Configuring Pins](#)). The Blinky pin configuration is stored in the BSP configuration file (see [BSP Pin Configuration](#)).

3.3.4.4 Configuring the Parameters for Blinky Components

The Blinky project automatically selects the following HAL components in the Components tab:

- r_ioport

To see the configuration parameters for any of the components, check the **Properties** tab in the HAL window for the respective driver (see [Adding and Configuring HAL Drivers](#)).

3.3.4.5 Where is main()?

The main function is located in < project >/ra_gen/main.c. It is one of the files that are generated during the project creation stage and only contains a call to hal_entry(). For more information on generated files, see [Adding and Configuring HAL Drivers](#).

3.3.4.6 Blinky Example Code

The blinky application is stored in the hal_entry.c file. This file is generated by e² studio when you select the Blinky Project template and is located in the project's src/ folder.

The application performs the following steps:

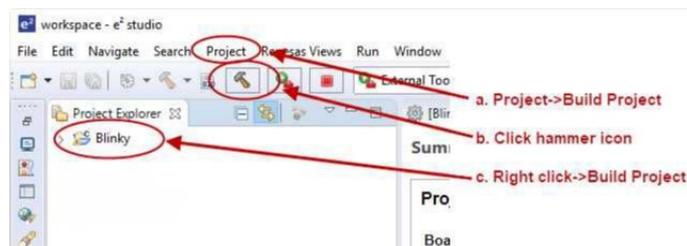

1. Get the LED information for the selected board by bsp_leds_t structure.
2. Define the output level HIGH for the GPIO pins controlling the LEDs for the selected board.
3. Get the selected system clock speed and scale down the clock, so the LED toggling can be observed.
4. Toggle the LED by writing to the GPIO pin with R_BSP_PinWrite((bsp_io_port_pin_t) pin, pin_level);

3.3.5 Build the Blinky Project

Highlight the new project in the **Project Explorer** window by clicking on it and build it.

There are three ways to build a project:

1. Click on **Project** in the menu bar and select **Build Project**.
2. Click on the hammer icon.
3. Right-click on the project and select **Build Project**.

Figure 79: e² studio Project Explorer window

Once the build is complete a message is displayed in the build **Console** window that displays the final image file name and section sizes in that image.

```

CDT Build Console [Blinky]
'Finished building: ../ra/board/ra6m3_ek/board_leds.c'
'Finished building: ../ra/board/ra6m3_ek/board_init.c'
'Finished building: ../ra/board/ra6m3_ek/board_qspi.c'
'Building target: Blinky.elf'
'Invoking: GNU ARM Cross C Linker'
arm-none-eabi-gcc @"Blinky.elf.in"
'Finished building target: Blinky.elf'
'Invoking: GNU ARM Cross Create Flash Image'
arm-none-eabi-objcopy -O srec "Blinky.elf" "Blinky.srec"
'Invoking: GNU ARM Cross Print Size'
arm-none-eabi-size --format=berkeley "Blinky.elf"
text  data  bss  dec  hex  filename
4240   8  1152  5400  1518 Blinky.elf
'Finished building: Blinky.srec'
'Finished building: Blinky.siz'
11:50:45 Build Finished. 0 errors, 0 warnings. (took 19s.208ms)

```

Figure 80: e² studio Project Build console

3.3.6 Debug the Blinky Project

3.3.6.1 Debug prerequisites

To debug the project on a board, you need

- The board to be connected to e² studio
- The debugger to be configured to talk to the board
- The application to be programmed to the microcontroller

Applications run from the internal flash of your microcontroller. To run or debug the application, the application must first be programmed to the microcontroller's flash. There are two ways to do this:

- JTAG debugger
- Built-in boot-loader via UART or USB

Some boards have an on-board JTAG debugger and others require an external JTAG debugger connected to a header on the board.

Refer to your board's user manual to learn how to connect the JTAG debugger to e² studio.

3.3.6.2 Debug steps

To debug the Blinky application, follow these steps:

1. Configure the debugger for your project by clicking **Run > Debugger Configurations ...**

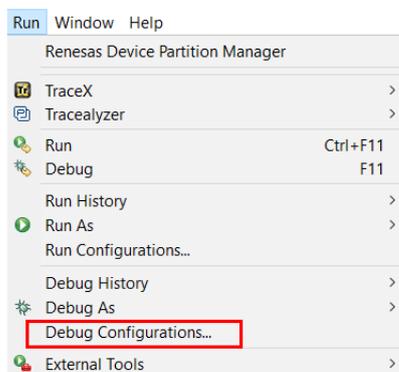

Figure 81: e² studio Debug icon

or by selecting the drop-down menu next to the bug icon and selecting **Debugger Configurations ...**

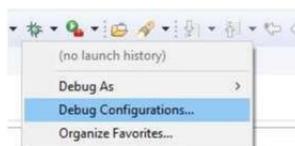

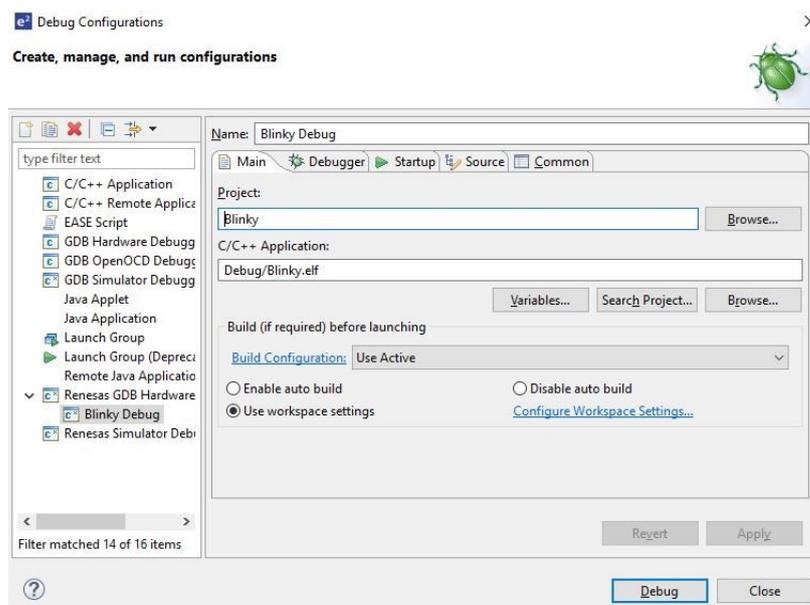

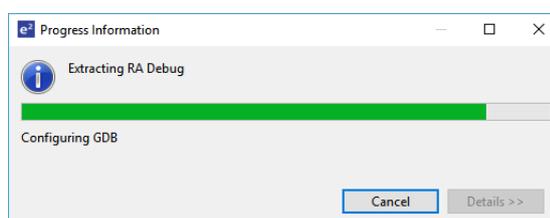

Figure 82: e² studio Debugger Configurations selection option

2. Select your debugger configuration in the window. If it is not visible then it must be created by clicking the **New** icon in the top left corner of the window. Once selected, the **Debug Configuration** window displays the Debug configuration for your Blinky project.

Figure 83: e² studio Debugger Configurations window with Blinky project

3. Click **Debug** to begin debugging the application.

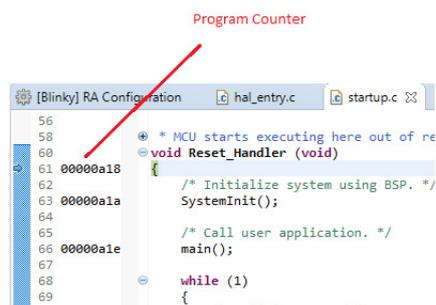

4. Extracting RA Debug.

3.3.6.3 Details about the Debug Process

In debug mode, e² studio executes the following tasks:

1. Downloading the application image to the microcontroller and programming the image to the internal flash memory.
2. Setting a breakpoint at main().
3. Setting the stack pointer register to the stack.
4. Loading the program counter register with the address of the reset vector.
5. Displaying the startup code where the program counter points to.

Figure 84: e² studio Debugger memory window

3.3.7 Run the Blinky Project

While in Debug mode, click **Run > Resume** or click on the **Play** icon twice.

Figure 85: e² studio Debugger Play icon

The LEDs on the board marked LED1, LED2, and LED3 should now be blinking.

3.4 Tutorial: Using HAL Drivers - Programming the WDT

3.4.1 Application WDT

This tutorial illustrates the creation of a simple application that uses the Watchdog Timer module to monitor program operation. The tutorial shows each step in the development process and in particular identifies the auto-generated files and project structure created when using FSP and its GUI based configurator. The level of detail provided here is more than is normally needed during development but can be helpful in explaining how FSP works behind the scenes to simplify your work.

This application makes use of the following FSP modules:

- [MCU Board Support Package](#)
- [Watchdog \(r_wdt\)](#)
- [I/O Port \(r_ioport\)](#)

3.4.2 Creating a WDT Application Using the RA MCU FSP and e² studio

3.4.2.1 Using FSP and e² studio

The Flexible Software Package (FSP) from Renesas provides a complete driver library for developing RA MCU applications. FSP provides Hardware Abstraction Layer (HAL) drivers, Board Support Package (BSP) drivers for the developer to use to create applications. FSP is integrated into Renesas e² studio based on eclipse providing build (editor, compiler and linker) and debug phases with an extended GNU Debug (GDB) interface.

3.4.2.2 The WDT Application

The flowchart for the WDT application is shown below.

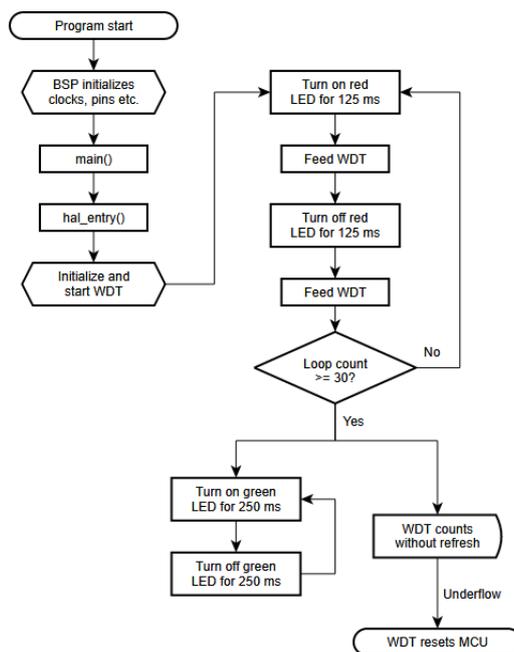

Figure 86: WDT Application flow diagram

3.4.2.3 WDT Application flow

The main sections of the WDT application are:

1. The BSP initializes the clocks, pins and other elements of the MCU readying the application to run.
2. main() calls hal_entry(). The function hal_entry() is created by FSP with a placeholder for user code. The code for the WDT is added to this function.
3. Initialize the WDT, but do not start it.
4. Start the WDT by refreshing it.
5. In the first loop the red LED flashes 30 times and refreshes the watchdog each time the LED state is changed.
6. In the second loop, the green LED flashes, but the program DOES NOT refresh the watchdog. After the watchdog timeout period the device will reset which can be observed by the red LED flashing again as the sequence repeats.

3.4.3 Creating the Project with e² studio

Start e² studio and choose a workspace folder in the Workspace Launcher. Configure a new RA MCU project as follows.

1. Select **File > New > RA C/C++ Project**. Then select the template for the project.

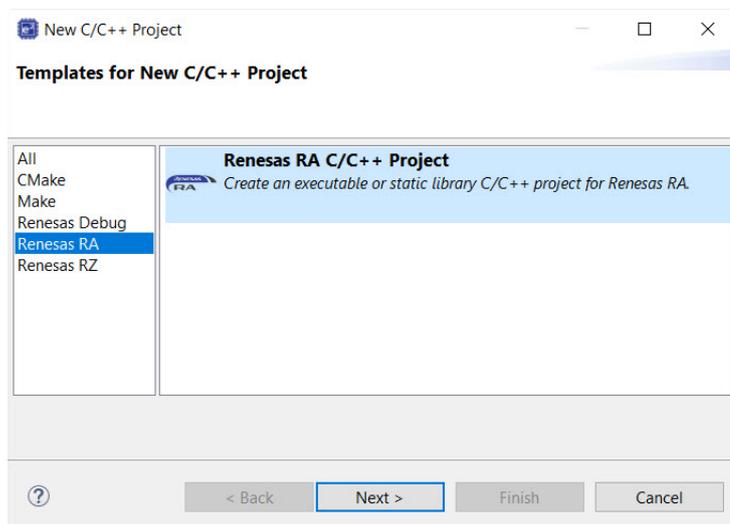

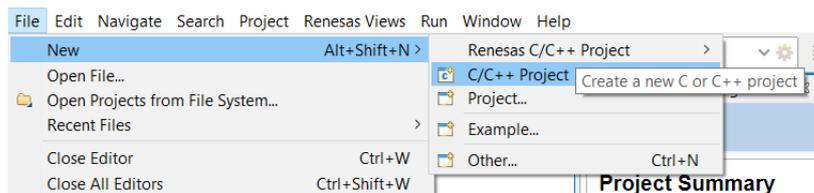

Figure 87: Creating a new project

2. In the e² studio Project **Configuration (RA Project)** window enter a project name, for example, WDT_Application. In addition, select the toolchain. If you want to choose new locations for the project unselect **Use default location**. Click **Next**.

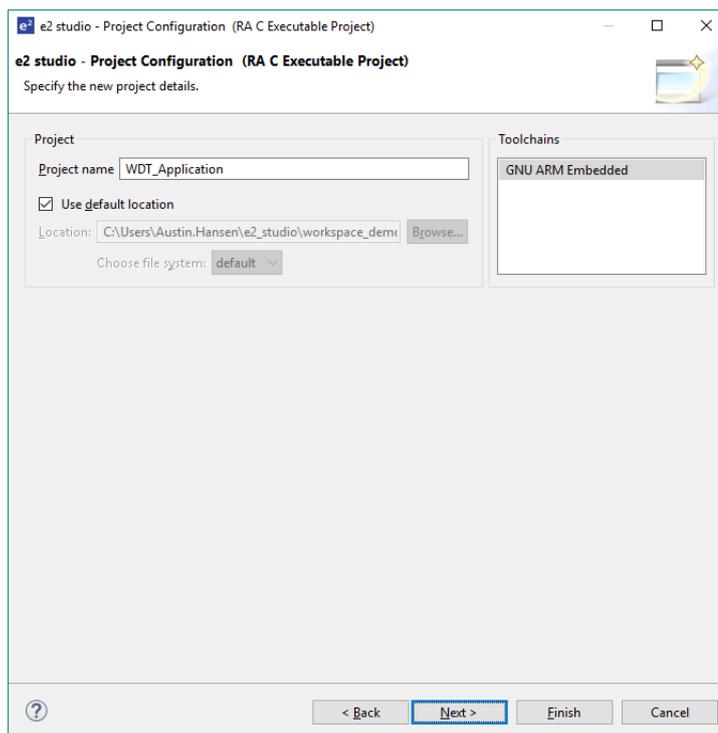

Figure 88: Project configuration (part 1)

- This application runs on the EK-RA6M3 board. So, for the **Board** select **EK-RA6M3**.

This will automatically populate the **Device** drop-down with the correct device used on this board. Select the **Toolchain** version. Select **J-Link ARM** as the **Debugger**. Click **Next** to configure the project.

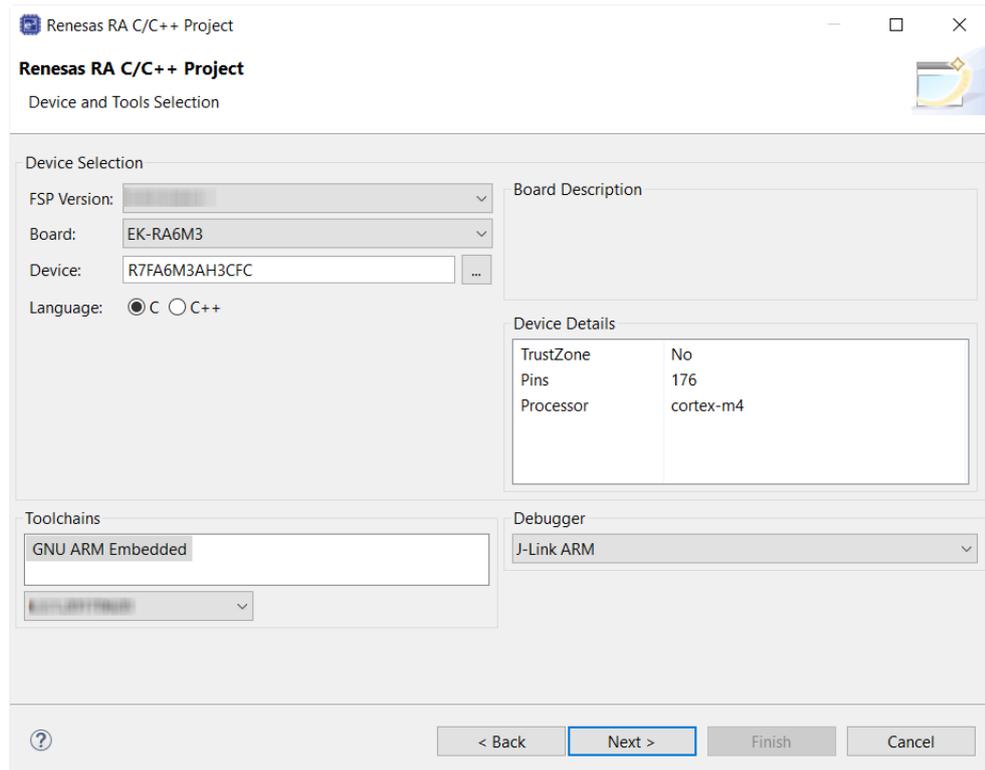

Figure 89: Project configuration (part 2)

The project template is now selected. As no RTOS is required select **Bare Metal - Blinky**.

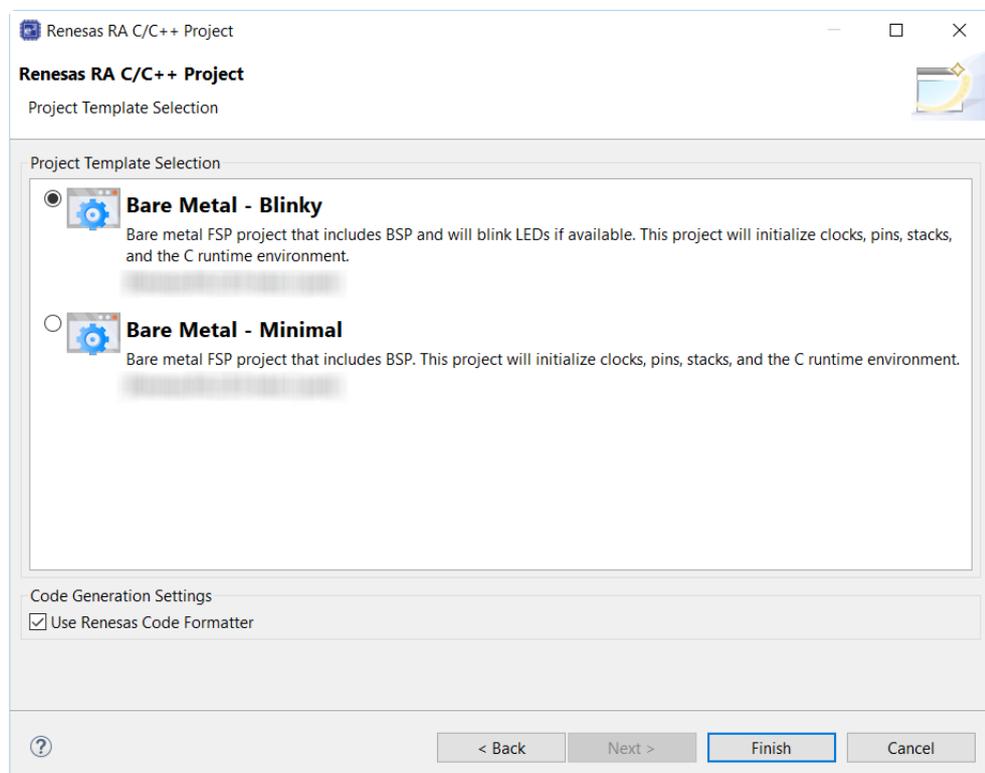

Figure 90: Project configuration (part 3)

4. Click **Finish**.

e² studio creates the project and opens the **Project Explorer** and **Project Configuration Settings** views with the **Summary** page showing a summary of the project configuration.

3.4.4 Configuring the Project with e² studio

e² studio simplifies and accelerates the project configuration process by providing a GUI interface for selecting the options to configure the project.

e² studio offers a selection of perspectives presenting different windows to the user depending on the operation in progress. The default perspectives are **C/C++**, **FSP Configuration** and **Debug**. The perspective can be changed by selecting a new one from the buttons at the top right.

Figure 91: Selecting a perspective

The **C/C++** perspective provides a layout selected for code editing. The **FSP Configuration** perspective provides elements for configuring a RA MCU project, and the **Debug** perspective provides a view suited for debugging.

1. In order to configure the project settings ensure the **FSP Configuration** perspective is selected.
2. Ensure the **Project Configuration [WDT Application]** is open. It is already open if the Summary information is visible. To open the Project Configuration now or at any time make sure the **RA Configuration** perspective is selected and double-click on the configuration.xml file in the Project Explorer pane on the right side of e² studio.

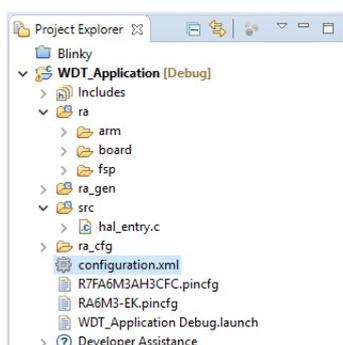

Figure 92: RA MCU Project Configuration Settings

At the base of the Project Configuration view there are several tabs for configuring the project. A project may require changes to some or all of these tabs. The tabs are shown below.

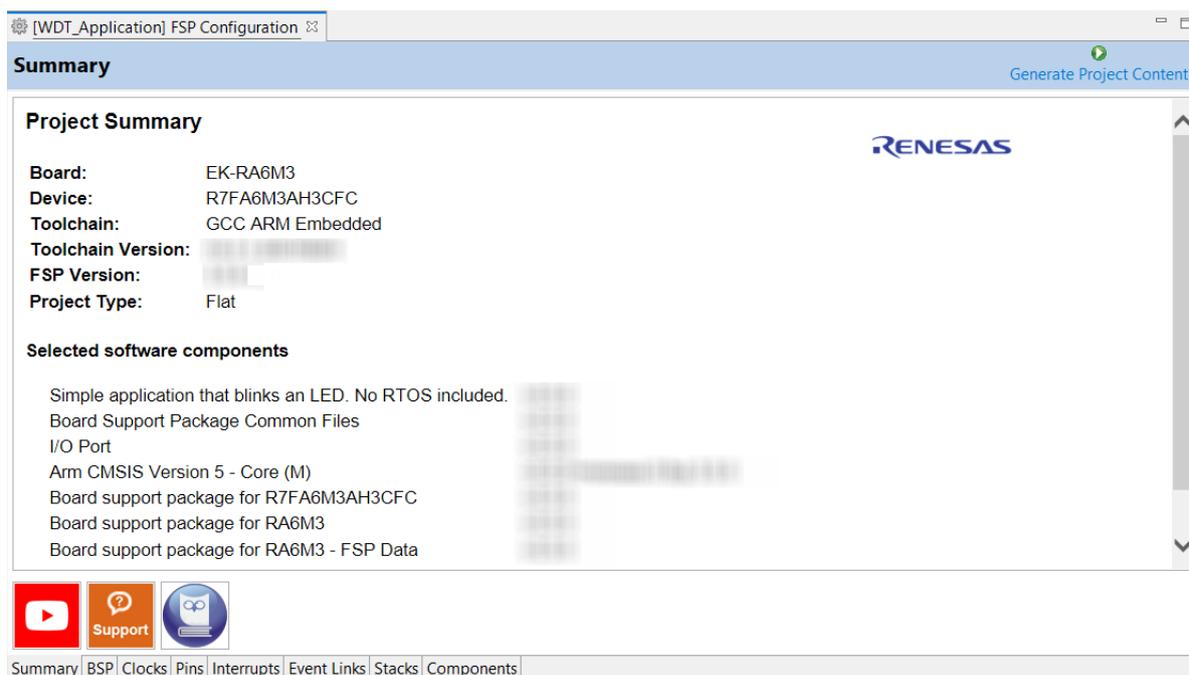

Figure 93: Project Configuration Tabs

3.4.4.1 BSP Tab

The **BSP** tab allows the Board Support Package (BSP) options to be modified from their defaults. For this particular WDT project no changes are required. However, if you want to use the WDT in auto-start mode, you can configure the settings of the OFS0 (Option Function Select Register 0) register in the **BSP** tab. See the RA Hardware User's Manual for details on the WDT autostart mode.

3.4.4.2 Clocks Tab

The **Clocks** tab presents a graphical view of the clock tree of the device. The drop-down boxes in the GUI enables configuration of the various clocks. The WDT uses PCLKB. The default output frequency for this clock is 60 MHz. Ensure this clock is outputting this value.

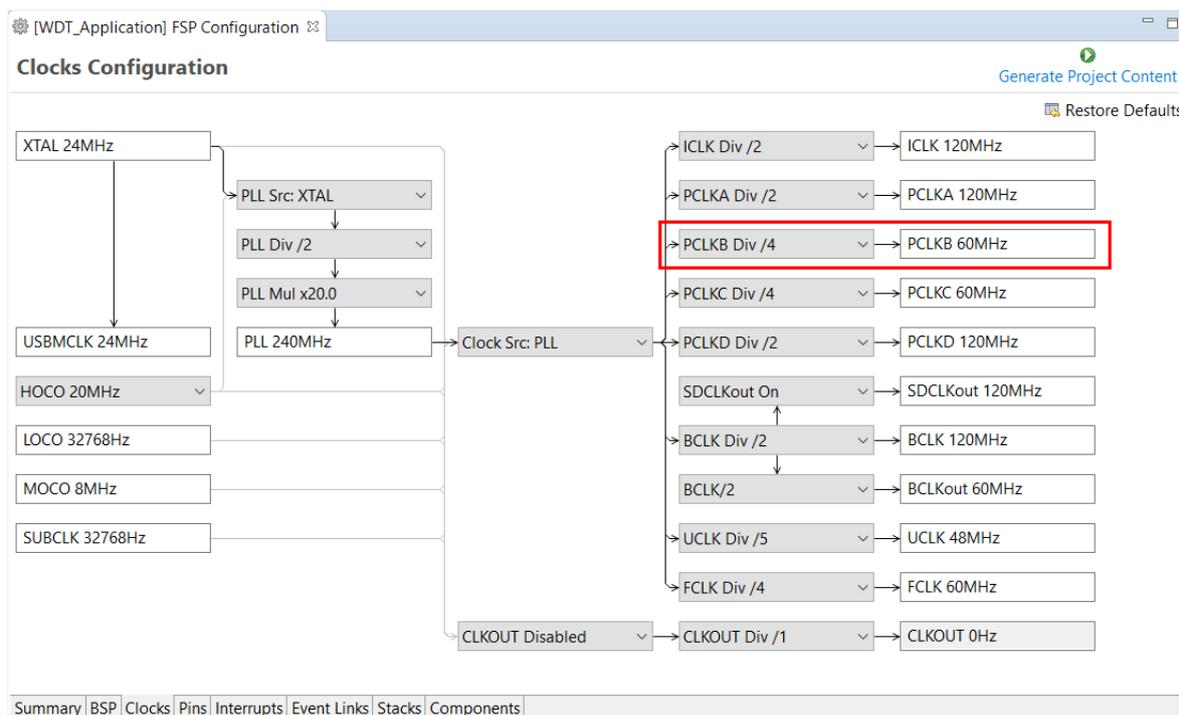

Figure 94: Clock configuration

3.4.4.3 Interrupts Tab

The **Interrupts** tab is used to add new user events or interrupts. No new interrupts or events are needed by the application, so no edits in this tab are required.

3.4.4.4 Event Links Tab

The **Event Links** tab is used to configure events used by the Event Link Controller (ELC). This project doesn't use the ELC, so no edits in this tab are required.

3.4.4.5 Pins Tab

The **Pins** tab provides a graphical tool for configuring the functionality of the pins of the device. For the WDT project no pin configuration is required. Although the project uses two LEDs connected to pins on the device, these pins are pre-configured as output GPIO pins by the BSP.

3.4.4.6 Stacks Tab

You can add any driver to the project using the **Stacks** tab. The HAL driver IO port pins are added automatically by e² studio when the project is configured. The WDT application uses no RTOS Resources, so you only need to add the HAL WDT driver.

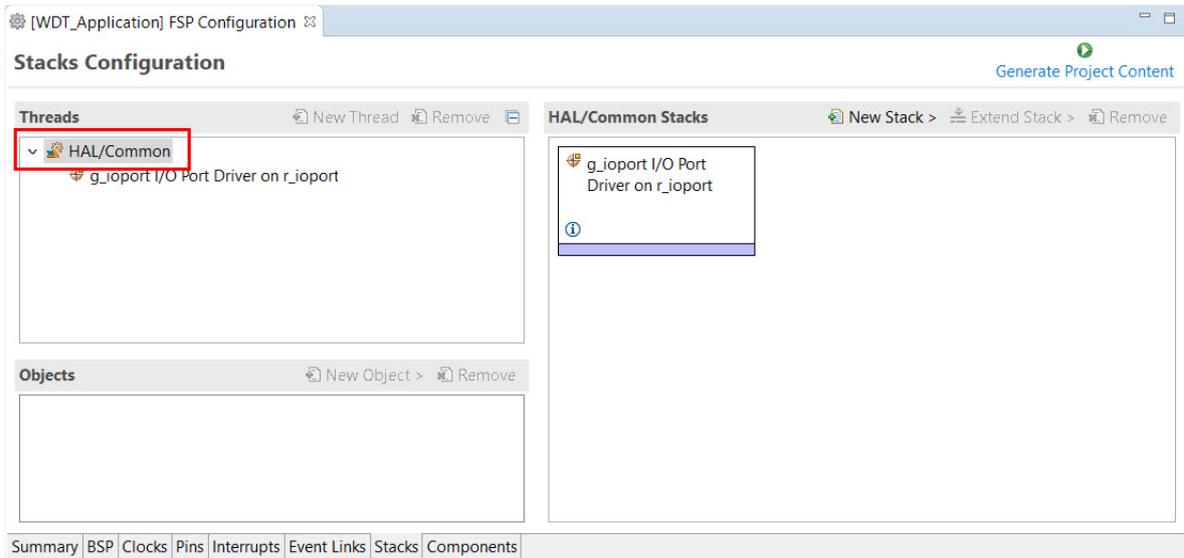

Figure 95: Stacks tab

1. Click on the **HAL/Common Panel** in the Threads Window as indicated in the figure above.

The Stacks Panel becomes a **HAL/Common Stacks** panel and is populated with the modules preselected by e² studio.

2. Click on **New Stack** to find a pop-up window with the available HAL level drivers.
3. Select **WATCHDOG Driver on r_wdt**.

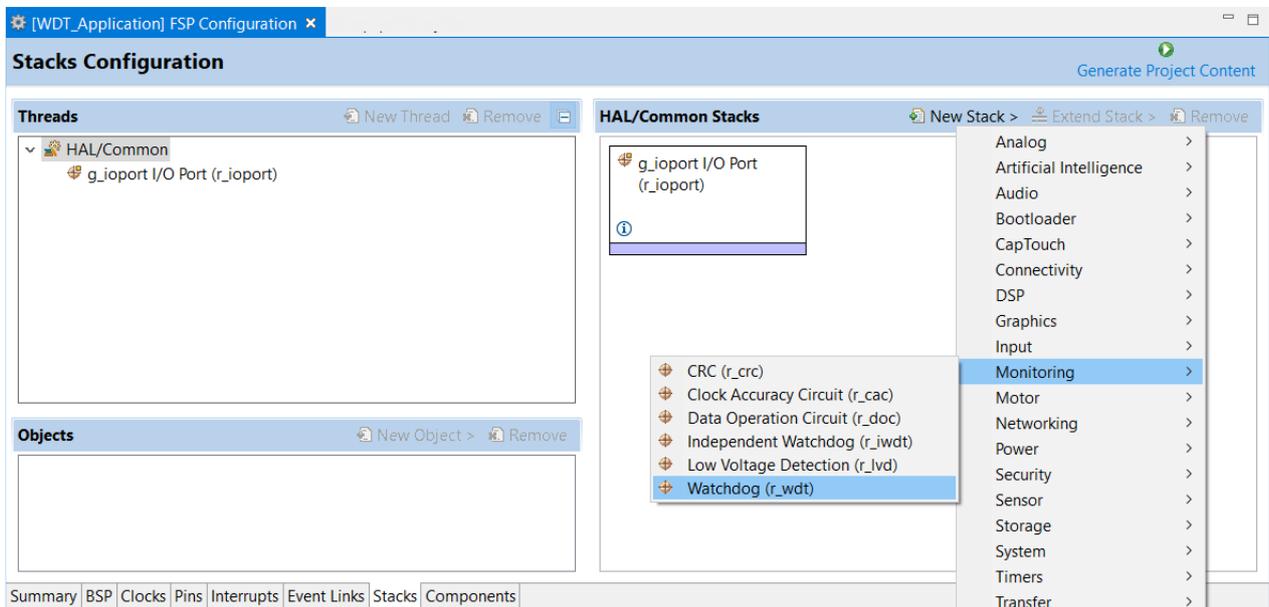

Figure 96: Module Selection

The selected HAL WDT driver is added to the **HAL/Common Stacks** Panel and the **Property** Window shows all configuration options for the selected module. The **Property** tab for the WDT should be visible at the bottom left of the screen. If it is not visible, check that the **FSP Configuration** perspective is selected.

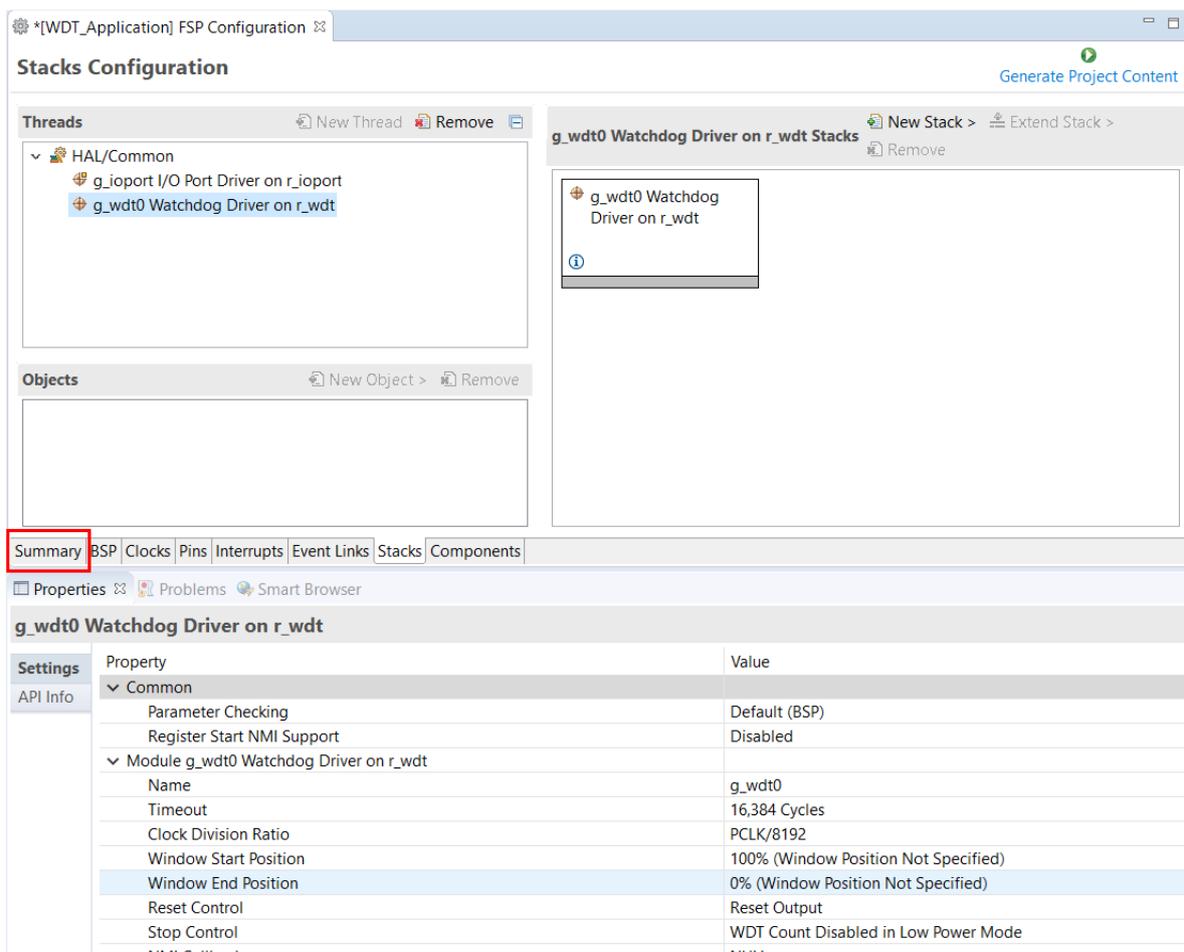

Figure 97: Module Properties

All parameters can be left with their default values.

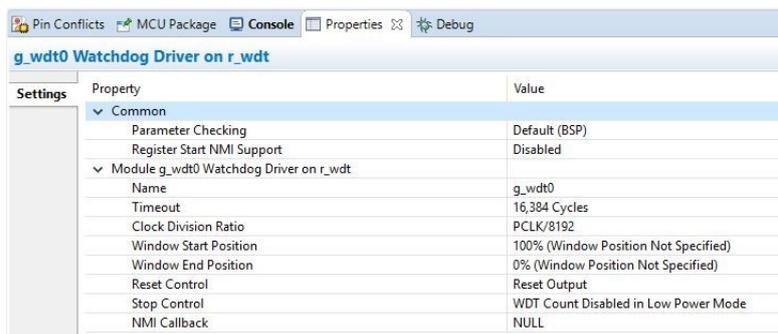

Figure 98: g_wdt WATCHDOG Driver on WDT properties

With PCLKB running at 60 MHz the WDT will reset the device 2.23 seconds after the last refresh.

$$\text{WDT clock} = 60 \text{ MHz} / 8192 = 7.32 \text{ kHz}$$

$$\text{Cycle time} = 1 / 7.324 \text{ kHz} = 136.53 \text{ us}$$

Timeout = 136.53 us x 16384 = 2.23 seconds

Save the **Project Configuration** file and click the **Generate Project Content** button in the top right corner of the **Project Configuration** pane.

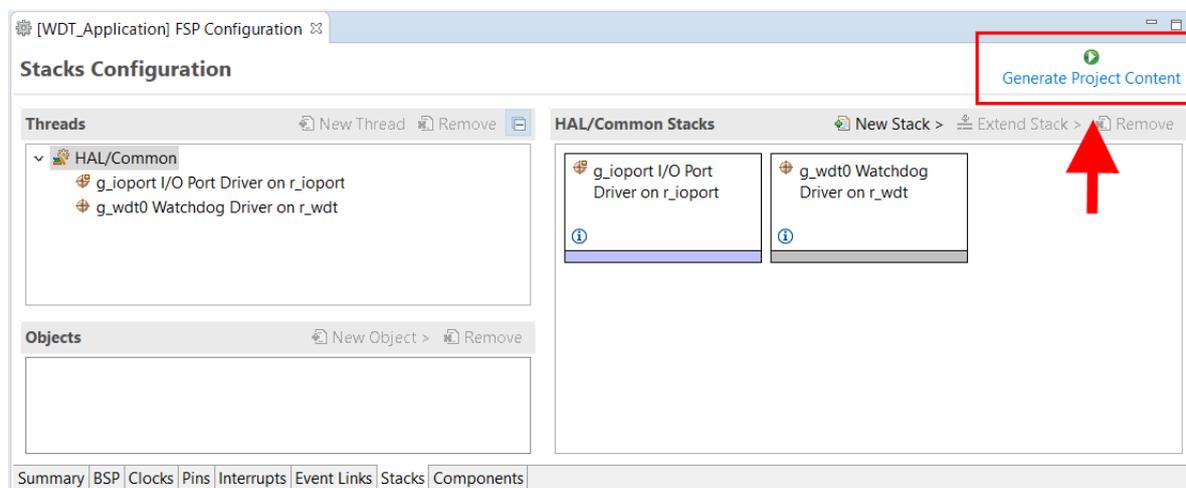

Figure 99: Generate Project Content button

e² studio generates the project files.

3.4.4.7 Components Tab

The components tab is included for reference to see which modules are included in the project. Modules are selected automatically in the Components view after they are added in the Stacks Tab.

For the WDT project ensure that the following modules are selected:

1. HAL_Drivers -> r_ioport
2. HAL_Drivers -> r_wdt

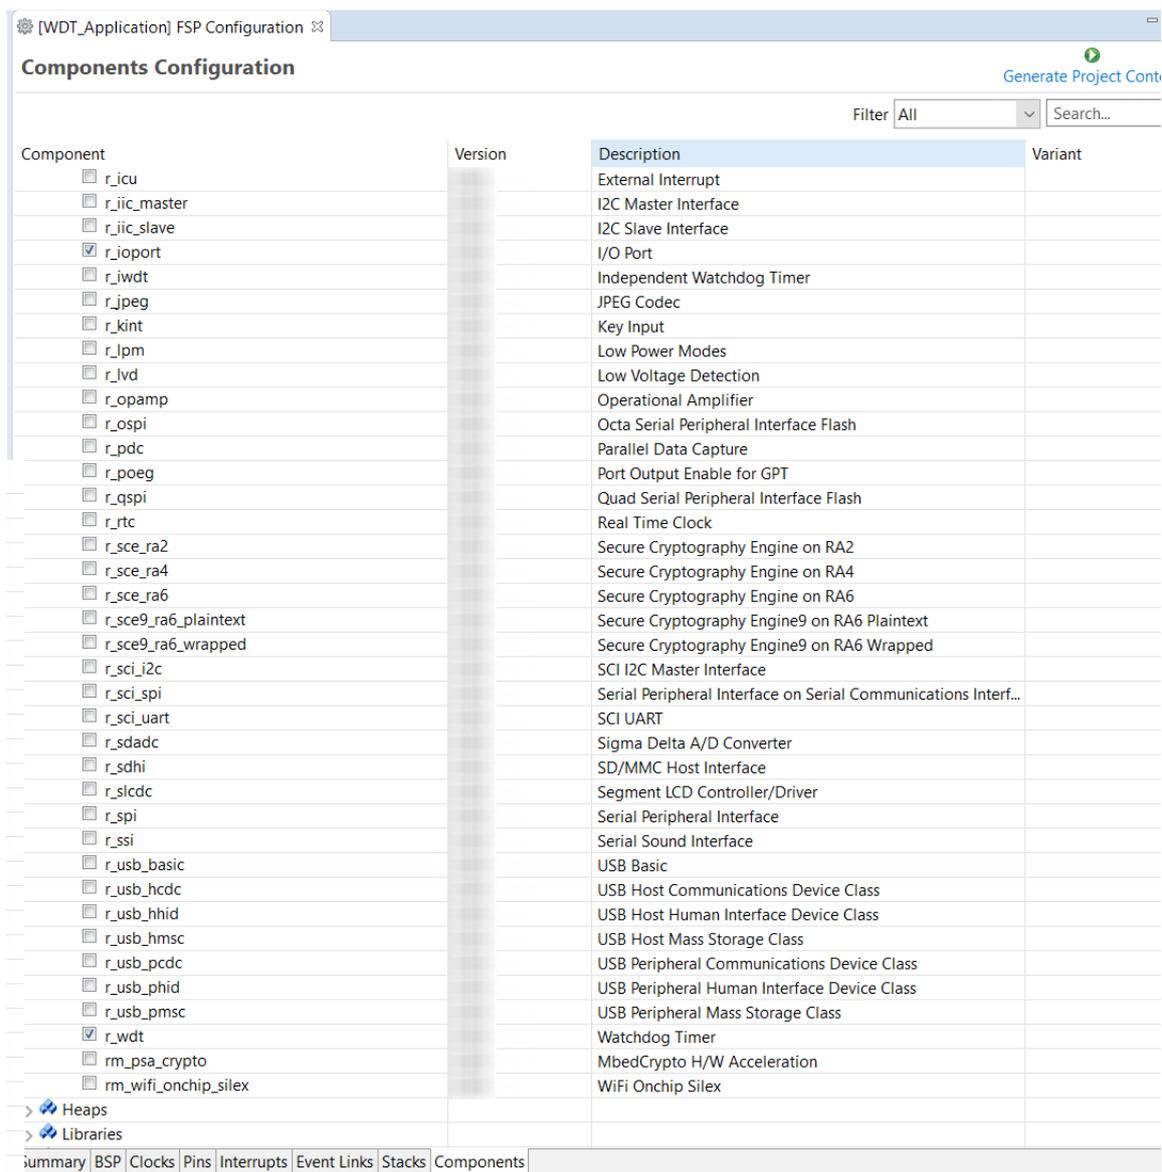

Figure 100: Component Selection

Note

The list of modules displayed in the Components tab depends on the installed FSP version.

3.4.5 WDT Generated Project Files

Clicking the Generate Project Content button performs the following tasks.

- r_wdt folder and WDT driver contents created at:

ra/fsp/src

- r_wdt_api.h created in:

ra/fsp/inc/api

- r_wdt.h created in:

ra/fsp/inc/instances

The above files are the standard files for the WDT HAL module. They contain no specific project contents. They are the driver files for the WDT. Further information on the contents of these files can be found in the documentation for the WDT HAL module.

Configuration information for the WDT HAL module in the WDT project is found in:

ra_cfg/fsp_cfg/r_wdt_cfg.h

The above file's contents are based upon the **Common** settings in the **g_wdt WATCHDOG Driver on WDT Properties** pane.

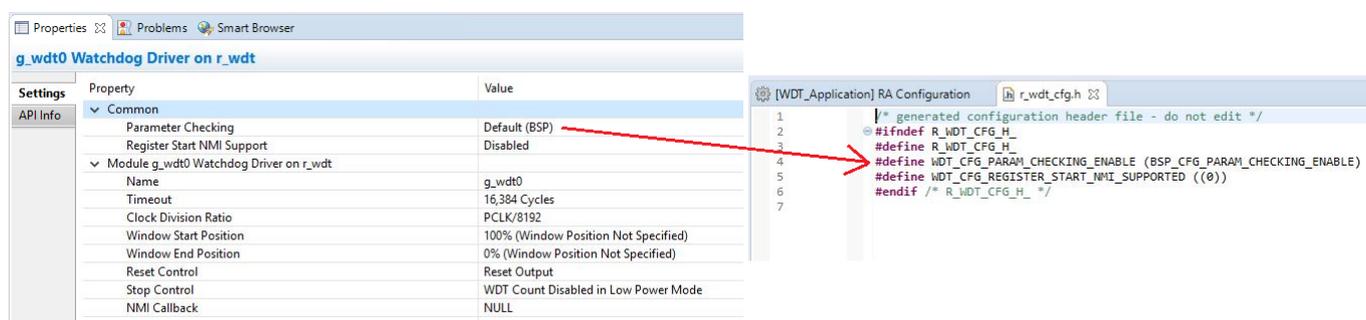

Figure 101: r_wdt_cfg.h contents

Warning

Do not edit any of these files as they are recreated every time the Generate Project Content button is clicked and so any changes will be overwritten.

The r_ioport folder is not created at ra/fsp/src as this module is required by the BSP and so already exists. It is included in the WDT project in order to include the correct header file in ra_gen/hal_data.c—see later in this document for further details. For the same reason the other IOPORT header files— ra/fsp/inc/api/r_ioport_api.h and ra/fsp/inc/instances/r_ioport.h—are not created as they already exist.

In addition to generating the HAL driver files for the WDT and IOPORT files e² studio also generates files containing configuration data for the WDT and a file where user code can safely be added. These files are shown below.

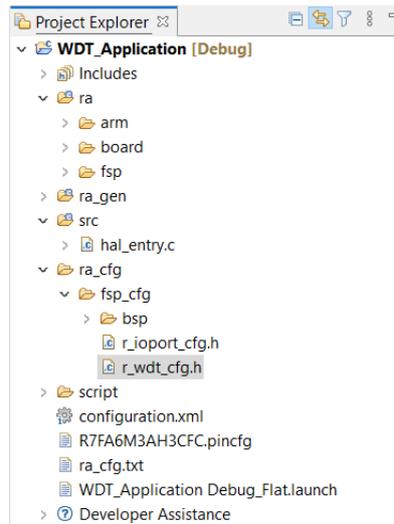

Figure 102: WDT project files

3.4.5.1 WDT hal_data.h

The contents of hal_data.h are shown below.

```
/* generated HAL header file - do not edit */
#ifndef HAL_DATA_H_
#define HAL_DATA_H_
#include <stdint.h>
#include "bsp_api.h"
#include "common_data.h"
#include "r_wdt.h"
#include "r_wdt_api.h"
#ifdef __cplusplus
extern "C"
{
#endif
extern const wdt_instance_t g_wdt0;
#ifdef NULL
void NULL(wdt_callback_args_t * p_args);
#endif
extern wdt_instance_ctrl_t g_wdt0_ctrl;
extern const wdt_cfg_t g_wdt0_cfg;
void hal_entry(void);
```

```
void g_hal_init(void);

#ifdef __cplusplus
} /* extern "C" */
#endif

#endif /* HAL_DATA_H_ */
```

hal_data.h contains the header files required by the generated project. In addition this file includes external references to the **g_wdt0** instance structure which contains pointers to the configuration, control, api structures used for WDT HAL driver.

Warning

This file is regenerated each time Generate Project Content is clicked and must not be edited.

3.4.5.2 WDT hal_data.c

The contents of hal_data.c are shown below.

```
/* generated HAL source file - do not edit */
#include "hal_data.h"
wdt_instance_ctrl_t g_wdt0_ctrl;
const wdt_cfg_t g_wdt0_cfg =
{
    .timeout          = WDT_TIMEOUT_16384,
    .clock_division  = WDT_CLOCK_DIVISION_8192,
    .window_start    = WDT_WINDOW_START_100,
    .window_end      = WDT_WINDOW_END_0,
    .reset_control   = WDT_RESET_CONTROL_RESET,
    .stop_control    = WDT_STOP_CONTROL_ENABLE,
    .p_callback      = NULL,
};
/* Instance structure to use this module. */
const wdt_instance_t g_wdt0 =
{.p_ctrl = &g_wdt0_ctrl, .p_cfg = &g_wdt0_cfg, .p_api = &g_wdt_on_wdt};
void g_hal_init (void)
{
    g_common_init();
}
```

hal_data.c contains g_wdt0_ctrl which is the control structure for this instance of the WDT HAL driver. This structure should not be initialized as this is done by the driver when it is opened.

The contents of g_wdt0_cfg are populated in this file using the **Watchdog Driver on g_wdt0** pane in the Project Configuration **Stacks** tab. If the contents of this structure do not reflect the settings made in the IDE, ensure the **Project Configuration** settings are saved before clicking the **Generate Project Content** button.

Warning

This file is regenerated each time Generate Project Content is clicked and so should not be edited.

3.4.5.3 WDT main.c

Contains main() called by the BSP start-up code. main() calls hal_entry() which contains user developed code (see next file). Here are the contents of main.c.

```
/* generated main source file - do not edit*/
#include "hal_data.h"
int main (void)
{
    hal_entry();
    return 0;
}
```

Warning

This file is regenerated each time Generate Project Content is clicked and so should not be edited.

3.4.5.4 WDT hal_entry.c

This file contains the function hal_entry() called from main(). User developed code should be placed in this file and function.

For the WDT project edit the contents of this file to contain the code below. This code implements the flowchart in overview section of this document.

```
#include "hal_data.h"
#include "bsp_pin_cfg.h"
#include "r_ioport.h"
#define RED_LED_NO_OF_FLASHES 30
#define RED_LED_PIN BSP_IO_PORT_01_PIN_00
```

```
#define GREEN_LED_PIN BSP_IO_PORT_04_PIN_00
#define RED_LED_DELAY_MS 125
#define GREEN_LED_DELAY_MS 250
volatile uint32_t delay_counter;
volatile uint16_t loop_counter;
void R_BSP_WarmStart(bsp_warm_start_event_t event);
/*****
*****/
void hal_entry (void)
{
    /* Allow the WDT to run when the debugger is connected */
    R_DEBUG->DBGSTOPCR_b.DBGSTOP_WDT = 0;

    /* Open the WDT */
    R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);
    /* Start the WDT by refreshing it */
    R_WDT_Refresh(&g_wdt0_ctrl);

    /* Flash the red LED and feed the WDT for a few seconds */
    for (loop_counter = 0; loop_counter < RED_LED_NO_OF_FLASHES; loop_counter++)
    {
        /* Turn red LED on */
        R_IOPORT_PinWrite(&g_ioport_ctrl, RED_LED_PIN, BSP_IO_LEVEL_LOW);

        /* Delay */
        R_BSP_SoftwareDelay(RED_LED_DELAY_MS, BSP_DELAY_UNITS_MILLISECONDS);

        /* Refresh WDT */
        R_WDT_Refresh(&g_wdt0_ctrl);

        R_IOPORT_PinWrite(&g_ioport_ctrl, RED_LED_PIN, BSP_IO_LEVEL_HIGH);

        /* Delay */
        R_BSP_SoftwareDelay(RED_LED_DELAY_MS, BSP_DELAY_UNITS_MILLISECONDS);

        /* Refresh WDT */
        R_WDT_Refresh(&g_wdt0_ctrl);
    }

    /* Flash green LED but STOP feeding the WDT. WDT should reset the
    * device */
    while (1)
```

```
{
/* Turn green LED on */
R_IOPORT_PinWrite(&g_ioport_ctrl, GREEN_LED_PIN, BSP_IO_LEVEL_LOW);
/* Delay */
R_BSP_SoftwareDelay(GREEN_LED_DELAY_MS, BSP_DELAY_UNITS_MILLISECONDS);
/* Turn green off */
R_IOPORT_PinWrite(&g_ioport_ctrl, GREEN_LED_PIN, BSP_IO_LEVEL_HIGH);
/* Delay */
R_BSP_SoftwareDelay(GREEN_LED_DELAY_MS, BSP_DELAY_UNITS_MILLISECONDS);
}
}
/*****
*****/
void R_BSP_WarmStart (bsp_warm_start_event_t event)
{
    if (BSP_WARM_START_RESET == event)
    {
#if BSP_FEATURE_FLASH_LP_VERSION != 0
        /* Enable reading from data flash. */
        R_FACI_LP->DFLCTL = 1U;
        /* Would normally have to wait for tDSTOP(6us) for data flash recovery. Placing the
enable here, before clock and
        * C runtime initialization, should negate the need for a delay since the
initialization will typically take more than 6us. */
#endif
    }
    if (BSP_WARM_START_POST_C == event)
    {
        /* C runtime environment and system clocks are setup. */
        /* Configure pins. */
        R_IOPORT_Open(&g_ioport_ctrl, &g_bsp_pin_cfg);
    }
}
}
```

The WDT HAL driver API functions are defined in `r_wdt.h`. The WDT HAL driver is opened through the open API call using the instance structure defined in `r_wdt_api.h`:

```
/* Open the WDT */  
R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);
```

The first passed parameter is the pointer to the control structure `g_wdt0_ctrl` instantiated in `hal_data.c`. The second parameter is the pointer to the configuration data `g_wdt0_cfg` instantiated in the same `hal_data.c` file.

The WDT is started and refreshed through the API call:

```
/* Start the WDT by refreshing it */  
R_WDT_Refresh(&g_wdt0_ctrl);
```

Again the first (and only in this case) parameter passed to this API is the pointer to the control structure of this instance of the driver.

3.4.6 Building and Testing the Project

Build the project in e² studio by clicking **Build > Build Project** or by clicking the build icon. The project should build without errors.

To debug the project

1. Connect the USB cable between the target board debug port and host PC.
2. In the **Project Explorer** pane on the left side of e² studio, right-click on the WDT project **WDT_Application** and select **Debug As > Debug Configurations**.
3. Under **Renesas GDB Hardware Debugging** select **WDT_Application Debug** as shown below.

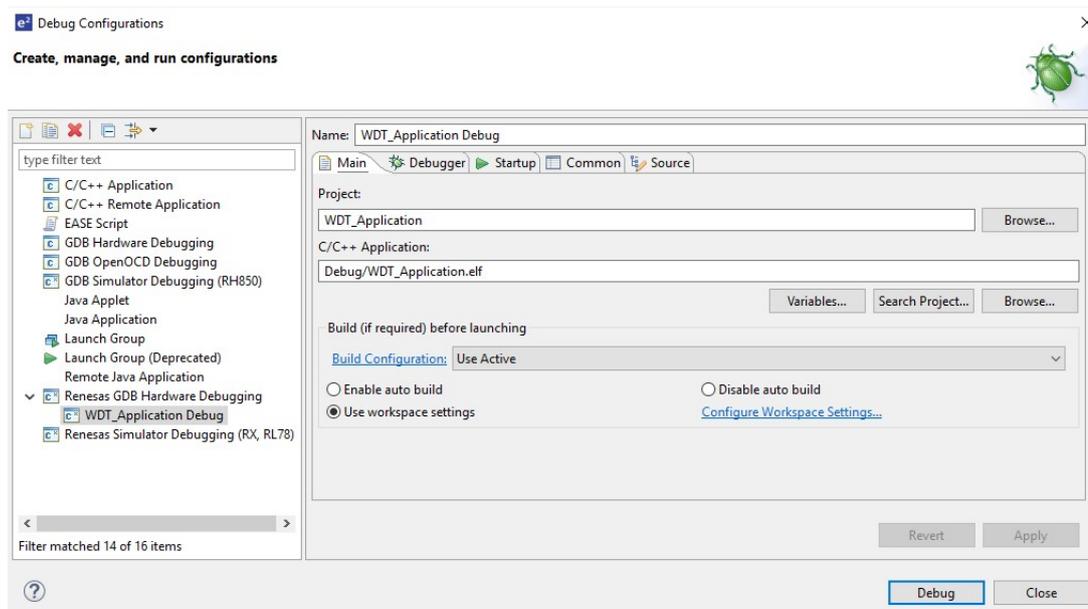

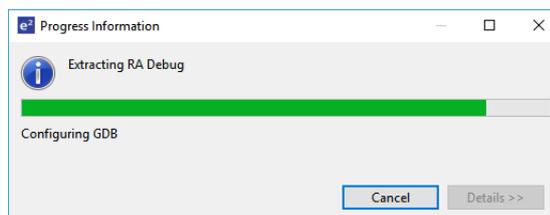

Figure 103: Debug configuration

- Click the **Debug** button. Click Yes to the debug perspective if asked.

- The code should run the `Reset_Handler()` function.
- Resume execution via **Run > Resume**. Execution will stop in `main()` at the call to `hal_entry()`.
- Resume execution again.

The red LED should start flashing. After 30 flashes the green LED will start flashing and the red LED will stop flashing.

While the green LED is flashing the WDT will underflow and reset the device resulting in the red LED to flash again as the sequence repeats.

- Stop the debugger in e² studio via **Run > Terminate**.
- Click the reset button on the target board. The LEDs begin flashing.

3.5 Primer: Arm TrustZone Project Development

This section will introduce the user to the tools supporting Arm® TrustZone® technology configuration for the RA Family of microcontrollers. It is intended to be read by development engineers implementing RA Arm TrustZone projects for the first time. It will introduce basic concepts

followed by workflow and tooling functions designed to simplify and accelerate their first Arm TrustZone development. A background knowledge of e² studio and RA device hardware is expected.

3.5.1 Target Device

RA Cortex®-M33 and Cortex®-M85 devices with Arm TrustZone security extension. As shown in the following table, most RA devices that include TrustZone support also support Device Lifecycle Management (DLM).

| MCU Groups with TrustZone and DLM | MCU Groups with TrustZone and no DLM | MCU Groups with TrustZone and Alternate DLM |
|---|--------------------------------------|---|
| RA4E1, RA4M2, RA4M3, RA6E1, RA6M4, RA6M5, RA6T2 | RA4E2, RA4T1, RA6E2, RA6T3 | RA8M1 |

3.5.2 Renesas Implementation of Arm TrustZone Technology

The following section is supplied for reference only. For full details of TrustZone implementation, refer to Arm documentation (<https://developer.arm.com/ip-products/security-ip/trustzone>) and the MCU user manual.

Arm TrustZone technology divides the MCU and therefore the application into Secure and Non-Secure partitions. Secure applications can access both Secure and Non-Secure memory and resources. Non-Secure code can access Non-Secure memory and resources as well as Secure resources through a set of so-called veneers located in the Non-Secure Callable (NSC) region. This ensures a single access point for Secure code when called from the Non-Secure partition. The MCU starts up in the Secure partition by default. The security state of the CPU can be either Secure or Non-Secure.

The MCU code flash, data flash, and SRAM are divided into Secure (S) and Non-Secure (NS) regions. Code flash and SRAM include a further region known as Non-Secure Callable (NSC). The method to set these memory security attributes depends on whether the device supports DLM:

- For devices that support DLM, memory security attributes are set into the non-volatile memory through SCI or USB boot mode commands when the device lifecycle is Secure Software Debug (SSD) state. The memory security attributes are loaded into the Implementation Defined Attribution Unit (IDAU) peripheral and the memory controller before application execution and cannot be updated by application code.
- For devices that do not support DLM, memory security attributes are written to IDAU registers at startup by application code using secure accesses.

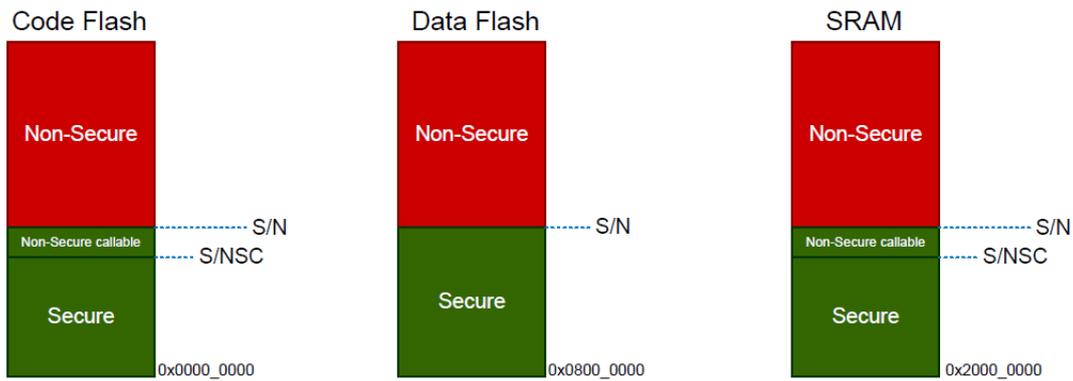

Figure 104: Secure and Non-Secure Regions

Note: All external memory accesses are considered to be Non-Secure.

Code Flash and SRAM can be divided into Secure, Non-Secure, and Non-Secure Callable. All secure memory accesses from the Non-Secure region MUST go through the Non-Secure Callable gateway and target a specific Secure Gateway (SG) assembler instruction. This forces access to Secure APIs at a fixed location and prevents calls to sub-functions and so on. Failing to target an SG instruction will generate a TrustZone exception.

TrustZone enabled compilers will manage generation of the NSC veneer automatically using CMSE extensions.

3.5.2.1 Calling from Non-Secure to Secure

A new instruction SG (Secure Gateway) has been added to the Armv8-M architecture. This MUST be the destination instruction for any branch within the Non-Secure Callable region. If an attempt is made to branch to any other instruction from the Non-Secure partition, a TrustZone exception will be thrown.

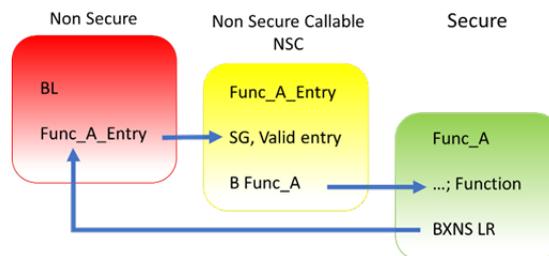

Figure 105: Calling from Non-Secure to Secure Functions

3.5.2.2 Calling from Secure to Non-Secure

Secure code uses B(L)XNS instructions to make direct calls to Non-Secure functions. While this is certainly possible, it can create a security vulnerability in the application. It is also challenging for the Secure application to determine the address of the non-secure function during build phase. From the RA Tools and FSP point view, calling directly from Secure to Non-Secure via FSP API is not supported.

Preference is for the Secure code to initialise as necessary from reset, then pass control to the Non-Secure partition. It will manage any data transfers and so forth via FSP call-backs as security checks. For example, secure data can be copied to Non-Secure RAM.

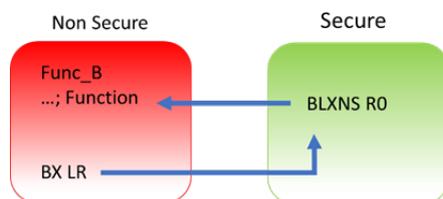

Figure 106: Calling from Secure to Non-Secure Functions

3.5.3 Workflow

Arm TrustZone MCU development normally consists of two projects within a workspace, Secure and Non-Secure. General project workflows are described in the following sections. The Renesas project generator also supports development with "Flat project" model with no Arm TrustZone awareness.

3.5.3.1 Secure Project

1. Start a new Secure project in e² studio.
2. Select and configure pins and drivers/stacks that need to be initialized and used in Secure mode. This should be kept to a minimum to reduce the security attack surface.
3. Expose top of stacks as Non-Secure Callable (NSC) **if** they need to be accessed from Non-Secure partition. Again, this should be kept to a minimum.
4. Generate project content and write Secure code such as key handling and opening drives as needed.
5. Modify/remove any unnecessary "Guard" functions as needed to control access via NSC.
6. Build project.
7. A Non-Secure project will be needed before debugging. If necessary, prepare a "dummy" Non-Secure project or replace `R_BSP_NonSecureEnter();` with `while(1);` in `hal_entry.c`.

3.5.3.2 Non-Secure Project

1. Start a new Non-Secure project.
2. If you have access to the Secure project, choose this option. However, if you only have access to a device with pre-programmed Secure code (commonly referred to as provisioned device) choose "Secure Bundle".
3. Select and configure pins and drivers/stacks that need to be initialized and used in Non-Secure mode.
4. Note that you can add NSC drivers and stacks as needed.
5. Generate project content and write Non-Secure code as needed
6. Access NSC drivers and Stacks via Guard functions.
7. Build and debug project.

3.5.3.3 Flat Project

A flat project does not technically use Arm TrustZone as the developer has made a decision to place the entire application in Secure partition from restart.

Notes:

- Any code placed in external memory (such as OSPI or QSPI) will be Non-Secure.

- The Ethernet EDMAC is designed to be a Non-Secure bus master so associated Ethernet RAM buffers will be placed in Non-Secure RAM. The tooling will automatically manage this.

The workflow is as follows:

1. Start a new Flat project.
2. Select and configure pins and drivers/stacks as needed.
3. Generate project content and write code as needed.
4. Build and debug project.

3.5.4 RA Project Generator (PG)

The RA project generators have been created to help users through setting up new TrustZone enabled projects. User will be prompted for project settings such as Project Type (Secure, Non-Secure, or Flat), compiler, RTOS and debugger. Care is needed when setting up a TrustZone project to ensure that the connection between Secure and Non-Secure partitions are managed correctly.

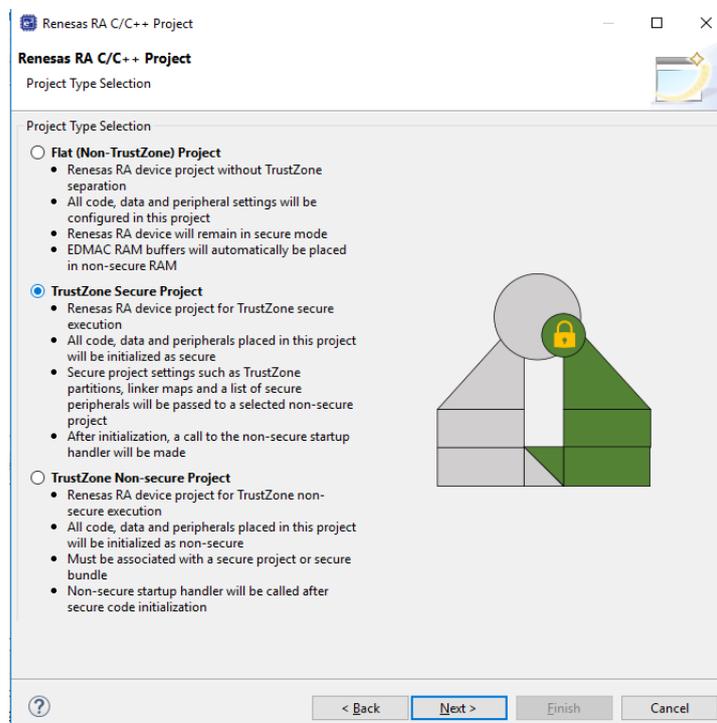

Figure 107: Secure Project (following Arm notation as green)

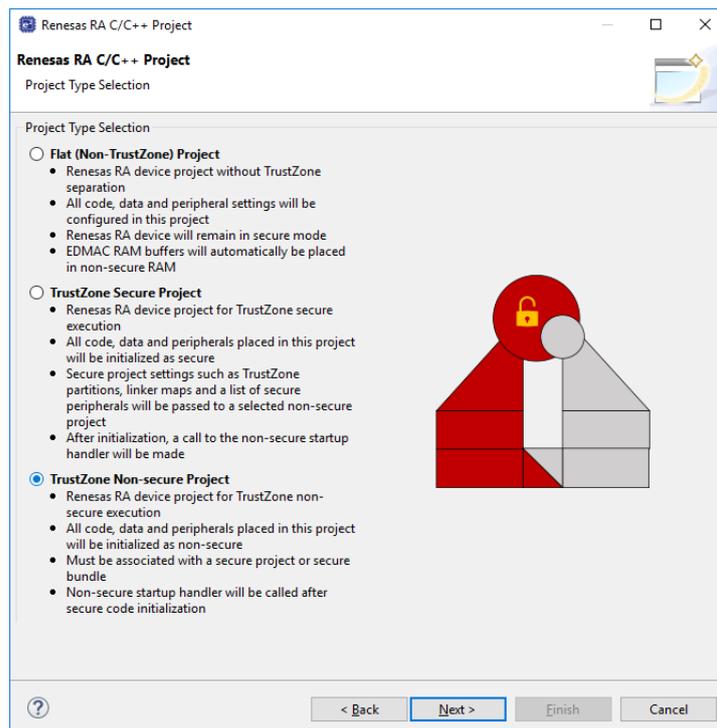

Figure 108: Non-Secure Project (following Arm notation as red)

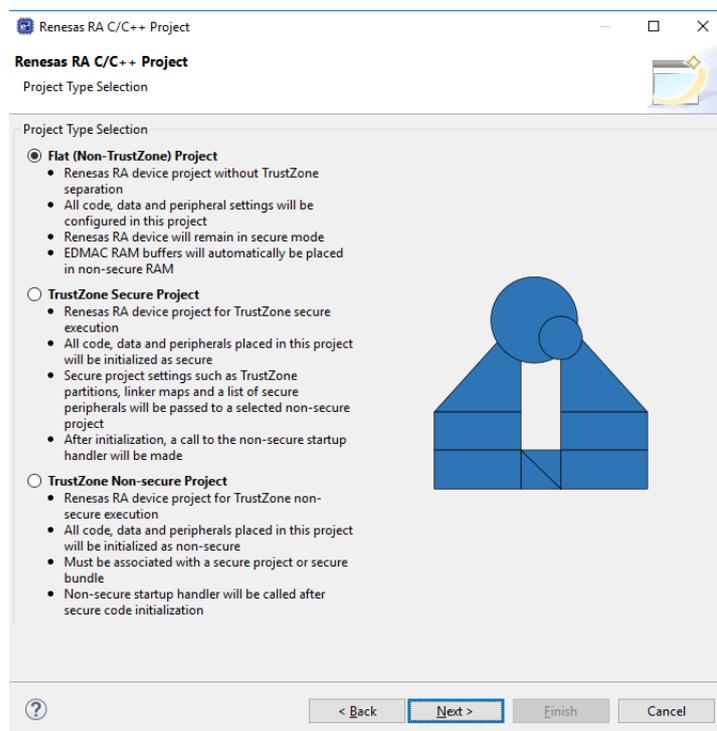

Figure 109: Flat Project

3.5.4.1 Secure Project Set Up

All code, data, and peripherals in this project will be configured as Secure using the device Peripheral

Security Attribution (PSA) registers. Although it is very application specific, we recommend keeping the Secure project code as small as possible to reduce the attack surface. For example, secure key handling may be the only application code in the secure project.

Necessary values to set up the TrustZone memory partition (IDAU registers) will be automatically calculated after the project is built to ensure they match the code and data size, keeping the attack surface as small as possible.

Typically, ANSI C start up code (clearing of RAM, variable initialisation, etc) , clock, and secure peripheral initialisation will occur in this project.

At the end of the Secure code, a call will be made to `R_BSP_NonSecureEnter()`; to pass control to the Non-Secure partition.

Non-Secure Callable (NSC) "Guard" functions are added to the project and expose selected modules to Non-Secure projects. User can add application-specific access checks as needed in these functions.

Output of this project type will be an elf file that must be either pre-programmed (provisioned) into a device or referenced by a Non-Secure project (via Secure bundle *.SBD) to build a final image.

This project type will NOT typically be debugged in isolation and will normally require a Non-Secure project such as a call to a `R_BSP_NonSecureEnter()` to be made. This can be replaced with `while(1)`; if needed.

3.5.4.2 RTOS Support in TrustZone Project

Although the RTOS kernel and user tasks will reside in the Non-Secure partition, the Secure partition needs to allocate stack space and so on. It is essential when starting a new RTOS project that the TrustZone Secure RTOS-Minimal template is selected. This will add the Arm TrustZone Context RA Port as below.

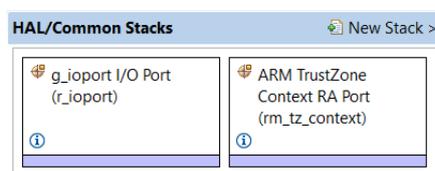

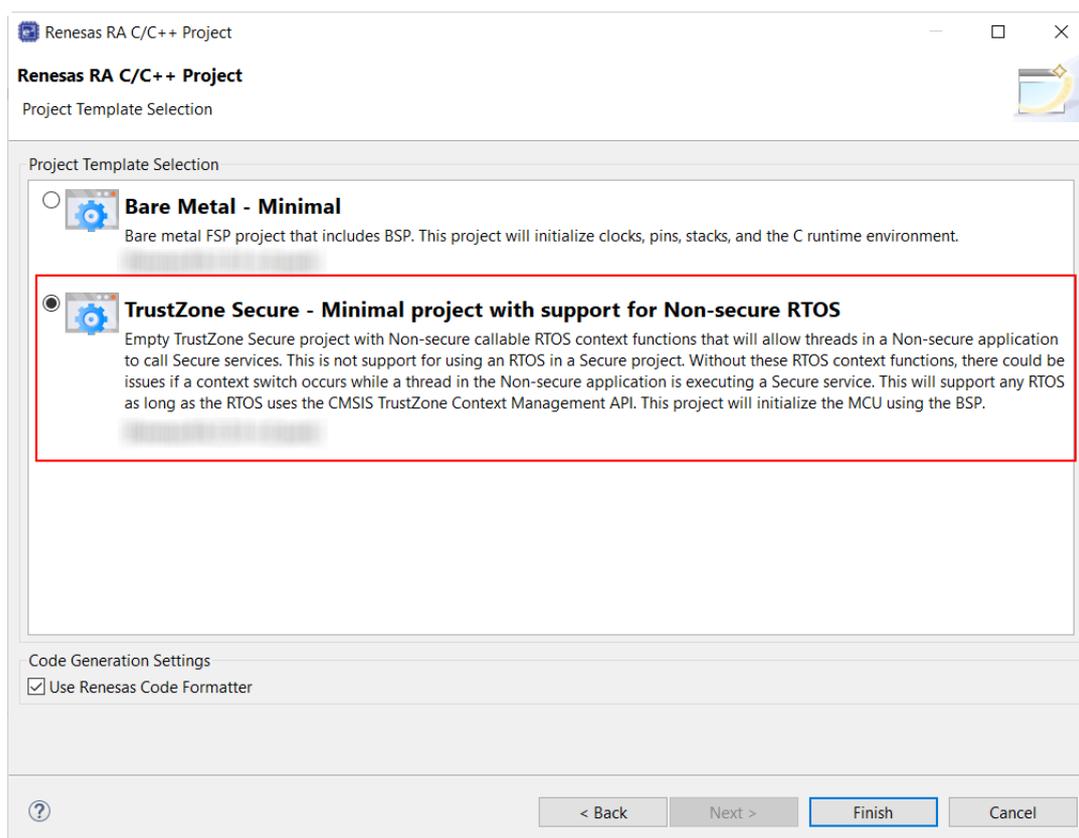

Figure 110: Secure RTOS-Minimal Template

3.5.4.3 Peripheral Security Attribution

Each peripheral can be configured to be Secure or Non-Secure. Peripherals are divided into two types.

Type-1 peripherals have one security attribute. Access to all registers is controlled by one security attribute. The Type-1 peripheral security attribute is set in the PSAR_x (x = B to E) register by the secure application.

Type-2 peripherals have the security attribute for each register or for each bit. Access to each register or bit field is controlled according to these security attributes. The Type-2 peripheral security attribute is set in the Security Attribution register in each module by the Secure application. For more information about the Security Attribution register, see sections in the Appropriate MCU's User's Manual for each peripheral.

Table 1. Secure and Non-Secure Peripherals

| Type | Peripheral |
|-------------------|---|
| Type 1 | SCI, SPI, USBFS, CAN, IIC, SCE9, DOC, SDHI, SSIE, CTSU, CRC, CAC, TSN, ADC12, DAC12, POEG, AGT, GPT, RTC, IWDT, WDT |
| Type 2 | System control (Resets, LVD, Clock Generation Circuit, Low Power Modes, Battery Backup Function), FLASH CACHE, SRAM controller, CPU CACHE, DMAC, DTC, ICU, MPU, BUS, Security setting, ELC, I/O ports |
| Always Non-Secure | CS Area Controller, QSPI, OSPI, ETHERC, EDMAC |

FSP will initialise the arbitration registers during Secure project BSP start up. User code may also be written to set or clear further arbitration. However care must be taken not to undermine FSP.

3.5.4.4 Non-Secure

All code, data, and peripherals in this project will be configured as Non-Secure. This project type must be associated with a Secure project to enable access to secure code, peripherals, linker scripts and others.

3.5.4.5 Flat Project Type

All code, data, and peripherals are configured in a Secure single partition except for the EDMAC RAM buffers that will remain in the Non-Secure partition. Effectively, TrustZone is disabled.

3.5.4.6 Secure Connection to Non-Secure Project

When starting a new Non-Secure Project, the user will be prompted for either a Secure Project or Secure Bundle. In each case, details of the linker settings, Non-Secure Callable functions, and Secure peripherals will be read to enable the Non-Secure project setup.

Should the Secure project or bundle be rebuilt, the Non-Secure editor will detect this and prompt user to regenerate the Non-Secure project configuration.

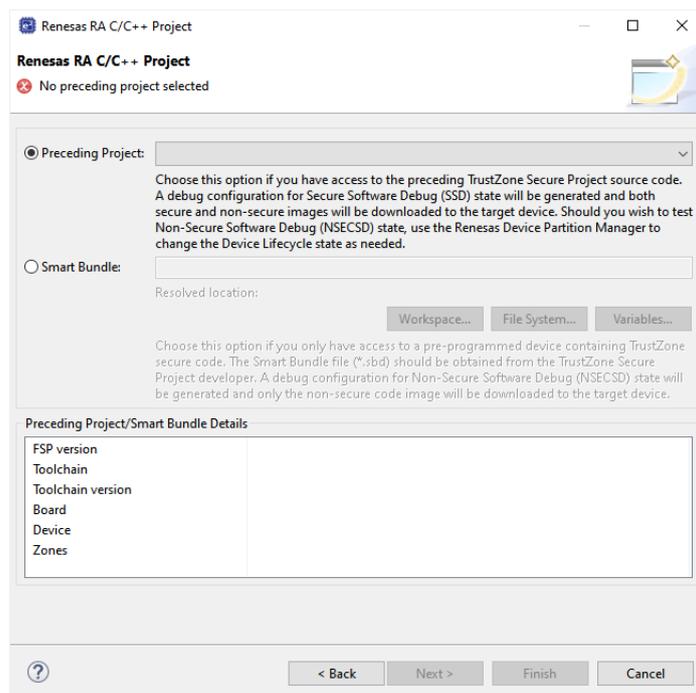

Figure 111: Secure Project or Bundle Selection

Secure Project (Combined)

A Secure project must reside in the same Workspace as the Non-Secure project and will typically be used when a design engineer has access to both the Secure and Non-Secure project sources. This is sometimes known as "Combined model".

A Secure .elf file will be referenced and included in the debug configuration for download to the target device. The development engineer will have visibility of Secure and Non-Secure project source code and configuration.

Secure Bundle (Split)

A Secure Bundle will ONLY include linker memory ranges, symbol references, and details of locked Secure peripheral configuration settings but no access to Secure source code (API header files will be included as necessary).

The Secure bundle file (*.SBD) must be supplied to the Non-Secure developer by the Secure project developer.

The development engineer will typically not have access to the Secure project or .elf file which MUST be pre-programmed or provisioned into the target MCU.

For devices that support DLM, the DLM state of the target device should then be switched to NSECSD (see section 6.2) before the device is provided to the non-secure developer.

This is often referred to as "Split model" where a basic security set up is developed by a Secure team and then passed to the Non-Secure team in the same facility or at a third party. The Non-Secure team has no access to the Secure source code and cannot directly access Secure peripherals, data, or APIs.

3.5.4.7 Debug Configurations

After each project type has been selected, a suitable debug configuration will be generated.

Non-Secure with Secure Project (Combined)

Both Secure and Non-Secure .elf files will be downloaded.

A debug configuration called <project name>_SSD will be generated.

Non-Secure with Secure Bundle (Split)

Only a Non-Secure elf will be downloaded. This configuration must be used with a pre-provisioned device (Secure project pre-programmed into MCU Flash).

A debug configuration called <project name>_NSECSD will be generated.

Flat Debug

A single .elf file will be downloaded.

A debug configuration called <project name>_FLAT will be generated.

3.5.5 Secure Projects

As mentioned, Secure code will be called immediately after device reset and run ANSI C start up, clock, interrupt vector table, and secure peripheral initialization before starting user code. All selected peripheral configuration settings will be automatically initialised as Secure.

3.5.5.1 Secure Clock

Device clock settings are the possible exception in that they will be initialised in the Secure project (to enable faster start up from reset) but can be set as Secure or Non-Secure as user application may need to change settings during execution (for low-power mode and so on). The Secure and Non-Secure FSP BSPs can both change the clock settings.

However, clock settings can be locked as Secure should the developer choose to do so.

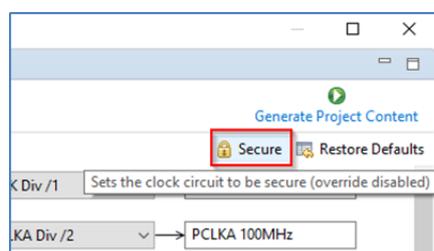

Figure 112: Secure Clock Setting

3.5.5.2 Setting Drivers as NSC

Some driver and middleware stacks in the Secure project may need to be accessed by the Non-Secure partition. To enable generation of NSC veneers, set "Non-Secure Callable" from the right-click context menu for the selected modules in the Configurator.

Note: It is only possible to "expose" top of stacks as NSC.

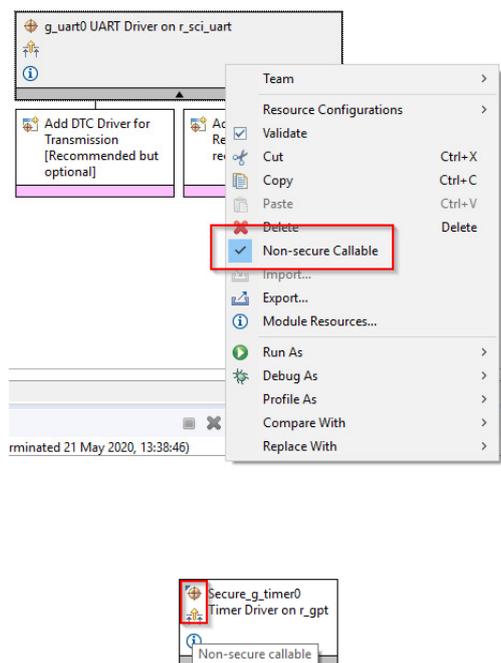

Figure 113: Generate NSC Veneers

The top of the stack will be marked with a new icon and tool tip to signify NSC access.

3.5.5.3 Guard Functions

Access to NSC drivers from a Non-Secure project is possible through the Guard APIs. FSP will automatically generate Guard functions for all the top of stack/driver APIs added to the project as Non-Secure Callable.

User can choose to add further levels of access control or delete guard function if they wish to only expose a limited range of APIs to a Non-Secure developer.

```
BSP_CMSE_NONSECURE_ENTRY fsp_err_t g_uart0_open_guard(
    uart_ctrl_t *const p_api_ctrl, uart_cfg_t const *const p_cfg) {
    /* User can add security checks here */
    FSP_PARAMETER_NOT_USED(p_api_ctrl);
    FSP_PARAMETER_NOT_USED(p_cfg);
    return R_SCI_UART_Open(&g_uart0_ctrl, &g_uart0_cfg);
}
```

For example, an SCI channel may be opened and configured for a desired baud rate by the Secure developer, but only enable the Write API to the Non-Secure developer. In which case, all but `g_uart0_write_guard()` could be deleted. CTRL structures are not required as they will be added on the Secure side.

For example, the call from the Non-Secure partition would be as follows:

```
err = g_uart0_open_guard(0,0);
```

3.5.6 Non-Secure projects

Configuration of the project can continue as for other RA devices, but certain resources will be locked if they have been previously set up as Secure.

The Non-Secure project will be called from the Secure project via `R_BSP_NonSecureEnter()`;

3.5.6.1 Clock Set Up

You may recall that clocks can be set as Secure or Non-Secure. If they are set as Secure, settings will only be available to view, and user will not be able to change them. The Override button will be greyed. This is useful to preserve CGC sync with secure project by not overriding unless necessary. If it is NOT set as Secure, user can choose to override the initial Secure settings

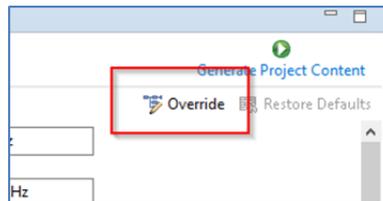

Figure 114: Clock Setting as Non-Secure

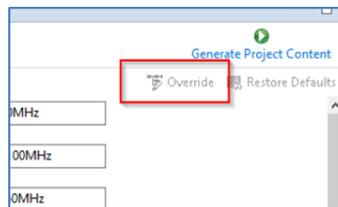

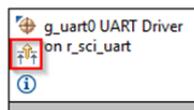

Figure 115: Clock Setting as Secure

3.5.6.2 Selecting NSC Drivers

Drivers declared as NSC in a Secure project can be selected and added to Non-Secure project and will be decorated as before.

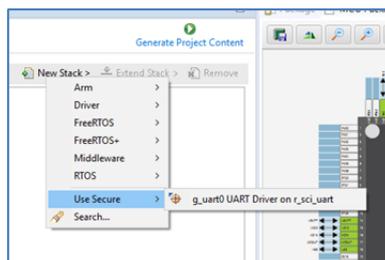

Figure 116: Selecting NSC Drivers

3.5.6.3 Locked Resources

When a NSC Secure driver is added to a Non-Secure project, the configuration settings are locked and are available for information only. A padlock is added for indication.

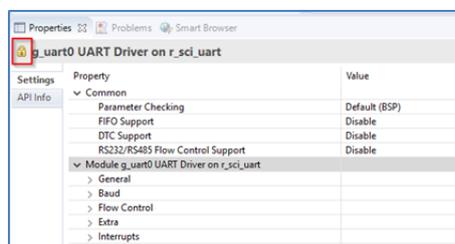

Figure 117: Locked Resources

3.5.6.4 Locked Channels

In a peripheral with multiple channels, for example, DMA, if a Non-Secure developer tries to select a channel that has already been defined as Secure, the following error message type will be displayed.

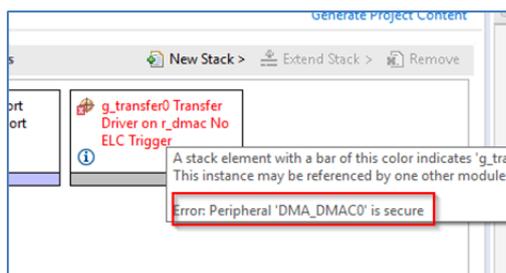

Figure 118: Error Message when Selecting a Secure Channel

3.5.7 IDAU registers

Renesas RA TrustZone-enabled devices include a set of registers known as Implementation Defined Attribution Unit (IDAU) that are used to set up partitions between Secure, Non-Secure Callable, and Non-Secure regions.

For devices that use DLM, the IDAU registers can only be programmed during MCU **boot mode** and NOT through the debug interfaces. Because of this, special debugger firmware has been developed to manage bringing the device up in SCI boot mode to set up the IDAU registers (automatically

drives MD pin) and then switch back to debug mode as needed.

Note: Please be aware of the extra signal connection (MD pin) needed on the debug interface connector. The Renesas Evaluation Kit (EK) for your selected device is a good reference.

| Pin No. | SWD | JTAG | Serial Programming using SCI |
|------------------|--------------------------------|------------------------------|------------------------------|
| 1 | VCC | VCC | VCC |
| 2 | P108/SWDIO | P108/TMS | NC |
| 4 | P300/SWCLK Wired OR with MD | P300/TCK Wired OR with MD | P201/MD |
| 6 | P109/SWO/TXD9 | P109/TDO/TXD9 | P109/TXD9 |
| 8 | P110/RXD9 | P110/TDI/RXD9 | P110/RXD9 |
| 9 | GNDdetect | GNDdetect | GNDdetect |
| 10 | nRESET | nRESET | nRESET |
| 12 | P214/TRACECLK | P214/TRACECLK | NC |
| 14 | P211/TRACEDATA[0] | P211/TRACEDATA[0] | NC |
| 16 | P210/TRACEDATA[1] | P210/TRACEDATA[1] | NC |
| 18 | P209/TRACEDATA[2] | P209/TRACEDATA[2] | NC |
| 20 | P208/TRACEDATA[3] | P208/TRACEDATA[3] | NC |
| 3, 5, 15, 17, 19 | GND | GND | GND |
| 7 | NC | NC | NC |
| 11, 13 | NC | NC | NC |

The e² studio build phase automatically extracts the IDAU partition register settings from the Secure .elf file and programs them into the device during debug connection, which can be observed in the console.

This is an important phase of TrustZone development as the Secure partitions should be set as small as possible to ensure that the security attack surface is as small as possible.

However, should the developer wish to make these partitions larger to accommodate, for example during field firmware updates, const or data arrays should be placed in the Secure project as needed.

```

Figure 119: RA TrustZone Device Current Status

It is also possible to manually set up the partition registers through the Renesas Device Partition Manager.

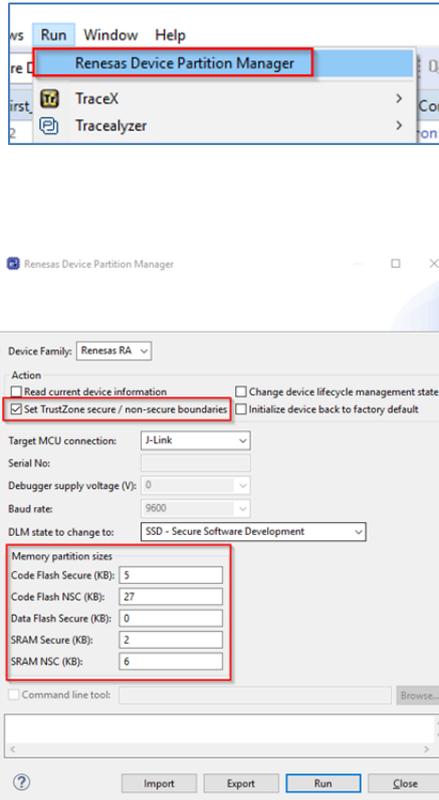

Figure 120: Renesas Device Partition Manager

In e² studio, when manually setting partitions, make sure to disable setting partitions in the debug configuration to prevent the settings from being overridden when a debug session is launched.

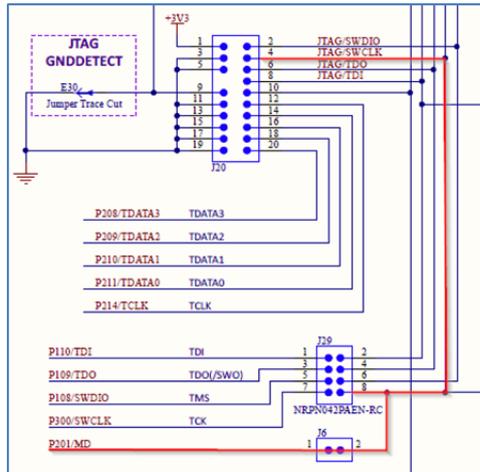

Figure 121: Example of MD Mode Pin Connection to Debugger Connector (from EK schematic)

3.5.7.2 DLM States

Device lifecycle defines the current phase of the device and controls the capabilities of the debug interface, the serial programming interface and Renesas test mode. The following illustration shows the lifecycle definitions and capability in each lifecycle.

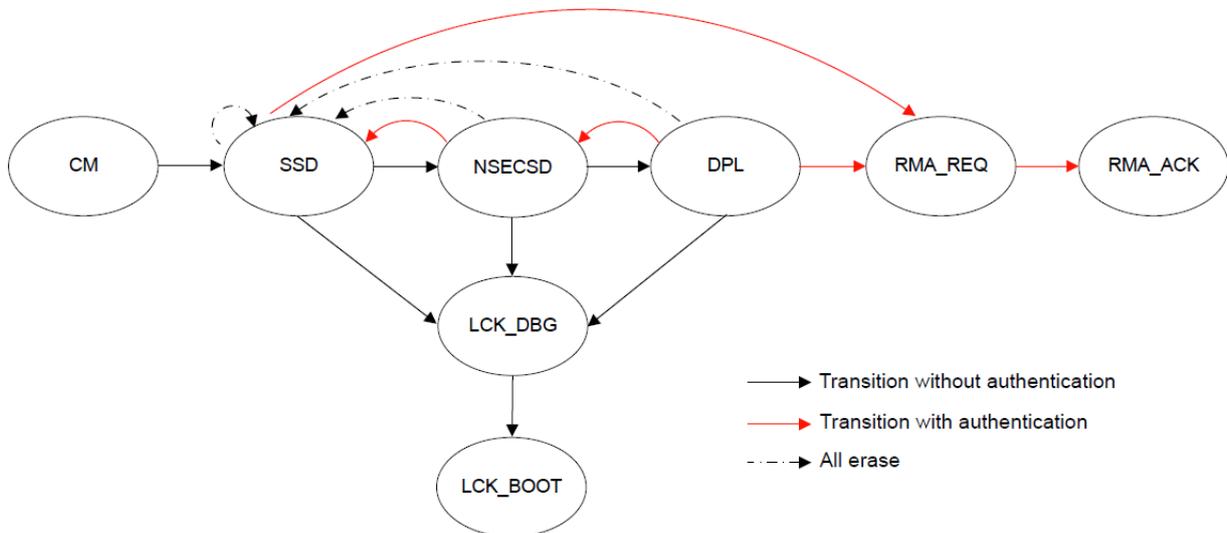

Figure 122: Lifecycle Stages

Note: All authentication key exchange and transitioning to LCK_DBG, LCK_BOOT, RMA_REQ is only managed by Renesas Flash Programmer (RFP) or other production programming tools, and NOT within e² studio.

| Lifecycle | Definition | Debug level | Serial programming | Test mode |
|-----------|---|-------------|--|---------------|
| CM | "Chip Manufacturing" The state when the customer received the device. | DBG2 | Available, cannot access code/data flash | Not available |
| SSD | "Secure Software Development" The secure part of application is being developed. | DBG2 | Available can program/erase/read all code/data flash area | Not available |
| NSECSD | "Non-SECure Software Development" The non-secure part of application is being developed. | DBG1 | Available can program/erase/read all code/data flash area | Not available |
| DPL | "DePLoyed" The device is in-field. | DBG0 | Available cannot access code/data flash area | Not available |
| LCK_DBG | "LoCKed DeBuG" The debug interface is permanently disabled. | DBG0 | Available cannot access code/data flash area | Not available |
| LCK_BOOT | "LoCKed BOOT interface" The debug interface and the serial programming interface are permanently disabled. | DBG0 | Not available | Not available |
| RMA_REQ | "Return Material Authorization REQuest" Request for RMA. The customer must send the device to Renesas in this state. | DBG0 | Available cannot access code/data flash area | Not available |
| RMA_ACK | "Return Material Authorization ACKnowledged" Failure analysis in Renesas | DBG2 | Available cannot access code/data flash area | Available |

Figure 123: Lifecycle Stages and Debug Levels

There are three debug access levels. The debug access level changes according to the lifecycle state.

- DBG2: The debugger connection is allowed, and no restriction to access memories and peripherals
- DBG1: The debugger connection is allowed, and restricted to access only Non-Secure memory regions and peripherals
- DBG0: The debugger connection is not allowed

State transitions can be performed using the Renesas Flash Programmer (RFP, see section below) or using the Renesas Device Partition Manager (limited number of states possible). It is possible to secure transitions between states using authentication keys. For more information on DLM states and transitions (device specific), please refer to device user manual.

3.5.7.3 Devices with Alternate DLM States

Some devices have an alternate implementation of Device Lifecycle Management (See [Target Device](#)). While the concept is the same, the DLM states are a little different. The following illustration shows the lifecycle definitions and capability in each lifecycle.

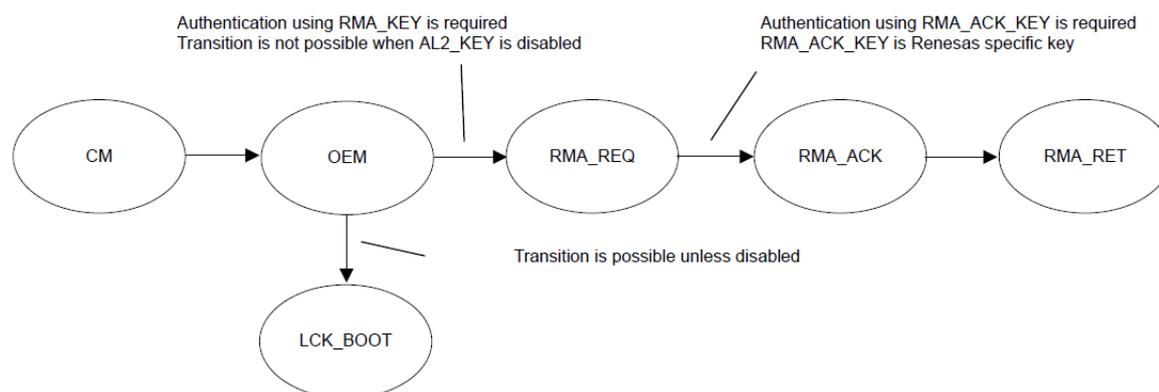

Figure 124: Lifecycle Stages

Note: All authentication key exchange and transitioning to LCK_BOOT, and RMA_REQ is only managed by Renesas Flash Programmer (RFP) or other production programming tools, and NOT within e² studio.

| Lifecycle | Definition | Protection level | Debug function | Serial programming | Renesas test mode |
|-----------|---|-------------------|--|---|-------------------|
| CM | "Chip Manufacturing" The device is out of Renesas factory. The customer receives the device in this state. | PL2 | Available in the secure and non-secure debug | Available Cannot access code/data flash area | Not available |
| OEM | "Original Equipment Manufacturer" The device is owned by the customer. | PL2 or PL1 or PL0 | Depend on the authentication level | | Not available |
| LCK_BOOT | "LoCKed BOOT interface" The debug interface and the serial programming interface are permanently disabled. | PL0 | Not available | Not available | Not available |
| RMA_REQ | "Return Material Authorization REQuest" Request for RMA. The customer must send the device to Renesas in this state. | PL0 | Not available | Available Cannot access code/data flash area | Not available |
| RMA_ACK | "Return Material Authorization ACKnowledged" Failure analysis in Renesas | PL2 | Available in the secure and non-secure debug | Available Cannot access code/data flash area | Available |
| RMA_RET | "Return Material Authorization RETurn" The device is back to the customer. The device does not boot. | PL0 | Not available | Not available | Not available |

Figure 125: Lifecycle Stages and Debug Levels

There are three authentication levels. The available authentication levels change according to the lifecycle state and determine the memory and resources that are accessible by the debugger.

- AL2: The debugger connection is allowed, and no restriction to access memories and peripherals
- AL1: The debugger connection is allowed, and restricted to access only Non-Secure memory regions and peripherals
- AL0: The debugger connection is not allowed

State transitions can be performed using the Renesas Flash Programmer (RFP, see section below) or using the Renesas Device Partition Manager (limited number of states possible). It is possible to secure transitions between states using authentication keys. For more information on DLM states and transitions (device specific), please refer to device user manual.

In addition to having different DLM States, these devices also handle memory partitioning differently. Code Flash and Data Flash partitions are divided into secure and non-secure regions using SCI or USB boot mode commands. All other memory regions are set in IDAU and SAU registers in the secure application during the BSP startup procedure. All memory regions and peripherals that are configured as non-secure must be accessed using an aliased non-secure address. This non-secure address is calculated by setting bit 28 in the address.

3.5.7.4 Devices without DLM

For devices that do not have DLM, the IDAU registers are programmed by secure application code at startup. Devices without DLM do not support IDAU register programming using boot mode commands.

3.5.8 Debug

By default, devices supporting DLM will be in SSD mode and so allow access to Secure and Non-Secure partitions. In this mode both Secure and Non-Secure .elf files will be downloaded.

The current debugger status is displayed in the lower left corner and includes the DLM state (SSD or NSECSD) and current partition (Secure, Non-Secure, or Non-Secure Callable) when the debugger is stopped, for example.

Figure 126: Current Debugger Status

3.5.8.1 Non-Secure Debug

Once the device is transitioned to NSECSD mode, only Non-Secure Flash, RAM and Peripherals can be accessed. In this mode, a Secure .elf must be pre-programmed (provisioned) into the device, and only a Non-Secure .elf file will be downloaded.

When in NSECSD mode access to Secure elements will be blocked and data displayed as ????????.

In NSECSD mode, it is not possible to set breakpoints on Secure code or data.

It is not possible to step into Secure code; the debugger will perform a step-over of any Secure function calls. Should the user press the Suspend button during execution, the debugger will stop at the next Non-Secure code access.

Assuming Secure memory region finishes at 32K (0x8000) in NSECSD debug mode (colour coding

added for indication only), memory will be displayed as shown in the following figure.

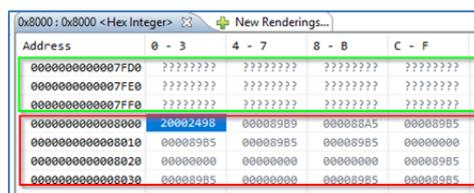

Figure 127: Memory Display in NSECSD Debug Mode

Disassembly will be displayed as shown in the following figure.

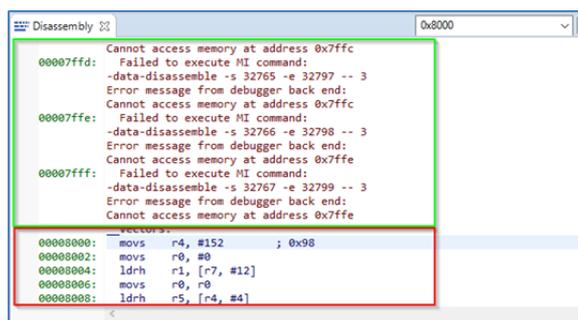

Figure 128: Disassembly Display in NSECSD Debug Mode

3.5.9 Debugger support

Renesas E2, E2 Lite, and SEGGER J-Link are supported in e² studio for TrustZone projects.

Debugger Support for TrustZone Projects

| Feature | E2 Lite | E2 | J-Link | J-Link OB | ULINK | IAR I-jet |
|---------------------------------|---------|-----|--------|-----------|-------|-----------|
| JTAG | Yes | Yes | Yes | No | Yes | Yes |
| SWD | Yes | Yes | Yes | Yes | Yes | Yes |
| ETB trace | Yes | Yes | Yes | Yes | Yes | Yes |
| ETM trace | No | Yes | Yes | No | Yes | Yes |
| TrustZone partition programming | Yes | Yes | Yes | Yes | No | Yes |
| Non secure debug | Yes | Yes | Yes | Yes | No | Yes |
| e ² studio | Yes | Yes | Yes | Yes | No | No |
| IAR EW Arm | Yes | Yes | Yes | Yes | No | Yes |

| | | | | | | |
|----------|---------------------|---------------------|-----|-----|-----|----|
| Keil MDK | Under consideration | Under consideration | Yes | Yes | Yes | No |
|----------|---------------------|---------------------|-----|-----|-----|----|

3.5.10 Third-Party IDEs

Third-party IDEs such as IAR Systems EWARM and Keil MDK (uVision) are supported by the RA Smart Configurator (RASC).

In general, RASC offers the same configurator functionality as e² studio documented above. Project generators are available to initialise workspaces in the target IDEs as well as setting up debug configurations and so forth. However, there are some limitations that need to be noted especially with regards to IDAU TrustZone partition register programming. See the specific RASC documentation for usage details.

3.5.11 Renesas Flash Programmer (RFP)

Updated versions of Renesas Flash Programmer (RFP) are available to support setting of partitions, DLM state and Authentication keys.

RFP can be downloaded free of charge on the Renesas web site.

A new mode has been added to Program Flash Options as shown in the following graphics.

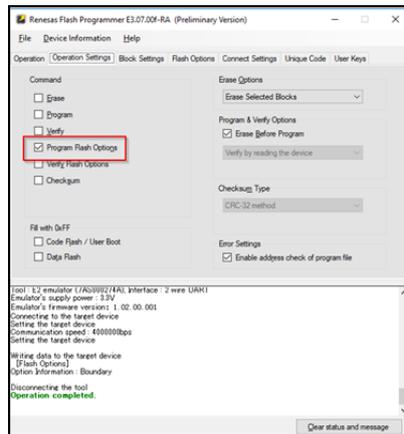

Figure 129: RFP Program Flash Options

Options to set partition boundaries are shown in the following figure.

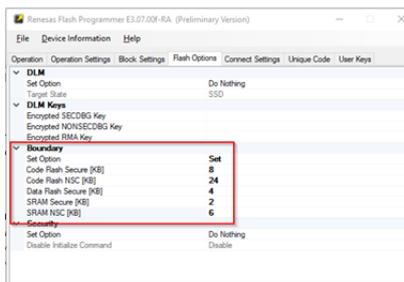

Figure 130: RFP Partition Boundaries

Options to set DLM state, Authentication keys, and Security settings are shown in the following figure.

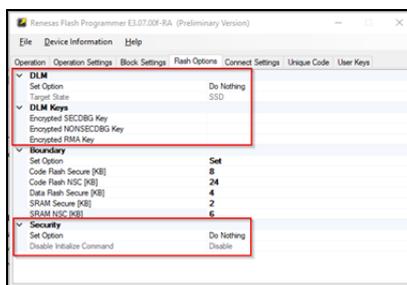

Figure 131: RFP DLM State, Authentication Keys, and Security Settings

Great care is needed here as some DLM states can ****permanently**** turn off debug and boot mode on the devices. Equally programming a security access authentication key can lead to permanently locked devices if the key is lost.

3.5.12 Glossary

IDAU

Implementation Defined Attribute Unit. Used to program TrustZone partitions.

NSECSD

Non-Secure Software Development mode

SSD

Secure Software Development mode

NSC

Non-Secure Callable. Special Secure memory region used for Veneer to allow access to Secure APIs from Non-Secure code.

Provisioned

Device with Secure code pre-programmed and DLM state set to **NSECSD**

Flat project

All code, data and peripherals are configured as secure with the exception of the EDMAC RAM buffer which are placed in Non-Secure RAM due to the configuration of the internal bus masters.

Veneer

Code that resides in Non-Secure Callable region

Combined model

Development engineer has access to both Secure and Non-Secure project and source code

Split model

Development Engineer has access to only the Non-Secure partition. No visibility of Secure source code. Secure code will be provisioned into device.

3.5.12.1 Configurator Icon Glossary

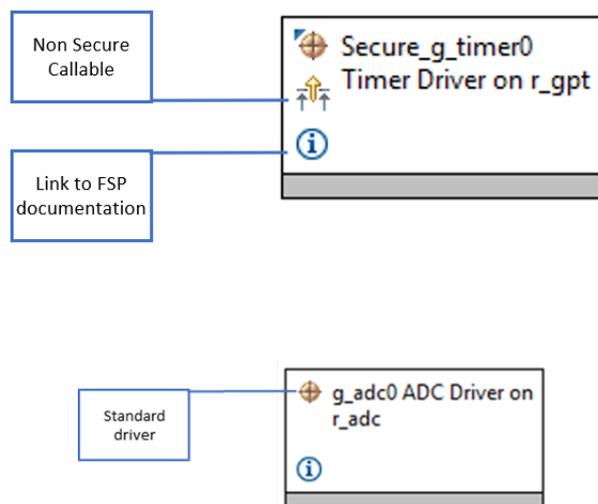

Figure 132: Configurator Icons

3.6 RASC User Guide for MDK and IAR

3.6.1 What is RASC?

The Renesas RA Smart Configurator (RASC) is a desktop application designed to configure device hardware such as clock set up and pin assignment as well as initialization of FSP software components for a Renesas RA microcontroller project when using a 3rd-party IDE and toolchain.

The RA Smart Configurator can currently be used with

1. Keil MDK and the Arm compiler toolchain.
2. IAR EWARM with IAR toolchain for Arm

Projects can be configured and the project content generated in the same way as in e² studio. Please refer to [Configuring a Project](#) section for more details.

3.6.2 Using RA Smart Configurator with Keil MDK

3.6.2.1 Prerequisites

- Keil MDK and Arm compiler are installed and licensed. Please refer to the RASC Release notes for the version to be installed.
- Import the RA device pack. Download the RA device pack archive file (ex: MDK_Device_Packs_2.x.x.zip) from the [FSP GitHub release page](#). Extract the archive file to locate the RA device pack. To import the RA device pack, launch the PackInstaller.exe from <keil_mdk_install_dir>\UV4. Select the menu item **File > Import...** and browse to the

extracted .pack file.

- Verify that the latest updates for RA devices are included in Keil MDK. To verify, select the menu "Packs" in Pack Installer and verify that the menu item **Check for Updates on Launch** is selected. If not, select **Check for Updates on Launch** and relaunch Pack Installer.
- For flashing and debugging, the latest Segger J-Link DLL is installed into Keil MDK.
- Install RASC and FSP using the Platform Installer from the GitHub release page.

3.6.2.2 Create new RA project

The following steps are required to create an RA project using Keil MDK, RASC and FSP:

1. Start the RA Smart Configurator.
2. Enter a project folder and project name.

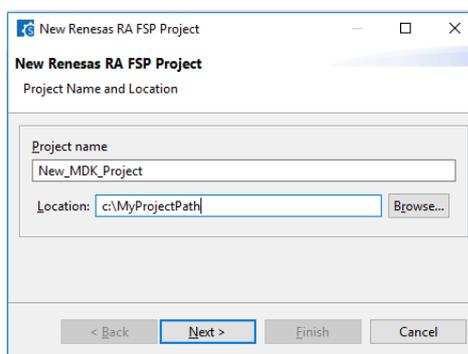

Figure 133: RASC project settings

3. Select the target device and IDE.

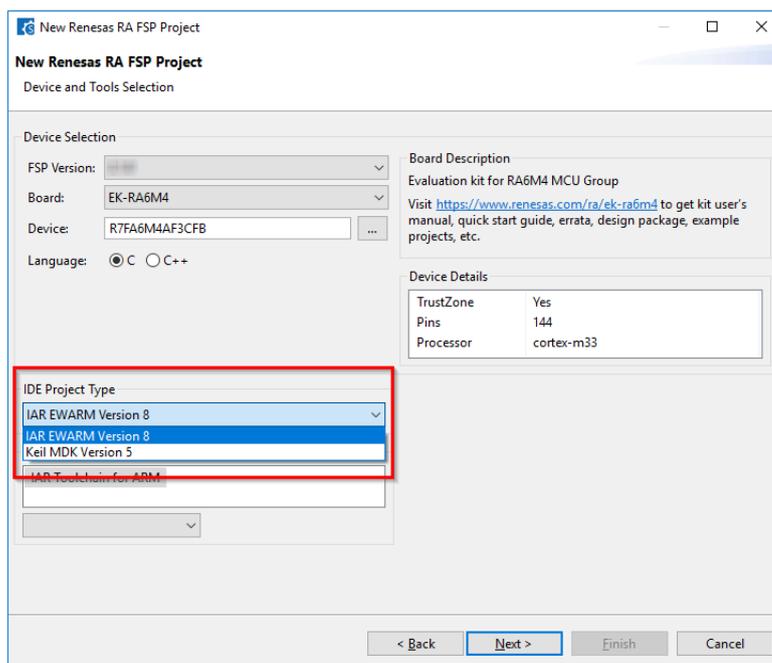

Figure 134: Target device and IDE selection

4. The rest of the project generator and FSP configuration is the same as e² studio. Please refer to the previous sections for details.
5. On completion of FSP configuration, press "Generate Project Content"
6. A new Keil MDK project file will be generated in the project path. Double click this file to open MDK and continue development as usual.

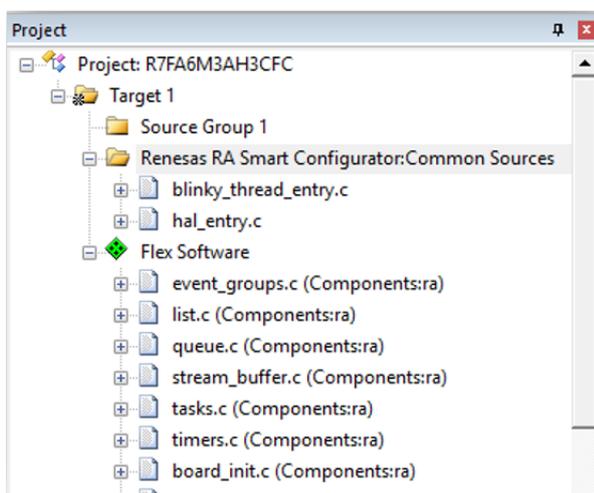

Figure 135: uVision project workspace with imported project data

3.6.2.3 Modify existing RA project

Once an initial project has been generated and configured, it is also possible to make changes using RASC as follows.

Note

This setup only needs to be done once per project.

Set up the following links to RASC:

1. In Keil MDK uVision, select **Tools > Customize Tools Menu....**
2. Select the **new** icon and fill in the fields as follows for each tool:
 - a. RA Smart Configurator:
 - Menu item name: Enter: RA Smart Configurator
 - Command: Select "." and navigate to rasc.exe
 - Initial Folder: Enter: \$P
 - Arguments: Enter: configuration.xml
 - b. Device Partition Manager:
 - Menu item name: Enter: Device Partition Manager
 - Command: Select "." and navigate to rasc.exe
 - Initial Folder: Enter: \$P
 - Arguments: Enter: -application com.renesas.cdt.ddsc.dpm.ui.dpmapplication configuration.xml "\$L%L"

To reconfigure an existing project select **Tools > RA Smart Configurator**

To reconfigure the TrustZone partitions select **Tools > Device Partition Manager**

3.6.2.4 Build and Debug RA project

The project can be built by selecting the menu item **Project > Build Target** or tool bar item **Rebuild** or the keyboard shortcut F7.

Assembler, Compiler, Linker and Debugger settings can be changed in **Options for Target** dialog, which can be launched using the menu item **Project > Options for Target**, the tool bar item **Options for Target** or the keyboard shortcut Alt+F7.

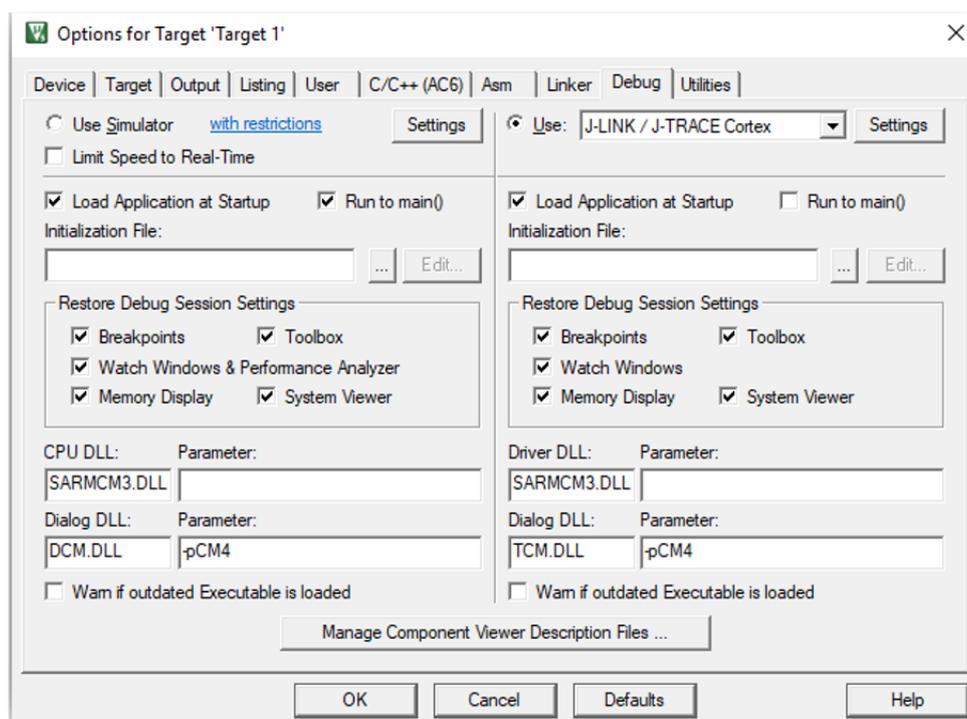

Figure 136: Options for Target

RASC will set up the uVision project to debug the selected device using J-Link or J-Link OB debugger by default.

A Debug session can be started or stopped by selecting the menu item **Debug > Start/Stop Debug Session** or keyboard shortcut CTRL+F5. When debugging for the first time, J-Link firmware update may be needed if requested by the tool.

Refer to the documentation from Keil to get more information on the debug features in uVision. Note that not all features supported by uVision debugger are implemented in the J-Link interface. Consult SEGGER J-Link documentation for more information.

3.6.2.5 Notes and Restrictions

1. **When debugging a TrustZone based project, the Secure project image MUST be downloaded before the Non Secure project.**
2. For TrustZone enabled devices, the user will need to manually set up the memory partitions using the "Renesas Device Partition Manager" from inside RASC before downloading.

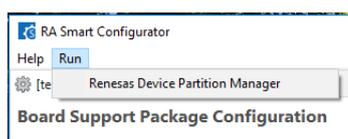

Figure 137: Renesas Device partition Manager

3. RA FSP contains a full set of drivers and middleware and may not be compatible with other CMSIS packs from Keil, Arm or third parties.
4. Flash programming is currently only supported through the debugger connection.

3.6.3 Using RA Smart Configurator with IAR EWARM

IAR Systems Embedded Workbench for Arm (EWARM) includes support for Renesas RA devices. These can be set up as bare metal designs within EWARM. However, most RA developers will want to integrate RA FSP drivers and middleware into their designs. RASC will facilitate this.

RASC generates a "Project Connection" file that can be loaded directly into EWARM to update project files.

3.6.3.1 Prerequisites

- IAR EWARM installed and licensed. Please refer to the Release notes for the version to be installed.
- RASC and FSP Installed

3.6.3.2 Create new RA project

The following steps are required to create an RA project using IAR EWARM, RASC and FSP:

1. Start the RA Smart Configurator.

2. Enter a project folder and project name.

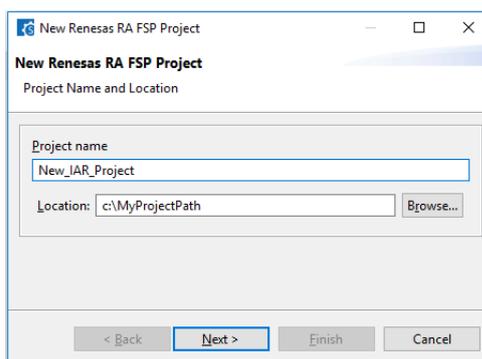

Figure 138: RASC project settings

3. Select the target device and IDE.

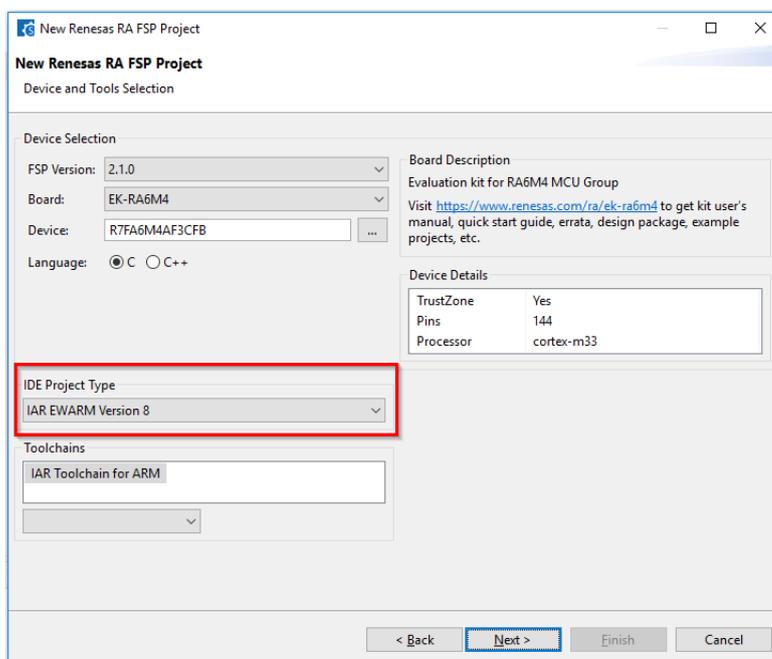

Figure 139: Target device and IDE selection

4. The rest of the project generator and FSP configuration operates the same as e² studio. Refer to the previous sections for details.
5. On completion of FSP configuration, press **Generate Project Content**.
6. A new IAR EWARM project file will be generated in the project path. Double click this file to open IAR EWARM and continue development as usual.
7. To Use RASC with EWARM, RASC needs to be configured as a tool in EWARM by selecting the menu item **Tools > Configure Tools....** Select **New** to create a new tool in the dialog shown and add the following information:
 - Menu Text: **RA Smart Configurator**
 - a. Command: Select **Browse...** and navigate to rasc.exe in the installed RASC
 - b. Argument: configuration.xml

- c. Initial Directory: \$PROJ_DIR\$
 - d. Tool Available: Always
 - Menu Text: **Device Partition Manager**
 - a. Command: Select **Browse...** and navigate to rasc.exe in the installed RASC
 - b. Argument: -application com.renesas.cdt.ddsc.dpm.ui.dpmapplication configuration.xml "\$TARGET_PATH\$"
 - c. Initial Directory: \$PROJ_DIR\$
 - d. Tool Available: Always
8. RASC can now be re-launched from EWARM using the menu item **Tools > RA Smart Configurator**.
9. A Project connection needs to be set up in EWARM to build the project. Select **Project > Add Project Connection** in EWARM and select **IAR Project Connection**. Navigate to the project folder and select buildinfo.ipcf and click **Open**. The project can now build in EWARM.

3.6.3.3 Notes and Restrictions

When starting a TrustZone enabled debug session Partition sizes are checked automatically.

- If partition sizes are set correctly, the debug session will launch as normal.
- If partition sizes need to be changed, IAR EWARM will prompt to run the Renesas Device Partition Manager. Select **Yes**. The Device Partition Manager will start with the required partition sizes prefilled.
- Select **Set TrustZone secure / non-secure boundaries** as the only action.
- Enter debugger details, if required.
- Select **Run** to program the partitions.
- Return to the IDE and relaunch the debug session

Chapter 4 FSP Architecture

4.1 FSP Architecture Overview

This guide describes the Renesas Flexible Software Package (FSP) architecture and how to use the FSP Application Programming Interface (API).

4.1.1 C99 Use

FSP uses the ISO/IEC 9899:1999 (C99) C programming language standard. Specific features introduced in C99 that are used include standard integer types (`stdint.h`), booleans (`stdbool.h`), designated initializers, and the ability to intermingle declarations and code.

4.1.2 Doxygen

Doxygen is the default documentation tool used by FSP. You can find Doxygen comments throughout the FSP source.

4.1.3 Weak Symbols

Weak symbols are used occasionally in FSP. They are used to ensure that a project builds even when the user has not defined an optional function.

4.1.4 Memory Allocation

Dynamic memory allocation through use of the `malloc()` and `free()` functions are not used in FSP modules; all memory required by FSP modules is allocated in the application and passed to the module in a pointer. Exceptions are considered only for ports of 3rd party code that require dynamic memory.

4.1.5 FSP Terms

| Term | Description | Reference |
|------|---|---|
| BSP | Short for Board Support Package. In FSP, the BSP provides just enough foundation to allow other FSP modules to work together without issue. | MCU Board Support Package |

| | | |
|-----------------|--|--------------------------------|
| Module | Modules can be peripheral drivers, purely software, or anything in between. Each module consists of a folder with source code, documentation, and anything else that the customer needs to use the code effectively. Modules are independent units, but they may depend on other modules. Applications can be built by combining multiple modules to provide the user with the features they need. | FSP Modules |
| Driver | A driver is a specific kind of module that directly modifies registers on the MCU. | - |
| Interface | An interface contains API definitions that can be shared by modules with similar features. Interfaces are definitions only and do not add to code size. | FSP Interfaces |
| Stacks | The FSP architecture is designed such that modules work together to form a stack. A stack consists of a top level module and all its dependencies. | FSP Stacks |
| Module Instance | Single and independent instantiation of a module. An application may require two GPT timers. Each of these timers is a module instance of the r_gpt module. | - |
| Application | Code that is owned and maintained by the user. Application code may be based on sample application code provided by Renesas, but it is the responsibility of the user to maintain as necessary. | - |

| | | |
|-------------------|---|---|
| Callback Function | This term refers to a function that is called when an event occurs. As an example, suppose the user would like to be notified every second based on the RTC. As part of the RTC configuration, a callback function can be supplied that will be jumped to during each RTC interrupt. When a single callback services multiple events, the arguments contain the triggering event. Callback functions for interrupts should be kept short and handled carefully because when they are called the MCU is still inside of an interrupt, delaying any pending interrupts. | - |
|-------------------|---|---|

4.2 FSP Modules

Modules are the core building block of FSP. Modules can do many different things, but all modules share the basic concept of providing functionality upwards and requiring functionality from below.

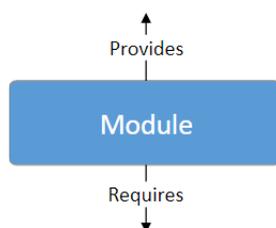

Figure 140: Modules

The amount of functionality provided by a module is determined based on functional use cases. Common functionality required by multiple modules is often placed into a self-contained submodule so it can be reused. Code size, speed and complexity are also considered when defining a module.

The simplest FSP application consists of one module with the Board Support Package (BSP) and the user application on top.

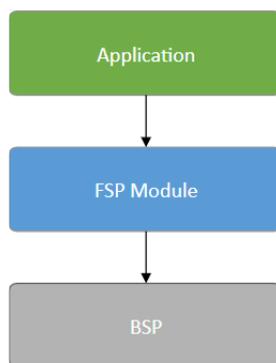

Figure 141: Module with application

The Board Support Package (BSP) is the foundation for FSP modules, providing functionality to determine the MCU used as well as configuring clocks, interrupts and pins. For the sake of clarity, the BSP will be omitted from further diagrams.

4.2.1 Module Sources

Some modules distributed alongside FSP originate from outside sources. A full list of sources for FSP modules, including versions and hyperlinks, can be found in the Third Party Software section of the release notes for each release.

4.2.2 Module Distribution

All modules distributed with FSP are packaged as CMSIS components in CMSIS packs. Each module consists of source files and a tooling support file used to integrate the module with e² studio or RASC. The tooling support file defines the configurations used to generate code in the ra_gen and ra_cfg folders.

4.2.3 Module Versioning

Module versions can be seen on the Components tab of the FSP Configuration editor. The FSP Configuration editor automatically selects compatible components.

All third party modules have a semantic version are versioned with their original semantic version plus added metadata fsp.<fsp_semantic_version>. The metadata is added to reflect the tooling support file added for the FSP configuration tool.

Third party modules versioned with +renesas.<counter> in the metadata have been forked and updated for FSP. If +renesas.<counter> is not in the metadata, the third party code is unchanged from its original source.

If changes are made to third party module source code to support FSP, the changes are pushed to a public Renesas GitHub fork of the original source. Links to Renesas forks are provided in the Third Party Software section of the release notes for each release.

Modules that originate from outside sources that do not have a semantic version are versioned with the FSP version.

All modules that are part of FSP or integrated with FSP are tested as a package. Mixing versions is not encouraged and may lead to support issues.

4.3 FSP Stacks

When modules are layered atop one another, an FSP stack is formed. The stacking process is performed by matching what one module provides with what another module requires. For example, the SPI module (`SPI (r_spi)`) requires a module that provides the transfer interface (`Transfer Interface`) to send or receive data without a CPU interrupt. The transfer interface requirement can be fulfilled by the DTC driver module (`Transfer (r_dtc)`).

Through this methodology the same code can be shared by several modules simultaneously. The example below illustrates how the same DTC module can be used with SPI (`SPI (r_spi)`), UART (`UART (r_sci_uart)`) and SDHI (`SD/MMC (r_sdhi)`).

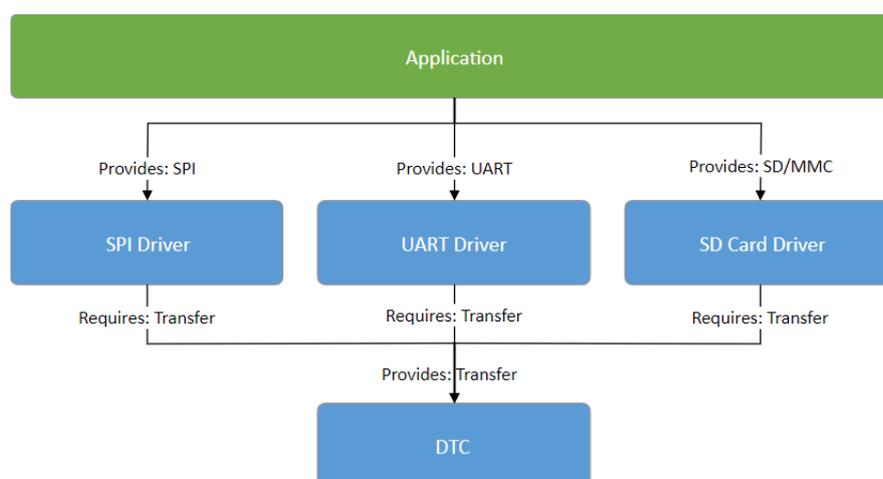

Figure 142: Stacks -- Shared DTC Module

The ability to stack modules ensures the flexibility of the architecture as a whole. If multiple modules include the same functionality issues arise when application features must work across different user designs. To ensure that modules are reusable, any dependent modules must be capable of being swapped out for other modules that provide the same features. The FSP architecture provides this flexibility to swap modules in and out through the use of FSP interfaces.

4.4 FSP Interfaces

At the architecture level, interfaces are the way that modules provide common features. This commonality allows modules that adhere to the same interface to be used interchangeably. Interfaces can be thought of as a contract between two modules - the modules agree to work together using the information that was established in the contract.

On RA hardware there is occasionally an overlap of features between different peripherals. For example, I2C communications can be achieved through use of the IIC peripheral or the SCI peripheral. However, there is a difference in the level of features provided by both peripherals; in I2C mode the SCI peripheral will only support a subset of the capabilities of the fully-featured IIC.

Interfaces aim to provide support for the common features that most users would expect. This means that some of the advanced features of a peripheral (such as IIC) might not be available in the interface. In most cases these features are still available through interface extensions.

In FSP design, interfaces are defined in header files. All interface header files are located in the folder

ra/fsp/inc/api and end with *_api.h. Interface extensions are defined in header files in the folder ra/fsp/inc/instances. The following sections detail what makes up an interface.

4.4.1 FSP Interface Enumerations

Whenever possible, interfaces use typed enumerations for function parameters and structure members.

```
typedef enum e_i2c_master_addr_mode
{
    I2C_MASTER_ADDR_MODE_7BIT = 1,    ///< Use 7-bit addressing mode
    I2C_MASTER_ADDR_MODE_10BIT = 2,   ///< Use 10-bit addressing mode
} i2c_master_addr_mode_t;
```

Enumerations remove uncertainty when deciding what values are available for a parameter. FSP enumeration options follow a strict naming convention where the name of the type is prefixed on the available options. Combining the naming convention with the autocomplete feature available in e² studio (Ctrl + Space) provides the benefits of rapid coding while maintaining high readability.

4.4.2 FSP Interface Callback Functions

Callback functions allow modules to asynchronously alert the user application when an event has occurred, such as when a byte has been received over a UART channel or an IRQ pin is toggled. FSP driver modules define and handle the interrupt service routines for RA MCU peripherals to ensure any required hardware procedures are implemented. The interrupt service routines in FSP modules then call the user-defined callbacks to allow the application to respond.

Callback functions must be defined in the user application. They always return void and take a structure for their one parameter. The structure is defined in the interface for the module and is named <interface>_callback_args_t. The contents of the structure may vary depending on the interface, but two members are common: event and p_context.

The event member is an enumeration defined in the interface used by the application to determine why the callback was called. Using the UART example, the callback could be triggered for many different reasons, including when a byte is received, all bytes have been transmitted, or a framing error has occurred. The event member allows the application to determine which of these three events has occurred and handle it appropriately.

The p_context member is used for providing user-specified data to the callback function. In many cases a callback function is shared between multiple channels or module instances; when the callback occurs, the code handling the callback needs context information so that it can determine which module instance the callback is for. For example, if the callback wanted to make an FSP API call in the callback, then at a minimum the callback will need a reference to the relevant control structure. To make this easy, the user can provide a pointer to the control structure as the p_context. When the callback occurs, the control structure is passed in the p_context element of the callback structure.

Callback functions are called from within an interrupt service routine. For this reason callback functions should be kept as short as possible so they do not affect the real time performance of the user's system. An example skeleton function for the flash interface callback is shown below.

```
void flash_callback (flash_callback_args_t * p_args)
{
    /* See what event caused this callback. */
    switch (p_args->event)
    {
        case FLASH_EVENT_ERASE_COMPLETE:
            {
                /* Handle event. */
                break;
            }
        case FLASH_EVENT_WRITE_COMPLETE:
            {
                /* Handle event. */
                break;
            }
        case FLASH_EVENT_BLANK:
            {
                /* Handle event. */
                break;
            }
        case FLASH_EVENT_NOT_BLANK:
            {
                /* Handle event. */
                break;
            }
        case FLASH_EVENT_ERR_DF_ACCESS:
            {
                /* Handle error. */
                break;
            }
        case FLASH_EVENT_ERR_CF_ACCESS:
            {
                /* Handle error. */
                break;
            }
    }
}
```

```
    }  
    case FLASH_EVENT_ERR_CMD_LOCKED:  
    {  
        /* Handle error. */  
        break;  
    }  
    case FLASH_EVENT_ERR_FAILURE:  
    {  
        /* Handle error. */  
        break;  
    }  
    case FLASH_EVENT_ERR_ONE_BIT:  
    {  
        /* Handle error. */  
        break;  
    }  
}
```

When a module is not directly used in the user application (that is, it is not the top layer of the stack), its callback function will be handled by the module above. For example, if a module requires a UART interface module the upper layer module will control and use the UART's callback function. In this case the user would not need to create a callback function for the UART module in their application code.

4.4.3 FSP Interface Data Structures

At a minimum, all FSP interfaces include three data structures: a configuration structure, an API structure, and an instance structure.

4.4.3.1 FSP Interface Configuration Structure

The configuration structure is used for the initial configuration of a module during the <MODULE>_Open() call. The structure consists of members such as channel number, bitrate, and operating mode.

The configuration structure is used purely as an input into the module. It may be stored and referenced by the module, so the configuration structure and anything it references must persist as long as the module is open.

The configuration structure is allocated for each module instance in files generated by the RA Configuration editor.

When FSP stacks are used, it is also important to understand that configuration structures only have members that apply to the current interface. If multiple layers in the same stack define the same configuration parameters then it becomes difficult to know where to modify the option. For example, the baud rate for a UART is only defined in the UART module instance. Any modules that use the UART interface rely on the baud rate being provided in the UART module instance and do not offer it in their own configuration structures.

4.4.3.2 FSP Interface API Structure

All interfaces include an API structure which contains function pointers for all the supported interface functions. An example structure for the DAC is shown below.

```
typedef struct st_dac_api
{
    /** Initial configuration.
     *
     * @param[in] p_ctrl Pointer to control block. Must be declared by user. Elements
    set here.
     * @param[in] p_cfg Pointer to configuration structure. All elements of this
    structure must be set by user.
     */
    fsp_err_t (* open)(dac_ctrl_t * const p_ctrl, dac_cfg_t const * const p_cfg);
    /** Close the D/A Converter.
     *
     * @param[in] p_ctrl Control block set in @ref dac_api_t::open call for this
    timer.
     */
    fsp_err_t (* close)(dac_ctrl_t * const p_ctrl);
    /** Write sample value to the D/A Converter.
     *
     * @param[in] p_ctrl Control block set in @ref dac_api_t::open call for this
    timer.
     * @param[in] value Sample value to be written to the D/A Converter.
     */
    fsp_err_t (* write)(dac_ctrl_t * const p_ctrl, uint16_t value);
    /** Start the D/A Converter if it has not been started yet.
     *
     * @param[in] p_ctrl Control block set in @ref dac_api_t::open call for this
    timer.
     */
}
```

```
*/  
fsp_err_t (* start)(dac_ctrl_t * const p_ctrl);  
/** Stop the D/A Converter if the converter is running.  
*  
* @param[in] p_ctrl Control block set in @ref dac_api_t::open call for this  
timer.  
*/  
fsp_err_t (* stop)(dac_ctrl_t * const p_ctrl);  
} dac_api_t;
```

The API structure is what allows for modules to easily be swapped in and out for other modules that are instances of the same interface. Let's look at an example application using the DAC interface above.

RA MCUs have an internal DAC peripheral. If the DAC API structure in the DAC interface is not used the application can make calls directly into the module. In the example below the application is making calls to the [R_DAC_Write\(\)](#) function which is provided in the `r_dac` module.

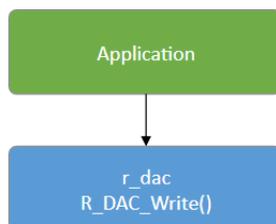

Figure 143: DAC Write example

Now let's assume that the user needs more DAC channels than are available on the MCU and decides to add an external DAC module named `dac_external` using I2C for communications. The application must now distinguish between the two modules, adding complexity and further dependencies to the application.

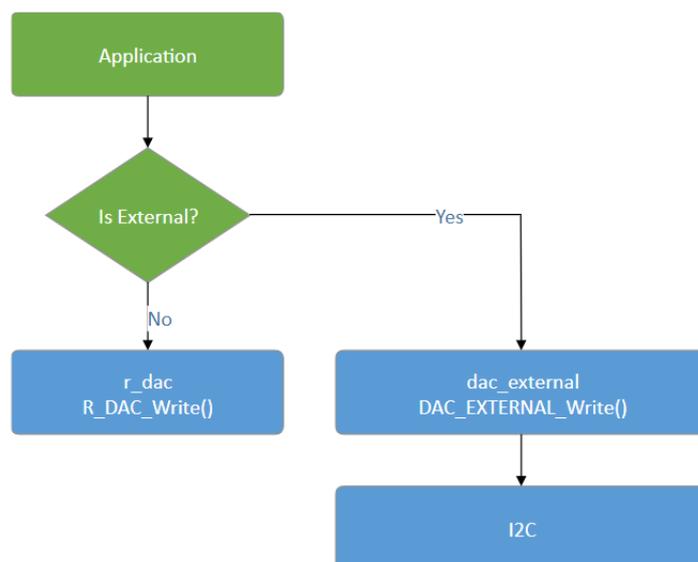

Figure 144: DAC Write with two write modules

The use of interfaces and the API structure allows for the use of an abstracted DAC. This means that no extra logic is needed if the user's `dac_external` module implements the FSP DAC interface, so the application no longer depends upon hard-coded module function names. Instead the application now depends on the DAC interface API which can be implemented by any number of modules.

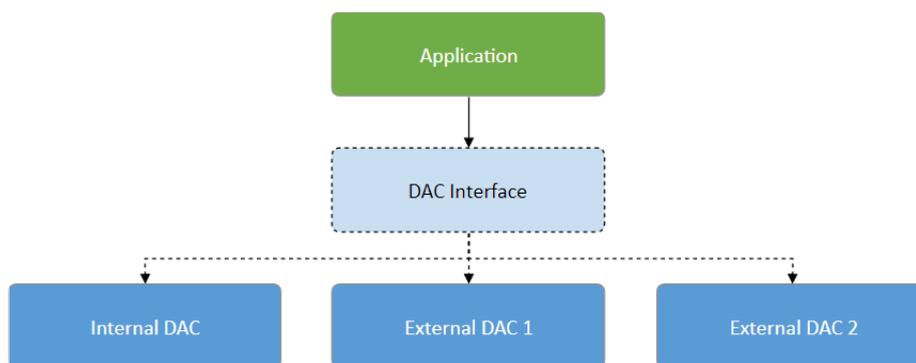

Figure 145: DAC Interface

4.4.3.3 FSP Interface Instance Structure

Every FSP interface also has an instance structure. The instance structure encapsulates everything required to use the module:

- A pointer to the instance API structure ([FSP Instance API](#))
- A pointer to the configuration structure
- A pointer to the control structure

The instance structure is not required at the application layer. It is used to connect modules to their dependencies (other than the BSP).

Instance structures have a standardized name of `<interface>_instance_t`. An example from the [Transfer Interface](#) is shown below.

```
typedef struct st_transfer_instance
{
    transfer_ctrl_t      * p_ctrl; ///< Pointer to the control structure for this
instance
    transfer_cfg_t const * p_cfg;    ///< Pointer to the configuration structure
for this instance
    transfer_api_t const * p_api;    ///< Pointer to the API structure for this
instance
} transfer_instance_t;
```

Note that when an instance structure variable is declared, the API is the only thing that is instance specific, not *module instance* specific. This is because all module instances of the same module share the same underlying module source code. If SPI is being used on SCI channels 0 and 2 then both module instances use the same API while the configuration and control structures are typically different.

4.5 FSP Instances

While interfaces dictate the features that are provided, instances actually implement those features. Each instance is tied to a specific interface. Instances use the enumerations, data structures, and API prototypes from the interface. This allows an application that uses an interface to swap out the instance when needed.

On RA MCUs some peripherals are used to implement multiple interfaces. In the example below the IIC and SPI peripherals map to only one interface each while the SCI peripheral implements three interfaces.

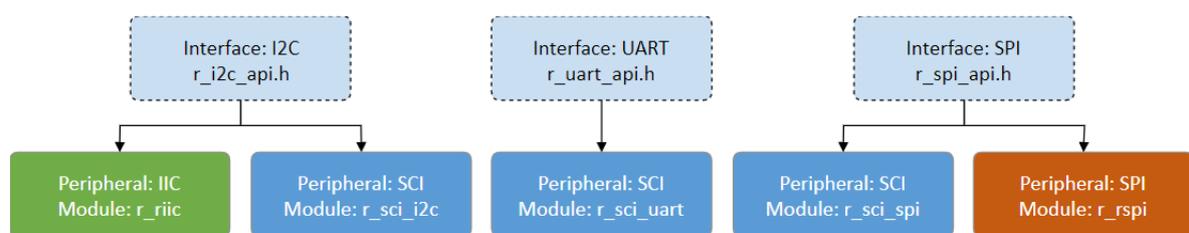

Figure 146: Instances

In FSP design, instances consist of the interface extension and API defined in the instance header file located in the folder `ra/fsp/inc/instances` and the module source `ra/fsp/src/<module>`.

4.5.1 FSP Instance Control Structure

The control structure is used as a unique identifier for the module instance and contains memory required by the module. Elements in the control structure are owned by the module and *must not be modified* by the application. The user allocates storage for a control structure, often as a global variable, then sends a pointer to it into the `<MODULE>_Open()` call for a module. At this point, the

module initializes the structure as needed. The user must then send in a pointer to the control structure for all subsequent module calls.

4.5.2 FSP Interface Extensions

In some cases, instances require more information than is provided in the interface. This situation can occur in the following cases:

- An instance offers extra features that are not common to most instances of the interface. An example of this is the start source selection of the GPT ([Timer](#), [General PWM \(r_gpt\)](#)). The GPT can be configured to start based on hardware events such as a falling edge on a trigger pin. This feature is not common to all timers, so it is included in the GPT instance.
- An interface must be very generic out of necessity. As an interface becomes more generic, the number of possible instances increases. An example of an interface that must be generic is a block media interface that abstracts functions required by a file system. Possible instances include SD card, SPI Flash, SDRAM, USB, and many more.

The `p_extend` member provides this extension function.

Use of interface extensions is not always necessary. Some instances do not offer an extension since all functionality is provided in the interface. In these cases the `p_extend` member can be set to `NULL`. The documentation for each instance indicates whether an interface extension is available and whether it is mandatory or optional.

4.5.2.1 FSP Extended Configuration Structure

When extended configuration is required it can be supplied through the `p_extend` parameter of the interface configuration structure.

The extended configuration structure is part of the instance, but it is also still considered to be part of the configuration structure. All usage notes about the configuration structure described in [FSP Interface Configuration Structure](#) apply to the extended configuration structure as well.

The extended configuration structure and all typed structures and enumerations required to define it make up the interface extension.

4.5.3 FSP Instance API

Each instance includes a constant global variable tying the interface API functions to the functions provided by the module. The name of this structure is standardized as `g_<interface>_on_<instance>`. Examples include `g_spi_on_spi`, `g_transfer_on_dtc`, and `g_adc_on_adc`. This structure is available to be used through an extern in the instance header file (`r_spi.h`, `r_dtc.h`, and `r_adc.h` respectively).

4.6 FSP API Standards

4.6.1 FSP Function Names

FSP functions start with the uppercase module name (`<MODULE>`). All modules have `<MODULE>_Open()` and `<MODULE>_Close()` functions. The `<MODULE>_Open()` function must be called before any of the other functions.

Other functions that will commonly be found are `<MODULE>_Read()`, `<MODULE>_Write()`, `<MODULE>_InfoGet()`, and `<MODULE>_StatusGet()`. The `<MODULE>_StatusGet()` function provides

a status that could change asynchronously, while `<MODULE>_InfoGet()` provides information that cannot change after open or can only be updated by API calls. Example function names include:

- `R_SPI_Read()`, `R_SPI_Write()`, `R_SPI_WriteRead()`
- `R_SDHI_StatusGet()`
- `R_RTC_CalendarAlarmSet()`, `R_RTC_CalendarAlarmGet()`
- `R_FLASH_HP_AccessWindowSet()`, `R_FLASH_HP_AccessWindowClear()`

4.6.2 Use of const in API parameters

The const qualifier is used with API parameters whenever possible. An example case is shown below.

```
fsp_err_t R_FLASH_HP_Open(flash_ctrl_t * const p_api_ctrl, flash_cfg_t const * const p_cfg);
```

In this example, `flash_cfg_t` is a structure of configuration parameters for the `r_flash_hp` module. The parameter `p_cfg` is a pointer to this structure. The first const qualifier on `p_cfg` ensures the `flash_cfg_t` structure cannot be modified by `R_FLASH_HP_Open()`. This allows the structure to be allocated as a const variable and stored in ROM instead of RAM.

The const qualifier after the pointer star for both `p_ctrl` and `p_cfg` ensures the FSP function does not modify the input pointer addresses. While not fool-proof by any means this does provide some extra checking inside the FSP code to ensure that arguments that should not be altered are treated as such.

4.6.3 FSP Version Information

The BSP provides a function `R_FSP_VersionGet()` which fills in a structure of type `fsp_pack_version_t`. This can be used to determine the FSP version at runtime.

There are also `FSP_VERSION_*` macros in `fsp_version.h` that can be used to determine the FSP version at build time.

4.7 FSP Build Time Configurations

All modules have a build-time configuration header file. Most configuration options are supplied at run time, though options that are rarely used or apply to all instances of a module may be moved to build time. The advantage of using a build-time configuration option is to potentially reduce code size reduction by removing an unused feature.

All modules have a build time option to enable or disable parameter checking for the module. FSP modules check function arguments for validity when possible, though this feature is disabled by default to reduce code size. Enabling it can help catch parameter errors during development and debugging. By default, each module's parameter checking configuration inherits the BSP parameter checking setting (set on the BSP tab of the RA Configuration editor). Leaving each module's parameter checking configuration set to Default (BSP) allows parameter checking to be enabled or disabled globally in all FSP code through the parameter checking setting on the BSP tab.

If an error condition can reasonably be avoided it is only checked in a section of code that can be disabled by disabling parameter checking. Most FSP APIs can only return `FSP_SUCCESS` if parameter checking is disabled. An example of an error that cannot be reasonably avoided is the "bus busy"

error that occurs when another master is using an I2C bus. This type of error can be returned even if parameter checking is disabled.

4.8 FSP File Structure

The high-level file structure of an FSP project is shown below.

```
ra_gen
ra
+---fsp
    +---inc
    |   +---api
    |   \---instances
    \---src
        +---bsp
        \---r_module
ra_cfg
+---fsp_cfg
    +---bsp
    +---driver
```

Directly underneath the base ra folder the folders are split into the source and include folders. Include folders are kept separate from the source for easy browsing and easy setup of include paths.

The ra_gen folder contains code generated by the RA Configuration editor. This includes global variables for the control structure and configuration structure for each module.

The ra_cfg folder is where configuration header files are stored for each module. See [FSP Build Time Configurations](#) for information on what is provided in these header files.

4.9 FSP TrustZone Support

TrustZone support for FSP is primarily handled in the RA Configuration Tool.

4.9.1 FSP TrustZone Projects

During development of a TrustZone project, users create an RA TrustZone Secure Project first, followed by an RA TrustZone Non-secure Project that is linked to the RA TrustZone Secure Project. Allocation of secure memory is handled automatically within the tooling. The non-secure project starts at the required alignment boundary beyond the memory taken by the secure project.

4.9.2 Non-Secure Callable Guard Functions

The tooling generates guard functions for any module marked as Non-secure Callable. These guard

functions are owned by the application once generated, so they can be modified as necessary by the secure application developer.

The default non-secure callable guard functions limit the configuration and control structure to the structures generated in the secure project. They also check any input pointers to ensure the caller does not overwrite secure memory.

4.9.3 Callbacks in Non-Secure from Non-Secure Callable Modules

If the non-secure project needs a callback function from a non-secure callable module, the callback can be registered after the module is opened using the `callback_set()` guard function.

4.9.4 Migrating TrustZone Project to newer FSP Version

The TrustZone projects can be migrated to newer FSP version as mentioned in the following resource.

- [Migrating Projects to New FSP Version](#) (Application Note)

Additional steps are required if newer FSP version introduces new guard function. In such case, simply migrating the project would result in the build failure for non secure project. Following extra steps are required:

- If `xxx_guard.c` file in `src` folder of secure project was not modified earlier
 1. Delete the `xxx_guard.c` file in secure project before generating the Project Files.
 2. Generate Project contents and build the secure project.
 3. Follow the steps in Application Note to migrate the Non-Secure project.
- If `xxx_guard.c` file in `src` folder of secure project was modified earlier
 1. Take the backup of existing `xxx_guard.c` file and delete it from `src` folder of secure project before generating the Project Files.
 2. Generate Project contents. It creates a new `guard.c` file. Compare the contents of the older file and newly generated `guard.c` file.
 3. Copy the modified code from the older file (i.e Security checks added by user) and add it to newly generated file.
 4. Follow the steps in Application Note to migrate the Non-Secure project.

4.9.5 Additional TrustZone Information

The following resources provide technical background, application notes and example projects that demonstrate key TrustZone concepts and implementation procedures.

- [The Benefits of Using Arm® TrustZone® in Your Design](#) (Brochure)
- [RA Arm® TrustZone® Tooling Primer](#) (Application Note)

4.10 FSP Architecture in Practice

4.10.1 FSP Connecting Layers

FSP modules are meant to be both reusable and stackable. It is important to remember that modules are not dependent upon other modules, but upon other interfaces. The user is then free to fulfill the interface using the instance that best fits their needs.

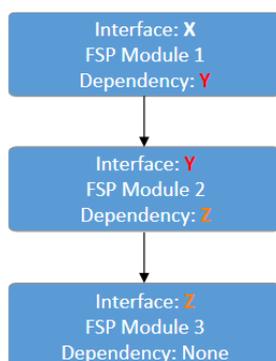

Figure 147: Connecting layers

In the image above interface Y is a dependency of interface X and has its own dependency on interface Z. Interface X only has a dependency on interface Y. Interface X has no knowledge of interface Z. This is a requirement for ensuring that layers can easily be swapped out.

4.10.2 Using FSP Modules in an Application

The typical use of an FSP module involves generating required module data then using the API in the application.

4.10.2.1 Create a Module Instance in the RA Configuration Editor

The RA Configuration editor (available both in the Renesas e² studio IDE as well as through the standalone RA Smart Configurator) provides a graphical user interface for setting the parameters of the interface and instance configuration structures. It also automatically includes those structures (once they are configured in the GUI) in application-specific header files that can be included in application code.

The RA Configuration editor allocates storage for the control structures, all required configuration structures, and the instance structure in generated files in the `ra_gen` folder. Use the **Properties** window to set the values for the members of the configuration structures as needed. Refer to the Configuration section of the module usage notes for documentation about the configuration options.

If the interface has a callback function option then the application must declare and define the function. The return value is always of type `void` and the parameter to the function is a typed structure of name `<interface>_callback_args_t`. Once the function has been defined, assign its name to the `p_callback` member of the configuration structure. Callback function names can be assigned through the **Properties** window for the selected module.

4.10.2.2 Use the Instance API in the Application

Call the module's `<MODULE>_Open()` function. Pass pointers to the generated control structure and configuration structure. The names of these structures are based on the 'Name' field provided in the configuration editor. The control structure is `<Name>_ctrl` and the configuration structure is `<Name>_cfg`. An example `<MODULE>_Open()` call for an `r_rtc` module instance named `g_clock` is:

```
R_RTC_Open(&g_clock_ctrl, &g_clock_cfg);
```

Note

Each layer in the FSP Stack is responsible for calling the API functions of its dependencies. This means that users are only responsible for calling the API functions at the layer at which they are interfacing. Using the example above of a SPI module with a DTC dependency, the application uses only SPI APIs. The application starts by calling `R_SPI_Open()`. Internally, the SPI module opens the DTC. It locates `R_DTC_Open()` by accessing the dependent transfer interface function pointers from the pointers DTC instances (`spi_cfg_t::p_transfer_tx` and `spi_cfg_t::p_transfer_rx`) to open the DTC.

Refer to the module usage notes for example code to help get started with any particular module.

Chapter 5 API Reference

This section includes the FSP API Reference for the Module and Interface level functions.

| BSP_IO_PORT_14_PIN_00 | IO port 14 pin 0. |
| BSP_IO_PORT_14_PIN_01 | IO port 14 pin 1. |
| BSP_IO_PORT_14_PIN_02 | IO port 14 pin 2. |
| BSP_IO_PORT_14_PIN_03 | IO port 14 pin 3. |
| BSP_IO_PORT_14_PIN_04 | IO port 14 pin 4. |
| BSP_IO_PORT_14_PIN_05 | IO port 14 pin 5. |
| BSP_IO_PORT_14_PIN_06 | IO port 14 pin 6. |
| BSP_IO_PORT_14_PIN_07 | IO port 14 pin 7. |
| BSP_IO_PORT_14_PIN_08 | IO port 14 pin 8. |
| BSP_IO_PORT_14_PIN_09 | IO port 14 pin 9. |
| BSP_IO_PORT_14_PIN_10 | IO port 14 pin 10. |
| BSP_IO_PORT_14_PIN_11 | IO port 14 pin 11. |
| BSP_IO_PORT_14_PIN_12 | IO port 14 pin 12. |
| BSP_IO_PORT_14_PIN_13 | IO port 14 pin 13. |
| BSP_IO_PORT_14_PIN_14 | IO port 14 pin 14. |
| BSP_IO_PORT_14_PIN_15 | IO port 14 pin 15. |

Function Documentation

◆ **R_BSP_PinRead()**

| | | |
|--|-------------|---------|
| <code>__STATIC_INLINE uint32_t R_BSP_PinRead (bsp_io_port_pin_t pin)</code> | | |
| Read the current input level of the pin. | | |
| Parameters | | |
| [in] | pin | The pin |
| Return values | | |
| Current | input level | |

◆ **R_BSP_PinWrite()**

| | | |
|--|-------|-----------|
| <code>__STATIC_INLINE void R_BSP_PinWrite (bsp_io_port_pin_t pin, bsp_io_level_t level)</code> | | |
| Set a pin to output and set the output level to the level provided. If PFS protection is enabled, disable PFS protection using R_BSP_PinAccessEnable() before calling this function. | | |
| Parameters | | |
| [in] | pin | The pin |
| [in] | level | The level |

◆ **R_BSP_PinCfg()**

| | | |
|---|-----|---|
| <code>__STATIC_INLINE void R_BSP_PinCfg (bsp_io_port_pin_t pin, uint32_t cfg)</code> | | |
| Configure a pin. If PFS protection is enabled, disable PFS protection using R_BSP_PinAccessEnable() before calling this function. | | |
| Parameters | | |
| [in] | pin | The pin |
| [in] | cfg | Configuration for the pin (PmnPFS register setting) |

◆ **R_BSP_PinAccessEnable()**

| | | |
|---|--|--|
| <code>__STATIC_INLINE void R_BSP_PinAccessEnable (void)</code> | | |
| Enable access to the PFS registers. Uses a reference counter to protect against interrupts that could occur via multiple threads or an ISR re-entering this code. | | |

◆ R_BSP_PinAccessDisable()

```
__STATIC_INLINE void R_BSP_PinAccessDisable ( void )
```

Disable access to the PFS registers. Uses a reference counter to protect against interrupts that could occur via multiple threads or an ISR re-entering this code.

5.1.2 Common Error Codes**BSP****Detailed Description**

All FSP modules share these common error codes.

Macros

```
#define FSP_PARAMETER_NOT_USED(p)
```

```
#define FSP_CPP_HEADER
```

```
#define FSP_HEADER
```

```
#define FSP_SECURE_ARGUMENT
```

Enumerations

```
enum fsp_err_t
```

Macro Definition Documentation**◆ FSP_PARAMETER_NOT_USED**

```
#define FSP_PARAMETER_NOT_USED ( p)
```

This macro is used to suppress compiler messages about a parameter not being used in a function. The nice thing about using this implementation is that it does not take any extra RAM or ROM.

◆ FSP_CPP_HEADER

```
#define FSP_CPP_HEADER
```

Determine if a C++ compiler is being used. If so, ensure that standard C is used to process the API information.

◆ **FSP_HEADER**

#define FSP_HEADER

FSP Header and Footer definitions

◆ **FSP_SECURE_ARGUMENT**

#define FSP_SECURE_ARGUMENT

Macro to be used when argument to function is ignored since function call is NSC and the parameter is statically defined on the Secure side.

Enumeration Type Documentation◆ **fsp_err_t**

enum fsp_err_t

Common error codes

Enumerator

| | |
|--------------------------|--|
| FSP_ERR_ASSERTION | A critical assertion has failed. |
| FSP_ERR_INVALID_POINTER | Pointer points to invalid memory location. |
| FSP_ERR_INVALID_ARGUMENT | Invalid input parameter. |
| FSP_ERR_INVALID_CHANNEL | Selected channel does not exist. |
| FSP_ERR_INVALID_MODE | Unsupported or incorrect mode. |
| FSP_ERR_UNSUPPORTED | Selected mode not supported by this API. |
| FSP_ERR_NOT_OPEN | Requested channel is not configured or API not open. |
| FSP_ERR_IN_USE | Channel/peripheral is running/busy. |
| FSP_ERR_OUT_OF_MEMORY | Allocate more memory in the driver's cfg.h. |
| FSP_ERR_HW_LOCKED | Hardware is locked. |
| FSP_ERR_IRQ_BSP_DISABLED | IRQ not enabled in BSP. |
| FSP_ERR_OVERFLOW | Hardware overflow. |
| FSP_ERR_UNDERFLOW | |

| | |
|-------------------------------|--|
| | Hardware underflow. |
| FSP_ERR_ALREADY_OPEN | Requested channel is already open in a different configuration. |
| FSP_ERR_APPROXIMATION | Could not set value to exact result. |
| FSP_ERR_CLAMPED | Value had to be limited for some reason. |
| FSP_ERR_INVALID_RATE | Selected rate could not be met. |
| FSP_ERR_ABORTED | An operation was aborted. |
| FSP_ERR_NOT_ENABLED | Requested operation is not enabled. |
| FSP_ERR_TIMEOUT | Timeout error. |
| FSP_ERR_INVALID_BLOCKS | Invalid number of blocks supplied. |
| FSP_ERR_INVALID_ADDRESS | Invalid address supplied. |
| FSP_ERR_INVALID_SIZE | Invalid size/length supplied for operation. |
| FSP_ERR_WRITE_FAILED | Write operation failed. |
| FSP_ERR_ERASE_FAILED | Erase operation failed. |
| FSP_ERR_INVALID_CALL | Invalid function call is made. |
| FSP_ERR_INVALID_HW_CONDITION | Detected hardware is in invalid condition. |
| FSP_ERR_INVALID_FACTORY_FLASH | Factory flash is not available on this MCU. |
| FSP_ERR_INVALID_STATE | API or command not valid in the current state. |
| FSP_ERR_NOT_ERASED | Erase verification failed. |
| FSP_ERR_SECTOR_RELEASE_FAILED | Sector release failed. |
| FSP_ERR_NOT_INITIALIZED | Required initialization not complete. |
| FSP_ERR_NOT_FOUND | The requested item could not be found. |
| FSP_ERR_NO_CALLBACK_MEMORY | Non-secure callback memory not provided for non-secure callback. |
| FSP_ERR_BUFFER_EMPTY | No data available in buffer. |
| FSP_ERR_INVALID_DATA | Accuracy of data is not guaranteed. |

| | |
|-------------------------------|---|
| FSP_ERR_INTERNAL | Internal error. |
| FSP_ERR_WAIT_ABORTED | Wait aborted. |
| FSP_ERR_FRAMING | Framing error occurs. |
| FSP_ERR_BREAK_DETECT | Break signal detects. |
| FSP_ERR_PARITY | Parity error occurs. |
| FSP_ERR_RXBUF_OVERFLOW | Receive queue overflow. |
| FSP_ERR_QUEUE_UNAVAILABLE | Can't open s/w queue. |
| FSP_ERR_INSUFFICIENT_SPACE | Not enough space in transmission circular buffer. |
| FSP_ERR_INSUFFICIENT_DATA | Not enough data in receive circular buffer. |
| FSP_ERR_TRANSFER_ABORTED | The data transfer was aborted. |
| FSP_ERR_MODE_FAULT | Mode fault error. |
| FSP_ERR_READ_OVERFLOW | Read overflow. |
| FSP_ERR_SPI_PARITY | Parity error. |
| FSP_ERR_OVERRUN | Overrun error. |
| FSP_ERR_CLOCK_INACTIVE | Inactive clock specified as system clock. |
| FSP_ERR_CLOCK_ACTIVE | Active clock source cannot be modified without stopping first. |
| FSP_ERR_NOT_STABILIZED | Clock has not stabilized after its been turned on/off. |
| FSP_ERR_PLL_SRC_INACTIVE | PLL initialization attempted when PLL source is turned off. |
| FSP_ERR_OSC_STOP_DET_ENABLED | Illegal attempt to stop LOCO when Oscillation stop is enabled. |
| FSP_ERR_OSC_STOP_DETECTED | The Oscillation stop detection status flag is set. |
| FSP_ERR_OSC_STOP_CLOCK_ACTIVE | Attempt to clear Oscillation Stop Detect Status with PLL/MAIN_OSC active. |

| | |
|------------------------------------|--|
| FSP_ERR_CLKOUT_EXCEEDED | Output on target output clock pin exceeds maximum supported limit. |
| FSP_ERR_USB_MODULE_ENABLED | USB clock configure request with USB Module enabled. |
| FSP_ERR_HARDWARE_TIMEOUT | A register read or write timed out. |
| FSP_ERR_LOW_VOLTAGE_MODE | Invalid clock setting attempted in low voltage mode. |
| FSP_ERR_PE_FAILURE | Unable to enter Programming mode. |
| FSP_ERR_CMD_LOCKED | Peripheral in command locked state. |
| FSP_ERR_FCLK | FCLK must be ≥ 4 MHz. |
| FSP_ERR_INVALID_LINKED_ADDRESS | Function or data are linked at an invalid region of memory. |
| FSP_ERR_BLANK_CHECK_FAILED | Blank check operation failed. |
| FSP_ERR_INVALID_CAC_REF_CLOCK | Measured clock rate < reference clock rate. |
| FSP_ERR_INVALID_RESULT | The result of one or more calculations was +/- infinity. |
| FSP_ERR_CLOCK_GENERATION | Clock cannot be specified as system clock. |
| FSP_ERR_INVALID_TIMING_SETTING | Invalid timing parameter. |
| FSP_ERR_INVALID_LAYER_SETTING | Invalid layer parameter. |
| FSP_ERR_INVALID_ALIGNMENT | Invalid memory alignment found. |
| FSP_ERR_INVALID_GAMMA_SETTING | Invalid gamma correction parameter. |
| FSP_ERR_INVALID_LAYER_FORMAT | Invalid color format in layer. |
| FSP_ERR_INVALID_UPDATE_TIMING | Invalid timing for register update. |
| FSP_ERR_INVALID_CLUT_ACCESS | Invalid access to CLUT entry. |
| FSP_ERR_INVALID_FADE_SETTING | Invalid fade-in/fade-out setting. |
| FSP_ERR_INVALID_BRIGHTNESS_SETTING | Invalid gamma correction parameter. |
| FSP_ERR_JPEG_ERR | JPEG error. |

| | |
|---|--|
| FSP_ERR_JPEG_SOI_NOT_DETECTED | SOI not detected until EOI detected. |
| FSP_ERR_JPEG_SOF1_TO_SOFF_DETECTED | SOF1 to SOFF detected. |
| FSP_ERR_JPEG_UNSUPPORTED_PIXEL_FORMAT | Unprovided pixel format detected. |
| FSP_ERR_JPEG_SOF_ACCURACY_ERROR | SOF accuracy error: other than 8 detected. |
| FSP_ERR_JPEG_DQT_ACCURACY_ERROR | DQT accuracy error: other than 0 detected. |
| FSP_ERR_JPEG_COMPONENT_ERROR1 | Component error 1: the number of SOF0 header components detected is other than 1, 3, or 4. |
| FSP_ERR_JPEG_COMPONENT_ERROR2 | Component error 2: the number of components differs between SOF0 header and SOS. |
| FSP_ERR_JPEG_SOF0_DQT_DHT_NOT_DETECTED | SOF0, DQT, and DHT not detected when SOS detected. |
| FSP_ERR_JPEG_SOS_NOT_DETECTED | SOS not detected: SOS not detected until EOI detected. |
| FSP_ERR_JPEG_EOI_NOT_DETECTED | EOI not detected (default) |
| FSP_ERR_JPEG_RESTART_INTERVAL_DATA_NUMBER_ERROR | Restart interval data number error detected. |
| FSP_ERR_JPEG_IMAGE_SIZE_ERROR | Image size error detected. |
| FSP_ERR_JPEG_LAST_MCU_DATA_NUMBER_ERROR | Last MCU data number error detected. |
| FSP_ERR_JPEG_BLOCK_DATA_NUMBER_ERROR | Block data number error detected. |
| FSP_ERR_JPEG_BUFFER_SIZE_NOT_ENOUGH | User provided buffer size not enough. |
| FSP_ERR_JPEG_UNSUPPORTED_IMAGE_SIZE | JPEG Image size is not aligned with MCU. |
| FSP_ERR_CALIBRATE_FAILED | Calibration failed. |
| FSP_ERR_IIRFA_ECC_1BIT | 1-bit ECC error detected |
| FSP_ERR_IIRFA_ECC_2BIT | 2-bit ECC error detected |
| FSP_ERR_IP_HARDWARE_NOT_PRESENT | Requested IP does not exist on this device. |
| FSP_ERR_IP_UNIT_NOT_PRESENT | Requested unit does not exist on this device. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | Requested channel does not exist on this |

| | |
|--|---|
| | device. |
| FSP_ERR_NO_MORE_BUFFER | No more buffer found in the memory block pool. |
| FSP_ERR_ILLEGAL_BUFFER_ADDRESS | Buffer address is out of block memory pool. |
| FSP_ERR_INVALID_WORKBUFFER_SIZE | Work buffer size is invalid. |
| FSP_ERR_INVALID_MSG_BUFFER_SIZE | Message buffer size is invalid. |
| FSP_ERR_TOO_MANY_BUFFERS | Number of buffer is too many. |
| FSP_ERR_NO_SUBSCRIBER_FOUND | No message subscriber found. |
| FSP_ERR_MESSAGE_QUEUE_EMPTY | No message found in the message queue. |
| FSP_ERR_MESSAGE_QUEUE_FULL | No room for new message in the message queue. |
| FSP_ERR_ILLEGAL_SUBSCRIBER_LISTS | Message subscriber lists is illegal. |
| FSP_ERR_BUFFER_RELEASED | Buffer has been released. |
| FSP_ERR_D2D_ERROR_INIT | D/AVE 2D has an error in the initialization. |
| FSP_ERR_D2D_ERROR_DEINIT | D/AVE 2D has an error in the initialization. |
| FSP_ERR_D2D_ERROR_RENDERING | D/AVE 2D has an error in the rendering. |
| FSP_ERR_D2D_ERROR_SIZE | D/AVE 2D has an error in the rendering. |
| FSP_ERR_ETHER_ERROR_NO_DATA | No Data in Receive buffer. |
| FSP_ERR_ETHER_ERROR_LINK | ETHERC/EDMAC has an error in the Auto-negotiation. |
| FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE | As a Magic Packet is being detected, and transmission/reception is not enabled. |
| FSP_ERR_ETHER_ERROR_TRANSMIT_BUFFER_FULL | Transmit buffer is not empty. |
| FSP_ERR_ETHER_ERROR_FILTERING | Detect multicast frame when multicast frame filtering enable. |
| FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION | ETHERC/EDMAC has an error in the phy communication. |
| FSP_ERR_ETHER_RECEIVE_BUFFER_ACTIVE | Receive buffer is active. |

| | |
|------------------------------------|---|
| FSP_ERR_ETHER_PHY_ERROR_LINK | PHY is not link up. |
| FSP_ERR_ETHER_PHY_NOT_READY | PHY has an error in the Auto-negotiation. |
| FSP_ERR_QUEUE_FULL | Queue is full, cannot queue another data. |
| FSP_ERR_QUEUE_EMPTY | Queue is empty, no data to dequeue. |
| FSP_ERR_CTSU_SCANNING | Scanning. |
| FSP_ERR_CTSU_NOT_GET_DATA | Not processed previous scan data. |
| FSP_ERR_CTSU_INCOMPLETE_TUNING | Incomplete initial offset tuning. |
| FSP_ERR_CTSU_DIAG_NOT_YET | Diagnosis of data collected no yet. |
| FSP_ERR_CTSU_DIAG_LDO_OVER_VOLTAGE | Diagnosis of LDO over voltage failed. |
| FSP_ERR_CTSU_DIAG_CCO_HIGH | Diagnosis of CCO into 19.2uA failed. |
| FSP_ERR_CTSU_DIAG_CCO_LOW | Diagnosis of CCO into 2.4uA failed. |
| FSP_ERR_CTSU_DIAG_SSCG | Diagnosis of SSCG frequency failed. |

| FSP_ERR_WIFI_FUNC_NOT_CONFIG | DA16200 Function is not configured. |
| FSP_ERR_WIFI_NVRAM_WR_FAIL | DA16200 NVRAM write failure. |
| FSP_ERR_WIFI_RET_MEM_WR_FAIL | DA16200 Retention memory write failure. |
| FSP_ERR_WIFI_UNKNOWN_ERR | DA16200 unknown error. |
| FSP_ERR_CELLULAR_CONFIG_FAILED | Cellular module Configuration failed. |
| FSP_ERR_CELLULAR_INIT_FAILED | Cellular module initialization failed. |
| FSP_ERR_CELLULAR_TRANSMIT_FAILED | Transmission failed. |
| FSP_ERR_CELLULAR_FW_UPTODATE | Firmware is uptodate. |
| FSP_ERR_CELLULAR_FW_UPGRADE_FAILED | Firmware upgrade failed. |
| FSP_ERR_CELLULAR_FAILED | Cellular Failed. |
| FSP_ERR_CELLULAR_INVALID_STATE | API Called in invalid state. |
| FSP_ERR_CELLULAR_REGISTRATION_FAILED | Cellular Network registration failed. |
| FSP_ERR_BLE_FAILED | BLE operation failed. |
| FSP_ERR_BLE_INIT_FAILED | BLE device initialization failed. |
| FSP_ERR_BLE_CONFIG_FAILED | BLE device configuration failed. |
| FSP_ERR_BLE_PRF_ALREADY_ENABLED | BLE device Profile already enabled. |
| FSP_ERR_BLE_PRF_NOT_ENABLED | BLE device not enabled. |

| | |
|---------------------------------------|--|
| FSP_ERR_BLE_ABS_INVALID_OPERATION | Invalid operation is executed. |
| FSP_ERR_BLE_ABS_NOT_FOUND | Valid data or free space is not found. |
| FSP_ERR_CRYPTOC_CONTINUE | Continue executing function. |
| FSP_ERR_CRYPTOC_SCE_RESOURCE_CONFLICT | Hardware resource busy. |
| FSP_ERR_CRYPTOC_SCE_FAIL | Internal I/O buffer is not empty. |
| FSP_ERR_CRYPTOC_SCE_HRK_INVALID_INDEX | Invalid index. |
| FSP_ERR_CRYPTOC_SCE_RETRY | Retry. |
| FSP_ERR_CRYPTOC_SCE_VERIFY_FAIL | Verify is failed. |
| FSP_ERR_CRYPTOC_SCE_ALREADY_OPEN | HW SCE module is already opened. |
| FSP_ERR_CRYPTOC_NOT_OPEN | Hardware module is not initialized. |
| FSP_ERR_CRYPTOC_UNKNOWN | Some unknown error occurred. |
| FSP_ERR_CRYPTOC_NULL_POINTER | Null pointer input as a parameter. |
| FSP_ERR_CRYPTOC_NOT_IMPLEMENTED | Algorithm/size not implemented. |
| FSP_ERR_CRYPTOC_RNG_INVALID_PARAM | An invalid parameter is specified. |
| FSP_ERR_CRYPTOC_RNG_FATAL_ERROR | A fatal error occurred. |
| FSP_ERR_CRYPTOC_INVALID_SIZE | Size specified is invalid. |
| FSP_ERR_CRYPTOC_INVALID_STATE | Function used in an valid state. |
| FSP_ERR_CRYPTOC_ALREADY_OPEN | control block is already opened |
| FSP_ERR_CRYPTOC_INSTALL_KEY_FAILED | Specified input key is invalid. |
| FSP_ERR_CRYPTOC_AUTHENTICATION_FAILED | Authentication failed. |
| FSP_ERR_CRYPTOC_SCE_KEY_SET_FAIL | Failure to Init Cipher. |
| FSP_ERR_CRYPTOC_SCE_AUTHENTICATION | Authentication failed. |
| FSP_ERR_CRYPTOC_SCE_PARAMETER | Input date is illegal. |
| FSP_ERR_CRYPTOC_SCE_PROHIBIT_FUNCTION | An invalid function call occurred. |

| | |
|---|---|
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | Hardware resource is busy. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Hardware fatal error or unexpected return. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Internal error. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key type is illegal. |
| FSP_ERR_CRYPTO_RSIP_AUTHENTICATION | Authentication failed. |
| FSP_ERR_CRYPTO_COMMON_NOT_OPENED | Crypto Framework Common is not opened. |
| FSP_ERR_CRYPTO_HAL_ERROR | Crypto HAL module returned an error. |
| FSP_ERR_CRYPTO_KEY_BUF_NOT_ENOUGH | Key buffer size is not enough to generate a key. |
| FSP_ERR_CRYPTO_BUF_OVERFLOW | Attempt to write data larger than what the buffer can hold. |
| FSP_ERR_CRYPTO_INVALID_OPERATION_MODE | Invalid operation mode. |
| FSP_ERR_MESSAGE_TOO_LONG | Message for RSA encryption is too long. |
| FSP_ERR_RSA_DECRYPTION_ERROR | RSA Decryption error. |
| FSP_ERR_SENSOR_INVALID_DATA | Data is invalid. <i>Note</i> <i>SF_CRYPTO APIs may return an error code starting from 0x10000 which is of Crypto module. Refer to sf_cryoto_err.h for Crypto error codes.</i> |
| FSP_ERR_SENSOR_IN_STABILIZATION | Sensor is stabilizing. |
| FSP_ERR_SENSOR_MEASUREMENT_NOT_FINISHED | Measurement is not finished. |
| FSP_ERR_COMMS_BUS_NOT_OPEN | Bus is not open. |

5.1.3 MCU Board Support Package

```

Detailed Description

The BSP is responsible for getting the MCU from reset to the user's application. Before reaching the user's application, the BSP sets up the stacks, heap, clocks, interrupts, C runtime environment, and stack monitor.

Overview

BSP Features

BSP Clock Configuration

All system clocks are set up during BSP initialization based on the settings in `bsp_clock_cfg.h`. These settings are derived from clock configuration information provided from the RA Configuration editor **Clocks** tab.

- Clock configuration is performed prior to initializing the C runtime environment to speed up the startup process, as it is possible to start up on a relatively slow (that is, 32 kHz) clock.
- The BSP implements the required delays to allow the selected clock to stabilize.
- The BSP will configure the CMSIS `SystemCoreClock` variable after clock initialization with the current system clock frequency.

System Interrupts

As RA MCUs are based on the Arm Cortex-M architecture, the NVIC Nested Vectored Interrupt Controller (NVIC) handles exceptions and interrupt configuration, prioritization and interrupt masking. In the Arm architecture, the NVIC handles exceptions. Some exceptions are known as System Exceptions. System exceptions are statically located at the "top" of the vector table and occupy vector numbers 1 to 15. Vector zero is reserved for the MSP Main Stack Pointer (MSP). The remaining 15 system exceptions are shown below:

- Reset
- NMI
- Cortex-M4 Hard Fault Handler
- Cortex-M4 MPU Fault Handler
- Cortex-M4 Bus Fault Handler
- Cortex-M4 Usage Fault Handler
- Reserved
- Reserved
- Reserved
- Reserved
- Cortex-M4 SVCALL Handler
- Cortex-M4 Debug Monitor Handler
- Reserved
- Cortex-M4 PendSV Handler
- Cortex-M4 SysTick Handler

NMI and Hard Fault exceptions are enabled out of reset and have fixed priorities. Other exceptions have configurable priorities and some can be disabled.

Group Interrupts

Group interrupt is the term used to describe the 12 sources that can trigger the Non-Maskable Interrupt (NMI). When an NMI occurs the NMI Handler examines the NMISR (status register) to determine the source of the interrupt. NMI interrupts take precedence over all interrupts, are usable only as CPU interrupts, and cannot activate the RA peripherals Data Transfer Controller (DTC) or Direct Memory Access Controller (DMAC).

Possible group interrupt sources include:

- IWDT Underflow/Refresh Error
- WDT Underflow/Refresh Error
- Voltage-Monitoring 1 Interrupt
- Voltage-Monitoring 2 Interrupt
- VBATT monitor Interrupt
- Oscillation Stop is detected
- NMI pin
- RAM Parity Error
- RAM ECC Error
- MPU Bus Slave Error
- MPU Bus Master Error
- MPU Stack Error
- TrustZone Filter Error A user may enable notification for one or more group interrupts by registering a callback using the BSP API function `R_BSP_GroupIrqWrite()`. When an NMI interrupt occurs, the NMI handler checks to see if there is a callback registered for the cause of the interrupt and if so calls the registered callback function.

External and Peripheral Interrupts

User configurable interrupts begin with slot 16. These may be external, or peripheral generated interrupts.

Although the number of available slots for the NVIC interrupt vector table may seem small, the BSP defines up to 512 events that are capable of generating an interrupt. By using Event Mapping, the BSP maps user-enabled events to NVIC interrupts. For an RA6M3 MCU, only 96 of these events may be active at any one time, but the user has flexibility by choosing which events generate the active event.

By allowing the user to select only the events they are interested in as interrupt sources, we are able to provide an interrupt service routine that is fast and event specific.

For example, on other microcontrollers a standard NVIC interrupt vector table might contain a single vector entry for the SCI0 (Serial Communications Interface) peripheral. The interrupt service routine for this would have to check a status register for the 'real' source of the interrupt. In the RA implementation there is a vector entry for each of the SCI0 events that we are interested in.

BSP Weak Symbols

You might wonder how the BSP is able to place ISR addresses in the NVIC table without the user having explicitly defined one. All that is required by the BSP is that the interrupt event be given a priority.

This is accomplished through the use of the 'weak' attribute. The weak attribute causes the declaration to be emitted as a weak symbol rather than a global. A weak symbol is one that can be overridden by an accompanying strong reference with the same name. When the BSP declares a function as weak, user code can define the same function and it will be used in place of the BSP function. By defining all possible interrupt sources as weak, the vector table can be built at compile time and any user declarations (strong references) will be used at runtime.

Weak symbols are supported for ELF targets and also for a.out targets when using the GNU assembler and linker.

Note that in CMSIS system.c, there is also a weak definition (and a function body) for the Warm Start callback function [R_BSP_WarmStart\(\)](#). Because this function is defined in the same file as the weak declaration, it will be called as the 'default' implementation. The function may be overridden by the user by copying the body into their user application and modifying it as necessary. The linker identifies this as the 'strong' reference and uses it.

Warm Start Callbacks

As the BSP is in the process of bringing up the board out of reset, there are three points where the user can request a callback. These are defined as the 'Pre Clock Init', 'Post Clock Init' and 'Post C' warm start callbacks.

As described above, this function is already weakly defined as [R_BSP_WarmStart\(\)](#), so it is a simple matter of redefining the function or copying the existing body from CMSIS system.c into the application code to get a callback. [R_BSP_WarmStart\(\)](#) takes an event parameter of type `bsp_warm_start_event_t` which describes the type of warm start callback being made.

This function is not enabled/disabled and is always called for both events as part of the BSP startup. Therefore it needs a function body, which will not be called if the user is overriding it. The function body is located in system.c. To use this function just copy this function into your own code and modify it to meet your needs.

Sub Clock Stabilization Wait Callback

When Sub-Clock oscillator is populated in the application, the BSP startup code waits for some time(sub-clock stabilization time) to allow Sub-clock to stabilize. Enabling the watchdog (IWDT or WDT) timer with Auto start mode in an application using Sub-clock may cause system to generate Reset or NMI interrupt before reaching the application code if watchdog refresh register is not updated in the configured refresh Window. To overcome this problem a weakly defined callback `R_BSP_SubClockStabilizeWait()` can be overridden. Redefine the callback function in the application code and add code to update the watchdog refresh register. `R_BSP_SubClockStabilizeWait()` takes a parameter delay of type `uint32_t` which describes the time in milliseconds required to stabilize the sub-clock.

Sub Clock Stabilization Wait After Reset callback

After Power-On-Reset, the BSP startup code may have to wait for some time(sub-clock stabilization time) to allow Sub-clock to stabilize. This can cause problem to RTC in case device is to be reset frequently. If Sub-Clock registers are not initialized during a reset, BSP actually does not have to wait for Sub-clock to stabilize. To overcome this problem, a weakly defined callback `R_BSP_SubClockStabilizeWaitAfterReset()` is provided. Reimplement the callback function in the application code to determine whether BSP has to wait for stabilization time based on the current reset type. `R_BSP_SubClockStabilizeWaitAfterReset()` takes a parameter delay of type `uint32_t` which describes the time in milliseconds required to stabilize the sub-clock.

C Runtime Initialization

This BSP configuration allows the user to skip the FSP C runtime initialization code by setting the "C Runtime Initialization" to "Disabled" on the BSP tab of the RA Configuration editor. Disabling this option is useful in cases where a non-standard linker script is being used or other modifications to the runtime initialization are desired. If this macro is disabled, the user must use the 'Post Clock Init' event from the warm start (described above) to run their own runtime initialization code.

Heap Allocation

The relatively low amount of on-chip SRAM available and lack of memory protection in an MCU means that heap use must be very carefully controlled to avoid memory leaks, overruns and attempted overallocation. Further, many RTOSes provide their own dynamic memory allocation system. For these reasons the default heap size is set at 0 bytes, effectively disabling dynamic memory. If it is required for an application setting a positive value to the "Heap size (bytes)" option in the RA Common configurations on the **BSP** tab will allocate a heap.

Note

When using `printf/sprintf` (and other variants) to output floating point numbers a heap is required. A minimum size of 0x1000 (4096) bytes is recommended when starting development in this case.

Error Logging

When error logging is enabled, the error logging function can be redefined on the command line by defining `FSP_ERROR_LOG(err)` to the desired function call. The default function implementation is `FSP_ERROR_LOG(err)=fsp_error_log(err, FILE, LINE)`. This implementation uses the predefined macros **FILE** and **LINE** to help identify the location where the error occurred. Removing the line from the function call can reduce code size when error logging is enabled. Some compilers may support other predefined macros like **FUNCTION**, which could be helpful for customizing the error logger.

Register Protection

The BSP register protection functions utilize reference counters to ensure that an application which has specified a certain register and subsequently calls another function doesn't have its register protection settings inadvertently modified.

Each time `R_BSP_RegisterProtectDisable()` is called, the respective reference counter is incremented.

Each time `R_BSP_RegisterProtectEnable()` is called, the respective reference counter is decremented.

Both functions will only modify the protection state if their reference counter is zero.

```
/* Enable writing to protected CGC registers */  
R_BSP_RegisterProtectDisable(BSP_REG_PROTECT_CGC);  
/* Insert code to modify protected CGC registers. */  
/* Disable writing to protected CGC registers */  
R_BSP_RegisterProtectEnable(BSP_REG_PROTECT_CGC);
```

Option-setting memory

Option-setting memory includes OFS registers OFS0 and OFS1, OSIS debugger ID code, and block protections settings BPS and PBPS. Option-setting memory is MCU specific, and not all MCUs implement all option-setting registers. Option-setting configurations available on the selected device are configurable in the BSP properties. These configurations are placed in sections to be loaded at the required flash address by the linker.

The ID code is a 16-byte value that can be used to protect the MCU from being connected to a debugger or from connecting in Serial Boot Mode. There are different settings that can be set for the ID code; please refer to the hardware manual for your device for available options.

On MCUs that support TrustZone, option-setting registers are placed in a different locations for Non-Secure projects than for Secure or Flat projects. This is handled automatically by the BSP and linker scripts.

All `*_SEL` registers default to allowing both Secure and Non-Secure access unless otherwise noted here. If block protection is configured in a Secure project, the BSP sets the corresponding configuration to Secure access only by updating the corresponding `*_SEL` register. Similarly, the LVD related settings in the `OFSn_SEL` registers are automatically set to Secure if the corresponding LVD monitor is used in the Secure project.

TrustZone Security Attribution Registers

On MCUs that support TrustZone, Security Attribution Registers for modules used in the Secure project are configured to allow Secure access only as part of the startup code of the Secure project. This logic is skipped for Flat projects.

Software Delay

Implements a blocking software delay. A delay can be specified in microseconds, milliseconds or seconds. The delay is implemented based on the system clock rate.

```
/* Delay at least 1 second. Depending on the number of wait states required for the
```

region of memory

* that the `software_delay_loop` has been linked in this could take longer. The default is 4 cycles per loop.

* This can be modified by redefining `DELAY_LOOP_CYCLES`. `BSP_DELAY_UNITS_SECONDS`, `BSP_DELAY_UNITS_MILLISECONDS`,

* and `BSP_DELAY_UNITS_MICROSECONDS` can all be used with `R_BSP_SoftwareDelay`. */
`R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_SECONDS);`

Trigonometric Function

Implements Trigonometric math inline functions utilizing TFU hardware. These functions can calculate sine, cosine, arctangent and hypotenuse. The trigonometric library functions `sinf()`, `cosf()`, `atan2f()`, and `hypotf()` can be mapped to respective TFU functions by enabling TFU Mathlib property in FSP Configuration tool. Extended functions `sincosf()` and `atan2hypotf()` are also available when the TFU Mathlib property is enabled in the RA Configuration editor.

TFU functions are not reentrant. Disable the TFU Mathlib property in RA Configuration editor if reentrant access to trigonometric library functions is required.

Note

Refer to the MCU hardware user's manual or datasheet to determine if it has TFU support.

Digital Signal Processing With 32-bit Multiply-Accumulator

Implements DSP (digital signal processing) functions via MACL (32-bit Multiply-Accumulator) hardware. These functions will support CMSIS DSP APIs to perform the calculation, the activation of MACL can be controlled by stack MACL (`rm_cmsis_dsp`) in the RA Configuration editor.

When stack MACL (`rm_cmsis_dsp`) is added, the CMSIS DSP APIs will generate normal functions which overrides weak functions of Arm and use hardware for calculating. When stack MACL (`rm_cmsis_dsp`) is not added, CMSIS DSP APIs will perform the calculation by using software.

For examples, how to use the CMSIS DSP APIs refer to the link: <https://github.com/ARM-software/CMSIS-DSP/tree/main/Examples/ARM>.

CMSIS APIs supported by MACL list:

| No | CMSIS DSP API | MACL BSP API | Description |
|----|-----------------------------------|-------------------------------------|--------------------------------------|
| 1 | <code>arm_mult_q31</code> | <code>R_BSP_MacIMulQ31</code> | Q31 vector multiplication |
| 2 | <code>arm_scale_q31</code> | <code>R_BSP_MacIScaleQ31</code> | Multiplies a Q31 vector by a scalar |
| 3 | <code>arm_mat_mult_q31</code> | <code>R_BSP_MacIMatMultQ31</code> | Q31 matrix multiplication |
| 4 | <code>arm_mat_vec_mult_q31</code> | <code>R_BSP_MacIMatVecMulQ31</code> | Q31 matrix and vector multiplication |

| | | | |
|----|----------------------------|-----------------------------|---|
| 5 | arm_mat_scale_q31 | R_BSP_MacIMatScaleQ31 | Q31 matrix scaling |
| 6 | arm_biquad_cascade_df1_q31 | R_BSP_MacIBiquadCsdDf1Q31 | Processing function for the Q31 Biquad cascade filter |
| 7 | arm_conv_partial_q31 | R_BSP_MacIConvPartialQ31 | Partial convolution of Q31 sequences |
| 8 | arm_conv_q31 | R_BSP_MacIConvQ31 | Convolution of Q31 sequences |
| 9 | arm_correlate_q31 | R_BSP_MacICorrelateQ31 | Correlation of Q31 sequences |
| 10 | arm_fir_decimate_q31 | R_BSP_MacIFirDecimateQ31 | Processing function for the Q31 FIR decimator |
| 11 | arm_fir_interpolate_q31 | R_BSP_MacIFirInterpolateQ31 | Processing function for the Q31 FIR interpolator |
| 12 | arm_fir_q31 | R_BSP_MacIFirQ31 | Processing function for Q31 FIR filter |
| 13 | arm_fir_sparse_q31 | R_BSP_MacIFirSparseQ31 | Processing function for the Q31 sparse FIR filter |
| 14 | arm_lms_norm_q31 | R_BSP_MacILmsNormQ31 | Processing function for Q31 normalized LMS filter |
| 15 | arm_lms_q31 | R_BSP_MacILmsQ31 | Processing function for Q31 LMS filter |

Note

Refer to the MCU hardware user's manual or datasheet to determine if it has MACL support.

Critical Section Macros

Implements a critical section. Some MCUs (MCUs with the BASEPRI register) support allowing high priority interrupts to execute during critical sections. On these MCUs, interrupts with priority less than or equal to BSP_CFG_IRQ_MASK_LEVEL_FOR_CRITICAL_SECTION are not serviced in critical sections. Interrupts with higher priority than BSP_CFG_IRQ_MASK_LEVEL_FOR_CRITICAL_SECTION still execute in critical sections.

```

FSP_CRITICAL_SECTION_DEFINE;

/* Store the current interrupt posture. */
FSP_CRITICAL_SECTION_ENTER;

/* Interrupts cannot run in this section unless their priority is less than
BSP_CFG_IRQ_MASK_LEVEL_FOR_CRITICAL_SECTION. */

/* Restore saved interrupt posture. */

```

```
FSP_CRITICAL_SECTION_EXIT;
```

OctaClock Update

Supports changing the Octal-SPI Clock (OCTACLK) during runtime if supported by the MCU. The OCTACLK source and clock divisor can be updated. It is user's responsibility to ensure the selected clock source is running before attempting to update OCTACLK.

Sealing the Main Stack (TrustZone Secure Projects)

In TrustZone secure projects, the BSP seals the main stack by placing the value 0xFE5EDA5 above the stack top. For more information, refer to section 3.5 "Sealing a Stack" in "Secure software guidelines for ARMv8-M": <https://developer.arm.com/documentation/100720/0300>.

Limited D-Cache Support

For MCUs with Cortex-M85 cores with D-Cache, limited support is available for enabling the D-Cache and automatically configuring predefined non-cacheable regions via the MPU during BSP initialization. For these MCUs, D-Cache is disabled by default because certain existing drivers do not support data coherency with D-Cache enabled. Enabling the D-Cache requires that data coherency be considered in any circumstance where a core interacts with other bus members.

Non-Cacheable Buffer Placement Example

The predefined non-cacheable regions configured by the MPU when D-Cache is enabled can be used to contain data that should not be cached, ensuring data coherency for that data. To use the predefined non-cacheable regions, place the data into the corresponding non-cacheable section defined by the linker script for the chosen toolchain. The predefined non-cacheable regions are not initialized by the BSP.

Use one of the .nocache sections to place non-cacheable data.

```
uint8_t uncached_uninitialized_buffer_sram[1024] BSP_PLACE_IN_SECTION( ".nocache" );
```

Section names differ by data region and compiler. Names predefined by the BSP are shown below.

| Region | Name (GCC, IAR, LLVM) | Name (AC6) |
|--------|-----------------------|--------------------|
| SRAM | .nocache | .bss.nocache |
| SDRAM | .nocache_sdram | .bss.nocache_sdram |

Configuration

The BSP is heavily data driven with most features and functionality being configured based on the content from configuration files. Configuration files represent the settings specified by the user and are generated when the project is built and/or when the Generate Project Content button is clicked in the RA Configuration editor.

Build Time Configurations for fsp_common

The following build time configurations are defined in fsp_cfg/bsp/bsp_cfg.h:

| Configuration | Options | Default | Description |
|-------------------------|--|--------------------------|---|
| Main stack size (bytes) | Value must be an integer multiple of 8 and between 8 and 0xFFFFFFFF | 0x400 | Set the size of the main program stack. NOTE: This entry is for the main stack. When using an RTOS, thread stacks can be configured in the properties for each thread. |
| Heap size (bytes) | Value must be 0 or an integer multiple of 8 between 8 and 0xFFFFFFFF. | 0 | The main heap is disabled by default. Set the heap size to a positive integer divisible by 8 to enable it. A minimum of 4K (0x1000) is recommended if standard library functions are to be used. |
| MCU Vcc (mV) | Value must between 0 and 5500 (5.5V) | 3300 | Some peripherals require different settings based on the supplied voltage. Entering Vcc here (in mV) allows the relevant driver modules to configure the associated peripherals accordingly. |
| Parameter checking | <ul style="list-style-type: none"> Enabled Disabled | Disabled | When enabled, parameter checking for the BSP is turned on. In addition, any modules whose parameter checking configuration is set to 'Default (BSP)' will perform parameter checking as well. |
| Assert Failures | <ul style="list-style-type: none"> Return FSP_ERR_ASSERTION Call fsp_error_log then Return FSP | Return FSP_ERR_ASSERTION | Define the behavior of the FSP_ASSERT() macro. |

| | | | |
|---|--|----------------------|--|
| | <ul style="list-style-type: none"> • <code>_ERR_ASSERTION</code> | | |
| Error Log | <ul style="list-style-type: none"> • Use <code>assert()</code> to Halt Execution • Disable checks that would return <code>FSP_ERR_ASSERTION</code> | No Error Log | Specify error logging behavior. |
| Clock Registers not Reset Values during Startup | <ul style="list-style-type: none"> • No Error Log • Errors Logged via <code>fsp_error_log</code> | Disabled | If enabled, registers are assumed to be set to their reset value during startup. Enable this if another application such as a bootloader or Secure project has already configured the clocks before the startup code runs. |
| Main Oscillator Populated | <ul style="list-style-type: none"> • Disabled • Enabled | Populated | Select whether or not there is a main oscillator (XTAL) on the board. This setting can be overridden in <code>board_cfg.h</code> . |
| PFS Protect | <ul style="list-style-type: none"> • Populated • Not Populated | Enabled | Keep the PFS registers locked when they are not being modified. If disabled they will be unlocked during startup. |
| C Runtime Initialization | <ul style="list-style-type: none"> • Disabled • Enabled | Enabled | Select if the C runtime initialization in the BSP is to be used. If disabled, use the <code>BSP_WARM_START_POST_CLOCK</code> event to run user defined equivalent. |
| Early BSP Initialization | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Enable this option to use BSP functions before C runtime initialization (<code>BSP_WARM_START_RESET</code> or <code>BSP_WARM_START_POST_CLOCK</code>). |
| Main Oscillator Clock Source | <ul style="list-style-type: none"> • External Oscillator | Crystal or Resonator | Select the main oscillator clock source. |

| | | | |
|---|--|----------------------|--|
| | <ul style="list-style-type: none"> Crystal or Resonator | | This setting can be overridden in board_cfg.h |
| Subclock Populated | <ul style="list-style-type: none"> Populated Not Populated | Populated | Select whether or not there is a subclock crystal on the board. This setting can be overridden in board_cfg.h. |
| Subclock Drive (Drive capacitance availability varies by MCU) | <ul style="list-style-type: none"> Standard/Normal mode Low/Low power mode 1 Low power mode 2 Low power mode 3 | Standard/Normal mode | Select the subclock oscillator drive capacitance. This setting can be overridden in board_cfg.h |
| Subclock Stabilization Time (ms) | Value must between 0 and 10000 | 1000 | Select the subclock oscillator stabilization time. This is only used in the startup code if the subclock is selected as the system clock on the Clocks tab or if the HOCO FLL function is enabled. This setting can be overridden in board_cfg.h |

```

Macro Definition Documentation

◆ BSP_STACK_ALIGNMENT

```
#define BSP_STACK_ALIGNMENT
```

Stacks (and heap) must be sized and aligned to an integer multiple of this number.

◆ BSP_IRQ_DISABLED

```
#define BSP_IRQ_DISABLED
```

Used to signify that an ELC event is not able to be used as an interrupt.

◆ FSP_LOG_PRINT

```
#define FSP_LOG_PRINT ( X)
```

Macro that can be defined in order to enable logging in FSP modules.

◆ FSP_RETURN

```
#define FSP_RETURN ( err)
```

Macro to log and return error without an assertion.

◆ FSP_ERROR_LOG

```
#define FSP_ERROR_LOG ( err)
```

This function is called before returning an error code. To stop on a runtime error, define `fsp_error_log` in user code and do required debugging (breakpoints, stack dump, etc) in this function.

◆ FSP_ASSERT

```
#define FSP_ASSERT ( a)
```

Default assertion calls [FSP_ERROR_RETURN](#) if condition "a" is false. Used to identify incorrect use of API's in FSP functions.

◆ FSP_ERROR_RETURN

```
#define FSP_ERROR_RETURN ( a, err )
```

All FSP error codes are returned using this macro. Calls [FSP_ERROR_LOG](#) function if condition "a" is false. Used to identify runtime errors in FSP functions.

◆ FSP_CRITICAL_SECTION_ENTER

```
#define FSP_CRITICAL_SECTION_ENTER
```

This macro temporarily saves the current interrupt state and disables interrupts.

◆ FSP_CRITICAL_SECTION_EXIT

```
#define FSP_CRITICAL_SECTION_EXIT
```

This macro restores the previously saved interrupt state, reenabling interrupts.

◆ **FSP_INVALID_VECTOR**

```
#define FSP_INVALID_VECTOR
```

Used to signify that the requested IRQ vector is not defined in this system.

◆ **BSP_CFG_HANDLE_UNRECOVERABLE_ERROR**

```
#define BSP_CFG_HANDLE_UNRECOVERABLE_ERROR ( x)
```

In the event of an unrecoverable error the BSP will by default call the `__BKPT()` intrinsic function which will alert the user of the error. The user can override this default behavior by defining their own `BSP_CFG_HANDLE_UNRECOVERABLE_ERROR` macro.

◆ **R_BSP_MODULE_START**

```
#define R_BSP_MODULE_START ( ip, channel )
```

Cancels the module stop state.

Parameters

| | |
|---------|--|
| ip | fsp_ip_t enum value for the module to be stopped |
| channel | The channel. Use channel 0 for modules without channels. |

◆ **R_BSP_MODULE_STOP**

```
#define R_BSP_MODULE_STOP ( ip, channel )
```

Enables the module stop state.

Parameters

| | |
|---------|--|
| ip | fsp_ip_t enum value for the module to be stopped |
| channel | The channel. Use channel 0 for modules without channels. |

Enumeration Type Documentation

◆ **bsp_reg_protect_t**

| enum <code>bsp_reg_protect_t</code> | |
|---|--|
| The different types of registers that can be protected. | |
| Enumerator | |
| <code>BSP_REG_PROTECT_CGC</code> | Enables writing to the registers related to the clock generation circuit. |
| <code>BSP_REG_PROTECT_OM_LPC_BATT</code> | Enables writing to the registers related to operating modes, low power consumption, and battery backup function. |
| <code>BSP_REG_PROTECT_LVD</code> | Enables writing to the registers related to the LVD: <code>LVCMPCR</code> , <code>LVDLVLR</code> , <code>LVD1CR0</code> , <code>LVD1CR1</code> , <code>LVD1SR</code> , <code>LVD2CR0</code> , <code>LVD2CR1</code> , <code>LVD2SR</code> . |
| <code>BSP_REG_PROTECT_SAR</code> | Enables writing to the registers related to the security function. |

◆ **bsp_delay_units_t**

| enum <code>bsp_delay_units_t</code> | |
|---|--|
| Available delay units for <code>R_BSP_SoftwareDelay()</code> . These are ultimately used to calculate a total # of microseconds | |
| Enumerator | |
| <code>BSP_DELAY_UNITS_SECONDS</code> | Requested delay amount is in seconds. |
| <code>BSP_DELAY_UNITS_MILLISECONDS</code> | Requested delay amount is in milliseconds. |
| <code>BSP_DELAY_UNITS_MICROSECONDS</code> | Requested delay amount is in microseconds. |

◆ **bsp_warm_start_event_t**

| enum <code>bsp_warm_start_event_t</code> | |
|--|---|
| Different warm start entry locations in the BSP. | |
| Enumerator | |
| <code>BSP_WARM_START_RESET</code> | Called almost immediately after reset. No C runtime environment, clocks, or IRQs. |
| <code>BSP_WARM_START_POST_CLOCK</code> | Called after clock initialization. No C runtime environment or IRQs. |
| <code>BSP_WARM_START_POST_C</code> | Called after clocks and C runtime environment have been set up. |

◆ **fsp_priv_source_clock_t**

| enum <code>fsp_priv_source_clock_t</code> | |
|---|--------------------------------------|
| Enumerator | |
| <code>FSP_PRIV_CLOCK_HOCO</code> | The high speed on chip oscillator. |
| <code>FSP_PRIV_CLOCK_MOCO</code> | The middle speed on chip oscillator. |
| <code>FSP_PRIV_CLOCK_LOCO</code> | The low speed on chip oscillator. |
| <code>FSP_PRIV_CLOCK_MAIN_OSC</code> | The main oscillator. |
| <code>FSP_PRIV_CLOCK_SUBCLOCK</code> | The subclock oscillator. |
| <code>FSP_PRIV_CLOCK_PLL</code> | The PLL oscillator. |
| <code>FSP_PRIV_CLOCK_PLL2</code> | The PLL2 oscillator. |

◆ **bsp_grp_irq_t**

| enum bsp_grp_irq_t | |
|---|--|
| Which interrupts can have callbacks registered. | |
| Enumerator | |
| BSP_GRP_IRQ_IWDT_ERROR | IWDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_WDT_ERROR | WDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_LVD1 | Voltage monitoring 1 interrupt. |
| BSP_GRP_IRQ_LVD2 | Voltage monitoring 2 interrupt. |
| BSP_GRP_IRQ_OSC_STOP_DETECT | Oscillation stop is detected. |
| BSP_GRP_IRQ_NMI_PIN | NMI Pin interrupt. |
| BSP_GRP_IRQ_MPU_BUS_TZF | MPU Bus or TrustZone Filter Error. |
| BSP_GRP_IRQ_COMMON_MEMORY | SRAM ECC or SRAM Parity Error. |
| BSP_GRP_IRQ_LOCKUP | LockUp Error. |
| BSP_GRP_IRQ_IWDT_ERROR | IWDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_WDT_ERROR | WDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_LVD1 | Voltage monitoring 1 interrupt. |
| BSP_GRP_IRQ_LVD2 | Voltage monitoring 2 interrupt. |
| BSP_GRP_IRQ_VBATT | VBATT monitor interrupt. |
| BSP_GRP_IRQ_OSC_STOP_DETECT | Oscillation stop is detected. |
| BSP_GRP_IRQ_NMI_PIN | NMI Pin interrupt. |
| BSP_GRP_IRQ_RAM_PARITY | RAM Parity Error. |
| BSP_GRP_IRQ_RAM_ECC | RAM ECC Error. |
| BSP_GRP_IRQ_MPU_BUS_SLAVE | MPU Bus Slave Error. |
| BSP_GRP_IRQ_MPU_BUS_MASTER | MPU Bus Master Error. |
| BSP_GRP_IRQ_MPU_STACK | MPU Stack Error. |

| | |
|-----------------------------|--|
| BSP_GRP_IRQ_TRUSTZONE | MPU Stack Error. |
| BSP_GRP_IRQ_CACHE_PARITY | MPU Stack Error. |
| BSP_GRP_IRQ_IWDT_ERROR | IWDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_WDT_ERROR | WDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_LVD1 | Voltage monitoring 1 interrupt. |
| BSP_GRP_IRQ_LVD2 | Voltage monitoring 2 interrupt. |
| BSP_GRP_IRQ_OSC_STOP_DETECT | Oscillation stop is detected. |
| BSP_GRP_IRQ_NMI_PIN | NMI Pin interrupt. |
| BSP_GRP_IRQ_MPU_BUS_TZF | MPU Bus or TrustZone Filter Error. |
| BSP_GRP_IRQ_COMMON_MEMORY | SRAM ECC or SRAM Parity Error. |
| BSP_GRP_IRQ_LOCKUP | LockUp Error. |
| BSP_GRP_IRQ_IWDT_ERROR | IWDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_WDT_ERROR | WDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_LVD1 | Voltage monitoring 1 interrupt. |
| BSP_GRP_IRQ_LVD2 | Voltage monitoring 2 interrupt. |
| BSP_GRP_IRQ_OSC_STOP_DETECT | Oscillation stop is detected. |
| BSP_GRP_IRQ_NMI_PIN | NMI Pin interrupt. |
| BSP_GRP_IRQ_MPU_BUS_TZF | MPU Bus or TrustZone Filter Error. |
| BSP_GRP_IRQ_COMMON_MEMORY | SRAM ECC or SRAM Parity Error. |
| BSP_GRP_IRQ_LOCKUP | LockUp Error. |

◆ fsp_ip_t

| enum fsp_ip_t | |
|--------------------|---|
| Available modules. | |
| Enumerator | |
| FSP_IP_CFLASH | Code Flash. |
| FSP_IP_DFLASH | Data Flash. |
| FSP_IP_RAM | RAM. |
| FSP_IP_LVD | Low Voltage Detection. |
| FSP_IP_CGC | Clock Generation Circuit. |
| FSP_IP_LPM | Low Power Modes. |
| FSP_IP_FCU | Flash Control Unit. |
| FSP_IP_ICU | Interrupt Control Unit. |
| FSP_IP_DMACH | DMA Controller. |
| FSP_IP_DTC | Data Transfer Controller. |
| FSP_IP_IOPORT | I/O Ports. |
| FSP_IP_PFS | Pin Function Select. |
| FSP_IP_ELC | Event Link Controller. |
| FSP_IP_MPU | Memory Protection Unit. |
| FSP_IP_MSTP | Module Stop. |
| FSP_IP_MMF | Memory Mirror Function. |
| FSP_IP_KEY | Key Interrupt Function. |
| FSP_IP_CAC | Clock Frequency Accuracy Measurement Circuit. |
| FSP_IP_DOC | Data Operation Circuit. |
| FSP_IP_CRC | Cyclic Redundancy Check Calculator. |

| | |
|---------------|----------------------------------|
| FSP_IP_SCI | Serial Communications Interface. |
| FSP_IP_IIC | I2C Bus Interface. |
| FSP_IP_SPI | Serial Peripheral Interface. |
| FSP_IP_CTSU | Capacitive Touch Sensing Unit. |
| FSP_IP_SCE | Secure Cryptographic Engine. |
| FSP_IP_SLCD | Segment LCD Controller. |
| FSP_IP_AES | Advanced Encryption Standard. |
| FSP_IP_TRNG | True Random Number Generator. |
| FSP_IP_FCACHE | Flash Cache. |
| FSP_IP_SRAM | SRAM. |
| FSP_IP_ADC | A/D Converter. |
| FSP_IP_DAC | 12-Bit D/A Converter |
| FSP_IP_TSN | Temperature Sensor. |
| FSP_IP_DAAD | D/A A/D Synchronous Unit. |
| FSP_IP_ACMPLP | High Speed Analog Comparator. |
| FSP_IP_OPAMP | Operational Amplifier. |
| FSP_IP_SDADC | Sigma Delta A/D Converter. |
| FSP_IP_RTC | Real Time Clock. |
| FSP_IP_WDT | Watch Dog Timer. |
| FSP_IP_IWDT | Independent Watch Dog Timer. |
| FSP_IP_GPT | General PWM Timer. |
| FSP_IP_POEG | Port Output Enable for GPT. |
| FSP_IP_OPS | Output Phase Switch. |

| | |
|--------------|---|
| FSP_IP_AGT | Asynchronous General-Purpose Timer. |
| FSP_IP_CAN | Controller Area Network. |
| FSP_IP_IRDA | Infrared Data Association. |
| FSP_IP_QSPI | Quad Serial Peripheral Interface. |
| FSP_IP_USBFS | USB Full Speed. |
| FSP_IP_SDHI | SD/MMC Host Interface. |
| FSP_IP_SRC | Sampling Rate Converter. |
| FSP_IP_SSI | Serial Sound Interface. |
| FSP_IP_DALI | Digital Addressable Lighting Interface. |
| FSP_IP_ETHER | Ethernet MAC Controller. |
| FSP_IP_EDMAC | Ethernet DMA Controller. |
| FSP_IP_EPTPC | Ethernet PTP Controller. |
| FSP_IP_PDC | Parallel Data Capture Unit. |
| FSP_IP_GLCDC | Graphics LCD Controller. |
| FSP_IP_DRW | 2D Drawing Engine |
| FSP_IP_JPEG | JPEG. |
| FSP_IP_DAC8 | 8-Bit D/A Converter |
| FSP_IP_USBHS | USB High Speed. |
| FSP_IP_OSPI | Octa Serial Peripheral Interface. |
| FSP_IP_CEC | HDMI CEC. |
| FSP_IP_TFU | Trigonometric Function Unit. |
| FSP_IP_IIRFA | IIR Filter Accelerator. |
| FSP_IP_CANFD | CAN-FD. |
| FSP_IP_ULPT | Ultra Low Power Timer ULPT. |

| | |
|--------------|-----------------------------|
| FSP_IP_SAU | Serial Array Unit. |
| FSP_IP_IICA | Serial Interface IICA. |
| FSP_IP_UARTA | Serial Interface UARTA. |
| FSP_IP_TAU | Timer Array Unit. |
| FSP_IP_TML32 | 32-bit Interval Timer |
| FSP_IP_MACL | 32-bit Multiply-Accumulator |

◆ fsp_signal_t

| enum fsp_signal_t | |
|---|-----------------------|
| Signals that can be mapped to an interrupt. | |
| Enumerator | |
| FSP_SIGNAL_ADC_COMPARE_MATCH | ADC COMPARE MATCH. |
| FSP_SIGNAL_ADC_COMPARE_MISMATCH | ADC COMPARE MISMATCH. |
| FSP_SIGNAL_ADC_SCAN_END | ADC SCAN END. |
| FSP_SIGNAL_ADC_SCAN_END_B | ADC SCAN END B. |
| FSP_SIGNAL_ADC_WINDOW_A | ADC WINDOW A. |
| FSP_SIGNAL_ADC_WINDOW_B | ADC WINDOW B. |
| FSP_SIGNAL_AES_RDREQ | AES RDREQ. |
| FSP_SIGNAL_AES_WRREQ | AES WRREQ. |
| FSP_SIGNAL_AGT_COMPARE_A | AGT COMPARE A. |
| FSP_SIGNAL_AGT_COMPARE_B | AGT COMPARE B. |
| FSP_SIGNAL_AGT_INT | AGT INT. |
| FSP_SIGNAL_CAC_FREQUENCY_ERROR | CAC FREQUENCY ERROR. |
| FSP_SIGNAL_CAC_MEASUREMENT_END | CAC MEASUREMENT END. |
| FSP_SIGNAL_CAC_OVERFLOW | CAC OVERFLOW. |

| | |
|-------------------------------|---------------------|
| FSP_SIGNAL_CAN_ERROR | CAN ERROR. |
| FSP_SIGNAL_CAN_FIFO_RX | CAN FIFO RX. |
| FSP_SIGNAL_CAN_FIFO_TX | CAN FIFO TX. |
| FSP_SIGNAL_CAN_MAILBOX_RX | CAN MAILBOX RX. |
| FSP_SIGNAL_CAN_MAILBOX_TX | CAN MAILBOX TX. |
| FSP_SIGNAL_CGC_MOSC_STOP | CGC MOSC STOP. |
| FSP_SIGNAL_LPM_SNOOZE_REQUEST | LPM SNOOZE REQUEST. |

| FSP_SIGNAL_ULPT_INT | ULPT INT. |

Function Documentation

◆ R_FSP_VersionGet()

```
fsp_err_t R_FSP_VersionGet ( fsp_pack_version_t *const p_version)
```

Get the FSP version based on compile time macros.

Parameters

| | | |
|-------|-----------|--|
| [out] | p_version | Memory address to return version information to. |
|-------|-----------|--|

Return values

| | |
|-------------------|----------------------------------|
| FSP_SUCCESS | Version information stored. |
| FSP_ERR_ASSERTION | The parameter p_version is NULL. |

◆ SystemInit()

```
BSP_SECTION_FLASH_GAP void SystemInit ( void )
```

Initialize the MCU and the runtime environment.

◆ **R_BSP_WarmStart()**

```
void R_BSP_WarmStart ( bsp_warm_start_event_t event)
```

This function is called at various points during the startup process. This function is declared as a weak symbol higher up in this file because it is meant to be overridden by a user implemented version. One of the main uses for this function is to call functional safety code during the startup process. To use this function just copy this function into your own code and modify it to meet your needs.

Parameters

| | | |
|------|-------|---|
| [in] | event | Where the code currently is in the start up process |
|------|-------|---|

This function is called at various points during the startup process. This implementation uses the event that is called right before main() to set up the pins.

Parameters

| | | |
|------|-------|---|
| [in] | event | Where at in the start up process the code is currently at |
|------|-------|---|

◆ **Reset_Handler()**

```
BSP_SECTION_FLASH_GAP void Reset_Handler ( void )
```

MCU starts executing here out of reset. Main stack pointer is set up already.

◆ **Default_Handler()**

```
BSP_SECTION_FLASH_GAP void Default_Handler ( void )
```

Default exception handler.

◆ **NMI_Handler()**

```
BSP_SECTION_FLASH_GAP void NMI_Handler ( void )
```

Non-maskable interrupt handler. This exception is defined by the BSP, unlike other system exceptions, because there are many sources that map to the NMI exception.

◆ **R_BSP_RegisterProtectEnable()**

BSP_SECTION_FLASH_GAP void R_BSP_RegisterProtectEnable ([bsp_reg_protect_t](#) *regs_to_protect*)

Enable register protection. Registers that are protected cannot be written to. Register protection is enabled by using the Protect Register (PRCR) and the MPC's Write-Protect Register (PWPR).

Parameters

| | | |
|------|-----------------|--|
| [in] | regs_to_protect | Registers which have write protection enabled. |
|------|-----------------|--|

◆ **R_BSP_RegisterProtectDisable()**

BSP_SECTION_FLASH_GAP void R_BSP_RegisterProtectDisable ([bsp_reg_protect_t](#) *regs_to_unprotect*)

Disable register protection. Registers that are protected cannot be written to. Register protection is disabled by using the Protect Register (PRCR) and the MPC's Write-Protect Register (PWPR).

Parameters

| | | |
|------|-------------------|---|
| [in] | regs_to_unprotect | Registers which have write protection disabled. |
|------|-------------------|---|

◆ **R_BSP_IrqClearPending()**

BSP_SECTION_FLASH_GAP void R_BSP_IrqClearPending ([IRQn_Type](#) *irq*)

Clear the interrupt status flag (IR) for a given interrupt and clear the NVIC pending interrupt.

Parameters

| | | |
|------|-----|---|
| [in] | irq | Interrupt for which to clear the IR bit. Note that the enums listed for IRQn_Type are only those for the Cortex Processor Exceptions Numbers. |
|------|-----|---|

Warning

Do not call this function for system exceptions where the [IRQn_Type](#) value is < 0.

◆ **R_BSP_IrqCfg()**

BSP_SECTION_FLASH_GAP void R_BSP_IrqCfg (IRQn_Type const *irq*, uint32_t *priority*, void * *p_context*)

Sets the interrupt priority and context.

Parameters

| | | |
|------|------------------|---|
| [in] | <i>irq</i> | The IRQ to configure. |
| [in] | <i>priority</i> | NVIC priority of the interrupt |
| [in] | <i>p_context</i> | The interrupt context is a pointer to data required in the ISR. |

Warning

Do not call this function for system exceptions where the IRQn_Type value is < 0.

◆ **R_BSP_IrqEnableNoClear()**

BSP_SECTION_FLASH_GAP void R_BSP_IrqEnableNoClear (IRQn_Type const *irq*)

Enable the IRQ in the NVIC (Without clearing the pending bit).

Parameters

| | | |
|------|------------|---|
| [in] | <i>irq</i> | The IRQ to enable. Note that the enums listed for IRQn_Type are only those for the Cortex Processor Exceptions Numbers. |
|------|------------|---|

Warning

Do not call this function for system exceptions where the IRQn_Type value is < 0.

◆ **R_BSP_IrqEnable()**

BSP_SECTION_FLASH_GAP void R_BSP_IrqEnable (IRQn_Type const *irq*)

Clears pending interrupts in both ICU and NVIC, then enables the interrupt.

Parameters

| | | |
|------|------------|--|
| [in] | <i>irq</i> | Interrupt for which to clear the IR bit and enable in the NVIC. Note that the enums listed for IRQn_Type are only those for the Cortex Processor Exceptions Numbers. |
|------|------------|--|

Warning

Do not call this function for system exceptions where the IRQn_Type value is < 0.

◆ **R_BSP_IrqDisable()**

BSP_SECTION_FLASH_GAP void R_BSP_IrqDisable (IRQn_Type const *irq*)

Disables interrupts in the NVIC.

Parameters

| | | |
|------|------------|--|
| [in] | <i>irq</i> | The IRQ to disable in the NVIC. Note that the enums listed for IRQn_Type are only those for the Cortex Processor Exceptions Numbers. |
|------|------------|--|

Warning

Do not call this function for system exceptions where the IRQn_Type value is < 0.

◆ **R_BSP_IrqCfgEnable()**

```
BSP_SECTION_FLASH_GAP void R_BSP_IrqCfgEnable ( IRQn_Type const irq, uint32_t priority, void * p_context )
```

Sets the interrupt priority and context, clears pending interrupts, then enables the interrupt.

Parameters

| | | |
|------|------------------|---|
| [in] | <i>irq</i> | Interrupt number. |
| [in] | <i>priority</i> | NVIC priority of the interrupt |
| [in] | <i>p_context</i> | The interrupt context is a pointer to data required in the ISR. |

Warning

Do not call this function for system exceptions where the *IRQn_Type* value is < 0.

◆ **R_BSP_SourceClockHzGet()**

```
uint32_t R_BSP_SourceClockHzGet ( fsp_priv_source_clock_t clock )
```

Gets the frequency of a source clock.

Parameters

| | | |
|------|--------------|--|
| [in] | <i>clock</i> | Pointer to Octaclk setting structure which provides information regarding Octaclk source and divider settings to be applied. |
|------|--------------|--|

Returns

Frequency of requested clock in Hertz.

◆ **R_FSP_CurrentIrqGet()**

```
__STATIC_INLINE IRQn_Type R_FSP_CurrentIrqGet ( void )
```

Return active interrupt vector number value

Returns

Active interrupt vector number value

◆ R_FSP_SystemClockHzGet()

```
__STATIC_INLINE uint32_t R_FSP_SystemClockHzGet ( fsp_priv_clock_t clock)
```

Gets the frequency of a system clock.

Returns

Frequency of requested clock in Hertz.

◆ R_FSP_ClockDividerGet()

```
__STATIC_INLINE uint32_t R_FSP_ClockDividerGet ( uint32_t ckdivcr)
```

Converts a clock's CKDIVCR register value to a clock divider (Eg: SPICKDIVCR).

Returns

Clock Divider

◆ R_BSP_UniqueIdGet()

```
__STATIC_INLINE bsp_unique_id_t const* R_BSP_UniqueIdGet ( void )
```

Get unique ID for this device.

Returns

A pointer to the unique identifier structure

◆ R_BSP_FlashCacheDisable()

```
__STATIC_INLINE void R_BSP_FlashCacheDisable ( void )
```

Disables the flash cache.

◆ R_BSP_FlashCacheEnable()

```
__STATIC_INLINE void R_BSP_FlashCacheEnable ( void )
```

Enables the flash cache.

◆ R_BSP_SoftwareDelay()

```
BSP_SECTION_FLASH_GAP void R_BSP_SoftwareDelay ( uint32_t delay, bsp_delay_units_t units )
```

Delay for at least the specified duration in units and return.

Parameters

| | | |
|------|-------|---|
| [in] | delay | The number of 'units' to delay. |
| [in] | units | The 'base' (bsp_delay_units_t) for the units specified. Valid values are: BSP_DELAY_UNITS_SECONDS , BSP_DELAY_UNITS_MILLISECONDS, BSP_DELAY_UNITS_MICROSECONDS. For example: At 1 MHz one cycle takes 1 microsecond (.000001 seconds). At 12 MHz one cycle takes 1/12 microsecond or 83 nanoseconds. Therefore one run through bsp_prv_software_delay_loop() takes: ~ (83 * BSP_DELAY_LOOP_CYCLES) or 332 ns. A delay of 2 us therefore requires 2000ns/332ns or 6 loops. |

The 'theoretical' maximum delay that may be obtained is determined by a full 32 bit loop count and the system clock rate. @120MHz: $((0xFFFFFFFF \text{ loops} * 4 \text{ cycles /loop}) / 120000000) = 143$ seconds. @32MHz: $((0xFFFFFFFF \text{ loops} * 4 \text{ cycles /loop}) / 32000000) = 536$ seconds

Note that requests for very large delays will be affected by rounding in the calculations and the actual delay achieved may be slightly longer. @32 MHz, for example, a request for 532 seconds will be closer to 536 seconds.

Note also that if the calculations result in a loop_cnt of zero, the bsp_prv_software_delay_loop() function is not called at all. In this case the requested delay is too small (nanoseconds) to be carried out by the loop itself, and the overhead associated with executing the code to just get to this point has certainly satisfied the requested delay.

Note

This function calls bsp_cpu_clock_get() which ultimately calls R_CGC_SystemClockFreqGet() and therefore requires that the BSP has already initialized the CGC (which it does as part of the Sysinit). Care should be taken to ensure this remains the case if in the future this function were to be called as part of the BSP initialization.

*This function will delay for **at least** the specified duration. Due to overhead in calculating the correct number of loops to delay, very small delay values (generally 1-5 microseconds) may be significantly longer than specified.*

Approximate overhead for this function is as follows:

- CM4: 20-50 cycles

- CM33: 10-60 cycles
- CM23: 75-200 cycles

If more accurate microsecond timing must be performed in software it is recommended to use `bsp_prv_software_delay_loop()` directly. In this case, use `BSP_DELAY_LOOP_CYCLES` or `BSP_DELAY_LOOPS_CALCULATE()` to convert a calculated delay cycle count to a number of software delay loops.

Delays may be longer than expected when compiler optimization is turned off.

Warning

The delay will be longer than specified on CM23 devices when the core clock is greater than 32 MHz. Setting `BSP_DELAY_LOOP_CYCLES` to 6 will improve accuracy at 48 MHz but will result in shorter than expected delays at lower speeds.

◆ R_BSP_GroupIrqWrite()

```
BSP_SECTION_FLASH_GAP fsp_err_t R_BSP_GroupIrqWrite ( bsp_grp_irq_t irq, void(*) (bsp_grp_irq_t
irq) p_callback )
```

Register a callback function for supported interrupts. If NULL is passed for the callback argument then any previously registered callbacks are unregistered.

Parameters

| | | |
|------|------------|--|
| [in] | irq | Interrupt for which to register a callback. |
| [in] | p_callback | Pointer to function to call when interrupt occurs. |

Return values

| | |
|-------------------|--------------------------|
| FSP_SUCCESS | Callback registered |
| FSP_ERR_ASSERTION | Callback pointer is NULL |

Variable Documentation

◆ BSP_SECTION_EARLY_INIT

```
uint32_t SystemCoreClock BSP_SECTION_EARLY_INIT
```

System Clock Frequency (Core Clock)

| |
|--|
| <code>bsp_power_mode_t</code> <code>R_BSP_PowerModeSet (bsp_power_mode_t mode)</code> |
| Select either the LDO or DCDC regulator and/or update the MCU supply voltage range. Returns the previously selected mode. |
| <i>Note</i> <i>DCDC mode has the following limitations:</i> <ul style="list-style-type: none"> ◦ Supply voltage must be 2.4V or greater ◦ Low- and Subosc-speed modes are not available ◦ Software Standby is not available Ensure these limitations are respected before entering DCDC mode. If supply voltage may drop below 2.4V during operation, configure a LVD channel to interrupt or reset the MCU near this threshold to switch back to the LDO. <i>Switching to DCDC mode temporarily disables all interrupts and blocks for 22 microseconds; switching to LDO from DCDC temporarily disables all peripherals and interrupts and blocks for 60 microseconds. If the supply voltage falls outside the range originally specified when starting the DCDC regulator, call this function again with the updated supply voltage.</i> |
| Returns The previously selected power mode. |

Detailed Description

Build Time Configurations for ra4e1_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

| Configuration | Options | Default | Description |
|-------------------------------------|--|------------------------|--|
| Security | | | |
| Security > Exceptions | | | |
| Exception Response | <ul style="list-style-type: none"> Non-Maskable Interrupt Reset | Non-Maskable Interrupt | <p>Configure the result of a TrustZone Filter exception. This exception is generated when a the TrustZone Filter detects access to a protected region.</p> <p>This setting is only valid when building projects with TrustZone.</p> |
| BusFault, HardFault, and NMI Target | <ul style="list-style-type: none"> Non-Secure State Secure State | Secure State | <p>Value for SCB->AIRCR register bit BFHFNMIN. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception.</p> <p>This setting is only valid when building projects with TrustZone.</p> |
| Prioritize Secure Exceptions | <ul style="list-style-type: none"> Enabled Disabled | Disabled | <p>Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there</p> |

is effectively one less bit care must be taken to ensure the prioritization of non-secure interrupts is correct.

This setting is only valid when building projects with TrustZone.

Security > SRAM Accessibility

SRAM Protection

- Both Secure and Non-Secure State
- Secure State

Both Secure and Non-Secure State

Defines whether SRAMPRCR is write accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

SRAM ECC

- Both Secure and Non-Secure State
- Secure State

Both Secure and Non-Secure State

Defines whether SRAM ECC registers are write accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

Standby RAM

- Regions 7-0 are all Secure.
- Region 7 is Non-secure. Regions 6-0 are Secure.
- Regions 7-6 are Non-secure. Regions 5-0 are Secure.
- Regions 7-5 are Non-secure. Regions 4-0 are Secure.
- Regions 7-4 are Non-secure. Regions 3-0 are Secure.
- Regions 7-3 are Non-secure. Regions 2-0 are Secure.
- Regions 7-2 are

config.bsp.fsp.tz.stbra
msar.both

Defines whether Standby RAM registers are accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

- Non-secure.
Regions 1-0 are Secure.
- Regions 7-1 are Non-secure.
Region 0 is Secure.
 - Regions 7-0 are all Non-secure.

Security > BUS Accessibility

| | | | |
|-------------------------------------|--|----------------------------------|--|
| Bus Security Attribution Register A | <ul style="list-style-type: none"> • Both Secure and Non-Secure State • Secure State | Both Secure and Non-Secure State | <p>Defines whether the Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application.</p> <p>This setting is only valid when building projects with TrustZone.</p> |
| Bus Security Attribution Register B | <ul style="list-style-type: none"> • Both Secure and Non-Secure State • Secure State | Both Secure and Non-Secure State | <p>Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure application.</p> <p>This setting is only valid when building projects with TrustZone.</p> |

BSP » MCU Board Support Package

Detailed Description

Build Time Configurations for ra4m2_fsp

The following build time configurations are defined in `fsp_cfg/bsp/bsp_mcu_family_cfg.h`:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Security

Security > Exceptions

Exception Response

- Non-Maskable Interrupt
- Reset

Non-Maskable Interrupt

Configure the result of a TrustZone Filter exception. This exception is generated when the TrustZone Filter detects access to a protected region.

This setting is only valid when building projects with TrustZone.

BusFault, HardFault, and NMI Target

- Non-Secure State
- Secure State

Secure State

Value for SCB->AIRCR register bit BFHFNMIN. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception.

This setting is only valid when building projects with

| | | | |
|-------------------------------|--|--------------------------------------|---|
| Prioritize Secure Exceptions | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | <p>TrustZone.</p> <p>Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there is effectively one less bit care must be taken to ensure the prioritization of non-secure interrupts is correct.</p> <p>This setting is only valid when building projects with TrustZone.</p> |
| Security > SRAM Accessibility | | | |
| SRAM Protection | <ul style="list-style-type: none"> • Both Secure and Non-Secure State • Secure State | Both Secure and Non-Secure State | <p>Defines whether SRAMPRCR is write accessible for the Non-secure application.</p> <p>This setting is only valid when building projects with TrustZone.</p> |
| SRAM ECC | <ul style="list-style-type: none"> • Both Secure and Non-Secure State • Secure State | Both Secure and Non-Secure State | <p>Defines whether SRAM ECC registers are write accessible for the Non-secure application.</p> <p>This setting is only valid when building projects with TrustZone.</p> |
| Standby RAM | <ul style="list-style-type: none"> • Regions 7-0 are all Secure. • Region 7 is Non-secure. Regions 6-0 are Secure. • Regions 7-6 are Non-secure. Regions 5-0 are Secure. • Regions 7-5 are Non-secure. - Secure.
- Regions 7-4 are Non-secure.
Regions 3-0 are Secure.
 - Regions 7-3 are Non-secure.
Regions 2-0 are Secure.
 - Regions 7-2 are Non-secure.
Regions 1-0 are Secure.
 - Regions 7-1 are Non-secure.
Region 0 is Secure.
 - Regions 7-0 are all Non-secure.

Security > BUS Accessibility

Bus Security Attribution Register A

- Both Secure and Non-Secure State
 - Secure State
- Both Secure and Non-Secure State

Defines whether the Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

Bus Security Attribution Register B

- Both Secure and Non-Secure State
 - Secure State
- Both Secure and Non-Secure State

Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

System Reset Request Accessibility

- Both Secure and Non-Secure State
 - Secure State
- Secure State

Value for SCB->AIRCR register bit SYSRESETREQS. Defines whether the SYSRESETREQ bit is functional for Non-secure use.

This setting is only valid when building

| | | | |
|---|---|--|---|
| Cache Accessibility | <ul style="list-style-type: none"> Both Secure and Non-Secure State Secure State | Both Secure and Non-Secure State | <p>projects with TrustZone.</p> <p>Defines whether the Cache registers are write accessible for the Non-secure application.</p> <p>This setting is only valid when building projects with TrustZone.</p> |

If Secure State is selected, all battery backup registers are read only except for VBTBKRn registers which are both read and write protected.</p> |

This setting is only valid when building projects with TrustZone.

Uninitialized Non-Secure Application Fallback

- Enable Uninitialized Non-Secure Application Fallback
- Disable Uninitialized Non-Secure Application Fallback

Enable Uninitialized Non-Secure Application Fallback

If enabled, the secure application checks if the non-secure application has been programmed in non-secure flash before branching. If the non-secure application has not been programmed, then the secure application branches to an infinite loop in non-secure RAM. This prevents an issue where the debugger may not connect if the MCU is configured in the NSECSD lifecycle state.

BSP » MCU Board Support Package

Detailed Description

Build Time Configurations for ra4t1_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

| Configuration | Options | Default | Description |
|-------------------------------------|--|------------------------|---|
| Security | | | |
| Security > Exceptions | | | |
| Exception Response | <ul style="list-style-type: none"> Non-Maskable Interrupt Reset | Non-Maskable Interrupt | <p>Configure the result of a TrustZone Filter exception. This exception is generated when the TrustZone Filter detects access to a protected region.</p> <p>This setting is only valid when building projects with TrustZone.</p> |
| BusFault, HardFault, and NMI Target | <ul style="list-style-type: none"> Non-Secure State Secure State | Secure State | <p>Value for SCB->AIRCR register bit BFHFNMINs. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception.</p> <p>This setting is only valid when building projects with TrustZone.</p> |
| Prioritize Secure Exceptions | <ul style="list-style-type: none"> Enabled Disabled | Disabled | <p>Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there</p> |

is effectively one less bit care must be taken to ensure the prioritization of non-secure interrupts is correct.

This setting is only valid when building projects with TrustZone.

Security > SRAM Accessibility

SRAM Protection

- Both Secure and Non-Secure State
- Secure State

Both Secure and Non-Secure State

Defines whether SRAMPRCR is write accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

SRAM ECC

- Both Secure and Non-Secure State
- Secure State

Both Secure and Non-Secure State

Defines whether SRAM ECC registers are write accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

Standby RAM

- Regions 7-0 are all Secure.
- Region 7 is Non-secure. Regions 6-0 are Secure.
- Regions 7-6 are Non-secure. Regions 5-0 are Secure.
- Regions 7-5 are Non-secure. Regions 4-0 are Secure.
- Regions 7-4 are Non-secure. Regions 3-0 are Secure.
- Regions 7-3 are Non-secure. Regions 2-0 are Secure.
- Regions 7-2 are

config.bsp.fsp.tz.stbra
msar.both

Defines whether Standby RAM registers are accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

- Non-secure.
Regions 1-0 are Secure.
- Regions 7-1 are Non-secure.
Region 0 is Secure.
 - Regions 7-0 are all Non-secure.

Security > BUS Accessibility

Regions 1-0 are Secure. | config.bsp.fsp.tz.stbramsar.both | <p>Defines whether Standby RAM registers are accessible for the Non-secure application.</p> <p>This setting is only valid when building projects with TrustZone.</p> |

- Regions 7-1 are Non-secure. Region 0 is Secure.
- Regions 7-0 are all Non-secure.

Security > BUS Accessibility

Bus Security Attribution Register A

- Both Secure and Non-Secure State
- Secure State

Both Secure and Non-Secure State

Defines whether the Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

Bus Security Attribution Register B

- Both Secure and Non-Secure State
- Secure State

Both Secure and Non-Secure State

Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

System Reset Request Accessibility

- Both Secure and Non-Secure State
- Secure State

Secure State

Value for SCB->AIRCR register bit SYSRESETREQS. Defines whether the SYSRESETREQ bit is functional for Non-secure use.

This setting is only valid when building projects with TrustZone.

Cache Accessibility

- Both Secure and Non-Secure State
- Secure State

Both Secure and Non-Secure State

Defines whether the Cache registers are write accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

System Reset Status

- Both Secure

Both Secure and Non-

Defines whether the

| Configuration | Options | Default | Description |
|-------------------------------------|--|------------------------|---|
| Security | | | |
| Security > Exceptions | | | |
| Exception Response | <ul style="list-style-type: none"> Non-Maskable Interrupt Reset | Non-Maskable Interrupt | <p>Configure the result of a TrustZone Filter exception. This exception is generated when the TrustZone Filter detects access to a protected region.</p> <p>This setting is only valid when building projects with TrustZone.</p> |
| BusFault, HardFault, and NMI Target | <ul style="list-style-type: none"> Non-Secure State Secure State | Secure State | Value for SCB->AIRCR register bit BFHFNMINs. Defines whether BusFault and |

NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception.

This setting is only valid when building projects with TrustZone.

Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there is effectively one less bit care must be taken to ensure the prioritization of non-secure interrupts is correct.

This setting is only valid when building projects with TrustZone.

Prioritize Secure Exceptions

- Enabled
 - Disabled
- Disabled

Security > SRAM Accessibility

SRAM Protection

- Both Secure and Non-Secure State
 - Secure State
- Both Secure and Non-Secure State

Defines whether SRAMPRCR is write accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

SRAM ECC

- Both Secure and Non-Secure State
 - Secure State
- Both Secure and Non-Secure State

Defines whether SRAM ECC registers are write accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

Standby RAM

- Regions 7-0 are all Secure.
 - Region 7 is Non-
- config.bsp.fsp.tz.stbra
msar.both

Defines whether Standby RAM registers are accessible for the

- secure. Regions 6-0 are Secure.
- Regions 7-6 are Non-secure. Regions 5-0 are Secure.
 - Regions 7-5 are Non-secure. Regions 4-0 are Secure.
 - Regions 7-4 are Non-secure. Regions 3-0 are Secure.
 - Regions 7-3 are Non-secure. Regions 2-0 are Secure.
 - Regions 7-2 are Non-secure. Regions 1-0 are Secure.
 - Regions 7-1 are Non-secure. Region 0 is Secure.
 - Regions 7-0 are all Non-secure.

Non-secure application.

This setting is only valid when building projects with TrustZone.

Security > BUS Accessibility

Bus Security Attribution Register A

- Both Secure and Non-Secure State
- Secure State

Both Secure and Non-Secure State

Defines whether the Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

Bus Security Attribution Register B

- Both Secure and Non-Secure State
- Secure State

Both Secure and Non-Secure State

Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

System Reset Request

- Both Secure

Secure State

Value for SCB->AIRCR

| | | | |
|-----------------------------------|--|----------------------------------|---|
| Accessibility | <ul style="list-style-type: none"> • Secure State | and Non-Secure State | <p>register bit SYSRESETREQS. Defines whether the SYSRESETREQ bit is functional for Non-secure use.</p> <p>This setting is only valid when building projects with TrustZone.</p> |
| Cache Accessibility | <ul style="list-style-type: none"> • Both Secure and Non-Secure State • Secure State | Both Secure and Non-Secure State | <p>Defines whether the Cache registers are write accessible for the Non-secure application.</p> <p>This setting is only valid when building projects with TrustZone.</p> |
| System Reset Status Accessibility | <ul style="list-style-type: none"> • Both Secure and Non-Secure State • Secure State | Both Secure and Non-Secure State | <p>Defines whether the reset status registers (RSTSRn) can be cleared from the Non-secure application.</p> <p>This setting is only valid when building projects with TrustZone.</p> |
| Battery Backup Accessibility | <ul style="list-style-type: none"> • Both Secure and Non-Secure State • Secure State | Both Secure and Non-Secure State | <p>Defines whether the battery backup registers are accessible for the Non-secure application. If Secure State is selected, all battery backup registers are read only except for VBTBKRn registers which are both read and write protected.</p> <p>This setting is only valid when building projects with TrustZone.</p> |
| Flash Bank Select Accessibility | <ul style="list-style-type: none"> • Both Secure and Non-Secure State • Secure State | Both Secure and Non-Secure State | <p>Defines whether the BANKSEL register is write accessible for the Non-secure application.</p> |

This setting is only valid when building projects with TrustZone.

Uninitialized Non-Secure Application Fallback

- Enable Uninitialized Non-Secure Application Fallback
- Disable Uninitialized Non-Secure Application Fallback

Enable Uninitialized Non-Secure Application Fallback

If enabled, the secure application checks if the non-secure application has been programmed in non-secure flash before branching. If the non-secure application has not been programmed, then the secure application branches to an infinite loop in non-secure RAM. This prevents an issue where the debugger may not connect if the MCU is configured in the NSECSD lifecycle state.

Clocks

| | | | |
|-------------------|---|----------|---|
| HOCO FLL Function | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | <p>Setting this option to Enabled improves HOCO accuracy significantly by using the subclock, but incurs certain restrictions.</p> <p>The FLL function requires the subclock oscillator to be running and stabilized. When enabled and running the PLL or system clock from HOCO, the BSP will wait for both the Subclock Stabilization</p> |
|-------------------|---|----------|---|

Time as well as the FLL Stabilization Time when setting up clocks at startup.

When FLL is enabled Software Standby and Deep Software Standby modes are not available.

Using static inline functions will slightly increase code size, but will slightly decrease cycles taken in ISRs in return.

Set the C-Cache line size configured during startup.

Enabling dual bank mode splits the flash into two banks that can be swapped by programming the BANKSEL non-volatile register. When enabled, one bank will start at address 0x0 and the other will start at 0x200000. Each bank contains exactly half the capacity of the entire code flash. When Dual Bank mode is enabled, Startup Program Protection and Block Swap functions cannot be used.

Number of cycles to wait for the main oscillator clock to stabilize.

5.1.3.24 RA6T3

BSP » MCU Board Support Package

Detailed Description

Build Time Configurations for ra6t3_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

| Configuration | Options | Default | Description |
|-------------------------------------|--|------------------------|--|
| Security | | | |
| Security > Exceptions | | | |
| Exception Response | <ul style="list-style-type: none"> Non-Maskable Interrupt Reset | Non-Maskable Interrupt | <p>Configure the result of a TrustZone Filter exception. This exception is generated when the TrustZone Filter detects access to a protected region.</p> <p>This setting is only valid when building projects with TrustZone.</p> |
| BusFault, HardFault, and NMI Target | <ul style="list-style-type: none"> Non-Secure State Secure State | Secure State | <p>Value for SCB->AIRCR register bit BFHFNMIN. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception.</p> <p>This setting is only valid when building projects with TrustZone.</p> |
| Prioritize Secure Exceptions | <ul style="list-style-type: none"> Enabled Disabled | Disabled | <p>Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there</p> |

is effectively one less bit care must be taken to ensure the prioritization of non-secure interrupts is correct.

This setting is only valid when building projects with TrustZone.

Security > SRAM Accessibility

SRAM Protection

- Both Secure and Non-Secure State
- Secure State

Both Secure and Non-Secure State

Defines whether SRAMPRCR is write accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

SRAM ECC

- Both Secure and Non-Secure State
- Secure State

Both Secure and Non-Secure State

Defines whether SRAM ECC registers are write accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

Standby RAM

- Regions 7-0 are all Secure.
- Region 7 is Non-secure. Regions 6-0 are Secure.
- Regions 7-6 are Non-secure. Regions 5-0 are Secure.
- Regions 7-5 are Non-secure. Regions 4-0 are Secure.
- Regions 7-4 are Non-secure. Regions 3-0 are Secure.
- Regions 7-3 are Non-secure. Regions 2-0 are Secure.
- Regions 7-2 are

config.bsp.fsp.tz.stbra msar.both

Defines whether Standby RAM registers are accessible for the Non-secure application.

This setting is only valid when building projects with TrustZone.

- Non-secure.
Regions 1-0 are Secure.
- Regions 7-1 are Non-secure.
Region 0 is Secure.
 - Regions 7-0 are all Non-secure.

Security > BUS Accessibility

| | | | |
|-------------------------------------|--|----------------------------------|--|
| Bus Security Attribution Register A | <ul style="list-style-type: none"> • Both Secure and Non-Secure State • Secure State | Both Secure and Non-Secure State | <p>Defines whether the Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application.</p> <p>This setting is only valid when building projects with TrustZone.</p> |
| Bus Security Attribution Register B | <ul style="list-style-type: none"> • Both Secure and Non-Secure State • Secure State | Both Secure and Non-Secure State | <p>Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure application.</p> <p>This setting is only valid when building projects with TrustZone.</p> |

Detailed Description

Build Time Configurations for `ra8m1_fsp`

The following build time configurations are defined in `fsp_cfg/bsp/bsp_mcu_family_cfg.h`:

| Configuration | Options | Default | Description |
|-----------------------|---|------------------------|--|
| Security | | | |
| Security > Exceptions | | | |
| Exception Response | <ul style="list-style-type: none"> Non-Maskable Interrupt Reset | Non-Maskable Interrupt | Configure the result of a TrustZone Filter exception. This |

exception is generated when a the TrustZone Filter detects access to a protected region.

This setting is only valid when building projects with TrustZone.

Value for SCB->AIRCR register bit BFHFNMINs. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception.

This setting is only valid when building projects with TrustZone.

Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there is effectively one less bit care must be taken to ensure the prioritization of non-secure interrupts is correct.

This setting is only valid when building projects with TrustZone.

BusFault, HardFault, and NMI Target

- Non-Secure State
- Secure State

Secure State

Prioritize Secure Exceptions

- Enabled
- Disabled

Disabled

Security > SRAM Accessibility

SRAM0 Protection

- Both Secure and Non-Secure State
- Secure State

Both Secure and Non-Secure State

Defines whether SRAMCR0, SRAMECCRGNO, SRAMESCLR.CLR00, and SRAMESCLR.CLR01 are write accessible for the Non-secure application.

| | | | |
|-------------------------------------|--|----------------------------------|---|
| SRAM1 Protection | <ul style="list-style-type: none"> Both Secure and Non-Secure State Secure State | Both Secure and Non-Secure State | This setting is only valid when building projects with TrustZone. |
| Standby SRAM Protection | <ul style="list-style-type: none"> Both Secure and Non-Secure State Secure State | Both Secure and Non-Secure State | This setting is only valid when building projects with TrustZone. |
| Security > BUS Accessibility | | | This setting is only valid when building projects with TrustZone. |
| Bus Security Attribution Register A | <ul style="list-style-type: none"> Both Secure and Non-Secure State Secure State | Both Secure and Non-Secure State | Defines whether the Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application. |
| Bus Security Attribution Register B | <ul style="list-style-type: none"> Both Secure and Non-Secure State Secure State | Both Secure and Non-Secure State | This setting is only valid when building projects with TrustZone. |
| Bus Security Attribution Register C | <ul style="list-style-type: none"> Both Secure and Non-Secure State | Both Secure and Non-Secure State | This setting is only valid when building projects with TrustZone. |
| | | | Defines whether the SDRAM/CSC Control registers are write |

| | | | |
|------------------------------------|--|----------------------------------|---|
| | <ul style="list-style-type: none"> Secure State | | <p>accessible for the Non-secure application.</p> <p>This setting is only valid when building projects with TrustZone.</p> |
| System Reset Request Accessibility | <ul style="list-style-type: none"> Both Secure and Non-Secure State Secure State | Secure State | <p>Value for SCB->AIRCR register bit SYSRESETREQS. Defines whether the SYSRESETREQ bit is functional for Non-secure use.</p> <p>This setting is only valid when building projects with TrustZone.</p> |
| System Reset Status Accessibility | <ul style="list-style-type: none"> Both Secure and Non-Secure State Secure State | Both Secure and Non-Secure State | <p>Defines whether the reset status registers (RSTSRn) can be cleared from the Non-secure application.</p> <p>This setting is only valid when building projects with TrustZone.</p> |
| Battery Backup Accessibility | <ul style="list-style-type: none"> Both Secure and Non-Secure State Secure State | Both Secure and Non-Secure State | <p>Defines whether the battery backup registers are accessible for the Non-secure application. If Secure State is selected, all battery backup registers are read only except for VBTBKRn registers which are both read and write protected.</p> <p>This setting is only valid when building projects with TrustZone.</p> |
| Flash Bank Select Accessibility | <ul style="list-style-type: none"> Both Secure and Non-Secure State Secure State | Both Secure and Non-Secure State | <p>Defines whether the BANKSEL register is write accessible for the Non-secure application.</p> <p>This setting is only</p> |

valid when building projects with TrustZone.

Uninitialized Non-Secure Application Fallback

- Enable Uninitialized Non-Secure Application Fallback
- Disable Uninitialized Non-Secure Application Fallback

Enable Uninitialized Non-Secure Application Fallback

If enabled, the secure application checks if the non-secure application has been programmed in non-secure flash before branching. If the non-secure application has not been programmed, then the secure application branches to an infinite loop in non-secure RAM. This prevents an issue where the debugger may not connect if the MCU is configured in the NSECSD lifecycle state.

5.2 Modules

Detailed Description

Modules are the smallest unit of software available in FSP. Each module implements one interface.

For more information on FSP Modules and Interfaces review [FSP Modules](#), [FSP Stacks](#) and [FSP Interfaces](#) in the FSP Architecture section of this manual.

Note

Not all modules are available for all MCUs. For more information, see the User's Manual for the specific MCU.

Organization of Module Sections

Each module within FSP has a detailed Users' Guide listed below. Each guide typically includes the following content:

- **Functions:** A list of all the API functions associated with the module
- **Detailed Description:** A short description of the module and the peripherals used
- **Overview:** An operational summary and a list of high level features provided by the module
- **Configuration:** A description of module specific settings available in the configuration tool

- including clock and pin configurations
- Usage Notes: Module specific documentation and limitations
 - Examples: Illustrative code snippets that help the user better understand API use and operation
 - Data Structure and Enumeration: Definitions for data structures, enumerations and similar elements used by the module API
 - Function Documentation: Details on each API function, including the function prototype, a function summary, a simple use example, list of return values and links to documentation for any needed parameter definitions

Modules

Detailed Description

Analog Modules.

Modules

ADC (r_adc)

Driver for the ADC12, ADC14, and ADC16 peripherals on RA MCUs. This module implements the [ADC Interface](#).

ADC (r_adc_b)

Driver for the ADC_B peripheral on RA MCUs. This module implements the [ADC Interface](#).

ADC (r_adc_d)

Driver for ADC_D version of the ADC12 peripheral on RA MCUs. This module implements the [ADC Interface](#).

Comparator, High-Speed (r_acmphs)

Driver for the ACPHPS peripheral on RA MCUs. This module implements the [Comparator Interface](#).

Comparator, Low-Power (r_acmplp)

Driver for the ACPPLP peripheral on RA MCUs. This module implements the [Comparator Interface](#).

DAC (r_dac)

Driver for the DAC12 peripheral on RA MCUs. This module implements the [DAC Interface](#).

DAC8 (r_dac8)

Driver for the DAC8 peripheral on RA MCUs. This module implements the [DAC Interface](#).

Operational Amplifier (r_opamp)

Driver for the OPAMP peripheral on RA MCUs. This module implements the [OPAMP Interface](#).

SDADC Channel Configuration (r_sdadc)

Driver for the SDADC24 peripheral on RA MCUs. This module implements the [ADC Interface](#).

SDADC_B Channel Configuration (r_sdadc_b)

Driver for the SDADC_B peripheral on RA MCUs. This module implements the [ADC Interface](#).

```

Detailed Description

Driver for the ADC12, ADC14, and ADC16 peripherals on RA MCUs. This module implements the [ADC Interface](#).

Overview

Features

The ADC module supports the following features:

- 12, 14, or 16 bit maximum resolution depending on the MCU
- Configure scans to include:
 - Multiple analog channels
 - Temperature sensor channel
 - Voltage sensor channel
- Configurable scan start trigger:
 - Software scan triggers
 - Hardware scan triggers (timer expiration, for example)
 - External scan triggers from the ADTRGn port pins
- Configurable scan mode:
 - Single scan mode, where each trigger starts a single scan
 - Continuous scan mode, where all channels are scanned continuously
 - Group scan mode, where channels are grouped into group A and group B. The groups can be assigned different start triggers, and group A can be given priority over group B. When group A has priority over group B, a group A trigger suspends an ongoing group B scan.
- Supports adding and averaging converted samples
- Optional callback when scan completes
- Sample and hold support
- Double-trigger support
- Hardware comparator with interrupt and event output

Configuration

Build Time Configurations for r_adc

The following build time configurations are defined in fsp_cfg/r_adc_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> Default (BSP) Enabled Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Analog > ADC (r_adc)

This module can be added to the Stacks tab via New Stack > Analog > ADC (r_adc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|------------------|--|-------------|--|
| General | | | |
| Name | Name must be a valid C symbol | g_adc0 | Module name |
| Unit | Unit must be a non-negative integer | 0 | Specifies the ADC Unit to be used. |
| Resolution | MCU Specific Options | | Specifies the conversion resolution for this unit. |
| Alignment | MCU Specific Options | | Specifies the conversion result alignment. |
| Clear after read | <ul style="list-style-type: none"> Off On | On | Specifies if the result register will be automatically cleared after the conversion result is read. |
| Mode | <ul style="list-style-type: none"> Single Scan Continuous Scan Group Scan | Single Scan | Specifies the mode that this ADC unit is used in. |
| Double-trigger | <ul style="list-style-type: none"> Disabled Enabled Enabled (extended mode) | Disabled | <p>When enabled, the scan-end interrupt for Group A is only thrown on every second scan. Extended double-trigger mode (single-scan only) triggers on both ELC events, allowing (for example) a scan on two different timer compare match values.</p> <p>In group mode Group B is unaffected.</p> |

Input

Input > Sample and Hold

| | | | |
|--|---|----|---|
| Sample and Hold Channels (Available only on selected MCUs) | <ul style="list-style-type: none"> • Channel 0 • Channel 1 • Channel 2 | | Specifies if this channel is included in the Sample and Hold Mask. |
| Sample Hold States (Applies only to channels 0, 1, 2) | Must be a valid non-negative integer with configurable value 4 to 255 | 24 | Specifies the updated sample-and-hold count for the channel dedicated sample-and-hold circuit |

Input > Window Compare

Input > Window Compare > Window A

| | | | |
|---|---|----------|--|
| Enable | <ul style="list-style-type: none"> • Disabled • Enabled | Disabled | Enable or disable comparison with Window A. |
| Channels to compare (channel availability varies by MCU and unit) | Refer to the RA Configuration tool for available options. | | Select channels to be compared to Window A. |
| Channel comparison mode (channel availability varies by MCU and unit) | Refer to the RA Configuration tool for available options. | | Checking a box sets the comparison mode for that channel to Greater Than or Inside Window depending on whether Window Mode is disabled or enabled (respectively). If left unchecked the comparison mode will likewise be Less Than or Outside Window (respectively). |
| Lower Reference | Must be a positive 16-bit integer. | 0 | Set the lower comparison value. |
| Upper Reference | Must be a positive 16-bit integer. | 0 | Set the upper comparison value. |

Input > Window Compare > Window B

| | | | |
|--|---|-----------|--|
| Enable | <ul style="list-style-type: none"> • Disabled • Enabled | Disabled | Enable or disable comparison with Window B. |
| Channel to compare (channel availability varies by MCU and unit) | Refer to the RA Configuration tool for available options. | Channel 0 | Select a channel to be compared to Window B. |

| | | | |
|--|--|---|--|
| Comparison mode | <ul style="list-style-type: none"> Less Than or Outside Window Greater Than or Inside Window | module.driver.adc.compare.window_b.mode | Select the comparison mode for Window B. For each option, the first condition applies when Window Mode is disabled and the second option applies when Window Mode is enabled. |
| Lower Reference | Must be a positive 16-bit integer. | 0 | Set the lower comparison value. |
| Upper Reference | Must be a positive 16-bit integer. | 0 | Set the upper comparison value. |
| Window Mode | <ul style="list-style-type: none"> Disabled Enabled | Disabled | When disabled, ADC values will be compared only with the lower reference on each comparator. When enabled, both the lower and upper reference values will be used to create a comparison window. |
| Event Output | <ul style="list-style-type: none"> OR XOR AND | OR | Select how comparison results should be composited for event output. |
| Channel Scan Mask (channel availability varies by MCU) | Refer to the RA Configuration tool for available options. | | In Normal mode of operation, this bitmask field specifies the channels that are enabled in that ADC unit. In group mode, this field specifies which channels belong to group A. |
| Group B Scan Mask (channel availability varies by MCU) | Refer to the RA Configuration tool for available options. | | In group mode, this field specifies which channels belong to group B. |
| Add/Average Count | MCU Specific Options | | Specifies if addition or averaging needs to be done for any of the channels in this unit. |
| Reference Voltage control | MCU Specific Options | | Specify VREFH/VREFADC output voltage control. |
| Addition/Averaging Mask (channel | Refer to the RA Configuration tool for | | Select channels to include in the |

| | | | |
|--|---|----------------------------------|---|
| availability varies by MCU and unit) | available options. | | Addition/Averaging Mask |
| Interrupts | | | |
| Normal/Group A Trigger | MCU Specific Options | | Specifies the trigger type to be used for this unit. |
| Group B Trigger | MCU Specific Options | | Specifies the trigger for Group B scanning in group scanning mode. This event is also used to trigger Group A in extended double-trigger mode. |
| Group Priority (Valid only in Group Scan Mode) | <ul style="list-style-type: none"> Group A cannot interrupt Group B Group A can interrupt Group B; Group B scan restarts at next trigger Group A can interrupt Group B; Group B scan restarts immediately Group A can interrupt Group B; Group B scan restarts immediately and scans continuously | Group A cannot interrupt Group B | Determines whether an ongoing group B scan can be interrupted by a group A trigger, whether it should abort on a group A trigger, or if it should pause to allow group A scan and restart immediately after group A scan is complete. |
| Callback | Name must be a valid C symbol | NULL | A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the ADC scan completes. |
| Scan End Interrupt Priority | MCU Specific Options | | Select scan end interrupt priority. |
| Scan End Group B Interrupt Priority | MCU Specific Options | | Select group B scan end interrupt priority. |
| Window Compare A Interrupt Priority | MCU Specific Options | | Select Window Compare A interrupt priority. |
| Window Compare B | MCU Specific Options | | Select Window |

Interrupt Priority

Compare B interrupt priority.

Extra

ADC Ring Buffer

MCU Specific Options

ADC Ring Buffer to be used only with DMAC transfers, keep this property disabled for normal ADC operations. When enabled, ADC converted data is stored in ADBUF registers in place of ADDR registers. The read API will not read from this location for normal ADC operations.

Clock Configuration

The ADC clock is PCLKC if the MCU has PCLKC, or PCLKD otherwise.

The clock for this module is derived from the following peripheral clock for each MCU group:

| MCU Group | Peripheral Clock |
|-----------|------------------|
| RA0E1 | ICLK |
| RA2A1 | PCLKD |
| RA2A2 | PCLKD |
| RA2E1 | PCLKD |
| RA2E2 | PCLKD |
| RA2E3 | PCLKD |
| RA2L1 | PCLKD |
| RA4E1 | PCLKC |
| RA4E2 | PCLKC |
| RA4M1 | PCLKC |
| RA4M2 | PCLKC |
| RA4M3 | PCLKC |
| RA4T1 | PCLKC |
| RA4W1 | PCLKC |
| RA6E1 | PCLKC |
| RA6E2 | PCLKC |
| RA6M1 | PCLKC |

| RA8M1 | PCLKC |
| RA8T1 | PCLKC |

The ADC clock must be at least 1 MHz when the ADC is used. Many MCUs also have PCLK ratio restrictions when the ADC is used. For details on PCLK ratio restrictions, reference the footnotes in the second table of the Clock Generation Circuit chapter of the MCU User's Manual (for example, Table 9.2 "Specifications of the clock generation circuit for the internal clocks" in the RA6M3 manual R01UH0886EJ0100).

Pin Configuration

The ANxxx pins are analog input channels that can be used with the ADC.

ADTRG0 and ADTRG1 can be used to start scans with an external trigger for unit 0 and 1 respectively. When external triggers are used, ADC scans begin on the falling edge of the ADTRG pin.

Usage Notes

Sample Hold

Enabling the sample and hold functionality reduces the maximum scan frequency because the sample and hold time is added to each scan. Refer to the hardware manual for details on the sample and hold time.

ADC Operational Modes

The driver supports three operation modes: single-scan, continuous-scan, and group-scan modes. In each mode, analog channels are converted in ascending order of channel number, followed by scans of the temperature sensor and voltage sensor if they are included in the mask of channels to scan.

Single-scan Mode

In single scan mode, one or more specified channels are scanned once per trigger.

Continuous-scan Mode

In continuous scan mode, a single trigger is required to start the scan. Scans continue until [R_ADC_ScanStop\(\)](#) is called.

Note

1) To help ensure a responsive system, developers should consider system clock speed, ADCLK speed, and callback

processing time. In particular, using a scan-end callback with a high scan rate relative to core clocks (for example, in continuous scan mode) may result in constant or high-frequency interrupts and is not recommended.

2) On some MCUs, scanning the temperature sensor or internal reference voltage in continuous or group scan modes is prohibited. Check the "ADC12 specifications" section of the device's User Manual to see if this restriction applies.

Group-scan Mode

Group-scan mode allows the application to allocate channels to one of two groups (A and B). Conversion begins when the specified ELC start trigger for that group is received.

With the priority configuration parameter, you can optionally give group A priority over group B. If group A has priority over group B, a group B scan is interrupted when a group A scan trigger occurs. The following options exist for group B when group A has priority:

- To restart the interrupted group B scan after the group A scan completes.
- To wait for another group B trigger and forget the interrupted scan.
- To continuously scan group B and suspend scanning group B only when a group A trigger is received.

Note

If this option is selected, group B scanning begins immediately after `R_ADC_ScanCfg()`. Group A scan triggers must be enabled by `R_ADC_ScanStart()` and can be disabled by `R_ADC_ScanStop()`. Group B scans can only be disabled by reconfiguring the group A priority to a different mode.

Double-triggering

When double-triggering is enabled a single channel is selected to be scanned twice before an interrupt is thrown. The first scan result when using double-triggering is always saved to the selected channel's data register. The second result is saved to the data duplexing register (`ADC_CHANNEL_DUPLEX`).

Double-triggering uses Group A; only one channel can be selected when enabled. No other scanning is possible on Group A while double-trigger mode is selected. In addition, any special ADC channels (such as temperature sensors or voltage references) are not valid double-trigger channels.

When extended double-triggering is enabled both ADC input events are routed to Group A. The interrupt is still thrown after every two scans regardless of the triggering event(s). While the first and second scan are saved to the selected ADC data register and the ADC duplexing register as before, scans associated with event A and B are additionally copied into duplexing register A and B, respectively (`ADC_CHANNEL_DUPLEX_A` and `ADC_CHANNEL_DUPLEX_B`).

When Interrupts Are Not Enabled

If interrupts are not enabled, the `R_ADC_StatusGet` API can be used to poll the ADC to determine when the scan has completed. The read API function is used to access the converted ADC result. This applies to both normal scans and calibration scans for MCUs that support calibration.

Window Compare Function

The ADC contains comparators that allow scan data to be compared to user-provided reference values. When a value meets the configured condition an interrupt and/or an ELC event can be produced.

Each unit has two configurable comparison units, Window A and Window B. Window A allows for

configuring multiple simultaneous channels to compare while Window B only allows one channel at a time.

The window compare function can be configured both through the RA Configuration tool and at runtime by providing a pointer to an `adc_window_cfg_t` struct to `adc_channel_cfg_t::p_window_cfg` when calling `R_ADC_ScanCfg`. The available comparison modes are shown below:

| Window setting | Channel mode 0 | Channel mode 1 |
|----------------|---------------------------------------|---------------------------|
| Disabled | Scan < Low Ref | Scan > Low Ref |
| Enabled | (Scan < Low Ref) OR (Scan > High Ref) | Low Ref < Scan < High Ref |

Note

The window setting applies to all channels configured on a unit.

Sample-State Count Setting

The application program can modify the setting of the sample-state count for analog channels by calling the `R_ADC_SampleStateCountSet()` API function. The application program only needs to modify the sample-state count settings from their default values to increase the sampling time. This can be either because the impedance of the input signal is too high to secure sufficient sampling time under the default setting or if the ADCLK is too slow. To modify the sample-state count for a given channel, set the channel number and the number of states when calling the `R_ADC_SampleStateCountSet()` API function. Valid sample state counts are 7-255.

Note

Although the hardware supports a minimum number of sample states of 5, some MCUs require 7 states, so the minimum is set to 7. At the lowest supported ADC conversion clock rate (1 MHz), these extra states will lead to, at worst case, a 2 microsecond increase in conversion time. At 60 MHz the extra states will add 33.4 ns to the conversion time.

If the sample state count needs to be changed for multiple channels, the application program must call the `R_ADC_SampleStateCountSet()` API function repeatedly, with appropriately modified arguments for each channel.

If the ADCLK frequency changes, the sample states may need to be updated.

Sample States for Temperature Sensor and Internal Voltage Reference

Sample states for the temperature sensor and the internal reference voltage are calculated during `R_ADC_ScanCfg()` based on the ADCLK frequency at the time. The sample states for the temperature sensor and internal voltage reference cannot be updated with `R_ADC_SampleStateCountSet()`. If the ADCLK frequency changes, call `R_ADC_ScanCfg()` before using the temperature sensor or internal reference voltage again to ensure the sampling time for the temperature sensor and internal voltage reference is optimal.

Selecting Reference Voltage

The ADC high-potential and low-potential reference voltages may be configured for selected MCU's. Please refer to the RA Configuration editor in e² studio for further details.

Note

When using VREFADC, a stabilization time of 1500us is required after call for `R_ADC_Open()`. Consult Section

32.6 "Selecting Reference Voltage" in the RA2A1 User's Manual (R01UH0888EJ0100) for details.
When the internal reference voltage is selected as the high-potential reference voltage, the Low-power A/D Conversion mode will automatically be selected. Consult Section 29.6 "Selecting Reference Voltage" in the RA2E1 User's Manual (R01UH0852EJ0110) for details.

Using the Temperature Sensor with the ADC

The ADC HAL module supports reading the data from the on-chip temperature sensor. The value returned from the sensor can be converted into degrees Celsius or Fahrenheit in the application program using the following formula, $T = (V_s - V_1)/\text{slope} + T_1$, where:

- T: Measured temperature (degrees C)
- Vs: Voltage output by the temperature sensor at the time of temperature measurement (Volts)
- T1: Temperature experimentally measured at one point (degrees C)
- V1: Voltage output by the temperature sensor at the time of measurement of T1 (Volts)
- T2: Temperature at the experimental measurement of another point (degrees C)
- V2: Voltage output by the temperature sensor at the time of measurement of T2 (Volts)
- Slope: Temperature gradient of the temperature sensor (V/degrees C); slope = $(V_2 - V_1)/(T_2 - T_1)$

Note

The slope value can be obtained from the hardware manual for each device in the Electrical Characteristics Chapter - TSN Characteristics Table, Temperature slope entry.

Reading CTSU TSCAP with ADC

Some MCUs support reading CTSU TSCAP with ADC. CTSU TSCAP is connected to ADC0 channel 16. Use existing enums for channel 16 to set sample states for the sensor connected to CTSU TSCAP, enable scanning of CTSU TSCAP, and read results for CTSU TSCAP.

Usage Notes for ADC16

Calibration

Calibration is required to use the ADC16 peripheral. When using this driver on an MCU that has ADC16, call `R_ADC_Calibrate()` after open, and prior to any other function.

Range of ADC16 Results

The range of the ADC16 is from 0 (lowest) to 0x7FFF (highest) when used in single-ended mode. This driver only supports single ended mode.

Limitations

Developers should be aware of the following limitations when using the ADC:

- When using the Window Compare function:
 - Only Single Scan mode may be configured when match or mismatch ELC events are used.
 - When one compare window is configured to check the temperature sensor or voltage reference the other window cannot be used.
 - Both windows cannot reference the same channel.

Examples

Basic Example

This is a basic example of minimal use of the ADC in an application.

```
/* A channel configuration is generated by the RA Configuration editor based on the
options selected. If additional
 * configurations are desired additional adc_channel_cfg_t elements can be defined
and passed to R_ADC_ScanCfg. */
const adc_channel_cfg_t g_adc0_channel_cfg =
{
    .scan_mask          = ADC_MASK_CHANNEL_0 | ADC_MASK_CHANNEL_1,
    .scan_mask_group_b = 0,
    .priority_group_a  = (adc_group_a_t) 0,
    .add_mask          = 0,
    .sample_hold_mask  = 0,
    .sample_hold_states = 0,
};

void adc_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_ADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Enable channels. */
    err = R_ADC_ScanCfg(&g_adc0_ctrl, &g_adc0_channel_cfg);
    assert(FSP_SUCCESS == err);
    /* In software trigger mode, start a scan by calling R_ADC_ScanStart(). In other
modes, enable external
 * triggers by calling R_ADC_ScanStart(). */
    (void) R_ADC_ScanStart(&g_adc0_ctrl);
    /* Wait for conversion to complete. */
    adc_status_t status;
    status.state = ADC_STATE_SCAN_IN_PROGRESS;
    while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
    {
```

```
(void) R_ADC_StatusGet(&g_adc0_ctrl, &status);
}
/* Read converted data. */
uint16_t channel1_conversion_result;
err = R_ADC_Read(&g_adc0_ctrl, ADC_CHANNEL_1, &channel1_conversion_result);
assert(FSP_SUCCESS == err);
}
```

Temperature Sensor Example

This example shows how to calculate the MCU temperature using the ADC and the temperature sensor.

```
#define ADC_EXAMPLE_CALIBRATION_DATA_RA6M1 (0x7D5)
#define ADC_EXAMPLE_VCC_MICROVOLT (3300000)
#define ADC_EXAMPLE_TEMPERATURE_RESOLUTION (12U)
#define ADC_EXAMPLE_REFERENCE_CALIBRATION_TEMPERATURE (127)
void adc_temperature_example (void)
{
    /* The following example calculates the temperature on an RA6M1 device using the
    data provided in the section
    * 44.3.1 "Preparation for Using the Temperature Sensor" of the RA6M1 manual
    R01UH0884EJ0100. */
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_ADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Enable temperature sensor. */
    err = R_ADC_ScanCfg(&g_adc0_ctrl, &g_adc0_channel_cfg);
    assert(FSP_SUCCESS == err);
    /* In software trigger mode, start a scan by calling R_ADC_ScanStart(). In other
    modes, enable external
    * triggers by calling R_ADC_ScanStart(). */
    (void) R_ADC_ScanStart(&g_adc0_ctrl);
}
```

```
/* Wait for conversion to complete. */
adc_status_t status;
    status.state = ADC_STATE_SCAN_IN_PROGRESS;
while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
    {
        (void) R_ADC_StatusGet(&g_adc0_ctrl, &status);
    }
/* Read converted data. */
uint16_t temperature_conversion_result;
    err = R_ADC_Read(&g_adc0_ctrl, ADC_CHANNEL_TEMPERATURE,
&temperature_conversion_result);
    assert(FSP_SUCCESS == err);
/* If the MCU does not provide calibration data, use the value in the hardware
manual or determine it
* experimentally. */
/* Get Calibration data from the MCU if available. */
    int32_t    reference_calibration_data;
adc_info_t adc_info;
    (void) R_ADC_InfoGet(&g_adc0_ctrl, &adc_info);
    reference_calibration_data = (int32_t) adc_info.calibration_data;
/* NOTE: The slope of the temperature sensor varies from sensor to sensor. Renesas
recommends calculating
* the slope of the temperature sensor experimentally.
*
* This example uses the typical slope provided in Table 52.38 "TSN characteristics"
in the RA6M1 manual
* R01UM0011EU0050. */
    int32_t slope_uv_per_c = BSP_FEATURE_ADC_TSN_SLOPE;
/* Formula for calculating temperature copied from section 44.3.1 "Preparation for
Using the Temperature Sensor"
* of the RA6M1 manual R01UH0884EJ0100:
*
* In this MCU, the TSCDR register stores the temperature value (CAL127) of the
temperature sensor measured
```

```
* under the condition  $T_a = T_j = 127$  C and  $AVCC0 = 3.3$  V. By using this value as the
sample measurement result

* at the first point, preparation before using the temperature sensor can be
omitted.

*

* If  $V_1$  is calculated from CAL127,
*  $V_1 = 3.3 * CAL127 / 4096$  [V]
*

* Using this, the measured temperature can be calculated according to the following
formula.

*

*  $T = (V_s - V_1) / \text{Slope} + 127$  [C]
* T: Measured temperature (C)
*  $V_s$ : Voltage output by the temperature sensor when the temperature is measured (V)
*  $V_1$ : Voltage output by the temperature sensor when  $T_a = T_j = 127$  C and  $AVCC0 = 3.3$ 
V (V)
* Slope: Temperature slope given in Table 52.38 / 1000 (V/C)
*/

int32_t v1_uv = (ADC_EXAMPLE_VCC_MICROVOLT >> ADC_EXAMPLE_TEMPERATURE_RESOLUTION)
*
reference_calibration_data;
int32_t vs_uv = (ADC_EXAMPLE_VCC_MICROVOLT >> ADC_EXAMPLE_TEMPERATURE_RESOLUTION)
*
temperature_conversion_result;
int32_t temperature_c = (vs_uv - v1_uv) / slope_uv_per_c +
ADC_EXAMPLE_REFERENCE_CALIBRATION_TEMPERATURE;
/* Expect room temperature, break if temperature is outside the range of 20 C to 25
C. */
if ((temperature_c < 20) || (temperature_c > 25))
{
__BKPT(0);
}
}
```

Double-Trigger Example

This example demonstrates reading data from a double-trigger scan. A flag is used to wait for a callback event. Two scans must occur before the callback is called. These results are read via [R_ADC_Read](#) using the selected channel enum value as well as [ADC_CHANNEL_DUPLEX](#).

```
volatile bool scan_complete_flag = false;

void adc_callback (adc_callback_args_t * p_args)
{
    FSP_PARAMETER_NOT_USED(p_args);
    scan_complete_flag = true;
}

void adc_double_trigger_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initialize the module. */
    err = R_ADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Enable double-trigger channel. */
    err = R_ADC_ScanCfg(&g_adc0_ctrl, &g_adc0_channel_cfg);
    assert(FSP_SUCCESS == err);
    /* Enable scan triggering from ELC events. */
    (void) R_ADC_ScanStart(&g_adc0_ctrl);
    /* Wait for conversion to complete. Two scans must be triggered before a callback
occurs. */
    scan_complete_flag = false;
    while (!scan_complete_flag)
    {
        /* Wait for callback to set flag. */
    }
    /* Read converted data from both scans. */
    uint16_t channell_conversion_result_0;
    uint16_t channell_conversion_result_1;
    err = R_ADC_Read(&g_adc0_ctrl, ADC_CHANNEL_1, &channell_conversion_result_0);
    assert(FSP_SUCCESS == err);
}
```

```

    err = R_ADC_Read(&g_adc0_ctrl, ADC_CHANNEL_DUPLEX,
&channell_conversion_result_1);
    assert(FSP_SUCCESS == err);
}

```

ADC-DMAC Repeat-Block Transfer Example

This example demonstrates writing multiple data from DAC peripheral to ADC channels and storing the data in memory through DMAC using Repeat-Block Transfer mode. It creates single block to multiple ring buffer type of transfer topology. Ping-Pong mechanism is used to read the data from memory in between the transfers. This example is valid only for MCUs that have ADBUF.

```

#define ADC_DMACH_EXAMPLE_DATA_LOW (0U)
#define ADC_DMACH_EXAMPLE_DATA_HIGH (0x000FU)
#define ADC_DMACH_EXAMPLE_DELAY_1000_MS (1000U)
#define ADC_DMACH_EXAMPLE_NUM_PING_PONG_BUFFERS (2)
static uint16_t g_adc_dmac_example_buffer[ADC_DMACH_EXAMPLE_NUM_PING_PONG_BUFFERS][
    ADC_DMACH_EXAMPLE_ADC_CHANNELS_PER_BLOCK][ADC_DMACH_EXAMPLE_SAMPLES_PER_CHANNEL];
// Destination buffer for DMAC transfers
static volatile uint16_t g_adc_dmac_example_ping_pong_index = 0U;
static volatile void * gp_read_data;
/* DMAC callback */
void adc_dmac_callback (dmac_callback_args_t * p_args)
{
    (void) p_args;
    /* Store the pointer to the last buffer that was written
    * An array of data for the first enabled channel is at
    &g_adc_dmac_example_buffer[g_adc_dmac_example_ping_pong_index][0][0],
    * an array of data for the next channel is at
    &g_adc_dmac_example_buffer[g_adc_dmac_example_ping_pong_index][1][0], etc.
    */
    gp_read_data =
    &g_adc_dmac_example_buffer[g_adc_dmac_example_ping_pong_index][0][0];
    /* Select the other ping-pong buffer which is free for writing */
    g_adc_dmac_example_ping_pong_index = !g_adc_dmac_example_ping_pong_index;
    /* Reset the destination pointer and DMAC peripheral */
}

```

```
R_DMAC_Reset(&g_transfer0_ctrl,
             NULL,
             (void *)

Window Compare Example

This example shows how to configure the window compare function at runtime as well as how to handle events and obtain comparison results through a callback.

```
adc_window_cfg_t g_adc0_window_cfg =
{
/* Enable Window A and Window B; enable Window mode */
```

```
.compare_cfg          =
    (adc_compare_cfg_t) (ADC_COMPARE_CFG_A_ENABLE | ADC_COMPARE_CFG_B_ENABLE |
ADC_COMPARE_CFG_WINDOW_ENABLE),
/* Compare scan values from Channels 0 and 1 */
.compare_mask         = ADC_MASK_CHANNEL_0 | ADC_MASK_CHANNEL_1,
/* Set Channel 1 condition to be inside the window instead of outside */
.compare_mode_mask    = ADC_MASK_CHANNEL_1,
/* Set reference voltage levels for Window A */
.compare_ref_low      = ADC_SCAN_MAX / 3,
.compare_ref_high     = ADC_SCAN_MAX * 2 / 3,
/* Configure Window B to compare Channel 2 (inside window) */
.compare_b_channel    = ADC_WINDOW_B_CHANNEL_2,
.compare_b_mode       = ADC_WINDOW_B_MODE_GREATER_THAN_OR_INSIDE,
/* Set reference voltage levels for Window B */
.compare_b_ref_low    = ADC_SCAN_MAX / 4,
.compare_b_ref_high   = ADC_SCAN_MAX * 3 / 4,
};
void adc0_callback (adc_callback_args_t * p_args)
{
    if (ADC_EVENT_WINDOW_COMPARE_A == p_args->event)
    {
        /* Get channel that met the comparison criteria */
        adc_channel_t channel = p_args->channel;
        /* Process event here */
        FSP_PARAMETER_NOT_USED(channel);
    }
    else if (ADC_EVENT_WINDOW_COMPARE_B == p_args->event)
    {
        /* Process Window B events here */
    }
    else
    {
        /* ... */
    }
}
```

```
}  
  
void adc_window_compare_example (void)  
{  
    fsp_err_t err = FSP_SUCCESS;  
  
    /* Open the ADC module */  
    err = R_ADC_Open(&g_adc0_ctrl, &g_adc0_cfg);

| uint16_t | compare_ref_low | Window A lower reference value. |
| uint16_t | compare_ref_high | Window A upper reference value. |
| uint16_t | compare_b_ref_low | Window B lower reference value. |
| | | |

| | | |
|------------------------|--------------------|---------------------------------|
| uint16_t | compare_b_ref_high | Window A upper reference value. |
| adc_window_b_channel_t | compare_b_channel | Window B channel. |
| adc_window_b_mode_t | compare_b_mode | Window B condition setting. |

◆ **adc_extended_cfg_t**

| | | |
|---|---------------------|---|
| struct adc_extended_cfg_t | | |
| Extended configuration structure for ADC. | | |
| Data Fields | | |
| adc_add_t | add_average_count | Add or average samples. |
| adc_clear_t | clearing | Clear after read. |
| adc_trigger_t | trigger_group_b | Group B trigger source; valid only for group mode. |
| adc_double_trigger_t | double_trigger_mode | Double-trigger mode setting. |
| adc_vref_control_t | adc_vref_control | VREFADC output voltage control. |
| uint8_t | enable_adbuf | Enable ADC Ring Buffer, Valid only to use along with DMAC transfer. |
| IRQn_Type | window_a_irq | IRQ number for Window Compare A interrupts. |
| IRQn_Type | window_b_irq | IRQ number for Window Compare B interrupts. |
| uint8_t | window_a_ipl | Priority for Window Compare A interrupts. |
| uint8_t | window_b_ipl | Priority for Window Compare B interrupts. |

◆ **adc_channel_cfg_t**

| | | |
|------------------------------|-------------------|--|
| struct adc_channel_cfg_t | | |
| ADC channel(s) configuration | | |
| Data Fields | | |
| uint32_t | scan_mask | Channels/bits: bit 0 is ch0; bit 15 is ch15. |
| uint32_t | scan_mask_group_b | Valid for group modes. |
| uint32_t | add_mask | Valid if add enabled in Open(). |
| adc_window_cfg_t * | p_window_cfg | Pointer to Window Compare configuration. |
| adc_group_a_t | priority_group_a | Valid for group modes. |
| uint8_t | sample_hold_mask | Channels/bits 0-2. |

| | | |
|---------|--------------------|--|
| uint8_t | sample_hold_states | Number of states to be used for sample and hold. Affects channels 0-2. |
|---------|--------------------|--|

◆ adc_instance_ctrl_t

| |
|---|
| struct adc_instance_ctrl_t |
| ADC instance control block. DO NOT INITIALIZE. Initialized in adc_api_t::open() . |

Enumeration Type Documentation

◆ adc_mask_t

| | |
|--|-----------------------|
| enum adc_mask_t | |
| For ADC Scan configuration adc_channel_cfg_t::scan_mask , adc_channel_cfg_t::scan_mask_group_b , adc_channel_cfg_t::add_mask and adc_channel_cfg_t::sample_hold_mask . Use bitwise OR to combine these masks for desired channels and sensors. | |
| Enumerator | |
| ADC_MASK_OFF | No channels selected. |
| ADC_MASK_CHANNEL_0 | Channel 0 mask. |
| ADC_MASK_CHANNEL_1 | Channel 1 mask. |
| ADC_MASK_CHANNEL_2 | Channel 2 mask. |
| ADC_MASK_CHANNEL_3 | Channel 3 mask. |
| ADC_MASK_CHANNEL_4 | Channel 4 mask. |
| ADC_MASK_CHANNEL_5 | Channel 5 mask. |
| ADC_MASK_CHANNEL_6 | Channel 6 mask. |
| ADC_MASK_CHANNEL_7 | Channel 7 mask. |
| ADC_MASK_CHANNEL_8 | Channel 8 mask. |
| ADC_MASK_CHANNEL_9 | Channel 9 mask. |
| ADC_MASK_CHANNEL_10 | Channel 10 mask. |
| ADC_MASK_CHANNEL_11 | Channel 11 mask. |
| ADC_MASK_CHANNEL_12 | Channel 12 mask. |
| ADC_MASK_CHANNEL_13 | |

| | |
|----------------------|----------------------------------|
| | Channel 13 mask. |
| ADC_MASK_CHANNEL_14 | Channel 14 mask. |
| ADC_MASK_CHANNEL_15 | Channel 15 mask. |
| ADC_MASK_CHANNEL_16 | Channel 16 mask. |
| ADC_MASK_CHANNEL_17 | Channel 17 mask. |
| ADC_MASK_CHANNEL_18 | Channel 18 mask. |
| ADC_MASK_CHANNEL_19 | Channel 19 mask. |
| ADC_MASK_CHANNEL_20 | Channel 20 mask. |
| ADC_MASK_CHANNEL_21 | Channel 21 mask. |
| ADC_MASK_CHANNEL_22 | Channel 22 mask. |
| ADC_MASK_CHANNEL_23 | Channel 23 mask. |
| ADC_MASK_CHANNEL_24 | Channel 24 mask. |
| ADC_MASK_CHANNEL_25 | Channel 25 mask. |
| ADC_MASK_CHANNEL_26 | Channel 26 mask. |
| ADC_MASK_CHANNEL_27 | Channel 27 mask. |
| ADC_MASK_CHANNEL_28 | Channel 28 mask. |
| ADC_MASK_TEMPERATURE | Temperature sensor channel mask. |
| ADC_MASK_VOLT | Voltage reference channel mask. |
| ADC_MASK_SENSORS | All sensor channel mask. |

◆ **adc_add_t**

| enum <code>adc_add_t</code> | |
|--|---|
| ADC data sample addition and averaging options | |
| Enumerator | |
| <code>ADC_ADD_OFF</code> | Addition turned off for channels/sensors. |
| <code>ADC_ADD_TWO</code> | Add two samples. |
| <code>ADC_ADD_THREE</code> | Add three samples. |
| <code>ADC_ADD_FOUR</code> | Add four samples. |
| <code>ADC_ADD_SIXTEEN</code> | Add sixteen samples. |
| <code>ADC_ADD_AVERAGE_TWO</code> | Average two samples. |
| <code>ADC_ADD_AVERAGE_FOUR</code> | Average four samples. |
| <code>ADC_ADD_AVERAGE_EIGHT</code> | Average eight samples. |
| <code>ADC_ADD_AVERAGE_SIXTEEN</code> | Add sixteen samples. |

◆ **adc_clear_t**

| enum <code>adc_clear_t</code> | |
|---------------------------------------|-----------------------|
| ADC clear after read definitions | |
| Enumerator | |
| <code>ADC_CLEAR_AFTER_READ_OFF</code> | Clear after read off. |
| <code>ADC_CLEAR_AFTER_READ_ON</code> | Clear after read on. |

◆ **adc_vref_control_t**

| enum adc_vref_control_t | |
|---|--|
| Enumerator | |
| ADC_VREF_CONTROL_VREFH | VREFAMPCNT reset value. VREFADC Output voltage is Hi-Z. |
| ADC_VREF_CONTROL_1_5V_OUTPUT | BGR turn ON. VREFADC Output voltage is 1.5 V. |
| ADC_VREF_CONTROL_2_0V_OUTPUT | BGR turn ON. VREFADC Output voltage is 2.0 V. |
| ADC_VREF_CONTROL_2_5V_OUTPUT | BGR turn ON. VREFADC Output voltage is 2.5 V. |
| ADC_VREF_CONTROL_AVCC0_AVSS0 | High potential is AVCC0, low potential is AVSS0. |
| ADC_VREF_CONTROL_VREFH0_AVSS0 | High potential is VREFH0, low potential is AVSS0. |
| ADC_VREF_CONTROL_IVREF_AVSS0 | High potential is internal reference voltage, low potential is AVSS0. When the high potential is set to the internal reference voltage, wait 5 us after R_ADC_Open() to start an ADC measurement. |
| ADC_VREF_CONTROL_AVCC0_VREFLO | High potential is AVCC0, low potential is VREFLO. |
| ADC_VREF_CONTROL_VREFH0_VREFLO | High potential is VREFH0, low potential is VREFLO. |
| ADC_VREF_CONTROL_IVREF_VREFLO | High potential is internal reference voltage, low potential is VREFLO. When the high potential is set to the internal reference voltage, wait 5 us after R_ADC_Open() to start an ADC measurement. |

◆ **adc_sample_state_reg_t**

| enum <code>adc_sample_state_reg_t</code> | |
|--|---|
| ADC sample state registers | |
| Enumerator | |
| <code>ADC_SAMPLE_STATE_CHANNEL_0</code> | Sample state register channel 0. |
| <code>ADC_SAMPLE_STATE_CHANNEL_1</code> | Sample state register channel 1. |
| <code>ADC_SAMPLE_STATE_CHANNEL_2</code> | Sample state register channel 2. |
| <code>ADC_SAMPLE_STATE_CHANNEL_3</code> | Sample state register channel 3. |
| <code>ADC_SAMPLE_STATE_CHANNEL_4</code> | Sample state register channel 4. |
| <code>ADC_SAMPLE_STATE_CHANNEL_5</code> | Sample state register channel 5. |
| <code>ADC_SAMPLE_STATE_CHANNEL_6</code> | Sample state register channel 6. |
| <code>ADC_SAMPLE_STATE_CHANNEL_7</code> | Sample state register channel 7. |
| <code>ADC_SAMPLE_STATE_CHANNEL_8</code> | Sample state register channel 8. |
| <code>ADC_SAMPLE_STATE_CHANNEL_9</code> | Sample state register channel 9. |
| <code>ADC_SAMPLE_STATE_CHANNEL_10</code> | Sample state register channel 10. |
| <code>ADC_SAMPLE_STATE_CHANNEL_11</code> | Sample state register channel 11. |
| <code>ADC_SAMPLE_STATE_CHANNEL_12</code> | Sample state register channel 12. |
| <code>ADC_SAMPLE_STATE_CHANNEL_13</code> | Sample state register channel 13. |
| <code>ADC_SAMPLE_STATE_CHANNEL_14</code> | Sample state register channel 14. |
| <code>ADC_SAMPLE_STATE_CHANNEL_15</code> | Sample state register channel 15. |
| <code>ADC_SAMPLE_STATE_CHANNEL_16_TO_31</code> | Sample state register channel 16 to 31. |

◆ **adc_compare_cfg_t**

| enum <code>adc_compare_cfg_t</code> |
|-------------------------------------|
| ADC comparison settings |

◆ **adc_window_b_channel_t**

| |
|---|
| enum adc_window_b_channel_t |
| ADC Window B channel |

◆ **adc_window_b_mode_t**

| |
|--|
| enum adc_window_b_mode_t |
| ADC Window B comparison mode |

◆ **adc_group_a_t**

| | |
|---|---|
| enum adc_group_a_t | |
| ADC action for group A interrupts group B scan. This enumeration is used to specify the priority between Group A and B in group mode. | |
| Enumerator | |
| ADC_GROUP_A_PRIORITY_OFF | Group A ignored and does not interrupt ongoing group B scan. |
| ADC_GROUP_A_GROUP_B_WAIT_FOR_TRIGGER | Group A interrupts Group B(single scan) which restarts at next Group B trigger. |
| ADC_GROUP_A_GROUP_B_RESTART_SCAN | Group A interrupts Group B(single scan) which restarts immediately after Group A scan is complete. |
| ADC_GROUP_A_GROUP_B_CONTINUOUS_SCAN | Group A interrupts Group B(continuous scan) which continues scanning without a new Group B trigger. |

◆ **adc_double_trigger_t**

| enum <code>adc_double_trigger_t</code> | |
|--|---|
| ADC double-trigger mode definitions | |
| Enumerator | |
| <code>ADC_DOUBLE_TRIGGER_DISABLED</code> | Double-triggering disabled. |
| <code>ADC_DOUBLE_TRIGGER_ENABLED</code> | Double-triggering enabled. |
| <code>ADC_DOUBLE_TRIGGER_ENABLED_EXTENDED</code> | Double-triggering enabled on both ADC ELC events. |

Function Documentation◆ **R_ADC_Open()**

```
fsp_err_t R_ADC_Open ( adc_ctrl_t* p_ctrl, adc_cfg_t const*const p_cfg )
```

Sets the operational mode, trigger sources, interrupt priority, and configurations for the peripheral as a whole. If interrupt is enabled, the function registers a callback function pointer for notifying the user whenever a scan has completed.

Return values

| | |
|---|---|
| <code>FSP_SUCCESS</code> | Module is ready for use. |
| <code>FSP_ERR_ASSERTION</code> | An input argument is invalid. |
| <code>FSP_ERR_ALREADY_OPEN</code> | The instance control structure has already been opened. |
| <code>FSP_ERR_IRQ_BSP_DISABLED</code> | A callback is provided, but the interrupt is not enabled. |
| <code>FSP_ERR_IP_CHANNEL_NOT_PRESENT</code> | The requested unit does not exist on this MCU. |
| <code>FSP_ERR_INVALID_HW_CONDITION</code> | The ADC clock must be at least 1 MHz |

◆ **R_ADC_ScanCfg()**

```
fsp_err_t R_ADC_ScanCfg ( adc_ctrl_t* p_ctrl, void const *const p_channel_cfg )
```

Configures the ADC scan parameters. Channel specific settings are set in this function. Pass a pointer to `adc_channel_cfg_t` to `p_channel_cfg`.

Note

This starts group B scans if `adc_channel_cfg_t::priority_group_a` is set to `ADC_GROUP_A_GROUP_B_CONTINUOUS_SCAN`.

Return values

| | |
|-------------------|------------------------------------|
| FSP_SUCCESS | Channel specific settings applied. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |

◆ **R_ADC_CallbackSet()**

```
fsp_err_t R_ADC_CallbackSet ( adc_ctrl_t*const p_api_ctrl, void(*)(adc_callback_args_t*)
p_callback, void const *const p_context, adc_callback_args_t*const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `adc_api_t::callbackSet`

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | <code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL. |

◆ **R_ADC_ScanStart()**

```
fsp_err_t R_ADC_ScanStart ( adc_ctrl_t * p_ctrl)
```

Starts a software scan or enables the hardware trigger for a scan depending on how the triggers were configured in the R_ADC_Open call. If the unit was configured for ELC or external hardware triggering, then this function allows the trigger signal to get to the ADC unit. The function is not able to control the generation of the trigger itself. If the unit was configured for software triggering, then this function starts the software triggered scan.

Precondition

Call R_ADC_ScanCfg after R_ADC_Open before starting a scan.

On MCUs that support calibration, call R_ADC_Calibrate and wait for calibration to complete before starting a scan.

Return values

| | |
|-------------------------|---|
| FSP_SUCCESS | Scan started (software trigger) or hardware triggers enabled. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_NOT_INITIALIZED | Unit is not initialized. |
| FSP_ERR_IN_USE | Another scan is still in progress (software trigger). |

◆ **R_ADC_ScanGroupStart()**

```
fsp_err_t R_ADC_ScanGroupStart ( adc_ctrl_t * p_ctrl, adc_group_mask_t group_id )
```

`adc_api_t::scanStart` is not supported on the ADCH. Use `scanStart` instead.

Return values

| | |
|---------------------|--|
| FSP_ERR_UNSUPPORTED | Function not supported in this implementation. |
|---------------------|--|

◆ **R_ADC_ScanStop()**

```
fsp_err_t R_ADC_ScanStop ( adc_ctrl_t* p_ctrl)
```

Stops the software scan or disables the unit from being triggered by the hardware trigger (ELC or external) based on what type of trigger the unit was configured for in the R_ADC_Open function. Stopping a hardware triggered scan via this function does not abort an ongoing scan, but prevents the next scan from occurring. Stopping a software triggered scan aborts an ongoing scan.

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Scan stopped (software trigger) or hardware triggers disabled. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_NOT_INITIALIZED | Unit is not initialized. |

◆ **R_ADC_StatusGet()**

```
fsp_err_t R_ADC_StatusGet ( adc_ctrl_t* p_ctrl, adc_status_t* p_status )
```

Provides the status of any scan process that was started, including scans started by ELC or external triggers and calibration scans on MCUs that support calibration.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Module status stored in the provided pointer p_status |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |

◆ **R_ADC_Read()**

```
fsp_err_t R_ADC_Read ( adc_ctrl_t* p_ctrl, adc_channel_t const reg_id, uint16_t*const p_data )
```

Reads conversion results from a single channel or sensor.

Return values

| | |
|-------------------------|---------------------------------|
| FSP_SUCCESS | Data read into provided p_data. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_NOT_INITIALIZED | Unit is not initialized. |

◆ **R_ADC_Read32()**

```
fsp_err_t R_ADC_Read32 ( adc_ctrl_t* p_ctrl, adc_channel_t const reg_id, uint32_t*const p_data )
```

Reads conversion results from a single channel or sensor register into a 32-bit result.

Return values

| | |
|-------------------------|---------------------------------|
| FSP_SUCCESS | Data read into provided p_data. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_NOT_INITIALIZED | Unit is not initialized. |

◆ **R_ADC_SampleStateCountSet()**

```
fsp_err_t R_ADC_SampleStateCountSet ( adc_ctrl_t* p_ctrl, adc_sample_state_t* p_sample )
```

Sets the sample state count for individual channels. This only needs to be set for special use cases. Normally, use the default values out of reset.

Note

The sample states for the temperature and voltage sensor are set in R_ADC_ScanCfg.

Return values

| | |
|-------------------------|-------------------------------|
| FSP_SUCCESS | Sample state count updated. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_INITIALIZED | Unit is not initialized. |
| FSP_ERR_NOT_OPEN | Unit is not open. |

◆ **R_ADC_InfoGet()**

```
fsp_err_t R_ADC_InfoGet ( adc_ctrl_t* p_ctrl, adc_info_t* p_adc_info )
```

Returns the address of the lowest number configured channel and the total number of bytes to be read in order to read the results of the configured channels and return the ELC Event name. If no channels are configured, then a length of 0 is returned.

Also provides the temperature sensor slope and the calibration data for the sensor if available on this MCU. Otherwise, invalid calibration data of 0xFFFFFFFF will be returned.

Note

In group mode, information is returned for group A only. Calculating information for group B is not currently supported.

Return values

| | |
|-------------------|-----------------------------------|
| FSP_SUCCESS | Information stored in p_adc_info. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |

◆ **R_ADC_Close()**

```
fsp_err_t R_ADC_Close ( adc_ctrl_t* p_ctrl)
```

This function ends any scan in progress, disables interrupts, and removes power to the A/D peripheral.

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Module closed. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |

◆ **R_ADC_Calibrate()**

```
fsp_err_t R_ADC_Calibrate ( adc_ctrl_t *const p_ctrl, void const * p_extend )
```

Initiates calibration of the ADC on MCUs that require calibration. This function must be called before starting a scan on MCUs that require calibration.

Calibration is complete when the callback is called with ADC_EVENT_CALIBRATION_COMPLETE or when R_ADC_StatusGet returns ADC_STATUS_IDLE. Reference Figure 32.35 "Software flow and operation example of calibration operation." in the RA2A1 manual R01UH0888EJ0100.

ADC calibration time: 12 PCLKB + 774,930 ADCLK. (Reference Table 32.16 "Required calibration time (shown as the number of ADCLK and PCLKB cycles)" in the RA2A1 manual R01UH0888EJ0100. The lowest supported ADCLK is 1MHz.

Calibration will take a minimum of 24 milliseconds at 32 MHz PCLKB and ADCLK. This wait could take up to 780 milliseconds for a 1 MHz PCLKD (ADCLK).

Parameters

| | | |
|------|----------|---|
| [in] | p_ctrl | Pointer to the instance control structure |
| [in] | p_extend | Unused argument. Pass NULL. |

Return values

| | |
|------------------------------|---|
| FSP_SUCCESS | Calibration successfully initiated. |
| FSP_ERR_INVALID_HW_CONDITION | A scan is in progress or hardware triggers are enabled. |
| FSP_ERR_UNSUPPORTED | Calibration not supported on this MCU. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |

◆ **R_ADC_OffsetSet()**

```
fsp_err_t R_ADC_OffsetSet ( adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, int32_t offset )
```

adc_api_t::offsetSet is not supported on the ADC.

Return values

| | |
|---------------------|--|
| FSP_ERR_UNSUPPORTED | Function not supported in this implementation. |
|---------------------|--|

5.2.1.2 ADC (r_adc_b)

Detailed Description

Driver for the ADC_B peripheral on RA MCUs. This module implements the [ADC Interface](#).

Overview**Features**

The ADC_B module supports the following features:

- 16 bit resolution
- Selectable data format (16, 14, 12, and 10-bit)
- Configurable high-speed and high-accuracy conversion methods
- Configure scans to include:
 - Multiple analog channels
 - Temperature sensor channel
 - Reference Voltage sensor channel
 - Self-Diagnostic channel
- Configurable scan start trigger:
 - Software scan triggers
 - Hardware scan triggers (timer expiration, for example)
 - External scan triggers from the ADTRGn port pins
- Configurable scan modes:
 - Single scan mode, where each trigger starts a single scan
 - Continuous scan mode, where all channels are scanned continuously
 - Synchronous scan mode, where A/D converters operate synchronously
- Variable sampling time
- Self-calibration
- Channel-dedicated sample-and-hold circuits
- Supports adding and averaging converted samples
- Limiter clip function
- User offset adjustment function
- User gain adjustment function
- Built-in FIFO
- Channel-dedicated programable gain amplifier (PGA):
 - Support single-ended or pseudo-differential input
 - 2.5x to 13.33x gain (1.5x to 5.56x for pseudo-differential inputs)
- Optional callback when scan completes, FIFO data is ready, an error occurs, or other conditions are triggered.

Configuration

Virtual Channels and Scan Groups

A virtual channel is a group of registers that stores the A/D conversion configuration for a single analog pin. Each virtual channel has a number of options including the channel for conversion, settings for conversion, data processing method and so on.

To perform A/D conversion of an analog pin, the channel associated with the pin must first be assigned to a virtual channel. That virtual channel is then assigned to a scan group, which brings together one or more virtual channels to be converted in sequence with a specified conversion unit.

Note

Analog channels may be assigned to more than one virtual channel. However, a virtual channel can be assigned to only one scan group. When performing A/D conversion on one analog channel in different scan groups or when converting a channel several times within the same scan group, assign several virtual channels to one analog channel.

To avoid data being overwritten, when converting a channel multiple times within the same scan group use [R_ADC_B_FifoRead\(\)](#) instead of [R_ADC_B_Read\(\)](#).

Configuring a Scan

To perform A/D conversion of a scan group the following should be configured:

- Assign the analog channel for conversion to a virtual channel.
- Assign the virtual channel to a scan group.
- Assign the scan group to an A/D Converter.

Note

Up to 8 virtual channels can be assigned to a scan group. If more than 8 channels are assigned to a group, only the lowest 8 will be targeted for A/D conversion.

Build Time Configurations for r_adc_b

The following build time configurations are defined in fsp_cfg/r_adc_b_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------|--|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | bsp | If selected, code for parameter checking is included in the build. |

Note

The instance configurations available in this driver are too numerous to list here. Please refer to the RA Configuration editor in e² studio for further details.

Clock Configuration

The ADC_B conversion clock source may be configured to use PCLKC, PCLKA, or GPT with a selectable division ratio. The ADC_B clock may operate between 25 MHz at a minimum and 60 MHz at a maximum.

Pin Configuration

The ANxxx pins are analog input channels that can be used with the ADC_B.

ADTRG0 and ADTRG1 can be used to start scans with an external trigger. When external triggers are used, ADC_B scans begin on the falling edge of the ADTRG pin.

Usage Notes

Limitations

Developers should be aware of the following limitations when using R_ADC_B:

- Except for Group Priority Operation, if ADC0 or ADC1 are currently performing an A/D conversion operation, attempting to start another scan group that uses the same A/D converter will be ignored. This also applies to starting multiple groups at one time. When Group Priority Operation is not enabled, only the lowest numbered group will be started (for each ADC converter), other groups will be ignored.

Self-Calibration

Calibration is required to use this peripheral; call `R_ADC_B_Calibrate()` after `R_ADC_B_ScanCfg()` and prior to any other function. Self-Calibration should be performed any time ADC operating characteristics are modified, including after reset, releasing module-stop, when returning from software standby or deep software standby mode, each time the ADC ScanCfg function is called, and

any time ADC related clocks are updated.

Note

Self-calibration is a non-blocking operation. The application should wait for an `ADC_EVENT_CALIBRATION_COMPLETE` callback before using other ADC_B functionality. The self-calibration process will disable hardware triggers that were previously enabled.

ADC_B Operation Modes

The driver supports two primary operational modes, single-scan and continuous-scan. In single scan mode, one or more groups are scanned once per trigger. In continuous scan mode, one or more groups are started with a single trigger. Scans continue until `R_ADC_B_ScanStop()` is called. In each mode, analog groups and virtual channels are converted in ascending order.

Single Scan Mode

- Assign any selected analog input or analog channel to any scan group, and convert the selected analog input only once per scan group for each start condition.
- By selecting the scan start conditions for each scan group individually, A/D conversion for each scan group can be started at different times.

Continuous Scan Mode

- Assign any selected analog input or analog channel to any scan group and repeat A/D conversion in scan group units after the first start condition. Conversion continues until the driver is closed.

Background Continuous Scan Mode

- Assign any selected analog input or analog channel of the extended analog function to any scan group and repeat A/D conversion in scan group units after the first start condition. The A/D conversion is performed in the background until the driver is closed. In [Background Continuous Scan Mode](#), if the A/D conversion data will be acquired at the point a start condition is entered.

Note

Background Continuous Scan Mode is only available for Hybrid Mode

Synchronous-Scan Mode

When synchronous operation is enabled all A/D conversions are guaranteed to begin and end based on a user-configured period. When both conversion units are selected for synchronous scan they run from the same period, allowing for consistent timing of simultaneous conversions. Consult section 36.3.17 "Synchronous Operation" in the RA6T2 User's Manual (R01UH0951EJ0100) for details.

ADC_B Conversion Methods

Note

The ADC peripheral supports specific high-speed, high-precision, and normal-precision channels. See Table 46.34 "A/D conversion characteristics" in the RA6T2 User's Manual (R01UH0951EJ0100) for details about what conversion methods are supported by specific physical channels.

Successive Approximation Register (SAR) Mode

- A/D Converter samples the signal source once, and convert by Successive Approximation Register method.
- Fast A/D conversion
- Up to 8 channels per 1 scan group.
- Support only single-ended input (excluding Self-diagnosis function)
- Requires [Digital Filter Selection](#) to be disabled

Oversampling Mode

- A/D Converter oversamples the signal source, and converts analog to digital by Noise Shaping Successive Approximation Register method.
- High-accuracy A/D conversion
- Support up to 8 channels per 1 scan group
- Support single-ended input and differential input
- Requires [Digital Filter Selection](#) to be enabled

Hybrid Mode

- A/D Converter oversamples the signal source, and converts analog to digital by Noise Shaping Successive Approximation Register method.
- [Background Continuous Scan Mode](#) operation enables both high-precision A/D conversion and fast conversion.
- Support up to 4 channels per 1 scan group
- Support single-ended input and differential input
- Requires [Digital Filter Selection](#) to be enabled

Digital Filter Selection

The following characteristics of the digital filter for the A/D converter unit may be selected:

- Sinc3 Filter (Over Sampling = 8)
- Minimum Phase Filter (Group Delay < 5)

Note

*The digital filter must be disabled for ADC units configured to use [Successive Approximation Register \(SAR\) Mode](#)
The digital filter must be enabled for ADC units configured to use [Oversampling Mode](#) or [Hybrid Mode](#)*

Sample-and-Hold

Enabling sample-and-hold on one or more channels instructs the ADC to perform sampling on all channels as soon as a group scan is started. Internal circuitry holds the sampled voltages until the conversion unit is ready.

Note

*Each sample-and-hold unit is connected to two analog channels (0/1, 2/3 etc). When this function is enabled on both members of a pair only one of the two may be scanned at a time.
Enabling sample-and-hold functionality reduces maximum scan frequency because the sample hold time is added to each scan. Refer to the hardware manual for details on the sample-and-hold time. Consult section 46.4 "ADC Characteristics" in the RA6T2 User's Manual (R01UH0951EJ0100) for details.
If you use the channel-dedicated sample-and-hold circuits in Hybrid mode, the virtual channels and the scan groups are constrained. A dummy channel must be configured as last within the group. The A/D conversion data of the channel used as the dummy conversion channel is not guaranteed. See [Operation in Hybrid Mode with Channel-dedicated Sample-and-hold Circuit](#) section in the User Manual for more information.*

Self-Diagnosis

ADC_B has a built-in self-diagnosis function that can be used to confirm the unit is working correctly. One of three self-diagnosis voltages can be converted and compared to reference values. A self-diagnosis conversion produces a signed data value indicating the ideal A/D converter result. Reference values for 16-bit data format are shown below.

| Self-diagnosis mode | Expected reference data | Accuracy Error |
|-----------------------|-------------------------|--|
| Self-diagnosis mode 1 | 0x0000 | A/D conversion result becomes +1 or more when a positive accuracy error occurs and -1 or less when a negative accuracy error occurs. |
| Self-diagnosis mode 1 | 0x8000 | A/D conversion result becomes greater than or equal to reference data when an accuracy error occurs. |
| Self-diagnosis mode 1 | 0x7FFF | A/D conversion result becomes less than or equal to reference data when an accuracy error occurs. |

Add/Average Function

The ADC can be configured to automatically add or average a number of conversions into a single result. When enabled only the result of the operation is returned.

Note

When the A/D-converted value addition/average function is used, overflow of conversion data may occur. However, in certain conditions overflow may not be detected. See the [A/D Conversion Overflow](#) section below for details.

Data Format

The A/D converter in this peripheral has a resolution of 16 bits. When 14-bit or 12-bit data format is selected, the lower 2 or 4 bits (respectively) of the A/D conversion result are extended for data processing, error calibration (Self-Calibration), gain/offset adjustment and the averaging function before rounding is applied.

Limiter Clip

The limit clipping function allows for setting upper and lower bounds on converted data. When the A/D conversion data exceeds the specified upper limit value, it is clipped to the upper limit value. If the A/D conversion data falls below the specified lower limit, it is clipped to the lower limit value.

The upper and lower limits are set in one of eight table entries. To perform limit clip functionality, each virtual channel may (optionally) have one of these entries assigned. Interrupts may be enabled for when limiter clip conditions are triggered.

Note

When 14-/12-/10-bit is selected as the data length of the A/D conversion data, the lower bits are cut based on the data-format selection. When 16-bit format is selected, the data length is not rounded.

Using the Temperature Sensor with the ADC_B

The ADC_B HAL module supports reading the data from the on-chip temperature sensor. The value returned from the sensor can be converted into degrees Celsius or Fahrenheit in the application program using the following formula:

$$T = (Vs - V1)/slope + T1$$

- T: Measured temperature (degrees C)
- Vs: Voltage output by the temperature sensor at the time of measurement (Volts)
- T1: Temperature experimentally measured at one point (degrees C)
- V1: Voltage output by the temperature sensor at the time of measurement of T1 (Volts)
- slope: Temperature gradient of the temperature sensor (V/degrees C), given as $(V2 - V1) / (T2 - T1)$
 - T2: Temperature at the experimental measurement of another point (degrees C)
 - V2: Voltage output by the temperature sensor at the time of measurement of T2 (Volts)

Note

The slope value can be obtained from the hardware manual for each device in the Electrical Characteristics Chapter - TSN Characteristics Table, Temperature slope entry.

User Offset and Gain

The user offset adjustment function adds or subtracts a constant value to or from the A/D conversion data. Virtual channels select an offset from a table of values specified by the user.

The user gain adjustment function multiplies the A/D conversion data by an arbitrary coefficient value. As with offset adjustment, virtual channels may select a gain value from a table specified by the user.

Note

When the offset or gain adjusting functions are used overflow of A/D conversion data may occur. See the [A/D Conversion Overflow](#) section below for details.

When 14-/12-/10-bit is selected as the data length of converted data the lower bits of offset values are cut based on the data-format selection.

FIFO

The FIFOs consist of 8 stages and can hold up to 8 A/D conversion data. One FIFO is implemented for each scan group. Each FIFO acts as a ring buffer and data will be lost if the FIFO is not read as needed. Interrupts may be enabled for a specific data storage threshold and on overrun.

Programmable Gain Amplifier

ADC has built-in Programmable Gain Amplifier (PGA). The PGA amplifies an external analog input signal and outputs it to A/D converter, Channel-dedicated sample-and-hold circuit, and High-Speed Analog Comparator (ACMPHS). PGA units are channel specific and utilize two analog input pins per unit. Please refer to the RA Configuration editor in e² studio or the hardware manual for further details.

Note

When PGA is used, the analog input pin assigned to PGAVSS pin cannot be input to A/D conversion or Channel-dedicated sample-and-hold circuit.

Single-ended input

In single-ended input mode, PGA amplifies the input from PGAIN pin with the specified gain, between $\times 2.000$ to $\times 13.333$. When operating the PGA in single-ended input mode, PGAIN should be connected to the signal source and PGAVSS should be connected to the analog ground (AVSS0). The input voltage to PGAIN must not exceed the range specified in the Electrical Characteristics.

Pseudo-differential input

In pseudo differential input mode, PGA amplifies the difference between PGAIN pin and PGAVSS pin with the specified gain and output the voltage obtained by adding the offset of $0.5 * AV_{CC}$. Settable gains are $\times 1.500$, $\times 2.333$, $\times 4.000$, and $\times 5.667$.

When operating the PGA in Pseudo Differential Input Mode, PGAIN should be connected to the signal source, and PGAVSS should be connected to the reference ground of the signal source. The inputs to PGAIN and PGAVSS pins must not exceed the range specified in the Electrical Characteristics.

When Interrupts Are Not Enabled

Interrupts are enabled by default. If scan-complete interrupts are disabled, @ ref [R_ADC_B_StatusGet\(\)](#) can be used to poll the ADC_B driver to determine when the scan has completed. [R_ADC_B_Read\(\)](#) is used to access the converted ADC_B result.

A/D Conversion Overflow

A/D conversion overflow is detected when converted data exceeds the range that can be handled in the specified data format. When overflow occurs, data is restricted to the upper or lower limit value of the specified data format. Overflow is detected in the following cases:

- When the input to the A/D converter exceeds VREFH0 or falls below VREFL0
- When overflow occurs by the internal processing (calculation) for the A/D conversion data due to the following: - Gain Error and Offset Error Calibration - User Gain/Offset adjustment function - When using A/D-Converted Value Addition/Averaging Function - Data Formatting Process

Examples

Basic Example

This is a basic example of minimal use of the ADC_B in an application.

```
/* A channel configuration is generated by the RA Configuration editor based on the
options selected. If additional
* configurations are desired additional adc_channel_cfg_t elements can be defined
and passed to R_ADC_B_ScanCfg. */
extern const adc_b_scan_cfg_t g_adc_b0_scan_cfg;
void adc_b_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
```

```
err = R_ADC_B_Open(&g_adc_b0_ctrl, &g_adc_b0_cfg);
assert(FSP_SUCCESS == err);
/* Enable channels. */
err = R_ADC_B_ScanCfg(&g_adc_b0_ctrl, &g_adc_b0_scan_cfg);
assert(FSP_SUCCESS == err);
err = R_ADC_B_Calibrate(&g_adc_b0_ctrl, NULL);
assert(FSP_SUCCESS == err);
/* Wait for calibration to complete */
adc_status_t status = {.state = ADC_STATE_CALIBRATION_IN_PROGRESS};
while ((ADC_STATE_IDLE != status.state) &&
        (FSP_SUCCESS == err))
{
R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_MILLISECONDS);
err = R_ADC_B_StatusGet(&g_adc_b0_ctrl, &status);
}
assert(FSP_SUCCESS == err);
/* Start one or more scan groups by calling R_ADC_B_ScanGroupStart(). Alternatively,
all scan groups may be started
* by calling R_ADC_B_ScanCfg(). */
(void) R_ADC_B_ScanGroupStart(&g_adc_b0_ctrl, ADC_GROUP_MASK_0);
/* Wait for conversion to complete. */
status.state = ADC_STATE_SCAN_IN_PROGRESS;
while (ADC_STATE_IDLE != status.state)
{
(void) R_ADC_B_StatusGet(&g_adc_b0_ctrl, &status);
}
/* Read converted data. */
uint16_t channel_0_conversion_result;
err = R_ADC_B_Read(&g_adc_b0_ctrl, ADC_CHANNEL_0, &channel_0_conversion_result);
assert(FSP_SUCCESS == err);
}
```

| ADC_B_DATA_FORMAT_10_BIT | 10 bit adc_b data format |

◆ **adc_b_virtual_channel_t**

| enum adc_b_virtual_channel_t | |
|--|---------------------------|
| ADC channels | |
| Enumerator | |
| ADC_B_VIRTUAL_CHANNEL_0 | ADC B virtual channel 0. |
| ADC_B_VIRTUAL_CHANNEL_1 | ADC B virtual channel 1. |
| ADC_B_VIRTUAL_CHANNEL_2 | ADC B virtual channel 2. |
| ADC_B_VIRTUAL_CHANNEL_3 | ADC B virtual channel 3. |
| ADC_B_VIRTUAL_CHANNEL_4 | ADC B virtual channel 4. |
| ADC_B_VIRTUAL_CHANNEL_5 | ADC B virtual channel 5. |
| ADC_B_VIRTUAL_CHANNEL_6 | ADC B virtual channel 6. |
| ADC_B_VIRTUAL_CHANNEL_7 | ADC B virtual channel 7. |
| ADC_B_VIRTUAL_CHANNEL_8 | ADC B virtual channel 8. |
| ADC_B_VIRTUAL_CHANNEL_9 | ADC B virtual channel 9. |
| ADC_B_VIRTUAL_CHANNEL_10 | ADC B virtual channel 10. |
| ADC_B_VIRTUAL_CHANNEL_11 | ADC B virtual channel 11. |
| ADC_B_VIRTUAL_CHANNEL_12 | ADC B virtual channel 12. |
| ADC_B_VIRTUAL_CHANNEL_13 | ADC B virtual channel 13. |
| ADC_B_VIRTUAL_CHANNEL_14 | ADC B virtual channel 14. |
| ADC_B_VIRTUAL_CHANNEL_15 | ADC B virtual channel 15. |
| ADC_B_VIRTUAL_CHANNEL_16 | ADC B virtual channel 16. |
| ADC_B_VIRTUAL_CHANNEL_17 | ADC B virtual channel 17. |
| ADC_B_VIRTUAL_CHANNEL_18 | ADC B virtual channel 18. |
| ADC_B_VIRTUAL_CHANNEL_19 | ADC B virtual channel 19. |
| ADC_B_VIRTUAL_CHANNEL_20 | ADC B virtual channel 20. |

| | |
|--------------------------|---------------------------|
| ADC_B_VIRTUAL_CHANNEL_21 | ADC B virtual channel 21. |
| ADC_B_VIRTUAL_CHANNEL_22 | ADC B virtual channel 22. |
| ADC_B_VIRTUAL_CHANNEL_23 | ADC B virtual channel 23. |
| ADC_B_VIRTUAL_CHANNEL_24 | ADC B virtual channel 24. |
| ADC_B_VIRTUAL_CHANNEL_25 | ADC B virtual channel 25. |
| ADC_B_VIRTUAL_CHANNEL_26 | ADC B virtual channel 26. |
| ADC_B_VIRTUAL_CHANNEL_27 | ADC B virtual channel 27. |
| ADC_B_VIRTUAL_CHANNEL_28 | ADC B virtual channel 28. |
| ADC_B_VIRTUAL_CHANNEL_29 | ADC B virtual channel 29. |
| ADC_B_VIRTUAL_CHANNEL_30 | ADC B virtual channel 30. |
| ADC_B_VIRTUAL_CHANNEL_31 | ADC B virtual channel 31. |
| ADC_B_VIRTUAL_CHANNEL_32 | ADC B virtual channel 32. |
| ADC_B_VIRTUAL_CHANNEL_33 | ADC B virtual channel 33. |
| ADC_B_VIRTUAL_CHANNEL_34 | ADC B virtual channel 34. |
| ADC_B_VIRTUAL_CHANNEL_35 | ADC B virtual channel 35. |
| ADC_B_VIRTUAL_CHANNEL_36 | ADC B virtual channel 36. |

◆ **adc_b_channel_mask_t**

| enum <code>adc_b_channel_mask_t</code> | |
|--|-------------|
| ADC channel mask | |
| Enumerator | |
| <code>ADC_B_CHANNEL_MASK_0</code> | Channel 0. |
| <code>ADC_B_CHANNEL_MASK_1</code> | Channel 1. |
| <code>ADC_B_CHANNEL_MASK_2</code> | Channel 2. |
| <code>ADC_B_CHANNEL_MASK_3</code> | Channel 3. |
| <code>ADC_B_CHANNEL_MASK_4</code> | Channel 4. |
| <code>ADC_B_CHANNEL_MASK_5</code> | Channel 5. |
| <code>ADC_B_CHANNEL_MASK_6</code> | Channel 6. |

| ADC_B_GPT_TRIGGER_B3 | GPT Trigger B3. |
| ADC_B_GPT_TRIGGER_B4 | GPT Trigger B4. |
| ADC_B_GPT_TRIGGER_B5 | GPT Trigger B5. |
| ADC_B_GPT_TRIGGER_B6 | GPT Trigger B6. |
| ADC_B_GPT_TRIGGER_B7 | GPT Trigger B7. |
| ADC_B_GPT_TRIGGER_B8 | GPT Trigger B8. |
| ADC_B_GPT_TRIGGER_B9 | GPT Trigger B9. |

◆ adc_b_external_trigger_t

| | |
|--|------------------------------------|
| enum <code>adc_b_external_trigger_t</code> | |
| ADC External Trigger options | |
| Enumerator | |
| ADC_B_EXTERNAL_TRIGGER_NONE | External Trigger Disabled. |
| ADC_B_EXTERNAL_TRIGGER_ADTRG0 | External Trigger ADTRG0 Selection. |
| ADC_B_EXTERNAL_TRIGGER_ADTRG1 | External Trigger ADTRG1 Selection. |

◆ **adc_b_self_diagnosis_mode_t**

| enum <code>adc_b_self_diagnosis_mode_t</code> | |
|---|--------------------------|
| ADC Self-Diagnosis mode options | |
| Enumerator | |
| <code>ADC_B_SELF_DIAGNOSIS_DISABLED</code> | Self-Diagnosis Disabled. |
| <code>ADC_B_SELF_DIAGNOSIS_MODE_1</code> | Self-Diagnosis Mode 1. |
| <code>ADC_B_SELF_DIAGNOSIS_MODE_2</code> | Self-Diagnosis Mode 2. |
| <code>ADC_B_SELF_DIAGNOSIS_MODE_3</code> | Self-Diagnosis Mode 3. |

◆ **adc_b_sample_and_hold_mask_t**

| enum <code>adc_b_sample_and_hold_mask_t</code> | |
|--|---------------------------|
| ADC Sample-and-Hold unit enable mask | |
| Enumerator | |
| <code>ADC_B_SAMPLE_AND_HOLD_MASK_NONE</code> | Sample-and-Hold Disabled. |
| <code>ADC_B_SAMPLE_AND_HOLD_MASK_UNIT_0</code> | Sample-and-Hold Unit 0. |
| <code>ADC_B_SAMPLE_AND_HOLD_MASK_UNIT_1</code> | Sample-and-Hold Unit 1. |
| <code>ADC_B_SAMPLE_AND_HOLD_MASK_UNIT_2</code> | Sample-and-Hold Unit 2. |
| <code>ADC_B_SAMPLE_AND_HOLD_MASK_UNIT_4</code> | Sample-and-Hold Unit 3. |
| <code>ADC_B_SAMPLE_AND_HOLD_MASK_UNIT_5</code> | Sample-and-Hold Unit 4. |
| <code>ADC_B_SAMPLE_AND_HOLD_MASK_UNIT_6</code> | Sample-and-Hold Unit 5. |

◆ **adc_b_pga_gain_t**

| enum <code>adc_b_pga_gain_t</code> | |
|---|--------------------------|
| ADC PGA Gain | |
| Enumerator | |
| <code>ADC_B_PGA_GAIN_DISABLED</code> | PGA Gain Disabled. |
| <code>ADC_B_PGA_GAIN_DIFFERENTIAL_1_500</code> | PGA Gain Setting 1.500. |
| <code>ADC_B_PGA_GAIN_DIFFERENTIAL_2_333</code> | PGA Gain Setting 2.333. |
| <code>ADC_B_PGA_GAIN_DIFFERENTIAL_4_000</code> | PGA Gain Setting 4.000. |
| <code>ADC_B_PGA_GAIN_DIFFERENTIAL_5_667</code> | PGA Gain Setting 5.667. |
| <code>ADC_B_PGA_GAIN_SINGLE_ENDED_2_500</code> | PGA Gain Setting 2.500. |
| <code>ADC_B_PGA_GAIN_SINGLE_ENDED_2_667</code> | PGA Gain Setting 2.667. |
| <code>ADC_B_PGA_GAIN_SINGLE_ENDED_2_857</code> | PGA Gain Setting 2.857. |
| <code>ADC_B_PGA_GAIN_SINGLE_ENDED_3_077</code> | PGA Gain Setting 3.077. |
| <code>ADC_B_PGA_GAIN_SINGLE_ENDED_3_333</code> | PGA Gain Setting 3.333. |
| <code>ADC_B_PGA_GAIN_SINGLE_ENDED_3_636</code> | PGA Gain Setting 3.636. |
| <code>ADC_B_PGA_GAIN_SINGLE_ENDED_4_000</code> | PGA Gain Setting 4.000. |
| <code>ADC_B_PGA_GAIN_SINGLE_ENDED_4_444</code> | PGA Gain Setting 4.444. |
| <code>ADC_B_PGA_GAIN_SINGLE_ENDED_5_000</code> | PGA Gain Setting 5.000. |
| <code>ADC_B_PGA_GAIN_SINGLE_ENDED_5_714</code> | PGA Gain Setting 5.714. |
| <code>ADC_B_PGA_GAIN_SINGLE_ENDED_6_667</code> | PGA Gain Setting 6.667. |
| <code>ADC_B_PGA_GAIN_SINGLE_ENDED_8_000</code> | PGA Gain Setting 8.000. |
| <code>ADC_B_PGA_GAIN_SINGLE_ENDED_10_000</code> | PGA Gain Setting 10.000. |
| <code>ADC_B_PGA_GAIN_SINGLE_ENDED_13_333</code> | PGA Gain Setting 13.333. |

◆ **adc_b_digital_filter_selection_t**

| enum <code>adc_b_digital_filter_selection_t</code> | |
|--|---|
| ADC Digital Filter Selection | |
| Enumerator | |
| <code>ADC_B_DIGITAL_FILTER_MODE_SINC3</code> | Digital filter Sinc3 filter (Oversampling Rate = 8) |
| <code>ADC_B_DIGITAL_FILTER_MODE_PHASE</code> | Digital filter Minimum phase filter (Group delay < 2) |

◆ **adc_b_sampling_state_table_id_t**

| enum <code>adc_b_sampling_state_table_id_t</code> | |
|---|--------------------------|
| ADC Sampling State table selection options | |
| Enumerator | |
| <code>ADC_B_SAMPLING_STATE_TABLE_0</code> | Sampling State Table 0. |
| <code>ADC_B_SAMPLING_STATE_TABLE_1</code> | Sampling State Table 1. |
| <code>ADC_B_SAMPLING_STATE_TABLE_2</code> | Sampling State Table 2. |
| <code>ADC_B_SAMPLING_STATE_TABLE_3</code> | Sampling State Table 3. |
| <code>ADC_B_SAMPLING_STATE_TABLE_4</code> | Sampling State Table 4. |
| <code>ADC_B_SAMPLING_STATE_TABLE_5</code> | Sampling State Table 5. |
| <code>ADC_B_SAMPLING_STATE_TABLE_6</code> | Sampling State Table 6. |
| <code>ADC_B_SAMPLING_STATE_TABLE_7</code> | Sampling State Table 7. |
| <code>ADC_B_SAMPLING_STATE_TABLE_8</code> | Sampling State Table 8. |
| <code>ADC_B_SAMPLING_STATE_TABLE_9</code> | Sampling State Table 9. |
| <code>ADC_B_SAMPLING_STATE_TABLE_10</code> | Sampling State Table 10. |
| <code>ADC_B_SAMPLING_STATE_TABLE_11</code> | Sampling State Table 12. |
| <code>ADC_B_SAMPLING_STATE_TABLE_12</code> | Sampling State Table 13. |
| <code>ADC_B_SAMPLING_STATE_TABLE_13</code> | Sampling State Table 14. |
| <code>ADC_B_SAMPLING_STATE_TABLE_14</code> | Sampling State Table 15. |
| <code>ADC_B_SAMPLING_STATE_TABLE_15</code> | Sampling State Table 16. |

◆ **adc_b_user_gain_table_id_t**

| enum <code>adc_b_user_gain_table_id_t</code> | |
|--|---------------------|
| ADC User Gain table options | |
| Enumerator | |
| <code>ADC_B_USER_GAIN_TABLE_SELECTION_DISABLE</code> | User Gain disabled. |
| <code>ADC_B_USER_GAIN_TABLE_SELECTION_0</code> | User Gain table 0. |
| <code>ADC_B_USER_GAIN_TABLE_SELECTION_1</code> | User Gain table 1. |
| <code>ADC_B_USER_GAIN_TABLE_SELECTION_2</code> | User Gain table 2. |
| <code>ADC_B_USER_GAIN_TABLE_SELECTION_3</code> | User Gain table 3. |
| <code>ADC_B_USER_GAIN_TABLE_SELECTION_4</code> | User Gain table 4. |
| <code>ADC_B_USER_GAIN_TABLE_SELECTION_5</code> | User Gain table 5. |
| <code>ADC_B_USER_GAIN_TABLE_SELECTION_6</code> | User Gain table 6. |
| <code>ADC_B_USER_GAIN_TABLE_SELECTION_7</code> | User Gain table 7. |

◆ **adc_b_user_offset_table_selection_id_t**

| enum <code>adc_b_user_offset_table_selection_id_t</code> | |
|--|-----------------------|
| ADC User Offset table options | |
| Enumerator | |
| <code>ADC_B_USER_OFFSET_TABLE_SELECTION_DISABLED</code> | User Offset disabled. |
| <code>ADC_B_USER_OFFSET_TABLE_SELECTION_0</code> | User Offset table 0. |
| <code>ADC_B_USER_OFFSET_TABLE_SELECTION_1</code> | User Offset table 1. |
| <code>ADC_B_USER_OFFSET_TABLE_SELECTION_2</code> | User Offset table 2. |
| <code>ADC_B_USER_OFFSET_TABLE_SELECTION_3</code> | User Offset table 3. |
| <code>ADC_B_USER_OFFSET_TABLE_SELECTION_4</code> | User Offset table 4. |
| <code>ADC_B_USER_OFFSET_TABLE_SELECTION_5</code> | User Offset table 5. |
| <code>ADC_B_USER_OFFSET_TABLE_SELECTION_6</code> | User Offset table 6. |
| <code>ADC_B_USER_OFFSET_TABLE_SELECTION_7</code> | User Offset table 7. |

Function Documentation◆ **R_ADC_B_Open()**

`fsp_err_t R_ADC_B_Open (adc_ctrl_t * p_ctrl, adc_cfg_t const *const p_cfg)`

Sets the operational mode, trigger sources, interrupt priority, and configurations for the peripheral as a whole. If provided, the function registers a callback function pointer for notifying the user whenever a scan has completed, error has occurred, FIFO read request is generated, or other ADC interrupt event occurs. Implements `adc_api_t::open`.

Return values

| | |
|-----------------------------------|---|
| <code>FSP_SUCCESS</code> | Module is ready for use. |
| <code>FSP_ERR_ASSERTION</code> | An input argument is invalid. |
| <code>FSP_ERR_ALREADY_OPEN</code> | The instance control structure has already been opened. |

◆ **R_ADC_B_ScanCfg()**

```
fsp_err_t R_ADC_B_ScanCfg ( adc_ctrl_t* p_ctrl, void const *const p_scan_cfg )
```

Configures the ADC_B scan parameters. Channel specific settings are set in this function. Pass a pointer to `adc_b_scan_cfg_t` to `p_channel_cfg`. Implements `adc_api_t::scanCfg`.

Note

This starts group B scans if `adc_b_scan_cfg_t::priority_group_a` is set to `ADC_B_GROUP_A_GROUP_B_CONTINUOUS_SCAN`.

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Channel specific settings applied. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_INVALID_STATE | Invalid Scan Configuration. |
| FSP_ERR_INVALID_CHANNEL | Invalid configured channel for group converter id. |

◆ **R_ADC_B_CallbackSet()**

```
fsp_err_t R_ADC_B_CallbackSet ( adc_ctrl_t*const p_api_ctrl, void(*) (adc_callback_args_t*)
p_callback, void const *const p_context, adc_callback_args_t*const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `adc_api_t::callbackSet`

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | <code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL. |

◆ R_ADC_B_ScanStart()

`fsp_err_t R_ADC_B_ScanStart (adc_ctrl_t* p_ctrl)`

Enables the hardware trigger for a scan depending on how the triggers were configured in the R_ADC_B_ScanCfg call. If the unit was configured for ELC, GPT, or external hardware triggering, then this function allows the trigger signal to get to the ADC unit. The function is not able to control the generation of the trigger itself. If the unit was configured for software triggering, This function was added to this ADC version for compatability with r_adc driver. For additional flexibility, it is recommended to use R_ADC_B_ScanGroupStart.

Precondition

Call R_ADC_B_ScanCfg after R_ADC_B_Open before starting a scan.

Call R_ADC_B_Calibrate and wait for calibration to complete before starting a scan.

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Scan started (software trigger) or hardware triggers enabled. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_INVALID_ARGUMENT | No hardware triggers configured for groups. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_NOT_INITIALIZED | Unit not initialized. |
| FSP_ERR_INVALID_STATE | Calibration required. |

◆ **R_ADC_B_ScanGroupStart()**

```
fsp_err_t R_ADC_B_ScanGroupStart ( adc_ctrl_t* p_ctrl, adc_group_mask_t group_mask )
```

Starts a software scan or enables the hardware trigger for a scan depending on how triggers were configured. If the group was configured for ELC, GPT, or external hardware triggering then this function allows the trigger signal to get to the ADC unit. The function itself is not able to control the generation of peripheral triggers. If the unit was configured for software triggering, then this function starts the software triggered scan.

Note

Except for Group Priority Operation, if ADC0 or ADC1 are currently performing an A/D conversion operation, attempting to start another scan group that uses the same A/D converter will be ignored. This also applies to starting multiple groups at one time. When Group Priority Operation is not enabled, only the lowest numbered group will be started (for each ADC converter), other groups will be ignored.

Precondition

Call R_ADC_B_ScanCfg after R_ADC_B_Open before starting a scan.

Call R_ADC_B_Calibrate and wait for calibration to complete before starting a scan.

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Scan started (software trigger) or hardware triggers enabled. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_INVALID_ARGUMENT | An invalid group has been provided. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_NOT_INITIALIZED | Unit not initialized. |
| FSP_ERR_INVALID_STATE | Calibration required. |

◆ **R_ADC_B_ScanStop()**

```
fsp_err_t R_ADC_B_ScanStop ( adc_ctrl_t* p_ctrl)
```

Disables the hardware trigger for a scan and immediately stops all active converters. This function will abort all active conversions.

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | All scans stopped. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_INVALID_ARGUMENT | No hardware triggers configured for groups. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_NOT_INITIALIZED | Unit not initialized. |

◆ R_ADC_B_StatusGet()

```
fsp_err_t R_ADC_B_StatusGet ( adc_ctrl_t* p_ctrl, adc_status_t* p_status )
```

Provides the status of any scan process that was started, including scans started by ELC or external triggers and calibration scans on MCUs that support calibration.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Module status stored in the provided pointer p_status |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |

◆ R_ADC_B_Read()

```
fsp_err_t R_ADC_B_Read ( adc_ctrl_t* p_ctrl, adc_channel_t const channel_id, uint16_t*const p_data )
```

Reads conversion results from a single channel or sensor.

Return values

| | |
|-------------------------|---|
| FSP_SUCCESS | Data read into provided p_data. |
| FSP_ERR_INVALID_DATA | Accuracy of data cannot be guaranteed. ADC requires calibration or SAR timing settings are irregular. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_NOT_INITIALIZED | Unit not initialized. |
| FSP_ERR_INVALID_CHANNEL | Invalid channel provided. |

◆ R_ADC_B_Read32()

```
fsp_err_t R_ADC_B_Read32 ( adc_ctrl_t * p_ctrl, adc_channel_t const channel_id, uint32_t *const p_data )
```

Reads conversion results from a single channel or sensor register into a 32-bit result.

Return values

| | |
|-------------------------|---|
| FSP_SUCCESS | Data read into provided p_data. |
| FSP_ERR_INVALID_DATA | Accuracy of data cannot be guaranteed. ADC requires calibration or SAR timing settings are irregular. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_NOT_INITIALIZED | Unit not initialized. |
| FSP_ERR_INVALID_CHANNEL | Invalid channel provided. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [adc_api_t::read](#)

◆ R_ADC_B_FifoRead()

```
fsp_err_t R_ADC_B_FifoRead ( adc_ctrl_t * p_ctrl, adc_group_mask_t const group_mask, adc_b_fifo_read_t *const p_data )
```

Reads conversion results from FIFO for the given group mask.

Return values

| | |
|--------------------------|---------------------------------|
| FSP_SUCCESS | Data read into provided p_data. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_NOT_INITIALIZED | Unit not initialized. |
| FSP_ERR_INVALID_ARGUMENT | Invalid group provided. |
| FSP_ERR_UNDERFLOW | FIFO empty. |

◆ **R_ADC_B_InfoGet()**

```
fsp_err_t R_ADC_B_InfoGet ( adc_ctrl_t* p_ctrl, adc_info_t* p_adc_info )
```

Provides the temperature sensor slope and the calibration data for the sensor if available on this MCU. Otherwise, invalid calibration data of 0xFFFFFFFF will be returned.

Return values

| | |
|-------------------------|-------------------------------|
| FSP_SUCCESS | Info is read into p_adc_info. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_NOT_INITIALIZED | Unit not initialized. |

◆ **R_ADC_B_Close()**

```
fsp_err_t R_ADC_B_Close ( adc_ctrl_t* p_ctrl)
```

This function ends any scan in progress, disables interrupts, and removes power to the A/D peripheral.

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Module closed. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |

◆ **R_ADC_B_Calibrate()**

```
fsp_err_t R_ADC_B_Calibrate ( adc_ctrl_t *const p_ctrl, void const * p_extend )
```

Initiates calibration of the ADC_B. This function must be called before starting a scan and again whenever ADC_B configuration or state is changed.

Note

Self-calibration is a non-blocking operation. The application should wait for an ADC_EVENT_CALIBRATION_COMPLETE callback before using other ADC_B functionality. The self-calibration process will disable hardware triggers that were previously enabled.

Parameters

| | | |
|------|----------|---|
| [in] | p_ctrl | Pointer to the instance control structure |
| [in] | p_extend | Unused argument. |

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Calibration successfully initiated. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |

◆ **R_ADC_B_OffsetSet()**

```
fsp_err_t R_ADC_B_OffsetSet ( adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, int32_t offset )
```

adc_api_t::offsetSet is not supported on the ADC_B.

Return values

| | |
|---------------------|--|
| FSP_ERR_UNSUPPORTED | Function not supported in this implementation. |
|---------------------|--|

5.2.1.3 ADC (r_adc_d)

Modules » Analog

Functions

reg_id, int32_t offset)
```

Detailed Description

Driver for ADC_D version of the ADC12 peripheral on RA MCUs. This module implements the [ADC Interface](#).

Overview

Features

The ADC module supports the following features:

- 8-, 10-, or 12-bit maximum resolution depending on the MCU
- Configure scans to include:
 - Single channel or Scan channels
 - Temperature sensor channel
 - Voltage sensor channel
- Configurable scan start trigger:
 - Software scan triggers with no-wait mode or wait mode
 - Hardware scan triggers with no-wait mode or wait mode (timer expiration, for example)
- Configurable scan mode:
 - One-shot scan mode, where each trigger starts a single scan
 - Sequential scan mode, where all channels are scanned continuously

- Optional callback when scan completes
 - Generated an interrupt request when $ADLL \leq ADCRn \leq ADUL$
 - Generated an interrupt request when $ADUL < ADCRn$ or $ADLL > ADCRn$
- Test mode support
 - Checking whether the ADC_D converter is operating normally

Configuration

Build Time Configurations for r_adc_d

The following build time configurations are defined in fsp_cfg/r_adc_d_cfg.h:

| Configuration | Options | Default | Description |
|------------------------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Internal Reference Voltage Support | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Enable Internal Reference Voltage support for the ADC module. |

Configurations for Analog > ADC (r_adc_d)

This module can be added to the Stacks tab via New Stack > Analog > ADC (r_adc_d).

| Configuration | Options | Default | Description |
|------------------------|--|----------|--|
| General | | | |
| Name | Name must be a valid C symbol | g_adc0 | Module name |
| Resolution | <ul style="list-style-type: none"> • 12-Bit • 10-Bit • 8-Bit | 12-Bit | Specifies the conversion resolution for this unit. |
| Conversion operation | <ul style="list-style-type: none"> • One-shot • Sequential | One-shot | Specifies the conversion operation mode. |
| Operation trigger | <ul style="list-style-type: none"> • Wait • No-wait | Wait | Specifies the operation trigger mode. |
| Operation voltage | <ul style="list-style-type: none"> • Normal 1 • Normal 2 • Low voltage 1 • Low voltage 2 | Normal 1 | Specifies operation voltage mode. |
| Conversion Clock (fAD) | <ul style="list-style-type: none"> • PCLK • PCLK/2 • PCLK/4 • PCLK/8 • PCLK/16 • PCLK/32 | PCLK | Specifies divider for conversion clock (fAD). |

Input

| | | | |
|---------------------------------|---|---------------------------------------|---|
| Channel Selection Mode | <ul style="list-style-type: none"> Select Scan | Select | Specifies the channel selection mode. |
| A/D Input channel | Refer to the RA Configuration tool for available options. | Channel 0 (channels 0-3 in scan mode) | Specifies the input channels. |
| Negative Side Reference Voltage | <ul style="list-style-type: none"> VSS VREFL0 | VSS | Selection of the Negative Side Reference Voltage. |
| Positive Side Reference Voltage | <ul style="list-style-type: none"> VCC VREFH0 Internal Reference Voltage | VCC | Selection of the Positive Side Reference Voltage. |

Interrupts

Interrupts > Conversion Result upper/lower bound value setting

| | | | |
|--|--|--|--|
| Generates an interrupt request (INTAD) | <ul style="list-style-type: none"> The interrupt signal is output when the ADLL register \leq the ADCRn register \leq the ADUL register The interrupt signal is output when the ADCRn register $<$ the ADLL register or the ADUL register $<$ the ADCRn register | The interrupt signal is output when the ADLL register \leq the ADCRn register \leq the ADUL register | Specify condition generates an interrupt(INTAD) after each time the ADC scan completes. |
| Upper bound (ADUL) value | Must be a valid integer | 255 | Specify the upper limit conversion value that corresponds to the condition to generate an interrupt request (INTAD). |
| Lower bound (ADLL) value | Must be a valid integer | 0 | Specify the lower limit conversion value that corresponds to the condition to generate an interrupt request (INTAD). |
| Callback | Name must be a valid C symbol | NULL | A user callback function. If this callback function is provided, it is called from the |

interrupt service routine (ISR) each time the ADC scan completes.

Pointer to the context structure to be passed through the callback argument.

Select scan end interrupt priority.

Specifies the trigger type to be used for this unit.

Callback Context Name must be a valid C symbol. NULL

Scan End Interrupt Priority MCU Specific Options

Start trigger source MCU Specific Options

Clock Configuration

The ADC_D conversion clock source may be configured to use ICLK with a selectable division ratio.

The ADC_D clock must be at least 1 MHz when the ADC is used.

Pin Configuration

The ANxxx pins are analog input channels that can be used with the ADC_D.

Usage Notes

ADC_D Operational Conversion

The driver supports two operation conversion mode: One-shot scan and Sequential scan modes. For each time conversion, ADC peripheral only converts for each a pin or group of pins depending on channels selection mode, it can be changed to another pin or group of other pins by calling [R_ADC_D_ScanCfg\(\)](#).

Oneshot-scan Mode

In One-shot scan mode, one or group specified channels are scanned once per trigger.

Sequential-scan Mode

In Sequential scan mode, a single trigger is required to start the scan. Scans continue until [R_ADC_D_ScanStop\(\)](#) is called.

When Interrupt Is Not Enabled

If interrupts are not enabled, the [R_ADC_D_StatusGet](#) API can be used to poll the ADC to determine when the scan has completed. The read API function is used to access the converted ADC result.

When Interrupt Is Enabled

An interrupt is generated depend on setting condition of converted ADC result is in range or out of range of Upper Bound Value (ADUL) and Low Bound Value (ADLL). Please refer to "Figure ADRCK Bit Interrupt Signal Generation Range" in RA0E1 User's Manual (R01UH1040EJ0100).

Selecting Reference Voltage

The ADC_D positive and negative side reference voltages may be configured for selected MCU's. Please refer to the RA Configuration editor in e2 studio for further details.

Note

When the internal reference voltage is selected as the positive side reference voltage. Please refer condition as below

- Select operation voltage is low-voltage mode 1 or 2.
- The conversion clock (fAD) must be range 1 to 2 MHz.
- Do not setting select internal reference voltage or temperature sensor channel as an A/D conversion channel.

Selecting Internal Reference Voltage or Temperature Sensor channel

When the internal reference voltage or temperature sensor output voltage is selected as the target for A/D conversion, please setting operation voltage is normal mode 2 or low-voltage mode 2.

Note

when using operation voltage is low-voltage mode 2, setting a conversion clock (fAD) is less than or equal 16 MHz.

Selecting Conversion Clock

Range for frequency of Conversion Clock (fAD) depends on frequency of ICLK. Please refer table as below.

| Frequency of ICLK | Frequency of Conversion Clock (fAD) |
|------------------------|-------------------------------------|
| 4 MHz < ICLK <= 32 MHz | ICLK to ICLK/32 |
| 1 MHz <= fCLK <= 4 MHz | ICLK to ICLK/4 |

Selecting Operation Voltage

The operation voltage is selectable depending on the analog input channel, VREFH0 voltage, operation mode, and ICLK. For detail, refer table A/D Conversion Time Selection in Section A/D Converter (ADC) in RA0E1 User's Manual (R01UH1040EJ0100).

Note

When operation voltage is low-voltage modes 1 or 2 in the Electrical Characteristics section in RA0E1 User's Manual (R01UH1040EJ0100), setting frequency of ICLK should be used with a frequency less than or equal 24 MHz.

ADC_D conversion in Test Mode

The conversion target for testing can be selected by using the **Input > A/D Input channel** property in the module configuration.

Note

For more details on the method of checking, refer to section 25.8 "Testing of the A/D Converter" in RA0E1 User's Manual (R01UH1040EJ0100).

Using the Temperature Sensor with the ADC_D

The ADC_D HAL module supports reading the data from the on-chip temperature sensor. The value returned from the sensor can be converted into degrees Celsius or Fahrenheit in the application

program using the following formula, $T = (V_s - V_1)/\text{slope} + T_1$, where:

- T: Measured temperature (degrees C)
- Vs: Voltage output by the temperature sensor at the time of temperature measurement (Volts)
- T1: Temperature experimentally measured at one point (degrees C)
- V1: Voltage output by the temperature sensor at the time of measurement of T1 (Volts)
- T2: Temperature at the experimental measurement of another point (degrees C)
- V2: Voltage output by the temperature sensor at the time of measurement of T2 (Volts)
- Slope: Temperature gradient of the temperature sensor (V/degrees C); slope = $(V_2 - V_1)/(T_2 - T_1)$

Note

The slope value can be obtained for each in the Electrical Characteristics Chapter - TSN Characteristics Table, Temperature slope entry.

For the setting flow, see section 25.6.5. "Example of Using the ADC12 when Selecting the Temperature Sensor Output Voltage or Internal Reference Voltage, and Software Trigger No-wait Mode and One-shot Conversion Mode" in RA0E1 User's Manual (R01UH1040EJ0100).

Examples

Basic Example

This is a basic example of minimal use of the ADC_D in an application.

```

/* A channel configuration is generated by the RA Configuration editor based on the
options selected. If additional
 * configurations are desired additional adc_d_channel_cfg_t elements can be defined
and passed to R_ADC_D_ScanCfg. */
adc_d_channel_cfg_t g_adc_d0_channel_cfg =
{
    .channel_input = ADC_CHANNEL_0,
};
void adc_d_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_ADC_D_Open(&g_adc_d0_ctrl, &g_adc_d0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Enable channels. */
    err = R_ADC_D_ScanCfg(&g_adc_d0_ctrl, &g_adc_d0_channel_cfg);
    assert(FSP_SUCCESS == err);

```

```
/* In software trigger mode, start a scan by calling R_ADC_D_ScanStart(). In other
modes, enable hardware
 * triggers by calling R_ADC_D_ScanStart(). */
(void) R_ADC_D_ScanStart(&g_adc_d0_ctrl);
/* Wait for conversion to complete. */
adc_status_t status;
status.state = ADC_STATE_SCAN_IN_PROGRESS;
while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
{
    (void) R_ADC_D_StatusGet(&g_adc_d0_ctrl, &status);
}
/* Read converted data. */
uint16_t channel1_conversion_result;
err = R_ADC_D_Read(&g_adc_d0_ctrl, ADC_CHANNEL_0, &channel1_conversion_result);
assert(FSP_SUCCESS == err);
}
```

Temperature Sensor Example

This example shows how to calculate the MCU temperature using the ADC_D and the temperature sensor.

```
#define ADC_D_EXAMPLE_TEMPERATURE_VOLTAGE_V1 (1050000)
#define ADC_D_EXAMPLE_VCC_MICROVOLT (3300000)
#define ADC_D_EXAMPLE_TEMPERATURE_RESOLUTION (12)
#define ADC_D_EXAMPLE_ADC_TEST_TEMPERATURE_CELSIUS_T1 (25)
#define ADC_PRV_COEFFICIENT (0.5)
void adc_d_temperature_example (void)
{
    /* The following example calculates the temperature using the data provided in the
section
 * "Temperature Sensor (TSN)" in RA0E1 User's Manual (R01UH1040EJ0100). */
    fsp_err_t err = FSP_SUCCESS;
    /* Using normal mode 2 when configure temperature channel */
    g_adc_d0_cfg_extend.operation_voltage = ADC_D_VOLTAGE_MODE_NORMAL_2;
```

```
g_adc_d0_cfg_extend.operation_trigger = ADC_D_TRIGGER_MODE_NO_WAIT;
/* Initializes the module. */
err = R_ADC_D_Open(&g_adc_d0_ctrl, &g_adc_d0_cfg);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
/* Configure temperature channel */
g_adc_d0_channel_cfg.channel_input = ADC_CHANNEL_TEMPERATURE;
/* Enable temperature sensor. */
err = R_ADC_D_ScanCfg(&g_adc_d0_ctrl, &g_adc_d0_channel_cfg);
assert(FSP_SUCCESS == err);
/* Start of A/D conversion */
(void) R_ADC_D_ScanStart(&g_adc_d0_ctrl);
/* Wait for conversion to complete. */
adc_status_t status;
status.state = ADC_STATE_SCAN_IN_PROGRESS;
while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
{
    (void) R_ADC_D_StatusGet(&g_adc_d0_ctrl, &status);
}
/* The 1st conversion result cannot be used. See Table 25.22 "Setup when temperature
sensor output voltage and
* internal reference voltage is selected" in RA0E1 User's Manual (R01UH1040EJ0100).
*/
/* Start of A/D conversion */
(void) R_ADC_D_ScanStart(&g_adc_d0_ctrl);
/* Wait for conversion to complete. */
status.state = ADC_STATE_SCAN_IN_PROGRESS;
while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
{
    (void) R_ADC_D_StatusGet(&g_adc_d0_ctrl, &status);
}
/* Read converted data. */
uint16_t temperature_conversion_result;
err = R_ADC_D_Read(&g_adc_d0_ctrl, ADC_CHANNEL_0,
```

```
&temperature_conversion_result);
    assert(FSP_SUCCESS == err);

    /* If the MCU does not provide calibration data, use the value in the hardware
manual or determine it
    * experimentally. */
    /* Get Calibration data from the MCU if available. */
    adc_info_t adc_info;
    (void) R_ADC_D_InfoGet(&g_adc_d0_ctrl, &adc_info);
    /* NOTE: The slope of the temperature sensor varies from sensor to sensor. Renesas
recommends calculating
    * the slope of the temperature sensor experimentally.
    *
    * This example uses the typical slope provided in Table "TSN characteristics" in
the user manual */
    int32_t slope_uv_per_c = BSP_FEATURE_ADC_TSN_SLOPE;
    /* Formula for calculating temperature copied from section "Temperature Sensor
(TSN)"
    * of the user manual:
    *
    * Using this, the measured temperature can be calculated according to the following
formula.
    *
    *  $T = (V_s - V_1) / \text{Slope} + T_1 \text{ [C]}$ 
    * T: Measured temperature (C)
    * Vs: Voltage output by the temperature sensor when the temperature is measured (V)
    * V1: Voltage output by T1(25 C) is 1.05 V. Refer table "TSN characteristics" in
the user manual
    * Slope: Temperature slope given in table "TSN characteristics" -3.3 mV/C
    * T1: Temperature of T1 is 25 C.Refer table "TSN characteristics" in the user
manual
    */
    int32_t v1_uv = ADC_D_EXAMPLE_TEMPERATURE_VOLTAGE_V1;
    /* Refer to chapter "Input Voltage and Conversion Results" in the user manual */
    int32_t vs_uv =
```

```
        (int32_t) (((temperature_conversion_result - ADC_PRV_COEFFICIENT) *
ADC_D_EXAMPLE_VCC_MICROVOLT) /
                ADC_D_EXAMPLE_TEMPERATURE_RESOLUTION);
    int32_t temperature_c =
        (int32_t) ((vs_uv - vl_uv) / slope_uv_per_c +
ADC_D_EXAMPLE_ADC_TEST_TEMPERATURE_CELSIUS_T1);
    /* Expect room temperature, break if temperature is outside the range of 20 C to 25
C. */
    if ((temperature_c < 20) || (temperature_c > 25))
    {
        __BKPT(0);
    }
}
```

| ADC_D_POSITIVE_VREF_IVREF | Supplied from the internal reference voltage. |

Function Documentation

◆ **R_ADC_D_Open()**

```
fsp_err_t R_ADC_D_Open ( adc_ctrl_t* p_ctrl, adc_cfg_t const *const p_cfg )
```

Initialize the ADC_D peripheral. If interrupt is enabled, the function registers a callback function for notifying the user when a scan has completed. Implements [adc_api_t::open](#).

Return values

| | |
|------------------------------|---|
| FSP_SUCCESS | Module is ready for use. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_ALREADY_OPEN | The instance control structure has already been opened. |
| FSP_ERR_IRQ_BSP_DISABLED | A callback is provided, but the interrupt is not enabled. |
| FSP_ERR_INVALID_HW_CONDITION | Invalid configuration corresponds to condition HardWare UM. |

◆ **R_ADC_D_ScanCfg()**

```
fsp_err_t R_ADC_D_ScanCfg ( adc_ctrl_t* p_ctrl, void const *const p_channel_cfg )
```

Configures the ADC_D scan parameters. Channel specific settings are set in this function. Pass a pointer to [adc_d_channel_cfg_t](#) to p_channel_cfg.

Return values

| | |
|------------------------------|---|
| FSP_SUCCESS | Channel specific settings applied. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_INVALID_HW_CONDITION | Invalid configuration corresponds to condition HardWare UM. |
| FSP_ERR_INVALID_STATE | Invalid Scan Configuration. |
| FSP_ERR_INVALID_CHANNEL | Channel is invalid. |

◆ **R_ADC_D_CallbackSet()**

```
fsp_err_t R_ADC_D_CallbackSet ( adc_ctrl_t *const p_api_ctrl, void(*) (adc_callback_args_t *)
p_callback, void const *const p_context, adc_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `adc_api_t::callbackSet`

Return values

| | |
|-------------------|--------------------------------|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |

◆ **R_ADC_D_ScanStart()**

```
fsp_err_t R_ADC_D_ScanStart ( adc_ctrl_t * p_ctrl)
```

Starts a software scan or enables the hardware trigger no-wait mode for a scan depending on how the triggers were configured in the `R_ADC_D_Open` call. If the unit was configured for ELC or interrupt hardware triggering, then this function allows the trigger signal to get to the `ADC_D`. The function is not able to control the generation of the trigger itself. If the `ADC_D` was configured for software triggering, then this function starts the software triggered scan.

Precondition

Call `R_ADC_D_ScanCfg` after `R_ADC_D_Open` before starting a scan.

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Scan started (software trigger) or hardware triggers no-wait mode enabled. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | ADC_D is not open. |
| FSP_ERR_NOT_INITIALIZED | ADC_D is not initialized. |

◆ **R_ADC_D_ScanGroupStart()**

```
fsp_err_t R_ADC_D_ScanGroupStart ( adc_ctrl_t * p_ctrl, adc_group_mask_t group_id )
```

`adc_api_t::scanStart` is not supported on the `ADC_D`. Use `scanStart` instead.

Return values

| | |
|---------------------|--|
| FSP_ERR_UNSUPPORTED | Function not supported in this implementation. |
|---------------------|--|

◆ **R_ADC_D_ScanStop()**

```
fsp_err_t R_ADC_D_ScanStop ( adc_ctrl_t * p_ctrl )
```

Disables the hardware trigger for a scan or select mode and immediately stops converters. This function will abort conversions.

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Scan stopped (software trigger) or hardware triggers disabled. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_NOT_INITIALIZED | Unit is not initialized. |

◆ **R_ADC_D_StatusGet()**

```
fsp_err_t R_ADC_D_StatusGet ( adc_ctrl_t * p_ctrl, adc_status_t * p_status )
```

Provides the status of any scan process that was started, including scans started by ELC or interrupts triggers.

Note

In Hardware no-wait mode, ADCS retains the value 1 after conversion end.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Module status stored in the provided pointer p_status. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | ADC_D is not open. |

◆ **R_ADC_D_Read()**

```
fsp_err_t R_ADC_D_Read ( adc_ctrl_t * p_ctrl, adc_channel_t const reg_id, uint16_t *const p_data )
```

Reads conversion results from a channel or sensor.

Return values

| | |
|-------------------------|---|
| FSP_SUCCESS | Data read into provided p_data. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_NOT_INITIALIZED | Unit is not initialized. |
| FSP_ERR_INVALID_MODE | Invalid configuration for channel_mode. |

◆ **R_ADC_D_Read32()**

```
fsp_err_t R_ADC_D_Read32 ( adc_ctrl_t * p_ctrl, adc_channel_t const reg_id, uint32_t *const p_data )
```

Reads conversion results from a a select/scan channel or sensor register into a 32-bit result.

Return values

| | |
|-------------------------|---|
| FSP_SUCCESS | Data read into provided p_data. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | ADC_D is not open. |
| FSP_ERR_NOT_INITIALIZED | ADC_D is not initialized. |
| FSP_ERR_INVALID_MODE | Invalid configuration for channel_mode. |

◆ **R_ADC_D_InfoGet()**

```
fsp_err_t R_ADC_D_InfoGet ( adc_ctrl_t* p_ctrl, adc_info_t* p_adc_info )
```

Get information of address ADCR to reading the data, determine the size of data that must be read, size data of each transfer, name of the ELC event for the peripheral, name of the peripheral in the ELC list

Return values

| | |
|-------------------------|-----------------------------------|
| FSP_SUCCESS | Information stored in p_adc_info. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | ADC_D is not open. |
| FSP_ERR_NOT_INITIALIZED | ADC_D is not initialized. |

◆ **R_ADC_D_Close()**

```
fsp_err_t R_ADC_D_Close ( adc_ctrl_t* p_ctrl)
```

This function ends any scan or select mode in progress, disables interrupts, and removes power to the A/D peripheral.

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Module closed. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | ADC_D is not open. |

◆ **R_ADC_D_Calibrate()**

```
fsp_err_t R_ADC_D_Calibrate ( adc_ctrl_t*const p_ctrl, void const* p_extend )
```

`adc_api_t::calibrate` is not supported on the ADC_D.

Return values

| | |
|---------------------|--|
| FSP_ERR_UNSUPPORTED | Function not supported in this implementation. |
|---------------------|--|

◆ R_ADC_D_OffsetSet()

```
fsp_err_t R_ADC_D_OffsetSet ( adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, int32_t offset )
```

adc_api_t::offsetSet is not supported on the ADC_D.

Return values

| | |
|---------------------|--|
| FSP_ERR_UNSUPPORTED | Function not supported in this implementation. |
|---------------------|--|

```

Detailed Description

Driver for the ACMPHS peripheral on RA MCUs. This module implements the [Comparator Interface](#).

Overview**Features**

The ACMPHS HAL module supports the following features:

- Callback on rising edge, falling edge or both
- Configurable debounce filter
- Option for comparator output on VCOUT, CMPOUTn¹, or CMPOUT012¹ pin
- ELC event output

Note

1. This output pin is not available on all MCUs.

Configuration

Build Time Configurations for r_acmphs

The following build time configurations are defined in fsp_cfg/r_acmphs_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> Default (BSP) Enabled Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Analog > Comparator, High-Speed (r_acmphs)

This module can be added to the Stacks tab via New Stack > Analog > Comparator, High-Speed (r_acmphs).

| Configuration | Options | Default | Description |
|---------------------------------|--|---------------|--|
| Name | Name must be a valid C symbol | g_comparator0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Select the hardware channel. |
| Trigger Edge Selector | <ul style="list-style-type: none"> Rising Falling Both Edge | Both Edge | The trigger specifies when a comparator callback event should occur. Unused if the interrupt priority is disabled or the callback is NULL. |
| Noise Filter | <ul style="list-style-type: none"> No Filter 8 16 32 | No Filter | Select the PCLK divisor for the hardware digital debounce filter. Larger divisors provide a longer debounce and take longer for the output to update. |
| Maximum status retries (CMPMON) | Must be a valid non-negative integer between 2 and 32-bit maximum value | 1024 | Maximum number of status retries. |
| Output Polarity | <ul style="list-style-type: none"> Not Inverted Inverted | Not Inverted | When enabled comparator output is inverted. This affects the output read from R_ACMPHS_StatusGet() , the pin output level, and the edge trigger. |
| Pin Output | <ul style="list-style-type: none"> Disabled | Disabled | Turn this on to enable |

- Enabled

the CMPOUTn signal for this channel. The CMPOUTn signal for each channel is OR'd together and the result is output to VCOUT. More pin output options are available on select MCUs.

Define this function in the application. It is called when the Trigger event occurs.

Select the interrupt priority for the comparator interrupt.

Select the Analog input voltage source. Channel mentioned in the options represents channel in ACMPHS

Select the Analog reference voltage source. Channel mentioned in the options represents channel in ACMPHS

Callback Name must be a valid C symbol NULL

Comparator Interrupt Priority MCU Specific Options

Analog Input Voltage Source (IVCMP) MCU Specific Options

Reference Voltage Input Source (IVREF) MCU Specific Options

Clock Configuration

The ACMPHS peripheral is clocked from PCLKB. You can set the PCLKB frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

Pin Configuration

Comparator output can be enabled or disabled on each channel individually. The VCOUT pin is a logical OR of all comparator outputs.

The IVCMPn pins are used as comparator inputs. The IVREFn pins are used as comparator reference values.

Usage Notes

Noise Filter

When the noise filter is enabled, the ACMPHP0/ACMPHP1 signal is sampled three times based on the sampling clock selected. The filter clock frequency is determined by PCLKB and the comparator_filter_t setting.

Output Polarity

If output polarity is configured as "Inverted" then the VCOUT signal will be inverted and the

[R_ACMPHS_StatusGet\(\)](#) will return an inverted status.

Limitations

- Once the analog comparator is configured, the program must wait for the stabilization time to elapse before using the comparator.
- When the noise filter is not enabled the hardware requires software debouncing of the output (two consecutive equal values). This is automatically managed in [R_ACMPHS_StatusGet](#) but may result in delay or an API error in rare edge cases.
- Constraints apply on the simultaneous use of ACMPHS analog input and ADC analog input. Refer to the "Usage Notes" section in your MCU's User's Manual for the ADC unit(s) for more details.
- To allow ACMPHS0 to cancel Software Standby mode or enter Snooze, set the CSTEN bit to 1 and the CDFS bits to 00 in the CMPCTL0 register.

Examples

Basic Example

The following is a basic example of using the ACMPHS to detect when the analog voltage input to IVCMP rises above the analog voltage input to IVREF. A GPIO output acts as the comparator input and is externally connected to the IVCMP input of the ACMPHS. An analog voltage input should also be supplied to the IVREF input pin.

```
#define ADC_PGA_BYPASS_VALUE (0x9999)

/* Connect this control pin to the IVCMP input of the comparator. This can be any
GPIO pin
 * that is not input only. */
#define ACMPHS_EXAMPLE_CONTROL_PIN (BSP_IO_PORT_05_PIN_03)
volatile uint32_t g_comparator_events = 0U;
/* This callback is called when a comparator event occurs. */
void acmphs_example_callback (comparator_callback_args_t * p_args)
{
    FSP_PARAMETER_NOT_USED(p_args);
    g_comparator_events++;
}
void acmphs_example ()
{
    fsp_err_t err = FSP_SUCCESS;
    /* Disable pin register write protection, if enabled */
    R_BSP_PinAccessEnable();
    /*
     * Start with the IVCMP pin low. This example assumes the comparator is configured
```

```
to trigger
 * when the voltage of the analog input to IVCMP rises above voltage of the analog
input to
 * IVREF.
 */
(void) R_BSP_PinWrite(ACMPHS_EXAMPLE_CONTROL_PIN, BSP_IO_LEVEL_LOW);
/* Initialize the ACMPHS module */
err = R_ACMPHS_Open(&g_comparator_ctrl, &g_comparator_cfg);
assert(FSP_SUCCESS == err);
/*
 * If an ADC PGA exists for the analog input pin, then the PGA must be manually
configured in order for the pin to be used as
 * an IVCMP input. This procedure is slightly different depending on the MCU (See
below).
 */
#if BSP_MCU_GROUP_RA6M3
/* The following applies for MCUs with the ADC peripheral:
 *
 * Bypass the PGA on ADC unit 0.
 * (See Table 50.2 "Input source configuration of the ACMPHS" in the RA6M3 User's
Manual (R01UH0886EJ0100)) */
R_BSP_MODULE_START(FSP_IP_ADC, 0);
R_ADC0->ADPGACR = ADC_PGA_BYPASS_VALUE;
R_ADC0->ADPGADCR0 = 0;
#elif BSP_MCU_GROUP_RA6T2
/* The following applies for MCUs with the ADC_B peripheral:
 *
 * Configure PGA on ADC unit 0.
 * (See Table 36.11 "PGA Settings and Available Related Functions" in the RA6T2
User's Manual (R01UH0951EJ0100)) */
R_BSP_MODULE_START(FSP_IP_ADC, 0);
R_ADC_B->ADPGACR[0] = R_ADC_B0_ADPGACR_PGAGEN_Msk;
#endif
/* Wait for the minimum stabilization wait time before enabling output. */
```

```

comparator_info_t info;
R_ACMPHS_InfoGet(&g_comparator_ctrl, &info);
R_BSP_SoftwareDelay(info.min_stabilization_wait_us, BSP_DELAY_UNITS_MICROSECONDS);
/* Enable the comparator output */
(void) R_ACMPHS_OutputEnable(&g_comparator_ctrl);
/* Set the IVCMP pin high. */
(void) R_BSP_PinWrite(ACMPHS_EXAMPLE_CONTROL_PIN, BSP_IO_LEVEL_HIGH);
while (0 == g_comparator_events)
{
/* Wait for interrupt. */
}
comparator_status_t status;
/* Check status of comparator, Status will be COMPARATOR_STATE_OUTPUT_HIGH */
(void) R_ACMPHS_StatusGet(&g_comparator_ctrl, &status);
}

```

Function Documentation

◆ R_ACMPHS_Open()

```

fsp_err_t R_ACMPHS_Open ( comparator_ctrl_t *const p_ctrl, comparator_cfg_t const *const p_cfg
)

```

Configures the comparator and starts operation. Callbacks and pin output are not active until `outputEnable()` is called. `comparator_api_t::outputEnable()` should be called after the output has stabilized. Implements `comparator_api_t::open()`.

Comparator inputs must be configured in the application code prior to calling this function.

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An input pointer is NULL |
| FSP_ERR_INVALID_ARGUMENT | An argument is invalid. Window mode (COMPARATOR_MODE_WINDOW) and filter of 1 (COMPARATOR_FILTER_1) are not supported in this implementation. |
| FSP_ERR_ALREADY_OPEN | The control block is already open or the hardware lock is taken. |

◆ **R_ACMPHS_InfoGet()**

```
fsp_err_t R_ACMPHS_InfoGet ( comparator_ctrl_t *const p_ctrl, comparator_info_t *const p_info )
```

Provides the minimum stabilization wait time in microseconds. Implements `comparator_api_t::infoGet()`.

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Information stored in p_info. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

◆ **R_ACMPHS_OutputEnable()**

```
fsp_err_t R_ACMPHS_OutputEnable ( comparator_ctrl_t *const p_ctrl)
```

Enables the comparator output, which can be polled using `comparator_api_t::statusGet()`. Also enables pin output and interrupts as configured during `comparator_api_t::open()`. Implements `comparator_api_t::outputEnable()`.

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Comparator output is enabled. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

◆ **R_ACMPHS_StatusGet()**

```
fsp_err_t R_ACMPHS_StatusGet ( comparator_ctrl_t *const p_ctrl, comparator_status_t *const p_status )
```

Provides the operating status of the comparator. Implements `comparator_api_t::statusGet()`.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Operating status of the comparator is provided in p_status. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |
| FSP_ERR_TIMEOUT | The debounce filter is off and 2 consecutive matching values were not read within 1024 attempts. |

◆ R_ACMPHS_Close()

```
fsp_err_t R_ACMPHS_Close ( comparator_ctrl_t* p_ctrl)
```

Stops the comparator. Implements `comparator_api_t::close()`.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Instance control block closed successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

```

Detailed Description

Driver for the ACMPPLP peripheral on RA MCUs. This module implements the [Comparator Interface](#).

Overview**Features**

The ACMPPLP HAL module supports the following features:

- Normal mode or window mode
- Callback on rising edge, falling edge or both
- Configurable debounce filter
- Option for comparator output on VCOOUT pin
- ELC event output

Configuration

Build Time Configurations for r_acmplp

The following build time configurations are defined in fsp_cfg/r_acmplp_cfg.h:

| Configuration | Options | Default | Description |
|--|--|---------------|--|
| Parameter Checking | <ul style="list-style-type: none"> Default (BSP) Enabled Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Reference Voltage Selection for ACMPLP1 (Standard mode only) | <ul style="list-style-type: none"> IVREF0 IVREF1 | IVREF1 | ACMPLP1 may optionally be configured to use IVREF0 as a reference input instead of IVREF1. Note that if IVREF0 is selected, ACMPLP0 and ACMPLP1 must use the same setting for IVREF. |

Configurations for Analog > Comparator, Low-Power (r_acmplp)

This module can be added to the Stacks tab via New Stack > Analog > Comparator, Low-Power (r_acmplp).

| Configuration | Options | Default | Description |
|---------------|--|----------------------|---|
| Name | Name must be a valid C symbol | g_comparator0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Select the hardware channel. |
| Mode | <ul style="list-style-type: none"> Standard Window | Standard | In standard mode, comparator output is high if VCMP > VREF. In window mode, comparator output is high if VCMP is outside the range of VREF0 to VREF1. |
| Trigger | <ul style="list-style-type: none"> Rising Falling Both Edge | Both Edge | The trigger specifies when a comparator callback event should occur. Unused if the interrupt priority is disabled or the callback is NULL. |
| Filter | <ul style="list-style-type: none"> No sampling | No sampling (bypass) | Select the PCLK divisor |

| | | | |
|--|--|--------------|--|
| | (bypass) | | for the hardware digital debounce filter. Larger divisors provide a longer debounce and take longer for the output to update. |
| | <ul style="list-style-type: none"> • Sampling at PCLKB • Sampling at PCLKB/8 • Sampling at PCLKB/32 | | |
| Output Polarity | <ul style="list-style-type: none"> • Not Inverted • Inverted | Not Inverted | When enabled comparator output is inverted. This affects the output read from R_ACMLP_StatusGet() , the pin output level, and the edge trigger. |
| Pin Output (VCOUT) | <ul style="list-style-type: none"> • Disabled • Enabled | Disabled | Turn this on to include the output from this comparator on VCOUT. The comparator output on VCOUT is OR'd with output from all other ACMPLP and ACMPLP comparators. |
| Vref (Standard mode only) | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | If reference voltage selection is enabled then internal reference voltage is used as comparator input |
| Callback | Name must be a valid C symbol | NULL | Define this function in the application. It is called when the Trigger event occurs. |
| Comparator Interrupt Priority | MCU Specific Options | | Select the interrupt priority for the comparator interrupt. |
| Analog Input Voltage Source (IVCMP) | MCU Specific Options | | Select the comparator input source. Only options for the configured channel are valid. |
| Reference Voltage Input Source (IVREF) | MCU Specific Options | | Select the comparator reference voltage source. |
| | | | If channel 1 is selected and the 'Reference Voltage Selection (ACMPLP1)' config option is set to IVREF0, select one of the Channel 0 options. In all other cases, only |

options for the configured channel are valid.

Clock Configuration

The ACMPLP peripheral is clocked from PCLKB. You can set the PCLKB frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

Pin Configuration

Comparator output can be enabled or disabled on each channel individually. The VCOUT pin is a logical OR of all comparator outputs.

The CMPINn pins are used as comparator inputs. The CMPREFn pins are used as comparator reference values.

Usage Notes

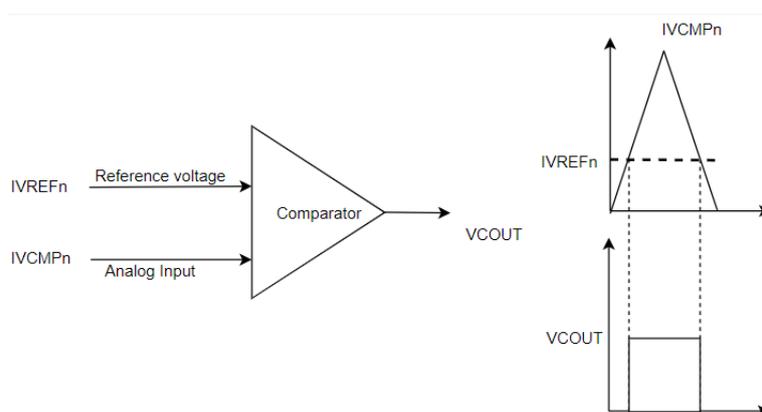

Figure 148: ACMPLP Standard Mode Operation

Noise Filter

When the noise filter is enabled, the ACMPLP0/ACMPLP1 signal is sampled three times based on the sampling clock selected. The filter clock frequency is determined by PCLKB and the comparator_filter_t setting.

Output Polarity

If output polarity is configured as "Inverted" then the VCOUT signal will be inverted and the [R_ACMPLP_StatusGet\(\)](#) will return an inverted status.

Window Mode

In window mode, the comparator indicates if the analog input voltage falls within the window (low and high reference voltage) or is outside the window.

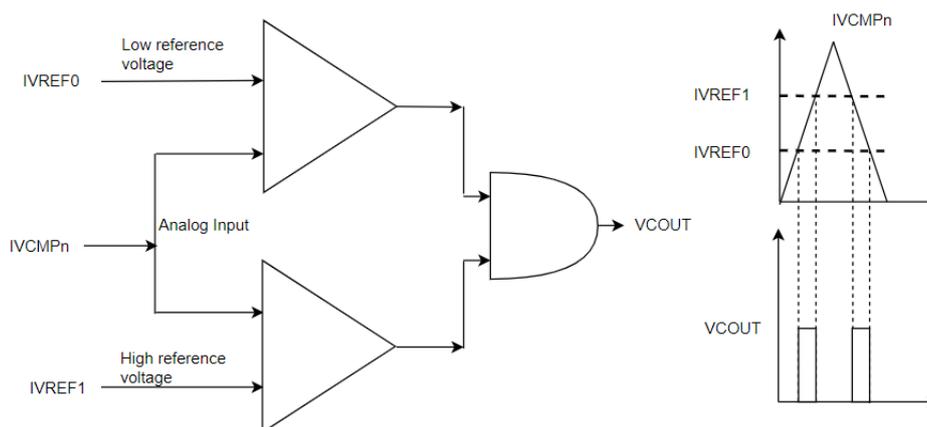

Figure 149: ACMLP Window Mode Operation

Limitations

- Once the analog comparator is configured, the program must wait for the stabilization time to elapse before using the comparator.
- Low speed is not supported by the ACMLP driver.

Examples

Basic Example

The following is a basic example of minimal use of the ACMLP. The comparator is configured to trigger a callback when the input rises above the internal reference voltage (VREF). A GPIO output acts as the comparator input and is externally connected to the CMPIN input of the ACMLP.

```

/* Connect this control pin to the VCMP input of the comparator. This can be any GPIO
pin
 * that is not input only. */
#define ACMLP_EXAMPLE_CONTROL_PIN (BSP_IO_PORT_04_PIN_08)
volatile uint32_t g_comparator_events = 0U;
/* This callback is called when a comparator event occurs. */
void acmplp_example_callback (comparator_callback_args_t * p_args)
{
    FSP_PARAMETER_NOT_USED(p_args);
    g_comparator_events++;
}
void acmplp_example ()
{
    fsp_err_t err = FSP_SUCCESS;

    /* Disable pin register write protection, if enabled */

```

```
R_BSP_PinAccessEnable();

/* Start with the VCMP pin low. This example assumes the comparator is configured to
trigger
 * when VCMP rises above VREF. */
(void) R_BSP_PinWrite(ACMPLP_EXAMPLE_CONTROL_PIN, BSP_IO_LEVEL_LOW);
/* Initialize the ACMPLP module */
err = R_ACMPLP_Open(&g_comparator_ctrl, &g_comparator_cfg);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
/* Wait for the minimum stabilization wait time before enabling output. */
comparator_info_t info;
R_ACMPLP_InfoGet(&g_comparator_ctrl, &info);
R_BSP_SoftwareDelay(info.min_stabilization_wait_us, BSP_DELAY_UNITS_MICROSECONDS);
/* Enable the comparator output */
(void) R_ACMPLP_OutputEnable(&g_comparator_ctrl);
/* Set VCMP low. */
(void) R_BSP_PinWrite(ACMPLP_EXAMPLE_CONTROL_PIN, BSP_IO_LEVEL_HIGH);
while (0 == g_comparator_events)
{
/* Wait for interrupt. */
}
comparator_status_t status;
/* Check status of comparator, Status will be COMPARATOR_STATE_OUTPUT_HIGH */
(void) R_ACMPLP_StatusGet(&g_comparator_ctrl, &status);
}
```

Enumerations

Function Documentation◆ **R_ACMLP_Open()**

`fsp_err_t R_ACMLP_Open (comparator_ctrl_t *const p_ctrl, comparator_cfg_t const *const p_cfg)`

Configures the comparator and starts operation. Callbacks and pin output are not active until `outputEnable()` is called. `comparator_api_t::outputEnable()` should be called after the output has stabilized. Implements `comparator_api_t::open()`.

Comparator inputs must be configured in the application code prior to calling this function.

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An input pointer is NULL |
| FSP_ERR_INVALID_ARGUMENT | An argument is invalid. Window mode (COMPARATOR_MODE_WINDOW) and filter of 1 (COMPARATOR_FILTER_1) are not supported in this implementation. <code>p_cfg->p_callback</code> is not NULL, but ISR is not enabled. ISR must be enabled to use callback function. |
| FSP_ERR_ALREADY_OPEN | The control block is already open or the hardware lock is taken. |
| FSP_ERR_IN_USE | The channel is already in use. |

◆ **R_ACMLP_InfoGet()**

```
fsp_err_t R_ACMLP_InfoGet ( comparator_ctrl_t *const p_ctrl, comparator_info_t *const p_info )
```

Provides the minimum stabilization wait time in microseconds. Implements `comparator_api_t::infoGet()`.

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Information stored in p_info. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

◆ **R_ACMLP_OutputEnable()**

```
fsp_err_t R_ACMLP_OutputEnable ( comparator_ctrl_t *const p_ctrl)
```

Enables the comparator output, which can be polled using `comparator_api_t::statusGet()`. Also enables pin output and interrupts as configured during `comparator_api_t::open()`. Implements `comparator_api_t::outputEnable()`.

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Comparator output is enabled. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

◆ **R_ACMLP_StatusGet()**

```
fsp_err_t R_ACMLP_StatusGet ( comparator_ctrl_t *const p_ctrl, comparator_status_t *const p_status )
```

Provides the operating status of the comparator. Implements `comparator_api_t::statusGet()`.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Operating status of the comparator is provided in p_status. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

◆ R_ACMLP_Close()

```
fsp_err_t R_ACMLP_Close ( comparator_ctrl_t * p_ctrl)
```

Stops the comparator. Implements `comparator_api_t::close()`.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Instance control block closed successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

5.2.1.6 DAC (r_dac)

Modules » Analog

Functions

```
fsp_err_t R_DAC_Open (dac_ctrl_t *p_api_ctrl, dac_cfg_t const *const p_cfg)
```

```
fsp_err_t R_DAC_Write (dac_ctrl_t *p_api_ctrl, uint16_t value)
```

```
fsp_err_t R_DAC_Start (dac_ctrl_t *p_api_ctrl)
```

```
fsp_err_t R_DAC_Stop (dac_ctrl_t *p_api_ctrl)
```

```
fsp_err_t R_DAC_Close (dac_ctrl_t *p_api_ctrl)
```

Detailed Description

Driver for the DAC12 peripheral on RA MCUs. This module implements the [DAC Interface](#).

Overview**Features**

The DAC module outputs one of 4096 voltage levels between the positive and negative reference voltages.

- Supports setting left-justified or right-justified 12-bit value format for the 16-bit input data registers
- Supports output amplifiers on selected MCUs
- Supports charge pump on selected MCUs
- Supports synchronization with the Analog-to-Digital Converter (ADC) module

Configuration

Note

For MCUs supporting more than one channel, the following configuration options are shared by all the DAC channels:

- Synchronize with ADC
- Data Format
- Charge Pump

Build Time Configurations for r_dac

The following build time configurations are defined in fsp_cfg/r_dac_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Analog > DAC (r_dac)

This module can be added to the Stacks tab via New Stack > Analog > DAC (r_dac). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|------------------------------------|---|-----------------|---|
| Name | Name must be a valid C symbol | g_dac0 | Module name. |
| Channel | Value must be an integer greater than or equal to 0 | 0 | Specify the hardware channel. |
| Synchronize with ADC | MCU Specific Options | | Enable DA/AD synchronization. |
| Data Format | <ul style="list-style-type: none"> • Right Justified • Left Justified | Right Justified | Specify the DAC data format. |
| Output Amplifier | MCU Specific Options | | Enable the DAC output amplifier. |
| Charge Pump (Requires MOCO active) | MCU Specific Options | | Enable the DAC charge pump. |
| Internal Output | MCU Specific Options | | Enable DAC output to internal modules. |
| ELC Trigger Source | MCU Specific Options | | ELC event source that will trigger the DAC to start a conversion. |
| Reference Voltage | MCU Specific Options | | Select the DAC reference voltage. |

Clock Configuration

The DAC peripheral module uses PCLKB as its clock source.

Pin Configuration

The DAN pins are used as analog outputs. Each DAC channel has one output pin.

The AVCC0 and AVSS0 pins are power and ground supply pins for the DAC and ADC.

The VREFH and VREFL pins are top and ground voltage reference pins for the DAC and ADC.

Usage Notes

Charge Pump

The charge pump must be enabled when using DAC pin output while operating at $AV_{CC} < 2.7V$.

Note

The MOCO must be running to use the charge pump.

If the DAC output is to be routed to an internal signal, do not enable the charge pump.

Output to Internal Modules

The DAC output can be used as an analog input to other peripherals on the MCU (eg. ACPH, ADC) without outputting the voltage to an external pin.

On some MCUs this functionality must be enabled during configuration using [dac_extended_cfg_t::internal_output_enabled](#). When internal output is enabled, the DAC output will be routed to internal modules. If the DAC output amplifier is enabled or when internal output is disabled, the output will be routed to the DAC output pin (DAN).

Synchronization with ADC

When ADC synchronization is enabled and an ADC conversion is in progress, if a DAC conversion is started it will automatically be delayed until after the ADC conversion is complete.

Limitations

- For MCUs supporting ADC unit 1:
 - Once synchronization between DAC and ADC unit 1 is turned on during R_DAC_Open synchronization cannot be turned off by the driver. In order to desynchronize DAC with ADC unit 1, manually clear DAADSCR.DAADST to 0 when the ADCSR.ADST bit is 0 and ADC unit 1 is halted.
 - The DAC module can only be synchronized with ADC unit 1.
 - For MCUs having more than 1 DAC channel, both channels are synchronized with ADC unit 1 if synchronization is enabled.

Examples

Basic Example

This is a basic example of minimal use of the R_DAC in an application. This example shows how this driver can be used for basic Digital to Analog Conversion operations.

```
void basic_example (void)
{
```

```

fsp_err_t err;

uint16_t value;

/* Pin configuration: Output enable DA0 as Analog. */
/* Initialize the DAC channel */
err = R_DAC_Open(&g_dac_ctrl, &g_dac_cfg);

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

value = (uint16_t) DAC_EXAMPLE_VALUE_ABC;

err = R_DAC_Write(&g_dac_ctrl, value);

assert(FSP_SUCCESS == err);

err = R_DAC_Start(&g_dac_ctrl);

assert(FSP_SUCCESS == err);
}

```

| DAC_VREF_VREFH_VREFL | Select VREFH/VREFL. |

Function Documentation

◆ **R_DAC_Open()**

```
fsp_err_t R_DAC_Open ( dac_ctrl_t* p_api_ctrl, dac_cfg_t const *const p_cfg )
```

Perform required initialization described in hardware manual. Implements [dac_api_t::open](#). Configures a single DAC channel, starts the channel, and provides a handle for use with the DAC API Write and Close functions. Must be called once prior to calling any other DAC API functions. After a channel is opened, Open should not be called again for the same channel without calling Close first.

Return values

| | |
|--------------------------------|---|
| FSP_SUCCESS | The channel was successfully opened. |
| FSP_ERR_ASSERTION | Parameter check failure due to one or more reasons below: <ul style="list-style-type: none"> 1. One or both of the following parameters may be NULL: p_api_ctrl or p_cfg 2. data_format value in p_cfg is out of range. 3. Extended configuration structure is set to NULL for MCU supporting charge pump. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | Channel ID requested in p_cfg may not be available on the devices. |
| FSP_ERR_ALREADY_OPEN | The control structure is already opened. |

◆ **R_DAC_Write()**

```
fsp_err_t R_DAC_Write ( dac_ctrl_t* p_api_ctrl, uint16_t value )
```

Write data to the D/A converter and enable the output if it has not been enabled.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Data is successfully written to the D/A Converter. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Channel associated with p_ctrl has not been opened. |

◆ **R_DAC_Start()**

```
fsp_err_t R_DAC_Start ( dac_ctrl_t * p_api_ctrl)
```

Start the D/A conversion output if it has not been started.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | The channel is started successfully. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_IN_USE | Attempt to re-start a channel. |
| FSP_ERR_NOT_OPEN | Channel associated with p_ctrl has not been opened. |

◆ **R_DAC_Stop()**

```
fsp_err_t R_DAC_Stop ( dac_ctrl_t * p_api_ctrl)
```

Stop the D/A conversion and disable the output signal.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | The control is successfully stopped. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Channel associated with p_ctrl has not been opened. |

◆ **R_DAC_Close()**

```
fsp_err_t R_DAC_Close ( dac_ctrl_t * p_api_ctrl)
```

Stop the D/A conversion, stop output, and close the DAC channel.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | The channel is successfully closed. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Channel associated with p_ctrl has not been opened. |

5.2.1.7 DAC8 (r_dac8)

Modules » Analog

Functions

```

```
fsp_err_t R_DAC8_Start (dac_ctrl_t *const p_ctrl)
```

```
fsp_err_t R_DAC8_Stop (dac_ctrl_t *const p_ctrl)
```

```
fsp_err_t R_DAC8_Close (dac_ctrl_t *const p_ctrl)
```

Detailed Description

Driver for the DAC8 peripheral on RA MCUs. This module implements the [DAC Interface](#).

Overview**Features**

The DAC8 module outputs one of 256 voltage levels between the positive and negative reference voltages. DAC8 on selected MCUs have below features

- Charge pump control
- Synchronization with the Analog-to-Digital Converter (ADC) module
- Multiple Operation Modes
 - Normal
 - Real-Time (Event Link)

Configuration*Note*

For MCUs supporting more than one channel, the following configuration options are shared by all the DAC8 channels:

- *Synchronize with ADC*
- *Charge Pump*

Build Time Configurations for r_dac8

The following build time configurations are defined in fsp_cfg/r_dac8_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Analog > DAC8 (r_dac8)

This module can be added to the Stacks tab via New Stack > Analog > DAC8 (r_dac8).

| Configuration | Options | Default | Description |
|------------------------------------|---|----------|--|
| Name | Name must be a valid C symbol | g_dac8_0 | Module name. |
| Channel | Value must be an integer greater than or equal to 0 | 0 | Specify the hardware channel. |
| D/A A/D Synchronous Conversion | MCU Specific Options | | Synchronize the DAC8 update with the ADC to reduce interference with A/D conversions. |
| DAC Mode | MCU Specific Options | | Select the DAC operating mode |
| Real-time Trigger Event | MCU Specific Options | | Specify the event used to trigger conversion in Real-time mode. This setting is only valid when Real-time mode is enabled. |
| Charge Pump (Requires MOCO active) | MCU Specific Options | | Enable the DAC charge pump. |

Clock Configuration

The DAC8 peripheral module uses the PCLKB as its clock source.

Pin Configuration

The DA8_n pins are used as analog outputs. Each DAC8 channel has one output pin.

The AVCC0 and AVSS0 pins are power and ground supply and reference pins for the DAC8.

Usage Notes

Charge Pump

The charge pump must be enabled when using DAC8 pin output while operating at $AV_{CC} < 2.7V$.

Note

The MOCO must be running to use the charge pump.

If DAC8 output is to be routed to an internal signal, do not enable the charge pump.

Synchronization with ADC

When ADC synchronization is enabled and an ADC conversion is in progress, if a DAC8 conversion is started it will automatically be delayed until after the ADC conversion is complete.

Real-time Mode

When Real-time mode is selected, the DAC8 will perform a conversion each time the selected ELC event is received.

Limitations

- Synchronization between DAC8 and ADC is activated when calling `R_DAC8_Open`. At this point synchronization cannot be deactivated by the driver. In order to desynchronize DAC8 with ADC, manually clear `DACADSCR.DACADST` to 0 while the `ADCSR.ADST` bit is 0 and the ADC is halted.
- For MCUs having more than 1 DAC8 channel, both channels are synchronized with ADC if synchronization is enabled.

Examples

Basic Example

This is a basic example of minimal use of the `R_DAC8` in an application. This example shows how this driver can be used for basic 8 bit Digital to Analog Conversion operations.

```
dac8_instance_ctrl_t g_dac8_ctrl;
dac_cfg_t g_dac8_cfg =
{
    .channel          = 0U,
    .ad_da_synchronized = false,
    .p_extend         = &g_dac8_cfg_extend
};
void basic_example (void)
{
    fsp_err_t err;
    uint16_t value;
    /* Pin configuration: Output enable DA8_0(RA2A1) as Analog. */
    /* Initialize the DAC8 channel */
    err = R_DAC8_Open(&g_dac8_ctrl, &g_dac8_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    value = (uint8_t) DAC8_EXAMPLE_VALUE_ABC;
    /* Write value to DAC module */
    err = R_DAC8_Write(&g_dac8_ctrl, value);
    assert(FSP_SUCCESS == err);
    /* Start DAC8 conversion */
    err = R_DAC8_Start(&g_dac8_ctrl);
```

```

assert(FSP_SUCCESS == err);
}

```

Data Fields

| | | |
|-----------------------------|------------------------------------|-------------------------|
| bool | enable_charge_pump | Enable DAC charge pump. |
| dac8_mode_t | dac_mode | DAC mode. |

Enumeration Type Documentation

◆ [dac8_mode_t](#)

enum [dac8_mode_t](#)

Enumerator

| | |
|-------------------------------------|----------------------------------|
| DAC8_MODE_NORMAL | DAC Normal mode. |
| DAC8_MODE_REAL_TIME | DAC Real-time (event link) mode. |

Function Documentation

◆ **R_DAC8_Open()**

```
fsp_err_t R_DAC8_Open ( dac_ctrl_t *const p_ctrl, dac_cfg_t const *const p_cfg )
```

Perform required initialization described in hardware manual.

Implements `dac_api_t::open`.

Configures a single DAC channel. Must be called once prior to calling any other DAC API functions. After a channel is opened, Open should not be called again for the same channel without calling Close first.

Return values

| | |
|--------------------------------|--|
| FSP_SUCCESS | The channel was successfully opened. |
| FSP_ERR_ASSERTION | One or both of the following parameters may be NULL: p_ctrl or p_cfg |
| FSP_ERR_ALREADY_OPEN | The instance control structure has already been opened. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | An invalid channel was requested. |
| FSP_ERR_NOT_ENABLED | Setting DACADSCR is not enabled when ADCSR.ADST = 0. |

Note

This function is reentrant for different channels. It is not reentrant for the same channel.

◆ **R_DAC8_Write()**

```
fsp_err_t R_DAC8_Write ( dac_ctrl_t *const p_ctrl, uint16_t value )
```

Write data to the D/A converter.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Data is successfully written to the D/A Converter. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Channel associated with p_instance_ctrl has not been opened. |
| FSP_ERR_OVERFLOW | Data overflow when data value exceeds 8-bit limit. |

◆ **R_DAC8_Start()**

```
fsp_err_t R_DAC8_Start ( dac_ctrl_t *const p_ctrl)
```

Start the D/A conversion output.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | The channel is started successfully. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Channel associated with p_instance_ctrl has not been opened. |
| FSP_ERR_IN_USE | Attempt to re-start a channel. |

◆ **R_DAC8_Stop()**

```
fsp_err_t R_DAC8_Stop ( dac_ctrl_t *const p_ctrl)
```

Stop the D/A conversion and disable the output signal.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | The control is successfully stopped. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Channel associated with p_instance_ctrl has not been opened. |

◆ **R_DAC8_Close()**

```
fsp_err_t R_DAC8_Close ( dac_ctrl_t *const p_ctrl)
```

Stop the D/A conversion, stop output, and close the DAC channel.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | The channel is successfully closed. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Channel associated with p_instance_ctrl has not been opened. |

Detailed Description

Driver for the OPAMP peripheral on RA MCUs. This module implements the [OPAMP Interface](#).

Overview

The OPAMP HAL module provides a high level API for signal amplification applications and supports the OPAMP peripheral available on RA MCUs.

Features

- Low power or high-speed mode
- Start by software or AGT compare match
- Stop by software or ADC conversion end (stop by ADC conversion end only supported on op-amp channels configured to start by AGT compare match)
- Trimming available on some MCUs (see hardware manual)

Configuration**Build Time Configurations for r_opamp**

The following build time configurations are defined in fsp_cfg/r_opamp_cfg.h:

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

| | | | |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
|--------------------|--|---------------|---|

Configurations for Analog > Operational Amplifier (r_opamp)

This module can be added to the Stacks tab via New Stack > Analog > Operational Amplifier (r_opamp).

| Configuration | Options | Default | Description |
|--|---|---|--|
| Name | Name must be a valid C symbol | g_opamp0 | Module name. |
| AGT Start Trigger Configuration (N/A unless AGT Start Trigger is Selected for the Channel) | <ul style="list-style-type: none"> • AGT1 Compare Match Starts OPAMPs 0 and 2 if configured for AGT Start, AGT0 Compare Match Starts OPAMPs 1 and 3 if configured for AGT Start • AGT1 Compare Match Starts OPAMPs 0 and 1 if configured for AGT Start, AGT0 Compare Match Starts OPAMPs 2 and 3 if configured for AGT Start • AGT1 Compare Match Starts all OPAMPs configured for AGT Start | AGT1 Compare Match Starts all OPAMPs configured for AGT Start | Configure which AGT channel event triggers which op-amp channel. The AGT compare match event only starts the op-amp channel if the AGT Start trigger is selected in the Trigger configuration for the channel. |
| Power Mode | MCU Specific Options | | Configure the op-amp based on power or speed requirements. This setting affects the minimum required stabilization time. Middle speed is not available for all MCUs. |
| Trigger Channel 0 | MCU Specific Options | | Select the event triggers to start or stop op-amp channel 0. If the event trigger is selected for start, the start() API enables the event trigger for this |

| | | | |
|-------------------|---|---------------------------------|---|
| Trigger Channel 1 | MCU Specific Options | | channel. If the event trigger is selected for stop, the stop() API disables the event trigger for this channel. |
| Trigger Channel 2 | <ul style="list-style-type: none"> • Software Start • Software Stop • AGT Start • Software Stop • AGT Start ADC Stop | Software Start Software Stop | Select the event triggers to start or stop op-amp channel 1. If the event trigger is selected for start, the start() API enables the event trigger for this channel. If the event trigger is selected for stop, the stop() API disables the event trigger for this channel. |
| Trigger Channel 3 | MCU Specific Options | | Select the event triggers to start or stop op-amp channel 2. If the event trigger is selected for start, the start() API enables the event trigger for this channel. If the event trigger is selected for stop, the stop() API disables the event trigger for this channel. |
| OPAMP AMP0OS | MCU Specific Options | | Select the event triggers to start or stop op-amp channel 3. If the event trigger is selected for start, the start() API enables the event trigger for this channel. If the event trigger is selected for stop, the stop() API disables the event trigger for this channel. |
| OPAMP AMP0PS | MCU Specific Options | | Select output to connect to AMP0O pin |
| OPAMP AMP0MS | MCU Specific Options | | Select input to connect to AMP0+ pin |
| OPAMP AMP1PS | MCU Specific Options | | Select input to connect to AMP0- pin |
| OPAMP AMP1MS | MCU Specific Options | | Select input to connect to AMP1+ pin |
| | | | Select input to connect to AMP1- pin |

| | | |
|--------------|----------------------|--|
| OPAMP AMP2PS | MCU Specific Options | to AMP1- pin Select input to connect to AMP2+ pin |
| OPAMP AMP2MS | MCU Specific Options | Select input to connect to AMP2- pin |

Clock Configuration

The OPAMP runs on PCLKB.

Pin Configuration

To use the OPAMP HAL module, the port pins for the channels receiving the analog input must be set as inputs on the **Pins** tab of the RA Configuration editor.

Refer to the most recent FSP Release Notes for any additional operational limitations for this module.

Usage Notes

Trimming the OPAMP

- On MCUs that support trimming, the op-amp trim register is set to the factory default after the Open API is called.
- This function allows the application to trim the operational amplifier to a user setting, which overwrites the factory default trim values.
- Supported on selected MCUs. See hardware manual for details.
- Not supported if configured for low power mode (OPAMP_MODE_LOW_POWER).
- This function is not reentrant. Only one side of one op-amp can be trimmed at a time. Complete the procedure for one side of one channel before calling the trim API with the command OPAMP_TRIM_CMD_START again.
 - The trim procedure works as follows:
 - Call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_START.
 - Connect a fixed voltage to the Pch (+) input.
 - Connect the Nch (-) input to the op-amp output to create a voltage follower.
 - Ensure the op-amp is operating and stabilized.
 - Call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_START.
 - Measure the fixed voltage connected to the Pch (+) input using the SAR ADC and save the value (referred to as A later in this procedure).
 - Iterate over the following loop 5 times:
 - Call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_NEXT_STEP.
 - Measure the op-amp output using the SAR ADC (referred to as B in the next step).
 - If $A \leq B$, call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_CLEAR_BIT.
 - Call trim() for the Nch (-) side input with command OPAMP_TRIM_CMD_START.
 - Measure the fixed voltage connected to the Pch (+) input using the SAR ADC and save the value (referred to as A later in this procedure).
 - Iterate over the following loop 5 times:
 - Call trim() for the Nch (-) side input with command OPAMP_TRIM_CMD_NEXT_STEP.
 - Measure the op-amp output using the SAR ADC (referred to as B in the next step).

- If $A \leq B$, call trim() for the Nch (-) side input with command OPAMP_TRIM_CMD_CLEAR_BIT.

Examples

Basic Example

This is a basic example of minimal use of the R_OPAMP in an application. The example demonstrates configuring OPAMP channel 0 for high speed mode, starting the OPAMP and reading the status of the OPAMP channel running. It also verifies that the stabilization wait time is the expected time for selected power mode

```
#define OPAMP_EXAMPLE_CHANNEL (0U)

void basic_example (void)
{
    fsp_err_t err;

    /* Initialize the OPAMP module. */
    err = R_OPAMP_Open(&g_opamp_ctrl, &g_opamp_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Start the OPAMP module. */
    err = R_OPAMP_Start(&g_opamp_ctrl, 1 << OPAMP_EXAMPLE_CHANNEL);
    assert(FSP_SUCCESS == err);

    /* Look up the required stabilization wait time. */
    opamp_info_t info;
    err = R_OPAMP_InfoGet(&g_opamp_ctrl, &info);
    assert(FSP_SUCCESS == err);

    /* Wait for the OPAMP to stabilize. */
    R_BSP_SoftwareDelay(info.min_stabilization_wait_us, BSP_DELAY_UNITS_MICROSECONDS);
}
```

Trim Example

This example demonstrates the typical trimming procedure for opamp channel 0 using R_OPAMP_Trim() API.

```
#ifndef OPAMP_EXAMPLE_CHANNEL
#define OPAMP_EXAMPLE_CHANNEL (0U)
#endif

#ifndef OPAMP_EXAMPLE_ADC_CHANNEL
```

```
#define OPAMP_EXAMPLE_ADC_CHANNEL (ADC_CHANNEL_2)
#endif

#define ADC_SCAN_END_DELAY (100U)
#define OPAMP_TRIM_LOOP_COUNT (5)
#define ADC_SCAN_END_MAX_TIMEOUT (0xFFFF)
uint32_t          g_callback_event_counter = 0;
opamp_trim_args_t trim_args_ch =
{
    .channel = OPAMP_EXAMPLE_CHANNEL,
    .input   = OPAMP_TRIM_INPUT_PCH
};

/* This callback is called when ADC Scan Complete event is generated. */

Enumeration Type Documentation

◆ **opamp_trigger_t**

| | |
|---|---|
| enum <code>opamp_trigger_t</code> | |
| Start and stop trigger for the op-amp. | |
| Enumerator | |
| <code>OPAMP_TRIGGER_SOFTWARE_START_SOFTWARE_STOP</code> | Start and stop with APIs. |
| <code>OPAMP_TRIGGER_AGT_START_SOFTWARE_STOP</code> | Start by AGT compare match and stop with API. |
| <code>OPAMP_TRIGGER_AGT_START_ADC_STOP</code> | Start by AGT compare match and stop after ADC conversion. |

◆ **opamp_agt_link_t**

| | |
|---|---|
| enum <code>opamp_agt_link_t</code> | |
| Which AGT timer starts the op-amp. Only applies to channels if <code>OPAMP_TRIGGER_AGT_START_SOFTWARE_STOP</code> or <code>OPAMP_TRIGGER_AGT_START_ADC_STOP</code> is selected for the channel. If <code>OPAMP_TRIGGER_SOFTWARE_START_SOFTWARE_STOP</code> is selected for a channel, then no AGT compare match event will start that op-amp channel. | |
| Enumerator | |
| <code>OPAMP_AGT_LINK_AGT1_OPAMP_0_2_AGT0_OPA_MP_1_3</code> | OPAMP channel 0 and 2 are started by AGT1 compare match. OPAMP channel 1 and 3 are started by AGT0 compare match. |
| <code>OPAMP_AGT_LINK_AGT1_OPAMP_0_1_AGT0_OPA_MP_2_3</code> | OPAMP channel 0 and 1 are started by AGT1 compare match. OPAMP channel 2 and 3 are started by AGT0 compare match. |
| <code>OPAMP_AGT_LINK_AGT1_OPAMP_0_1_2_3</code> | All OPAMP channels are started by AGT1 compare match. |

◆ **opamp_mode_t**

| enum <code>opamp_mode_t</code> | |
|--------------------------------|---|
| Op-amp mode. | |
| Enumerator | |
| OPAMP_MODE_LOW_POWER | Low power mode. |
| OPAMP_MODE_MIDDLE_SPEED | Middle speed mode (not supported on all MCUs) |
| OPAMP_MODE_HIGH_SPEED | High speed mode. |

◆ **opamp_plus_input_t**

| enum <code>opamp_plus_input_t</code> | |
|--------------------------------------|---|
| Options to connect AMPnPS pins. | |
| Enumerator | |
| OPAMP_PLUS_INPUT_NONE | No Connection. |
| OPAMP_PLUS_INPUT_AMPPS0 | Set AMPPS0. See hardware manual for channel specific options. |
| OPAMP_PLUS_INPUT_AMPPS1 | Set AMPPS1. See hardware manual for channel specific options. |
| OPAMP_PLUS_INPUT_AMPPS2 | Set AMPPS2. See hardware manual for channel specific options. |
| OPAMP_PLUS_INPUT_AMPPS3 | Set AMPPS3. See hardware manual for channel specific options. |
| OPAMP_PLUS_INPUT_AMPPS7 | Set AMPPS7. See hardware manual for channel specific options. |

◆ **opamp_minus_input_t**

| enum <code>opamp_minus_input_t</code> | |
|---------------------------------------|---|
| Options to connect AMPnMS pins. | |
| Enumerator | |
| OPAMP_MINUS_INPUT_NONE | No Connection. |
| OPAMP_MINUS_INPUT_AMPMS0 | Set AMPMS0. See hardware manual for channel specific options. |
| OPAMP_MINUS_INPUT_AMPMS1 | Set AMPMS1. See hardware manual for channel specific options. |
| OPAMP_MINUS_INPUT_AMPMS2 | Set AMPMS2. See hardware manual for channel specific options. |
| OPAMP_MINUS_INPUT_AMPMS3 | Set AMPMS3. See hardware manual for channel specific options. |
| OPAMP_MINUS_INPUT_AMPMS4 | Set AMPMS4. See hardware manual for channel specific options. |
| OPAMP_MINUS_INPUT_AMPMS7 | Set AMPMS7. See hardware manual for channel specific options. |

◆ **opamp_output_t**

| enum <code>opamp_output_t</code> | |
|----------------------------------|---|
| Options to connect AMP0OS pin. | |
| Enumerator | |
| OPAMP_OUTPUT_NONE | No Connection. |
| OPAMP_OUTPUT_AMPOS0 | Set AMPOS0. See hardware manual for channel specific options. |
| OPAMP_OUTPUT_AMPOS1 | Set AMPOS1. See hardware manual for channel specific options. |
| OPAMP_OUTPUT_AMPOS2 | Set AMPOS2. See hardware manual for channel specific options. |
| OPAMP_OUTPUT_AMPOS3 | Set AMPOS3. See hardware manual for channel specific options. |

Function Documentation

◆ R_OPAMP_Open()

```
fsp_err_t R_OPAMP_Open ( opamp_ctrl_t *const p_api_ctrl, opamp_cfg_t const *const p_cfg )
```

Applies power to the OPAMP and initializes the hardware based on the user configuration. Implements `opamp_api_t::open`.

The op-amp is not operational until the `opamp_api_t::start` is called. If the op-amp is configured to start after AGT compare match, the op-amp is not operational until `opamp_api_t::start` and the associated AGT compare match event occurs.

Some MCUs have switches that must be set before starting the op-amp. These switches must be set in the application code after `opamp_api_t::open` and before `opamp_api_t::start`.

Example:

```
/* Initialize the OPAMP module. */
err = R_OPAMP_Open(&g_opamp_ctrl, &g_opamp_cfg);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Configuration successful. |
| FSP_ERR_ASSERTION | An input pointer is NULL. |
| FSP_ERR_ALREADY_OPEN | Control block is already opened. |
| FSP_ERR_INVALID_ARGUMENT | An attempt to configure OPAMP in middle speed mode on MCU that does not support middle speed mode. |

◆ **R_OPAMP_InfoGet()**

```
fsp_err_t R_OPAMP_InfoGet ( opamp_ctrl_t*const p_api_ctrl, opamp_info_t*const p_info )
```

Provides the minimum stabilization wait time in microseconds. Implements `opamp_api_t::infoGet`.

• **Example:**

```
/* Look up the required stabilization wait time. */
opamp_info_t info;

err = R_OPAMP_InfoGet(&g_opamp_ctrl, &info);

assert(FSP_SUCCESS == err);

/* Wait for the OPAMP to stabilize. */
R_BSP_SoftwareDelay(info.min_stabilization_wait_us,
BSP_DELAY_UNITS_MICROSECONDS);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | information on <code>opamp_power_mode</code> stored in <code>p_info</code> . |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

◆ R_OPAMP_Start()

```
fsp_err_t R_OPAMP_Start ( opamp_ctrl_t *const p_api_ctrl, uint32_t const channel_mask )
```

If the OPAMP is configured for hardware triggers, enables hardware triggers. Otherwise, starts the op-amp. Implements `opamp_api_t::start`.

Some MCUs have switches that must be set before starting the op-amp. These switches must be set in the application code after `opamp_api_t::open` and before `opamp_api_t::start`.

Example:

```
/* Start the OPAMP module. */
err = R_OPAMP_Start(&g_opamp_ctrl, 1 << OPAMP_EXAMPLE_CHANNEL);
assert(FSP_SUCCESS == err);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Op-amp started or hardware triggers enabled successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |
| FSP_ERR_INVALID_ARGUMENT | channel_mask includes a channel that does not exist on this MCU. |

◆ R_OPAMP_Stop()

```
fsp_err_t R_OPAMP_Stop ( opamp_ctrl_t *const p_api_ctrl, uint32_t const channel_mask )
```

Stops the op-amp. If the OPAMP is configured for hardware triggers, disables hardware triggers. Implements `opamp_api_t::stop`.

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Op-amp stopped or hardware triggers disabled successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |
| FSP_ERR_INVALID_ARGUMENT | channel_mask includes a channel that does not exist on this MCU. |

◆ **R_OPAMP_StatusGet()**

```
fsp_err_t R_OPAMP_StatusGet ( opamp_ctrl_t *const p_api_ctrl, opamp_status_t *const p_status )
```

Provides the operating status for each op-amp in a bitmask. This bit is set when operation begins, before the stabilization wait time has elapsed. Implements `opamp_api_t::statusGet`.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Operating status of each op-amp provided in <code>p_status</code> . |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

◆ **R_OPAMP_Trim()**

```
fsp_err_t R_OPAMP_Trim ( opamp_ctrl_t *const p_api_ctrl, opamp_trim_cmd_t const cmd,
opamp_trim_args_t const *const p_args )
```

On MCUs that support trimming, the op-amp trim register is set to the factory default after `open()`. This function allows the application to trim the operational amplifier to a user setting, which overwrites the factory default factory trim values.

Not supported on all MCUs. See hardware manual for details. Not supported if configured for low power mode (`OPAMP_MODE_LOW_POWER`).

This function is not reentrant. Only one side of one op-amp can be trimmed at a time. Complete the procedure for one side of one channel before calling `trim()` with command `OPAMP_TRIM_CMD_START` again.

Implements `opamp_api_t::trim`.

Reference: Section 37.9 "User Offset Trimming" RA2A1 hardware manual R01UM0008EU0130. The trim procedure works as follows:

- Call `trim()` for the Pch (+) side input with command `OPAMP_TRIM_CMD_START`.
- Connect a fixed voltage to the Pch (+) input.
- Connect the Nch (-) input to the op-amp output to create a voltage follower.
- Ensure the op-amp is operating and stabilized.
- Call `trim()` for the Pch (+) side input with command `OPAMP_TRIM_CMD_START`.
- Measure the fixed voltage connected to the Pch (+) input using the SAR ADC and save the value (referred to as A later in this procedure).
- Iterate over the following loop 5 times:
 - Call `trim()` for the Pch (+) side input with command `OPAMP_TRIM_CMD_NEXT_STEP`.
 - Measure the op-amp output using the SAR ADC (referred to as B in the next step).
 - If $A \leq B$, call `trim()` for the Pch (+) side input with command `OPAMP_TRIM_CMD_CLEAR_BIT`.
- Call `trim()` for the Nch (-) side input with command `OPAMP_TRIM_CMD_START`.
- Measure the fixed voltage connected to the Pch (+) input using the SAR ADC and save the value (referred to as A later in this procedure).
- Iterate over the following loop 5 times:
 - Call `trim()` for the Nch (-) side input with command `OPAMP_TRIM_CMD_NEXT_STEP`.

- Measure the op-amp output using the SAR ADC (referred to as B in the next step).
- If $A \leq B$, call trim() for the Nch (-) side input with command OPAMP_TRIM_CMD_CLEAR_BIT.

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Conversion result in p_data. |
| FSP_ERR_UNSUPPORTED | Trimming is not supported on this MCU. |
| FSP_ERR_INVALID_STATE | The command is not valid in the current state of the trim state machine. |
| FSP_ERR_INVALID_ARGUMENT | The requested channel is not operating or the trim procedure is not in progress for this channel/input combination. |
| FSP_ERR_INVALID_MODE | Trim is not allowed in low power mode. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

◆ R_OPAMP_Close()

```
fsp_err_t R_OPAMP_Close ( opamp_ctrl_t *const p_api_ctrl)
```

Stops the op-amps. Implements `opamp_api_t::close`.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Instance control block closed successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

Detailed Description

Driver for the SDADC24 peripheral on RA MCUs. This module implements the [ADC Interface](#).

Overview

Features

The SDADC module supports the following features:

- 24 bit maximum resolution
- Configure scans to include:
 - Multiple analog channels
 - Outputs of OPAMP0 (P side) and OPAMP1 (N side) of SDADC channel 4
- Configurable scan start trigger:
 - Software scan triggers
 - Hardware scan triggers (timer expiration, for example)
- Configurable scan mode:
 - Single scan mode, where each trigger starts a single scan
 - Continuous scan mode, where all channels are scanned continuously
- Supports averaging converted samples
- Optional callback when single conversion, entire scan, or calibration completes
- Supports reading converted data
- Sample and hold support

Selecting an ADC

All RA MCUs have an [ADC \(r_adc\)](#). Only select RA MCUs have an SDADC. When selecting between them, consider these factors. Refer to the hardware manual for details.

| | ADC | SDADC |
|--------------------|--|---|
| Availability | Available on all RA MCUs. | Available on select RA MCUs. |
| Resolution | The ADC has a maximum resolution of 12, 14, or 16 bits depending on the MCU. | The SDADC has a maximum accuracy of 24 bits. |
| Number of Channels | The ADC has more channels than the SDADC. | The SDADC 5 channels, one of which is tied to OPAMP0 and OPAMP1. |
| Frequency | The ADC sampling time is shorter (more samples per second). | The SDADC sampling time is longer (fewer samples per second). |
| Settling Time | The ADC does not have a settling time when switching between channels. | The SDADC requires a settling time when switching between channels. |

Configuration

Build Time Configurations for r_sdadc

The following build time configurations are defined in fsp_cfg/r_sdadc_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> Default (BSP) Enabled Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Analog > ADC (r_sdadc)

This module can be added to the Stacks tab via New Stack > Analog > ADC (r_sdadc).

| Configuration | Options | Default | Description |
|---------------|--|-----------------|---|
| Name | Name must be a valid C symbol | g_adc0 | Module name. |
| Mode | <ul style="list-style-type: none"> Single Scan Continuous Scan | Continuous Scan | In single scan mode, all channels are converted once per start trigger, and conversion stops after all enabled channels are scanned. In continuous scan mode, conversion starts after a start |

| | | | |
|------------------------------------|---|----------|--|
| | | | trigger, then continues until stopped in software. |
| Resolution | <ul style="list-style-type: none"> • 16 Bit • 24 Bit | 24 Bit | Select 24-bit or 16-bit resolution. |
| Alignment | <ul style="list-style-type: none"> • Right • Left | Right | Select left or right alignment. |
| Trigger | MCU Specific Options | | Select conversion start trigger. Conversion can be started in software, or conversion can be started when a hardware event occurs if the hardware event is linked to the SDADC peripheral using the ELC API. |
| Vref Source | <ul style="list-style-type: none"> • Internal • External | Internal | Vref can be source internally and output on the SBIAS pin, or Vref can be input from VREFI. |
| Vref Voltage | <ul style="list-style-type: none"> • 0.8 V • 1.0 V • 1.2 V • 1.4 V • 1.6 V • 1.8 V • 2.0 V • 2.2 V • 2.4 V | 1.0 V | Select Vref voltage. If Vref is input externally, the voltage on VREFI must match the voltage selected within 3%. |
| Callback | Name must be a valid C symbol | NULL | Enter the name of the callback function to be called when conversion completes or a scan ends. |
| Conversion End Interrupt Priority | MCU Specific Options | | [Required] Select the interrupt priority for the conversion end interrupt. |
| Scan End Interrupt Priority | MCU Specific Options | | [Optional] Select the interrupt priority for the scan end interrupt. |
| Calibration End Interrupt Priority | MCU Specific Options | | [Optional] Select the interrupt priority for the calibration end interrupt. |

Configurations for Analog > SDADC Channel Configuration (r_sdadc)

| Configuration | Options | Default | Description |
|---|---|--|--|
| Input | <ul style="list-style-type: none"> Differential Single Ended | Differential | Select differential or single-ended input. |
| Stage 1 Gain | <ul style="list-style-type: none"> 1 2 3 4 8 | 1 | Select the gain for stage 1 of the PGA. Must be 1 for single-ended input. |
| Stage 2 Gain | <ul style="list-style-type: none"> 1 2 4 8 | 1 | Select the gain for stage 2 of the PGA. Must be 1 for single-ended input. |
| Oversampling Ratio | <ul style="list-style-type: none"> 64 128 256 512 1024 2048 | 256 | Select the oversampling ratio for the PGA. Must be 256 for single-ended input. |
| Polarity (Valid for Single-Ended Input Only) | <ul style="list-style-type: none"> Positive Negative | Positive | Select positive or negative polarity for single-ended input. VBIAS (1.0 V typical) is connected on the opposite input. |
| Conversions to Average per Result | <ul style="list-style-type: none"> Do Not Average (Interrupt after Each Conversion) Average 8 Average 16 Average 32 Average 64 | Do Not Average (Interrupt after Each Conversion) | Select the number of conversions to average for each result. The AD_C_EVENT_CONVERSION_END event occurs after each average, or after each individual conversion if averaging is disabled. |
| Invert (Valid for Negative Single-Ended Input Only) | <ul style="list-style-type: none"> Result Not Inverted Result Inverted | Result Not Inverted | Select whether to invert negative single-ended input. When the result is inverted, the lowest measurable voltage gives a result of 0, and the highest measurable voltage gives a result of $2^{\text{resolution}} - 1$. |
| Number of Conversions Per Scan | Refer to the RA Configuration tool for available options. | 1 | Number of conversions on this channel before AUTOSCAN moves to the next channel. When all conversions of all channels are complete, the |

ADC_EVENT_SCAN_END event occurs.

Clock Configuration

The SDADC clock is configurable on the clocks tab.

The SDADC clock must be 4 MHz when the SDADC is used.

Pin Configuration

The ANSDnP (n = 0-3) pins are analog input channels that can be used with the SDADC.

Usage Notes

Scan Procedure

In this document, the term "scan" refers to the AUTOSCAN feature of the SDADC, which works as follows:

1. Conversions are performed on enabled channels in ascending order of channel number. All conversions required for a single channel are completed before the sequencer moves to the next channel.
2. Conversions are performed at the rate (in Hz) of the SDADC oversampling clock frequency / oversampling ratio (configured per channel). FSP uses the normal mode SDADC oversampling clock frequency.
3. If averaging is enabled for the channel, the number of conversions to average are performed before each conversion end interrupt occurs.
4. If the number of conversions for the channel is more than 1, SDADC performs the number of conversions requested. These are performed consecutively. There is a settling time associated with switching channels. Performing all of the requested conversions for each channel at a time avoids this settling time after the first conversion.

If averaging is enabled for the channel, each averaged result counts as a single conversion.

5. Continues to the next enabled channel only after completing all conversions requested.
6. After all enabled channels are scanned, a scan end interrupt occurs. The driver supports single-scan and continuous scan operation modes.
 - Single-scan mode performs one scan per trigger (hardware trigger or software start using [R_SDADC_ScanStart](#)).
 - In continuous scan mode, the scan is restarted after each scan completes. A single trigger is required to start continuous operation of the SDADC.

When Interrupts Are Not Enabled

If interrupts are not enabled, the [R_SDADC_StatusGet\(\)](#) API can be used to poll the SDADC to determine when the scan has completed. The [R_SDADC_Read\(\)](#) API function is used to access the converted SDADC result. This applies to both normal scans and calibration scans.

Calibration

Calibration is required to use the SDADC if any channel is configured for differential mode. Call [R_SDADC_Calibrate\(\)](#) after open, and prior to any other function, then wait for a calibration complete

event before using the SDADC. `R_SDADC_Calibrate()` should not be called if all channels are configured for single-ended mode.

Examples

Basic Example

This is a basic example of minimal use of the SDADC in an application.

```
void sdadc_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_SDADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Calibrate all differential channels. */
    sdadc_calibrate_args_t calibrate_args;
    calibrate_args.mode      = SDADC_CALIBRATION_INTERNAL_GAIN_OFFSET;
    calibrate_args.channel = ADC_CHANNEL_0;
    err = R_SDADC_Calibrate(&g_adc0_ctrl, &calibrate_args);
    assert(FSP_SUCCESS == err);
    /* Wait for calibration to complete. */
    adc_status_t status;
    status.state = ADC_STATE_SCAN_IN_PROGRESS;
    while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
    {
        R_SDADC_StatusGet(&g_adc0_ctrl, &status);
    }
    /* In software trigger mode, start a scan by calling R_SDADC_ScanStart(). In other
modes, enable external
    * triggers by calling R_SDADC_ScanStart(). */
    (void) R_SDADC_ScanStart(&g_adc0_ctrl);
    /* Wait for conversion to complete. */
    status.state = ADC_STATE_SCAN_IN_PROGRESS;
    while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
    {
```

```

R_SDADC_StatusGet(&g_adc0_ctrl, &status);
}

/* Read converted data. */
uint32_t channel1_conversion_result;
R_SDADC_Read32(&g_adc0_ctrl, ADC_CHANNEL_1, &channel1_conversion_result);
}

```

Using DTC or DMAC with the SDADC

If desired, the DTC or DMAC can be used to store each conversion result in a circular buffer. An example configuration is below.

```

/* Example DTC transfer settings to used with SDADC. */
/* The transfer length should match the total number of conversions per scan. This
example assumes the SDADC is
* configured to scan channel 1 three times, then channel 2 and channel 4 once, for a
total of 5 conversions. */
#define SDADC_EXAMPLE_TRANSFER_LENGTH (5)
uint32_t g_sdadc_example_buffer[SDADC_EXAMPLE_TRANSFER_LENGTH];
transfer_info_t g_sdadc_transfer_info =
{
    .transfer_settings_word_b.dest_addr_mode = TRANSFER_ADDR_MODE_INCREMENTED,
    .transfer_settings_word_b.repeat_area    = TRANSFER_REPEAT_AREA_DESTINATION,
    .transfer_settings_word_b.irq           = TRANSFER_IRQ_END,
    .transfer_settings_word_b.chain_mode    = TRANSFER_CHAIN_MODE_DISABLED,
    .transfer_settings_word_b.src_addr_mode = TRANSFER_ADDR_MODE_FIXED,
    .transfer_settings_word_b.mode          = TRANSFER_MODE_REPEAT,
    /* NOTE: The data transferred will contain a 24-bit converted value in bits 23:0.
Bit 24 contains a status flag
* indicating if the result overflowed or not. Bits 27:25 contain the channel number
+ 1. The settings for
* resolution and alignment and ignored when DTC or DMAC is used. */
    .transfer_settings_word_b.size          = TRANSFER_SIZE_4_BYTE,
    /* NOTE: It is strongly recommended to enable averaging on all channels or no
channels when using DTC with SDADC

```

```
* because the result register is different when averaging is used. If averaging is
enabled on all channels,
* set transfer_info_t::p_src to &R_SDADC->ADAR. */
.p_src = (void const *) &R_SDADC0->ADCR,
.p_dest = &g_sdadc_example_buffer[0],
.length = SDADC_EXAMPLE_TRANSFER_LENGTH,
};
void sdadc_dtc_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_SDADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Calibrate all differential channels. */
    sdadc_calibrate_args_t calibrate_args;
    calibrate_args.mode = SDADC_CALIBRATION_INTERNAL_GAIN_OFFSET;
    calibrate_args.channel = ADC_CHANNEL_0;
    err = R_SDADC_Calibrate(&g_adc0_ctrl, &calibrate_args);
    assert(FSP_SUCCESS == err);
    /* Wait for calibration to complete. */
    adc_status_t status;
    status.state = ADC_STATE_SCAN_IN_PROGRESS;
    while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
    {
        R_SDADC_StatusGet(&g_adc0_ctrl, &status);
    }
    /* In software trigger mode, start a scan by calling R_SDADC_ScanStart(). In other
modes, enable external
* triggers by calling R_SDADC_ScanStart(). */
    (void) R_SDADC_ScanStart(&g_adc0_ctrl);
    /* After each conversion, the converted data is transferred to the next index in
g_sdadc_example_buffer. After
* the entire scan completes, the index in g_sdadc_example_buffer resets. The data
```

```
in g_sdadc_example_buffer
* is:
* - g_sdadc_example_buffer[0] = SDADC channel 1 conversion 0
* - g_sdadc_example_buffer[1] = SDADC channel 1 conversion 1
* - g_sdadc_example_buffer[2] = SDADC channel 1 conversion 2
* - g_sdadc_example_buffer[3] = SDADC channel 2 conversion 0
* - g_sdadc_example_buffer[4] = SDADC channel 4 conversion 0
/** At any point in the application after the first scan completes, the most
recent data for channel 2 can be read
* from the buffer like this. Shifting removes the unrelated bits in the result
register and propagates the sign
* bit so the value can be interpreted as a signed result. This assumes channel 2 is
configured in differential
* mode. */
int32_t channel_2_data = (int32_t) (g_sdadc_example_buffer[3] << 8) >> 8;
FSP_PARAMETER_NOT_USED(channel_2_data);
}
```

| <code>SDADC_VREF_VOLTAGE_2200_MV</code> | Vref is 2.2 V. |
| <code>SDADC_VREF_VOLTAGE_2400_MV</code> | Vref is 2.4 V (only valid for external Vref) |

◆ **sdadc_channel_input_t**

| enum <code>sdadc_channel_input_t</code> | |
|---|---------------------|
| Per channel input mode. | |
| Enumerator | |
| <code>SDADC_CHANNEL_INPUT_DIFFERENTIAL</code> | Differential input. |
| <code>SDADC_CHANNEL_INPUT_SINGLE_ENDED</code> | Single-ended input. |

◆ sdadc_channel_stage_1_gain_t

| enum sdadc_channel_stage_1_gain_t | |
|-----------------------------------|------------------------------------|
| Per channel stage 1 gain options. | |
| Enumerator | |
| SDADC_CHANNEL_STAGE_1_GAIN_1 | Gain of 1. |
| SDADC_CHANNEL_STAGE_1_GAIN_2 | Gain of 2. |
| SDADC_CHANNEL_STAGE_1_GAIN_3 | Gain of 3 (only valid for stage 1) |
| SDADC_CHANNEL_STAGE_1_GAIN_4 | Gain of 4. |
| SDADC_CHANNEL_STAGE_1_GAIN_8 | Gain of 8. |

◆ sdadc_channel_stage_2_gain_t

| enum sdadc_channel_stage_2_gain_t | |
|-----------------------------------|------------|
| Per channel stage 2 gain options. | |
| Enumerator | |
| SDADC_CHANNEL_STAGE_2_GAIN_1 | Gain of 1. |
| SDADC_CHANNEL_STAGE_2_GAIN_2 | Gain of 2. |
| SDADC_CHANNEL_STAGE_2_GAIN_4 | Gain of 4. |
| SDADC_CHANNEL_STAGE_2_GAIN_8 | Gain of 8. |

◆ **sdadc_channel_oversampling_t**

| enum <code>sdadc_channel_oversampling_t</code> | |
|--|-----------------------------|
| Per channel oversampling ratio. | |
| Enumerator | |
| <code>SDADC_CHANNEL_OVERSAMPLING_64</code> | Oversampling ratio of 64. |
| <code>SDADC_CHANNEL_OVERSAMPLING_128</code> | Oversampling ratio of 128. |
| <code>SDADC_CHANNEL_OVERSAMPLING_256</code> | Oversampling ratio of 256. |
| <code>SDADC_CHANNEL_OVERSAMPLING_512</code> | Oversampling ratio of 512. |
| <code>SDADC_CHANNEL_OVERSAMPLING_1024</code> | Oversampling ratio of 1024. |
| <code>SDADC_CHANNEL_OVERSAMPLING_2048</code> | Oversampling ratio of 2048. |

◆ **sdadc_channel_polarity_t**

| enum <code>sdadc_channel_polarity_t</code> | |
|--|-----------------------------------|
| Per channel polarity, valid for single-ended input only. | |
| Enumerator | |
| <code>SDADC_CHANNEL_POLARITY_POSITIVE</code> | Positive-side single-ended input. |
| <code>SDADC_CHANNEL_POLARITY_NEGATIVE</code> | Negative-side single-ended input. |

◆ **sdadc_channel_average_t**

| enum <code>sdadc_channel_average_t</code> | |
|--|--|
| Per channel number of conversions to average before conversion end callback. | |
| Enumerator | |
| <code>SDADC_CHANNEL_AVERAGE_NONE</code> | Do not average (callback for each conversion) |
| <code>SDADC_CHANNEL_AVERAGE_8</code> | Average 8 samples for each conversion end callback. |
| <code>SDADC_CHANNEL_AVERAGE_16</code> | Average 16 samples for each conversion end callback. |
| <code>SDADC_CHANNEL_AVERAGE_32</code> | Average 32 samples for each conversion end callback. |
| <code>SDADC_CHANNEL_AVERAGE_64</code> | Average 64 samples for each conversion end callback. |

◆ **sdadc_channel_inversion_t**

| enum <code>sdadc_channel_inversion_t</code> | |
|--|----------------------------------|
| Per channel polarity, valid for negative-side single-ended input only. | |
| Enumerator | |
| <code>SDADC_CHANNEL_INVERSION_OFF</code> | Do not invert conversion result. |
| <code>SDADC_CHANNEL_INVERSION_ON</code> | Invert conversion result. |

◆ **sdadc_channel_count_formula_t**

| enum <code>sdadc_channel_count_formula_t</code> | |
|--|-------------------------------------|
| Select a formula to specify the number of conversions. The following symbols are used in the formulas: | |
| <ul style="list-style-type: none"> • N: Number of conversions • n: <code>sdadc_channel_cfg_t::coefficient_n</code>, do not set to 0 if m is 0 • m: <code>sdadc_channel_cfg_t::coefficient_m</code>, do not set to 0 if n is 0 Either m or n must be non-zero. | |
| Enumerator | |
| <code>SDADC_CHANNEL_COUNT_FORMULA_EXPONENTIAL</code> | $N = 32 * (2 ^ n - 1) + m * 2 ^ n.$ |
| <code>SDADC_CHANNEL_COUNT_FORMULA_LINEAR</code> | $N = (32 * n) + m.$ |

◆ **sdadc_calibration_t**

| enum <code>sdadc_calibration_t</code> | |
|---|--|
| Calibration mode. | |
| Enumerator | |
| <code>SDADC_CALIBRATION_INTERNAL_GAIN_OFFSET</code> | Use internal reference to calibrate offset and gain. |
| <code>SDADC_CALIBRATION_EXTERNAL_OFFSET</code> | Use external reference to calibrate offset. |
| <code>SDADC_CALIBRATION_EXTERNAL_GAIN</code> | Use external reference to calibrate gain. |

Function Documentation

◆ **R_SDADC_Open()**

```
fsp_err_t R_SDADC_Open ( adc_ctrl_t * p_ctrl, adc_cfg_t const *const p_cfg )
```

Applies power to the SDADC and initializes the hardware based on the user configuration. As part of this initialization, the SDADC clock is configured and enabled. If an interrupt priority is non-zero, enables an interrupt which will call a callback to notify the user when a conversion, scan, or calibration is complete. [R_SDADC_Calibrate\(\)](#) must be called after this function before using the SDADC if any channels are used in differential mode. Implements [adc_api_t::open\(\)](#).

Note

This function delays at least 2 ms as required by the SDADC power on procedure.

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Configuration successful. |
| FSP_ERR_ASSERTION | An input pointer is NULL or an input parameter is invalid. |
| FSP_ERR_ALREADY_OPEN | Control block is already open. |
| FSP_ERR_IRQ_BSP_DISABLED | A required interrupt is disabled |

◆ **R_SDADC_ScanCfg()**

```
fsp_err_t R_SDADC_ScanCfg ( adc_ctrl_t * p_ctrl, void const *const p_extend )
```

Configures the enabled channels of the ADC. Pass a pointer to [sdadc_scan_cfg_t](#) to p_extend. Implements [adc_api_t::scanCfg\(\)](#).

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Information stored in p_adc_info. |
| FSP_ERR_ASSERTION | An input pointer is NULL or an input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

◆ **R_SDADC_InfoGet()**

```
fsp_err_t R_SDADC_InfoGet ( adc_ctrl_t* p_ctrl, adc_info_t* p_adc_info )
```

Returns the address of the lowest number configured channel, the total number of results to be read in order to read the results of all configured channels, the size of each result, and the ELC event enumerations. Implements `adc_api_t::infoGet()`.

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Information stored in p_adc_info. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

◆ **R_SDADC_ScanStart()**

```
fsp_err_t R_SDADC_ScanStart ( adc_ctrl_t* p_ctrl)
```

If the SDADC is configured for hardware triggers, enables hardware triggers. Otherwise, starts a scan. Implements `adc_api_t::scanStart()`.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Scan started or hardware triggers enabled successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |
| FSP_ERR_IN_USE | A conversion or calibration is in progress. |

◆ **R_SDADC_ScanGroupStart()**

```
fsp_err_t R_SDADC_ScanGroupStart ( adc_ctrl_t* p_ctrl, adc_group_mask_t group_id )
```

`adc_api_t::scanStart` is not supported on the SDADC. Use `scanStart` instead.

Return values

| | |
|---------------------|--|
| FSP_ERR_UNSUPPORTED | Function not supported in this implementation. |
|---------------------|--|

◆ **R_SDADC_ScanStop()**

`fsp_err_t R_SDADC_ScanStop (adc_ctrl_t * p_ctrl)`

If the SDADC is configured for hardware triggers, disables hardware triggers. Otherwise, stops any in-progress scan started by software. Implements `adc_api_t::scanStop()`.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Scan stopped or hardware triggers disabled successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

◆ **R_SDADC_StatusGet()**

`fsp_err_t R_SDADC_StatusGet (adc_ctrl_t * p_ctrl, adc_status_t * p_status)`

Returns the status of a scan started by software, including calibration scans. It is not possible to determine the status of a scan started by a hardware trigger. Implements `adc_api_t::scanStatusGet()`.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | No software scan or calibration is in progress. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

◆ **R_SDADC_Read()**

```
fsp_err_t R_SDADC_Read ( adc_ctrl_t* p_ctrl, adc_channel_t const reg_id, uint16_t*const p_data )
```

Reads the most recent conversion result from a channel. Truncates 24-bit results to the upper 16 bits. Implements `adc_api_t::read()`.

Note

The result stored in `p_data` is signed when the SDADC channel is configured in differential mode. Do not use this API if the conversion end interrupt (`SDADC0_ADI`) is used to trigger the DTC unless the interrupt mode is set to `TRANSFER_IRQ_EACH`.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Conversion result in <code>p_data</code> . |
| FSP_ERR_ASSERTION | An input pointer was NULL or an input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

◆ **R_SDADC_Read32()**

```
fsp_err_t R_SDADC_Read32 ( adc_ctrl_t* p_ctrl, adc_channel_t const reg_id, uint32_t*const p_data )
```

Reads the most recent conversion result from a channel. Implements `adc_api_t::read32()`.

Note

The result stored in `p_data` is signed when the SDADC channel is configured in differential mode. When the SDADC is configured for 24-bit resolution and right alignment, the sign bit is bit 23, and the upper 8 bits are 0. When the SDADC is configured for 16-bit resolution and right alignment, the sign bit is bit 15, and the upper 16 bits are 0. Do not use this API if the conversion end interrupt (`SDADC0_ADI`) is used to trigger the DTC unless the interrupt mode is set to `TRANSFER_IRQ_EACH`.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Conversion result in <code>p_data</code> . |
| FSP_ERR_ASSERTION | An input pointer was NULL or an input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

◆ **R_SDADC_OffsetSet()**

```
fsp_err_t R_SDADC_OffsetSet ( adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, int32_t const offset )
```

Sets the offset. Offset is applied after stage 1 of the input channel. Offset can only be applied when the channel is configured for differential input. Implements `adc_api_t::offsetSet()`.

Note: The offset is cleared if `adc_api_t::calibrate()` is called. The offset can be re-applied if necessary after the the callback with event `ADC_EVENT_CALIBRATION_COMPLETE` is called.

Parameters

| | | |
|------|--------|---|
| [in] | p_ctrl | See p_instance_ctrl in <code>adc_api_t::offsetSet()</code> . |
| [in] | reg_id | See reg_id in <code>adc_api_t::offsetSet()</code> . |
| [in] | offset | Must be between -15 and 15, offset (mV) = 10.9376 mV * offset_steps / stage 1 gain. |

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Offset updated successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL or an input parameter was invalid. |
| FSP_ERR_IN_USE | A conversion or calibration is in progress. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

◆ R_SDADC_Calibrate()

`fsp_err_t R_SDADC_Calibrate (adc_ctrl_t *const p_ctrl, void const * p_extend)`

Requires `sdadc_calibrate_args_t` passed to `p_extend`. Calibrates the specified channel. Calibration is not required or supported for single-ended mode. Calibration must be completed for differential mode before using the SDADC. A callback with the event `ADC_EVENT_CALIBRATION_COMPLETE` is called when calibration completes. Implements `adc_api_t::calibrate()`.

During external offset calibration, apply a differential voltage of 0 to ANSDnP - ANSDnN, where n is the input channel and ANSDnP is OPAMP0 for channel 4 and ANSDnN is OPAMP1 for channel 4. Complete external offset calibration before external gain calibration.

During external gain calibration apply a voltage between $0.4 \text{ V} / \text{total_gain}$ and $0.8 \text{ V} / \text{total_gain}$. The differential voltage applied during calibration is corrected to a conversion result of `0x7FFFFFFF`, which is the maximum possible positive differential measurement.

This function clears the offset value. If offset is required after calibration, it must be reapplied after calibration is complete using `adc_api_t::offsetSet`.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Calibration began successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_IN_USE | A conversion or calibration is in progress. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

◆ R_SDADC_Close()

`fsp_err_t R_SDADC_Close (adc_ctrl_t * p_ctrl)`

Stops any scan in progress, disables interrupts, and powers down the SDADC peripheral. Implements `adc_api_t::close()`.

Note

This function delays at least 3 us as required by the SDADC24 stop procedure.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Instance control block closed successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

Detailed Description

Driver for the SDADC_B peripheral on RA MCUs. This module implements the [ADC Interface](#).

Overview

Features

The SDADC_B module supports the following features:

- 24 bit maximum resolution
- Configure scans to include:
 - Multiple analog channels
- Configurable sampling mode:
 - 4 kHz sampling mode
 - 8 kHz sampling mode
 - 8 kHz/4 kHz Hybrid sampling mode
- Configurable Cut-off frequency of high-pass filter
- Configurable preamplifier gain for each channel
- Configurable phase adjustment for each channel

- Optional callback when conversion completes or zero-cross is detected
- Supports reading converted data
- Supports positive and negative input voltage

Selecting an ADC

All RA MCUs have an [ADC \(r_adc\)](#). Only select RA MCUs have an SDADC_B. When selecting between them, consider these factors. Refer to the hardware manual for details.

| | ADC | SDADC_B |
|--------------------|--|---|
| Availability | Available on all RA MCUs. | Available on select RA MCUs. |
| Resolution | The ADC has a maximum resolution of 12, 14, or 16 bits depending on the MCU. | The SDADC_B has a maximum accuracy of 24 bits. |
| Number of Channels | The ADC has 4 channels. | The SDADC_B has up to 7 channels. |
| Frequency | The ADC sampling time is shorter (more samples per second). | The SDADC sampling time is longer (fewer samples per second). |

Configuration

Build Time Configurations for r_sdadc_b

The following build time configurations are defined in fsp_cfg/r_sdadc_b_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Clock Configuration

The SDADC_B clock is configurable on the clocks tab.

The SDADC_B clock must be 12 MHz, 12.8 MHz or 16 MHz when the SDADC_B is used.

Pin Configuration

The ANINn/ANIPn (n = 0-6) pins are analog input channels that can be used with the SDADC_B.

Virtual Channel Configuration

- When 8KHz/4KHz Hybrid Mode is enabled, selected Virtual Channels 0 to 3 are converted at an 8KHz rate and corresponding Virtual Channels 4 to 7 are converted at a 4KHz rate.
- In some locations, 4KHz Hybrid Mode conversions may be referred to 'Type 2'. All other conversions may be referred to as 'Type 1'. The SDADC_B driver abstracts 'Type 1' and 'Type 2' and populates the user callback arguments with a mask of converted channel IDs. It is the responsibility of the application to know the configuration of provided channel IDs.

- Configuration of enabled virtual channels corresponding to Sampling mode is subject to below constraints:
 - Analog input n (n = 0 to 3) must be configured for Virtual Channel m (m = 4 to 7) if corresponding Analog input n is configured for Virtual Channel n and Hybrid mode is enabled
 - Analog input 4 to 6 cannot be configured for Virtual Channel 4 to 6 when Hybrid mode is enabled
 - Virtual Channel 7 can only be configured when Hybrid mode is enabled

Usage Notes

Cut-off frequency of HPF

Cut-off frequency of HPF (High Pass Filter) is selectable by setting SDADHPFCR.COF bit. Value of cut-off frequency of HPF corresponding to each COF value is as below table:

| COF | 4 kHz sampling mode fos = 1.5 MHz | 4 kHz sampling mode fos = 1.6 MHz | 8 kHz sampling mode fos = 3.0 MHz | 8 kHz sampling mode fos = 3.2 MHz | 8 kHz/4 kHz hybrid sampling mode fos = 3.0 MHz | 8 kHz/4 kHz hybrid sampling mode fos = 3.2 MHz |
|-------|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|---|---|
| COF 0 | 0.607 Hz | 0.647 Hz | 1.214 Hz | 1.295 Hz | 1.214 Hz | 1.295 Hz |
| COF 1 | 1.214 Hz | 1.295 Hz | 2.427 Hz | 2.589 Hz | 2.427 Hz | 2.589 Hz |
| COF 2 | 2.427 Hz | 2.589 Hz | 4.855 Hz | 5.179 Hz | 4.855 Hz | 5.179 Hz |
| COF 3 | 4.855 Hz | 5.179 Hz | 9.710 Hz | 10.357 Hz | 1.214 Hz (Type 1) 0.607 Hz (Type 2) | 1.295 Hz (Type 1) 0.647 Hz (Type 2) |

Channel ID used in driver

Channel ID input to [R_SDADC_B_Read](#) and [R_SDADC_B_Read32](#) API and Channel Mask provided to user callback is the virtual channel ID and does not necessarily correspond to a physical input channel number. When Hybrid sampling mode is enabled, reading conversion result for channel 4 to 7 returns the 4 kHz conversion (Type 2) result of corresponding channel 0 to 3.

Scan Procedure

Operation of 24-bit Sigma-Delta A/D Converter is as below:

1. Conversions are performed on enabled channels in ascending order of channel number after software trigger is started using [R_SDADC_B_ScanStart\(\)](#) API.
2. Conversions are performed at the rate (in Hz) of the SDADC_B sampling clock frequency.
3. The user callback function will be invoked after enabled channels are scanned.
4. If zero-cross detection interrupt is enabled, a zero-cross detection interrupt occurs in synchronization with the rising edge of the SDADC conversion end interrupt.

Triggering ELC Events with SDADC_B

- The interrupt signals SDADC_B can trigger the start of other peripherals. The [Event Link Controller \(r_elc\)](#) guide provides a list of all available peripherals.

Note

When using ELC events to directly read converted data, it is the responsibility of the application to ensure that the stabilization period of 80 conversions has passed since starting the converter by using [R_SDADC_B_StatusGet\(\)](#) API.

Limitations

- After powering on, an internal setup time is necessary. During this time [R_SDADC_B_StatusGet\(\)](#) will return `ADC_STATE_CALIBRATION_IN_PROGRESS`.
- SDADC_B does not operate in software standby mode. To reduce current consumption, stop and close the SDADC_B module before entering software standby.
- After stopping the conversion using [R_SDADC_B_ScanStop\(\)](#) API, it is necessary to wait at least 1.4us before performing conversion again.

Examples

Basic Example

This is a basic example of minimal use of the SDADC_B in an application.

```
void sdadc_b_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_SDADC_B_Open(&g_adc0_ctrl, &g_adc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* In software trigger mode, start a scan by calling R_SDADC_B_ScanStart(). In other
modes, enable external
    * triggers by calling R_SDADC_B_ScanStart(). */
    (void) R_SDADC_B_ScanStart(&g_adc0_ctrl);
    /* Wait for conversion to complete. */
    adc_status_t status;
    status.state = ADC_STATE_CALIBRATION_IN_PROGRESS;
    while (ADC_STATE_CALIBRATION_IN_PROGRESS == status.state)
    {
        R_SDADC_B_StatusGet(&g_adc0_ctrl, &status);
    }
    /* Read converted data. */
    uint32_t channel1_conversion_result;
    R_SDADC_B_Read32(&g_adc0_ctrl, ADC_CHANNEL_1, &channel1_conversion_result);
}
```

```
}

```

Using DTC or DMAC with the SDADC_B

If desired, the DTC or DMAC can be used to store each conversion result in a circular buffer. An example configuration is below.

```
/* Example DTC transfer settings to used with SDADC_B. */
/* The transfer length should match the total number of conversions per scan. This
example assumes the SDADC_B is
 * configured to scan all 7 channels. */
#define SDADC_B_EXAMPLE_TRANSFER_LENGTH (7)
uint32_t g_sdadc_b_example_buffer[SDADC_B_EXAMPLE_TRANSFER_LENGTH];
transfer_info_t g_sdadc_b_transfer_info =
{
    .transfer_settings_word_b.dest_addr_mode = TRANSFER_ADDR_MODE_INCREMENTED,
    .transfer_settings_word_b.repeat_area    = TRANSFER_REPEAT_AREA_DESTINATION,
    .transfer_settings_word_b.irq           = TRANSFER_IRQ_END,
    .transfer_settings_word_b.chain_mode    = TRANSFER_CHAIN_MODE_DISABLED,
    .transfer_settings_word_b.src_addr_mode = TRANSFER_ADDR_MODE_FIXED,
    .transfer_settings_word_b.mode         = TRANSFER_MODE_REPEAT,
    /* NOTE: The data transferred will contain a 24-bit converted value in bits 23:0.
The settings for
 * resolution and alignment are ignored when DTC or DMAC is used. */
    .transfer_settings_word_b.size          = TRANSFER_SIZE_4_BYTE,
    .p_src = (void const *) &R_SDADC_B->SDADCR0,
    .p_dest = &g_sdadc_b_example_buffer[0],
    .length = SDADC_B_EXAMPLE_TRANSFER_LENGTH,
};
void sdadc_b_dtc_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_SDADC_B_Open(&g_adc0_ctrl1, &g_adc0_cfg);
    /* Handle any errors. This function should be defined by the user. */

```

```
    assert(FSP_SUCCESS == err);

    /* Start a scan by calling R_SDADC_B_ScanStart(). */
    (void) R_SDADC_B_ScanStart(&g_adc0_ctrl);

    /* Wait for conversion to complete. */
    adc_status_t status;

    status.state = ADC_STATE_CALIBRATION_IN_PROGRESS;
    while (ADC_STATE_CALIBRATION_IN_PROGRESS == status.state)
    {
        R_SDADC_B_StatusGet(&g_adc0_ctrl, &status);
    }

    /* After each conversion, the converted data is transferred to the next index in
    g_sdadc_b_example_buffer. After
    * the entire scan completes, the index in g_sdadc_b_example_buffer resets. The data
    in g_sdadc_b_example_buffer
    * is:
    * - g_sdadc_b_example_buffer[0] = SDADC_B channel 0
    * - g_sdadc_b_example_buffer[1] = SDADC_B channel 1
    * - g_sdadc_b_example_buffer[2] = SDADC_B channel 2
    * - g_sdadc_b_example_buffer[3] = SDADC_B channel 3
    * - g_sdadc_b_example_buffer[4] = SDADC_B channel 4
    * - g_sdadc_b_example_buffer[5] = SDADC_B channel 5
    * - g_sdadc_b_example_buffer[6] = SDADC_B channel 6
    *//* At any point in the application after the first scan completes, the most
recent data for channel 2 can be read
    * from the buffer like this. Conversion data is signed integer value. */
    int32_t channel_2_data = (int32_t) g_sdadc_b_example_buffer[2];
    FSP_PARAMETER_NOT_USED(channel_2_data);
}
```

| SDADC_B_HYBRID_SAMPLING_MODE | 8 kHz / 4 kHz hybrid sampling mode |

◆ **sdadc_b_channel_gain_t**

| enum sdadc_b_channel_gain_t | |
|---|-------------|
| Per channel preamplifier gain options. | |
| Enumerator | |
| SDADC_B_CHANNEL_GAIN_1 | Gain of 1. |
| SDADC_B_CHANNEL_GAIN_2 | Gain of 2. |
| SDADC_B_CHANNEL_GAIN_4 | Gain of 4. |
| SDADC_B_CHANNEL_GAIN_8 | Gain of 8. |
| SDADC_B_CHANNEL_GAIN_16 | Gain of 16. |
| SDADC_B_CHANNEL_GAIN_32 | Gain of 32. |

◆ **sdadc_b_channel_hpf_t**

| enum sdadc_b_channel_hpf_t | |
|--|--------------|
| Per channel HPF bypass. | |
| Enumerator | |
| SDADC_B_CHANNEL_HPF_ENABLE | HPF enable. |
| SDADC_B_CHANNEL_HPF_DISABLE | HPF disable. |

◆ **sdadc_b_resolution_t**

| enum sdadc_b_resolution_t | |
|---|-------------------|
| SDADC data resolution definitions | |
| Enumerator | |
| SDADC_B_RESOLUTION_24_BIT | 24 bit resolution |
| SDADC_B_RESOLUTION_16_BIT | 16 bit resolution |

◆ **sdadc_b_zc_channel_t**

| enum sdadc_b_zc_channel_t | |
|---|---|
| Zero-cross detection channel | |
| Enumerator | |
| SDADC_B_ZC_CHANNEL_2_OR_3 | Detect channel 2 (ZCCTL0) or channel 3 (ZCCTL1) |
| SDADC_B_ZC_CHANNEL_1_OR_0 | Detect channel 1 (ZCCTL0) or channel 0 (ZCCTL1) |

◆ **sdadc_b_zc_output_mode_t**

| enum sdadc_b_zc_output_mode_t | |
|---|--------------------|
| Zero-cross detection output mode. | |
| Enumerator | |
| SDADC_B_ZC_PULSE_OUTPUT_MODE | Pulse output mode. |
| SDADC_B_ZC_LEVEL_OUTPUT_MODE | Level output mode. |

◆ **sdadc_b_zc_falling_edge_detection_t**

| | |
|---|-----------|
| enum <code>sdadc_b_zc_falling_edge_detection_t</code> | |
| Zero-cross detection output mode. | |
| Enumerator | |
| SDADC_B_ZC_FALLING_EDGE_DETECTION_DISABLE | Disabled. |
| SDADC_B_ZC_FALLING_EDGE_DETECTION_ENABLE | Enabled. |

◆ **sdadc_b_zc_rising_edge_detection_t**

| | |
|--|-----------|
| enum <code>sdadc_b_zc_rising_edge_detection_t</code> | |
| Zero-cross detection output mode. | |
| Enumerator | |
| SDADC_B_ZC_RISING_EDGE_DETECTION_DISABLE | Disabled. |
| SDADC_B_ZC_RISING_EDGE_DETECTION_ENABLE | Enabled. |

◆ **sdadc_b_cutoff_t**

| | |
|--|----------------------|
| enum <code>sdadc_b_cutoff_t</code> | |
| HPF cut off. The enum value is to set to SDADHPFCR register. See Table 31.8 Cut-off frequency of HPF of the manual R01UH1005EJ0051 | |
| Enumerator | |
| SDADC_B_CUTOFF_00B | Cut-off frequency 0. |
| SDADC_B_CUTOFF_01B | Cut-off frequency 1. |
| SDADC_B_CUTOFF_10B | Cut-off frequency 2. |
| SDADC_B_CUTOFF_11B | Cut-off frequency 3. |

Function Documentation

◆ R_SDADC_B_Open()

```
fsp_err_t R_SDADC_B_Open ( adc_ctrl_t* p_ctrl, adc_cfg_t const *const p_cfg )
```

Applies power to the SDADC_B and initializes the hardware based on the user configuration. Enabling interrupts which will call a callback to notify the user when a conversion is completed or a zero-cross is detected. Implements `adc_api_t::open()`.

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Configuration successful. |
| FSP_ERR_ASSERTION | An input pointer is NULL or an input parameter is invalid. |
| FSP_ERR_ALREADY_OPEN | Control block is already open. |
| FSP_ERR_INVALID_CHANNEL | Invalid channel configuration |

◆ R_SDADC_B_ScanCfg()

```
fsp_err_t R_SDADC_B_ScanCfg ( adc_ctrl_t* p_ctrl, void const *const p_extend )
```

Configures the enabled channels of the ADC. Implements `adc_api_t::scanCfg()`.

Note

This function is not compatible with Hybrid Mode operation.

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Information stored in p_adc_info. |
| FSP_ERR_ASSERTION | An input pointer is NULL or an input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |
| FSP_ERR_INVALID_MODE | Hybrid mode channel configuration is invalid |
| FSP_ERR_INVALID_CHANNEL | Invalid channel configuration |
| FSP_ERR_INVALID_STATE | Converter operation must be stopped before reconfiguring |

◆ **R_SDADC_B_InfoGet()**

```
fsp_err_t R_SDADC_B_InfoGet ( adc_ctrl_t* p_ctrl, adc_info_t* p_adc_info )
```

Returns the address of the lowest number configured channel, the total number of results to be read in order to read the results of all configured channels, the size of each result, and the ELC event enumerations. Implements `adc_api_t::infoGet()`.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Conversion is started successfully. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |
| FSP_ERR_ASSERTION | An input pointer is NULL or an input parameter is invalid. |

◆ **R_SDADC_B_ScanStart()**

```
fsp_err_t R_SDADC_B_ScanStart ( adc_ctrl_t* p_ctrl)
```

`adc_api_t::scanStart()`.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Conversion is started successfully. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |
| FSP_ERR_ASSERTION | An input pointer is NULL or an input parameter is invalid. |

◆ **R_SDADC_B_ScanGroupStart()**

```
fsp_err_t R_SDADC_B_ScanGroupStart ( adc_ctrl_t* p_ctrl, adc_group_mask_t group_id )
```

`adc_api_t::scanGroupStart` is not supported on the SDADC_B. Use `scanStart` instead.

Return values

| | |
|---------------------|--|
| FSP_ERR_UNSUPPORTED | Function not supported in this implementation. |
|---------------------|--|

◆ **R_SDADC_B_ScanStop()**

```
fsp_err_t R_SDADC_B_ScanStop ( adc_ctrl_t * p_ctrl)
```

```
adc_api_t::scanStop().
```

Note

According to Hardware specification, after stopping the conversion, it is necessary to wait at least 1.4us before performing conversion again.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Conversion is started successfully. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |
| FSP_ERR_ASSERTION | An input pointer is NULL or an input parameter is invalid. |

◆ **R_SDADC_B_StatusGet()**

```
fsp_err_t R_SDADC_B_StatusGet ( adc_ctrl_t * p_ctrl, adc_status_t * p_status )
```

Returns the status of a scan including calibration scans. Implements `adc_api_t::scanStatusGet()`.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Module status stored in the provided pointer p_status |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |

◆ **R_SDADC_B_Read()**

```
fsp_err_t R_SDADC_B_Read ( adc_ctrl_t* p_ctrl, adc_channel_t const reg_id, uint16_t*const p_data )
```

Reads the most recent conversion result from a channel. Truncates 24-bit results to the upper 16 bits. When the SDADC_B is configured for 16-bit resolution, the sign bit is bit 15 and the upper 16 bits are 0. Implements `adc_api_t::read()`.

Note

The result stored in p_data is signed.

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Conversion result in p_data. |
| FSP_ERR_ASSERTION | An input pointer was NULL or an input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |
| FSP_ERR_INVALID_DATA | Result buffer has not been updated with valid data. |

◆ **R_SDADC_B_Read32()**

```
fsp_err_t R_SDADC_B_Read32 ( adc_ctrl_t* p_ctrl, adc_channel_t const reg_id, uint32_t*const p_data )
```

Reads the most recent conversion result from a channel. Implements `adc_api_t::read32()`.

Note

The result stored in p_data is signed.

When the SDADC is configured for 24-bit resolution, the upper 8 bits are sign extended.

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Conversion result in p_data. |
| FSP_ERR_ASSERTION | An input pointer was NULL or an input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |
| FSP_ERR_INVALID_DATA | Result buffer has not been updated with valid data. |

◆ **R_SDADC_B_OffsetSet()**

```
fsp_err_t R_SDADC_B_OffsetSet ( adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, int32_t
const offset )
```

`adc_api_t::offsetSet` is not supported on the SDADC_B.

Return values

| | |
|---------------------|--|
| FSP_ERR_UNSUPPORTED | Function not supported in this implementation. |
|---------------------|--|

◆ **R_SDADC_B_Calibrate()**

```
fsp_err_t R_SDADC_B_Calibrate ( adc_ctrl_t *const p_ctrl, void const * p_extend )
```

Calibration is performed automatically each time a scan is started. `adc_api_t::calibrate` is not supported on the SDADC_B.

Return values

| | |
|---------------------|--|
| FSP_ERR_UNSUPPORTED | Function not supported in this implementation. |
|---------------------|--|

◆ **R_SDADC_B_Close()**

```
fsp_err_t R_SDADC_B_Close ( adc_ctrl_t * p_ctrl)
```

Stops any scan in progress, disables interrupts, and powers down the SDADC_B peripheral. Implements `adc_api_t::close()`.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Instance control block closed successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

Detailed Description

Middleware to implement the Data Collector for Reality AI applications. This module implements the [Data Collector Interface](#).

Overview

Data Collector is to abstract the collection of data from sensors so that data samples are accumulated into fixed length frames before being made available to application. Support of "snapshot" mode and "data feed" mode are required to accommodate for background and cooperative data collection. Each mode supports 8 sensor channels maximally. Each sensor channel will be captured into a separate frame buffer. Frame buffers shall have the same amount of data samples, however, data type can be different(int32_t, float, uint8_t etc). Users have to make sure that frame buffers will be filled up at the same rate.

When all frame buffers are filled up, they will be provided to the application via data ready callback. After they are consumed, application has to release them by calling [RM_RAI_DATA_COLLECTOR_BufferRelease\(\)](#). For seamless operation, PING-PONG buffer will be used. Ideally buffers will be released before the other set of buffers are filled up. However, it is possible that frame buffers will overrun due to the fact that application may take longer time to process the data in some cases. If it happens, application will be notified with a buffer-overrun event via the error callback. No intervention is required from user side in this case. Buffer overrun will disappear when frame buffers are released. However, if not all sensor channels are configured to work at the same pace, application will get a buffer-out-of-sync error. Users have to reconfigure sensor channels and ensure all of them will work at the same pace. If sensor channels can't work at the same rate, then multiple data collector instances are required.

Features

- Snapshot mode and data feed mode are supported
- Maximally 8 sensors are supported for each mode
- Mix mode is supported(both snapshot mode and data feed mode are enabled)

Snapshot Mode

Snapshot mode will periodically pull data from the user-specified places and save to designated frame buffers. It requires a DTC module and a timer module. DTC will work in chain mode, which enables data collection from various, potentially non-linear and different-sized sources. Timer, either General PWM Timer (GPT) or Asynchronous General Purpose Timer, provides activation source for DTC to work periodically. To select this activation source, relevant interrupt has to be configured in the timer module. Application has to start the timer to enable DTC after sensor source addresses are registered.

Data Feed Mode

Data feed mode will require data producer to push data directly to the designated frame buffer whenever data is ready. Data can be pushed synchronously or asynchronously. Synchronous mode is for use cases that the data producer has a short amount of data to be copied to the frame buffer. Asynchronous mode is to use DTC/DMAC for data transfer. Application has to add DTC/DMAC modules and initialize transfer descriptors for asynchronous transfer.

Usage Notes

1. Do not use the DTC stack and timer stack of the data collector instance for data feed mode.
2. Users must take care to make sure all channels of a data collector instance will work at the same pace.

Configuration

Build Time Configurations for rm_rai_data_collector

The following build time configurations are defined in fsp_cfg/rm_rai_data_collector_cfg.h:

| Configuration | Options | Default | Description |
|------------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> Default (BSP) Enabled Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Max Number Of Channels | Value must be a positive integer less than or equal to 16 | 16 | Max number of channels. |

Configurations for AI > Data Collector (rm_rai_data_collector)

This module can be added to the Stacks tab via New Stack > AI > Data Collector (rm_rai_data_collector).

| Configuration | Options | Default | Description |
|----------------------------|---|------------------------------------|--|
| General | | | |
| Name | Name must be a valid C symbol | g_rai_data_collector0 | Module name. |
| ID | Value must be a positive integer. | 0 | Instance ID |
| Frame Buffer Length | Value must be a positive integer greater than 0 | 100 | Length of frame buffers in data samples. |
| Data Ready Callback | Name must be a valid C symbol | rai_data_collector0_callback | Callback function on data ready. |
| Error Callback | Name must be a valid C symbol | rai_data_collector0_error_callback | Callback function for error events. |
| Data Feed Mode | | | |
| Data Feed Mode > Channel 0 | | | |
| Name | Must be valid C variable name | dc0_data_feed_ch0 | Channel name |

| Name | Must be valid C variable name | dc0_snapshot_ch1 | Channel name |
| Data Type | MCU Specific Options | | Channel Data Type |
| Snapshot Mode > Channel 2 | | | |
| Name | Must be valid C variable name | dc0_snapshot_ch2 | Channel name |
| Data Type | MCU Specific Options | | Channel Data Type |

Snapshot Mode > Channel 3

| | | | |
|-----------|-------------------------------|------------------|-------------------|
| Name | Must be valid C variable name | dc0_snapshot_ch3 | Channel name |
| Data Type | MCU Specific Options | | Channel Data Type |

Snapshot Mode > Channel 4

| | | | |
|-----------|-------------------------------|------------------|-------------------|
| Name | Must be valid C variable name | dc0_snapshot_ch4 | Channel name |
| Data Type | MCU Specific Options | | Channel Data Type |

Snapshot Mode > Channel 5

| | | | |
|-----------|-------------------------------|------------------|-------------------|
| Name | Must be valid C variable name | dc0_snapshot_ch5 | Channel name |
| Data Type | MCU Specific Options | | Channel Data Type |

Snapshot Mode > Channel 6

| | | | |
|-----------|-------------------------------|------------------|-------------------|
| Name | Must be valid C variable name | dc0_snapshot_ch6 | Channel name |
| Data Type | MCU Specific Options | | Channel Data Type |

Snapshot Mode > Channel 7

| | | | |
|--------------------|---|------------------|---------------------------------------|
| Name | Must be valid C variable name | dc0_snapshot_ch7 | Channel name |
| Data Type | MCU Specific Options | | Channel Data Type |
| Channels | Value must be an integer between 0 and 8 | 0 | Number of snapshot mode channels. |
| DTC Transfer Count | Value must be a positive integer greater than 0 | 1 | DTC transfer count on each activation |

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Examples**Snapshot Mode Example**

```
void rm_rai_data_collector_snapshot_mode_example ()
{
    fsp_err_t err;
```

```
err = RM_RAI_DATA_COLLECTOR_Open(&g_dc_ctrl, &g_dc_cfg);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
for (uint8_t i = 0; i < DC_TEST_CHAN_COUNT; i++)
{
RM_RAI_DATA_COLLECTOR_SnapshotChannelRegister(&g_dc_ctrl, i, g_sensor_buf[i]);
assert(FSP_SUCCESS == err);
}
err = RM_RAI_DATA_COLLECTOR_SnapshotStart(&g_dc_ctrl);
assert(FSP_SUCCESS == err);
do
{
/* Process error event */
if (RAI_DATA_COLLECTOR_ERROR_TYPE_BUF_OUT_OF_SYNC & g_dc_error_event)
{
/* Error! Please reconfigure sensors to make sure they all work at the same pace.*/
g_dc_error_event = RAI_DATA_COLLECTOR_ERROR_TYPE_NONE;
}
if (g_data_ready)
{
/* Process collected data saved in g_frame_buf. */
do_data_process(g_data_ready_callback_arg.instance_id,
g_data_ready_callback_arg.frames,
g_data_ready_callback_arg.frame_buf_len,
g_data_ready_callback_arg.p_frame_buf);
g_data_ready = false;
}
/* Release buffer when done */
RM_RAI_DATA_COLLECTOR_BufferRelease(&g_dc_ctrl);
} while (!g_exit);
err = RM_RAI_DATA_COLLECTOR_SnapshotStop(&g_dc_ctrl);
assert(FSP_SUCCESS == err);
err = RM_RAI_DATA_COLLECTOR_Close(&g_dc_ctrl);
assert(FSP_SUCCESS == err);
```

}

Data Structures

```
struct rai_data_collector_instance_ctrl_t
```

Data Structure Documentation

◆ rai_data_collector_instance_ctrl_t

```
struct rai_data_collector_instance_ctrl_t
```

RAI_DATA_COLLECTOR instance control block. Initialization occurs when [RM_RAI_DATA_COLLECTOR_Open\(\)](#) is called.

Function Documentation

◆ RM_RAI_DATA_COLLECTOR_Open()

```
fsp_err_t RM_RAI_DATA_COLLECTOR_Open ( rai_data_collector_ctrl_t *const p_api_ctrl,
rai_data_collector_cfg_t const *const p_cfg )
```

Opens and configures the Data Collector module.

Implements [rai_data_collector_api_t::open\(\)](#).

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | Data Collector successfully configured. |
| FSP_ERR_ALREADY_OPEN | Module already open. |
| FSP_ERR_ASSERTION | One or more pointers point to NULL or callback is NULL. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ RM_RAI_DATA_COLLECTOR_SnapshotChannelRegister()

```
fsp_err_t RM_RAI_DATA_COLLECTOR_SnapshotChannelRegister ( rai_data_collector_ctrl_t *const
p_api_ctrl, uint8_t channel, void const * p_src )
```

Config transfer src address for snapshot mode channel

Implements `rai_data_collector_api_t::snapshotChannelRegister()`.

Return values

| | |
|-------------------|---------------------------------|
| FSP_SUCCESS | Src addresses are set. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Module not open. |

◆ RM_RAI_DATA_COLLECTOR_BufferReset()

```
fsp_err_t RM_RAI_DATA_COLLECTOR_BufferReset ( rai_data_collector_ctrl_t *const p_api_ctrl)
```

Reset to discard accumulated data and start with PING buffer.

Note

Application must stop data transfer on all channels first.

Implements `rai_data_collector_api_t::bufferReset()`.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Data Collector module internal buffers reset. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Module not open. |

◆ RM_RAI_DATA_COLLECTOR_BufferRelease()

```
fsp_err_t RM_RAI_DATA_COLLECTOR_BufferRelease ( rai_data_collector_ctrl_t *const p_api_ctrl)
```

Release frame buffer

Implements `rai_data_collector_api_t::bufferRelease()`.

Return values

| | |
|-------------------|---------------------------------|
| FSP_SUCCESS | Buffer released. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Module not open. |

◆ **RM_RAI_DATA_COLLECTOR_ChannelBufferGet()**

```
fsp_err_t RM_RAI_DATA_COLLECTOR_ChannelBufferGet ( rai_data_collector_ctrl_t *const p_api_ctrl,
uint8_t channel, void ** pp_buf )
```

Get channel destination buffer address for asynchronous data transfer.

Implements `rai_data_collector_api_t::channelBufferGet()`.

Return values

| | |
|-------------------|---------------------------------|
| FSP_SUCCESS | Buffer available. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Module not open. |

◆ **RM_RAI_DATA_COLLECTOR_ChannelWrite()**

```
fsp_err_t RM_RAI_DATA_COLLECTOR_ChannelWrite ( rai_data_collector_ctrl_t *const p_api_ctrl,
uint8_t channel, const void * p_buf, uint32_t len )
```

Synchronous data transfer using CPU copy.

Implements `rai_data_collector_api_t::channelWrite()`.

Return values

| | |
|-------------------|---------------------------------|
| FSP_SUCCESS | Data copy completed. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Module not open. |

◆ **RM_RAI_DATA_COLLECTOR_SnapshotStart()**

```
fsp_err_t RM_RAI_DATA_COLLECTOR_SnapshotStart ( rai_data_collector_ctrl_t *const p_api_ctrl)
```

Starts snapshot mode channels

Implements `rai_data_collector_api_t::snapshotStart()`.

Return values

| | |
|---------------------|---------------------------------|
| FSP_SUCCESS | Snapshot mode started. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Module not open. |
| FSP_ERR_UNSUPPORTED | No snapshot mode channel |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ **RM_RAI_DATA_COLLECTOR_SnapshotStop()**

```
fsp_err_t RM_RAI_DATA_COLLECTOR_SnapshotStop ( rai_data_collector_ctrl_t *const p_api_ctrl)
```

Stops snapshot mode channels

Implements `rai_data_collector_api_t::snapshotStop()`.

Return values

| | |
|---------------------|---------------------------------|
| FSP_SUCCESS | Snapshot mode stopped. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Module not open. |
| FSP_ERR_UNSUPPORTED | No snapshot mode channel |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ RM_RAI_DATA_COLLECTOR_Close()

```
fsp_err_t RM_RAI_DATA_COLLECTOR_Close ( rai_data_collector_ctrl_t *const p_api_ctrl)
```

Closes Data Collector module instance.

Implements `rai_data_collector_api_t::close()`.

Return values

| | |
|-------------------|---------------------------------|
| FSP_SUCCESS | Data Collector module closed. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Module not open. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

5.2.2.2 Reality AI Data Shipper (rm_rai_data_shipper)

[Modules](#) » [AI](#)

Functions

```
fsp_err_t RM_RAI_DATA_SHIPPER_Open (rai_data_shipper_ctrl_t *const
p_api_ctrl, rai_data_shipper_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_RAI_DATA_SHIPPER_Read (rai_data_shipper_ctrl_t *const
p_api_ctrl, void *const p_buf, uint32_t *const buf_len)
```

```
fsp_err_t RM_RAI_DATA_SHIPPER_Write (rai_data_shipper_ctrl_t *const
p_api_ctrl, rai_data_shipper_write_params_t const *p_write_params)
```

```
fsp_err_t RM_RAI_DATA_SHIPPER_Close (rai_data_shipper_ctrl_t *const
p_api_ctrl)
```

Detailed Description

Middleware to implement the Data Shipper for Reality AI applications. This module implements the [Data Shipper Interface](#).

Overview

RAI Data Shipper is mainly for sending data collected by RAI Data Collector to PC so that they can be used for Reality AI model training. It utilizes the [Communications Middleware Interface](#) and all communications are fully asynchronous. The data being transported may be any combination of the following:

- Sensor data
- System events/errors
- Debug data and diagnostic information, including RAI runtime output

Sensor data is provided by Data Collector instance via the data ready callback. System events and debug data are prepared by application. A callback is used to notify application that communication is finished. Sensor data buffers must be released if they are not used. Error flag will be set if there is any error during data transmission.

Note

Debug data, diagnostic information, and associated events are provided for debug purposes only and are not tracked by upstream Reality AI tools.

Features

1. The RAI Data Shipper module supports up to 8 Data Collector instances.
2. The RAI Data Shipper module supports the following interface:
 - RM_COMMS_UART with/without CRC-8

Configuration

Build Time Configurations for rm_rai_data_shipper

The following build time configurations are defined in fsp_cfg/rm_rai_data_shipper_cfg.h:

| Configuration | Options | Default | Description |
|----------------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Max Number Of DC Instances | Value must be a positive integer that less than or equal to 8 | 8 | Max number of DC instances to be sent. |

Configurations for AI > Data Shipper (rm_rai_data_shipper)

This module can be added to the Stacks tab via New Stack > AI > Data Shipper (rm_rai_data_shipper).

| Configuration | Options | Default | Description |
|--------------------|-------------------------------|-----------------------------|---|
| Name | Name must be a valid C symbol | g_rai_data_shipper0 | Module name |
| Frame Rate Divider | Value must be non-negative | 0 | Skip write requests |
| Callback | Name must be a valid C symbol | rai_data_shipper0_callb ack | A user callback function on data sent or error. |

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Limitations

1. 2-way communication hasn't been supported yet - data is always sent from device to host.
2. Users shall take care to avoid race condition in the case of multiple data collector instances.

Examples

Basic Example

This is a basic example of minimal use of the Data Shipper implementation in an application.

```
void RM_RAI_DATA_SHIPPER_example();
void data_shipper_callback(rai_data_shipper_callback_args_t * p_args);
extern rai_data_shipper_cfg_t g_ds_cfg;
extern rai_data_shipper_instance_t g_ds_ctrl;
static bool g_exit = false;
extern bool g_data_ready;
extern rai_data_collector_callback_args_t g_data_ready_callback_arg;
void RM_RAI_DATA_SHIPPER_example ()
{
    fsp_err_t err;

    err = RM_RAI_DATA_SHIPPER_Open(&g_ds_ctrl, &g_ds_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    while (!g_exit)
    {
        if (g_data_ready)
        {
            rai_data_shipper_write_params_t g_write_params;

            g_write_params.p_sensor_data = &g_data_ready_callback_arg;
            /* Application is responsible to initialize diagnostic information and events.- */
            /* Application has no diagnostic information/events to report. */

            g_write_params.diagnostic_data_len = 0;
            g_write_params.events = 0;
            g_write_params.p_diagnostic_data = NULL;
        }
    }
}
```

```
    err = RM_RAI_DATA_SHIPPER_Write(&g_ds_ctrl, &g_write_params);
    assert(FSP_SUCCESS == err);
    g_data_ready = false;
}
}
err = RM_RAI_DATA_SHIPPER_Close(&g_ds_ctrl);
assert(FSP_SUCCESS == err);
}
/* Called when all sensor data are sent or there is an error */
void data_shipper_callback (rai_data_shipper_callback_args_t * p_args)
{
    if (RM_COMMS_EVENT_ERROR == p_args->result)
    {
        /* Communication error */
    }
    /* Release sensor buffers if they are not being used by any other modules. */
    /* RM_RAI_DATA_COLLECTOR_BufferRelease(g_dc_ctrl); */
}
```

Data Structures

```
struct rai_data_shipper_instance_ctrl_t
```

Data Structure Documentation

◆ rai_data_shipper_instance_ctrl_t

```
struct rai_data_shipper_instance_ctrl_t
```

RAI_DATA_SHIPPER instance control block. Initialization occurs when `RM_RAI_DATA_SHIPPER_Open()` is called.

Function Documentation

◆ **RM_RAI_DATA_SHIPPER_Open()**

```
fsp_err_t RM_RAI_DATA_SHIPPER_Open ( rai_data_shipper_ctrl_t *const p_api_ctrl,
rai_data_shipper_cfg_t const *const p_cfg )
```

Opens and configures the Data Shipper module.

Implements [rai_data_shipper_api_t::open\(\)](#).

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | Data Shipper successfully configured. |
| FSP_ERR_ALREADY_OPEN | Module already open. |
| FSP_ERR_ASSERTION | One or more pointers point to NULL or callback is NULL. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ **RM_RAI_DATA_SHIPPER_Read()**

```
fsp_err_t RM_RAI_DATA_SHIPPER_Read ( rai_data_shipper_ctrl_t *const p_api_ctrl, void *const
p_buf, uint32_t *const buf_len )
```

Read data.

Implements [rai_data_shipper_api_t::read\(\)](#).

Return values

| | |
|---------------------|--|
| FSP_ERR_UNSUPPORTED | Data Shipper module read not supported |
|---------------------|--|

◆ **RM_RAI_DATA_SHIPPER_Write()**

```
fsp_err_t RM_RAI_DATA_SHIPPER_Write ( rai_data_shipper_ctrl_t *const p_api_ctrl,
rai_data_shipper_write_params_t const * p_write_params )
```

Write data. Note this function may be called in ISR.

Implements [rai_data_shipper_api_t::write\(\)](#).

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Tx buf list created and transmission starts, or write request skipped. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Module not open. |

◆ RM_RAI_DATA_SHIPPER_Close()

```
fsp_err_t RM_RAI_DATA_SHIPPER_Close ( rai_data_shipper_ctrl_t *const p_api_ctrl)
```

Closes Data Shipper module instance.

Implements [rai_data_shipper_api_t::close\(\)](#).

Return values

| | |
|-------------------|---------------------------------|
| FSP_SUCCESS | Data Shipper module closed. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Module not open. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

5.2.3 Audio[Modules](#)**Detailed Description**

Audio Modules.

fsp_err_t RM_ADPCM_DECODER_Reset (adpcm_decoder_ctrl_t *p_ctrl)
```

```
fsp_err_t RM_ADPCM_DECODER_Close (adpcm_decoder_ctrl_t *p_ctrl)
```

Detailed Description

Middleware to implement the ADPCM Audio Decoder. This module implements the [ADPCM Decoder Interface](#).

Overview

Features

The ADPCM Audio Decoder has the following key features:

- Decodes 4-bit ADPCM input to 16-bit PCM output

Configuration

Build Time Configurations for rm_adpcm_decoder

The following build time configurations are defined in fsp_cfg/rm_adpcm_decoder_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Audio > ADPCM Decoder (rm_adpcm_decoder)

This module can be added to the Stacks tab via New Stack > Audio > ADPCM Decoder (rm_adpcm_decoder).

| Configuration | Options | Default | Description |
|---------------|-------------------------------|------------------|--------------|
| Name | Name must be a valid C symbol | g_adpcm_decoder0 | Module name. |

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Examples

Basic Example

This is a basic example of minimal use of the ADPCM Audio Decoder implementation in an application.

```
void rm_adpcm_decoder_example ()
{
    /* Open the ADPCM audio decoder instance. */
    fsp_err_t err = RM_ADPCM_DECODER_Open(&g_adpcmdec_ctrl, &g_adpcmdec_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Decode the data */
    err = RM_ADPCM_DECODER_Decode(&g_adpcmdec_ctrl, g_adpcm_stream1, g_pcm_stream,
ADPCM_BUFFER_SIZE_BYTES);
    assert(FSP_SUCCESS == err);
    /* Reset the ADPCM audio decoder instance before decoding a new stream. */
    err = RM_ADPCM_DECODER_Reset(&g_adpcmdec_ctrl);
    assert(FSP_SUCCESS == err);
    /* Decode the first chunk of ADPCM data */
    err = RM_ADPCM_DECODER_Decode(&g_adpcmdec_ctrl, g_adpcm_stream2, g_pcm_stream,
(ADPCM_BUFFER_SIZE_BYTES/2));
    assert(FSP_SUCCESS == err);
    /* Decode the second chunk of ADPCM data */
    err = RM_ADPCM_DECODER_Decode(&g_adpcmdec_ctrl,
&g_adpcm_stream2[ADPCM_BUFFER_SIZE_BYTES/2],
g_pcm_stream, (ADPCM_BUFFER_SIZE_BYTES/2));
    assert(FSP_SUCCESS == err);
}
```

Data Structures

```
struct adpcm_decoder_instance_ctrl_t
```

Data Structure Documentation

◆ adpcm_decoder_instance_ctrl_t

```
struct adpcm_decoder_instance_ctrl_t
```

RM_ADPCM_DECODER instance control block. DO NOT INITIALIZE. Initialized in `adpcm_decoder_api_t::open()`.

Function Documentation

◆ RM_ADPCM_DECODER_Open()

```
fsp_err_t RM_ADPCM_DECODER_Open ( adpcm_decoder_ctrl_t* p_ctrl, adpcm_decoder_cfg_t const *const p_cfg )
```

Initializes ADPCM audio decoder device.

Implements `adpcm_decoder_api_t::open()`.

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | Module is ready for use. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_ALREADY_OPEN | The instance control structure has already been opened. |

◆ RM_ADPCM_DECODER_Decode()

```
fsp_err_t RM_ADPCM_DECODER_Decode ( adpcm_decoder_ctrl_t*const p_ctrl, void const * p_src, void * p_dest, uint32_t src_len_bytes )
```

Decodes 4bit ADPCM data to 16bit PCM data. It reads ADPCM data from area pointed by inputAddr pointer, decodes the number of samples specified and stores the decoded data in buffer pointed with outputAddr pointer.

Implements `adpcm_decoder_api_t::decode()`.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Decode operation successfully completed. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |

◆ **RM_ADPCM_DECODER_Reset()**

```
fsp_err_t RM_ADPCM_DECODER_Reset ( adpcm_decoder_ctrl_t * p_ctrl)
```

This function resets the ADPCM decoder device.

Implements `adpcm_decoder_api_t::reset()`.

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Module closed. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |

◆ **RM_ADPCM_DECODER_Close()**

```
fsp_err_t RM_ADPCM_DECODER_Close ( adpcm_decoder_ctrl_t * p_ctrl)
```

This function closes the ADPCM decoder device.

Implements `adpcm_decoder_api_t::close()`.

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Module closed. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |

5.2.3.2 Audio Playback PWM (rm_audio_playback_pwm)

Modules » Audio

Functions

```
fsp_err_t RM_AUDIO_PLAYBACK_PWM_Open (audio_playback_ctrl_t *const
p_api_ctrl, audio_playback_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_AUDIO_PLAYBACK_PWM_Close (audio_playback_ctrl_t *const
p_api_ctrl)
```

```
fsp_err_t RM_AUDIO_PLAYBACK_PWM_Start (audio_playback_ctrl_t *const
p_api_ctrl)
```

```
fsp_err_t RM_AUDIO_PLAYBACK_PWM_Stop (audio_playback_ctrl_t *const
p_api_ctrl)
```

```
fsp_err_t RM_AUDIO_PLAYBACK_PWM_Play (audio_playback_ctrl_t *const
p_api_ctrl, void const *const p_buffer, uint32_t length)
```

Detailed Description

Driver for the Audio Playback middleware on RA MCUs. This module implements the [AUDIO PLAYBACK Interface](#).

Overview

Features

The Audio Playback with PWM middleware is used to play audio streams at user selected playback rate using Pulse Width Modulation hardware on GPT or AGT timers. This module can play 16-bit or 32-bit (available on selected MCUs) uncompressed, unsigned PCM audio stream when AGT is selected as PWM interface, and can play 32-bit uncompressed, unsigned PCM audio stream when GPT is used as PWM interface. Note some MCUs have 16-bit GPT timers/channels. In this case audio stream still needs to be 32 bits because the duty cycle register is 32-bit - just the upper 16 bits are ignored. The application code is expected to convert the signed PCM data to unsigned PCM data and scale it with the playback rate before starting the playback.

Configuration

Build Time Configurations for rm_audio_playback_pwm

The following build time configurations are defined in fsp_cfg/rm_audio_playback_pwm_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> Default (BSP) Enabled Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| DMAC Support | <ul style="list-style-type: none"> Enabled Disabled | Disabled | Select if DMAC will be used. |

Configurations for Audio > Audio Playback PWM (rm_audio_playback_pwm)

This module can be added to the Stacks tab via New Stack > Audio > Audio Playback PWM (rm_audio_playback_pwm).

| Configuration | Options | Default | Description |
|---------------------|---------------------------------------|-----------------------|-----------------------------------|
| General | | | |
| Name | Name must be a valid C symbol | g_rm_audio_playback0 | Module name. |
| Playback Speed (Hz) | Must be an integer and greater than 0 | 44100 | Enter playback sample rate in Hz. |
| Interrupts | | | |
| Callback | Name must be a valid | g_rm_audio_playback0_ | A user callback |

| | C symbol | callback | |
|----------------|--|----------|--|
| | | | function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the playback completes. |
| PWM Output Pin | <ul style="list-style-type: none"> Pin A Pin B | Pin A | Select which timer output pin should be used for audio output. |

Clock Configuration

The Audio Playback with PWM module does not require a specific clock configuration.

Pin Configuration

Configure the PWM output pins for selected PWM HAL layer peripheral (AGT/GPT). One of the following pins needs to be selected and enabled as PWM output for selected channel n,

If GPT is used as PWM interface,

- GTIOCA_n
- GTIOCB_n

If AGT is used as PWM interface,

- AGTOA_n
- AGTOB_n

Usage Notes

DMAC/DTC Integration

DMAC/DTC is used as a lower level transfer instance with this module and is operated in Normal mode to transfer 16 bit or 32 bit data from the audio stream buffer to the PWM peripheral AGT or GPT respectively. Destination address for transfer instance needs to be the Duty Cycle setting register GTCCR for GPT as PWM driver or AGTMA/AGTCMB in case of AGT as PWM driver. The Audio Playback with PWM module internally configures 'Transfer Size' as 2 Bytes if AGT is used for PWM generation, otherwise it configures 'Transfer Size' as 4 Bytes if GPT or AGTW is used for PWM generation. Refer the hardware manual to check whether the MCU supports AGT or the AGTW peripheral.

Examples

Basic Example

This is a basic example of minimal use of the RM_AUDIO_PLAYBACK_PWM in an application. This example shows how this driver can be used for playing a 16 bit uncompressed PCM audio from a single input buffer.

```
int16_t play_buffer[AUDIO_EXAMPLE_LENGTH];
uint32_t g_audio_callback_counter = 0;
void g_audio_example_counter_callback (audio_playback_callback_args_t * p_args)
{
    if (AUDIO_PLAYBACK_EVENT_PLAYBACK_COMPLETE == (p_args->event))
    {
        g_audio_callback_counter++;
    }
}
void basic_example (void)
{
    fsp_err_t err;

    /* Initialize the Audio Playback module for playing an audio stream. */
    err = RM_AUDIO_PLAYBACK_PWM_Open(&g_audio_playback_pwm_ctrl,
&g_audio_playback_pwm_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Set the 16 Bit PCM audio stream to play next */
    err = RM_AUDIO_PLAYBACK_PWM_Play(&g_audio_playback_pwm_ctrl, play_buffer,
AUDIO_EXAMPLE_LENGTH);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Start to the play the selected audio stream*/
    err = RM_AUDIO_PLAYBACK_PWM_Start(&g_audio_playback_pwm_ctrl);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Wait till the playback is completed */
    while (g_audio_callback_counter == 0)
    {
        ;
    }

    /* Stop playing. */
    err = RM_AUDIO_PLAYBACK_PWM_Stop(&g_audio_playback_pwm_ctrl);

    /* Handle any errors. This function should be defined by the user. */
}
```

```
    assert(FSP_SUCCESS == err);
}
```

Streaming Example

This is an example of using Audio Playback module to play audio stream. This application uses a double buffer to store PCM sine wave data. It starts playing in the main loop, then loads the next buffer if it is ready in the callback. If the next buffer is not ready, a flag is set in the callback so the application knows to restart playing in the main loop. This example also demonstrates conversion of signed PCM format data to unsigned PWM format data along with scaling the data samples for optimum PWM wave generation.

```
#define AUDIO_PLAYBACK_PWM_STREAMING_EXAMPLE_AUDIO_SAMPLING_FREQUENCY_HZ (22050U)
#define AUDIO_PLAYBACK_PWM_STREAMING_EXAMPLE_PERIOD_VALUE_AT_22050HZ (0x11B7U)
#define AUDIO_PLAYBACK_PWM_STREAMING_EXAMPLE_SAMPLES_PER_CHUNK (1024U)
#define AUDIO_PLAYBACK_PWM_STREAMING_EXAMPLE_TONE_FREQUENCY_HZ (800U)
#define AUDIO_PLAYBACK_PWM_EXAMPLE_SAMPLES_TO_TRANSFER (1024U)
#define AUDIO_PLAYBACK_PWM_EXAMPLE_CONVERT_TO_PWM_SAMPLES (32768U)
#define AUDIO_PLAYBACK_PWM_STREAMING_EXAMPLE_DATA_BIT_SIZE (16U)

int16_t      g_stream_src[2][AUDIO_PLAYBACK_PWM_EXAMPLE_SAMPLES_TO_TRANSFER];
q15_t       g_pwm_sample[2][AUDIO_PLAYBACK_PWM_EXAMPLE_SAMPLES_TO_TRANSFER];
q15_t       g_pwm_scaled_sample[2][AUDIO_PLAYBACK_PWM_EXAMPLE_SAMPLES_TO_TRANSFER];
uint32_t     g_buffer_index          = 0;
volatile bool g_send_data_in_main_loop = true;
volatile bool g_data_ready = false;

/* Example callback called when Audio Playback is ready for more data. */
void rm_audio_playback_example_callback (audio_playback_callback_args_t * p_args)
{
    /* Start playing next stream if data is ready. */
    if (AUDIO_PLAYBACK_EVENT_PLAYBACK_COMPLETE == (p_args->event))
    {
        if (g_data_ready)
        {
            /* Reload data and handle errors. */
            rm_audio_playback_example_play();
        }
    }
    else
```

```
    {
/* Data was not ready yet, send it in the main loop. */
        g_send_data_in_main_loop = true;
    }

Field Documentation

◆ p_callback

void(* audio_playback_pwm_instance_ctrl_t::p_callback) ([audio_playback_callback_args_t](#) *p_args)

Callback called when play is complete.

◆ p_context

void* audio_playback_pwm_instance_ctrl_t::p_context

Placeholder for user data. Passed to the user callback in [audio_playback_callback_args_t](#).

Function Documentation

◆ **RM_AUDIO_PLAYBACK_PWM_Open()**

```
fsp_err_t RM_AUDIO_PLAYBACK_PWM_Open ( audio_playback_ctrl_t *const p_api_ctrl,
audio_playback_cfg_t const *const p_cfg )
```

Opens and configures the Audio Playback with PWM driver. Sets playback speed and transfer rate to read the audio buffer.

Example:

```
/* Initialize the Audio Playback module for playing an audio stream. */
err = RM_AUDIO_PLAYBACK_PWM_Open(&g_audio_playback_pwm_ctrl,
&g_audio_playback_pwm_cfg);
```

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | Audio Playback module successfully configured. |
| FSP_ERR_ALREADY_OPEN | Module already open. |
| FSP_ERR_ASSERTION | One or more pointers point to NULL or callback is NULL. |

◆ **RM_AUDIO_PLAYBACK_PWM_Close()**

```
fsp_err_t RM_AUDIO_PLAYBACK_PWM_Close ( audio_playback_ctrl_t *const p_api_ctrl)
```

Closes the module driver. Enables module stop mode.

Return values

| | |
|-------------------|-----------------------------|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_NOT_OPEN | Driver not open. |
| FSP_ERR_ASSERTION | Pointer pointing to NULL. |

Note

This function will close all the lower level HAL drivers as well.

◆ **RM_AUDIO_PLAYBACK_PWM_Start()**

```
fsp_err_t RM_AUDIO_PLAYBACK_PWM_Start ( audio_playback_ctrl_t *const p_api_ctrl)
```

Start the PWM HAL driver (AGT or GPT) and timer HAL (AGT or GPT) drivers.

• Example:

```
/* Start to the play the selected audio stream*/
err = RM_AUDIO_PLAYBACK_PWM_Start(&g_audio_playback_pwm_ctrl);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
```

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Audio playback hardware started successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Driver not open. This function calls <ul style="list-style-type: none"> • timer_api_t::start |

◆ **RM_AUDIO_PLAYBACK_PWM_Stop()**

```
fsp_err_t RM_AUDIO_PLAYBACK_PWM_Stop ( audio_playback_ctrl_t *const p_api_ctrl)
```

Stop the PWM HAL driver (AGT or GPT) and timer HAL driver (AGT or GPT).

• Example:

```
/* Stop playing. */
err = RM_AUDIO_PLAYBACK_PWM_Stop(&g_audio_playback_pwm_ctrl);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Audio playback hardware stopped successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Driver not open. This function calls <ul style="list-style-type: none"> • timer_api_t::stop |

◆ RM_AUDIO_PLAYBACK_PWM_Play()

```
fsp_err_t RM_AUDIO_PLAYBACK_PWM_Play ( audio_playback_ctrl_t *const p_api_ctrl, void const
*const p_buffer, uint32_t length )
```

Play a single audio buffer by input samples to the PWM HAL (AGT or GPT) at the sampling frequency configured by the timer.

- Example:

```
/* Set the 16 Bit PCM audio stream to play next */
err = RM_AUDIO_PLAYBACK_PWM_Play(&g_audio_playback_pwm_ctrl, play_buffer,
AUDIO_EXAMPLE_LENGTH);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
```

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Buffer playback began successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl or p_buffer is NULL or buffer length is greater than 0x10000. |
| FSP_ERR_NOT_OPEN | Driver not open.. This function calls <ul style="list-style-type: none"> • transfer_api_t::reset |

5.2.4 Bootloader

Modules

Detailed Description

Bootloader Modules.

Modules

[MCUboot Port \(rm_mcuboot_port\)](#)

MCUboot Port for RA MCUs.

5.2.4.1 MCUboot Port (rm_mcuboot_port)

[Modules](#) » [Bootloader](#)

MCUboot Port for RA MCUs.

Overview

Note

The MCUboot Port does not provide any interfaces to the user. Consult the MCUboot documentation at <https://mcu-tools.github.io/mcuboot/> for further information.

Configuration

Build Time Configurations for MCUboot

The following build time configurations are defined in `mcu-tools/include/mcuboot_config/mcuboot_config.h`:

| Configuration | Options | Default | Description |
|---|---|----------------|---|
| General | | | |
| Custom <code>mcuboot_config.h</code> | Manual Entry | | Add a path to your custom <code>mcuboot_config.h</code> file. It can be used to override some or all of the configurations defined here, and to define additional configurations. |
| Upgrade Mode | <ul style="list-style-type: none"> Swap Overwrite Only Overwrite Only Fast Direct XIP | Overwrite Only | Swap supports A/B image swapping with rollback. Other modes with simpler code path, which only supports overwriting the existing image with the update image (Overwrite Only) or running the newest image directly from its flash partition (Direct XIP), are also available. |
| Validate Primary Image | <ul style="list-style-type: none"> Enabled Disabled | Enabled | Always check the signature of the image in the primary slot before booting, even if no upgrade was performed. This is recommended if the boot time penalty is acceptable. |

| | | | |
|--|---|-----------|---|
| Downgrade Prevention (Overwrite Only) | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Prevent downgrades by enforcing incrementing version numbers. When this option is set, any upgrade must have greater major version or greater minor version with equal major version. This mechanism only protects against some attacks against version downgrades (for example, a JTAG could be used to write an older version). |
| Number of Images Per Application | <ul style="list-style-type: none"> • 1 • 2 (TrustZone) | 1 | Number of separately updateable images. |
| Watchdog Feed | Manual Entry | | This function might be implemented if the OS / HW watchdog is enabled while doing a swap upgrade and the time it takes for a swapping is long enough to cause an unwanted reset. If implementing this, the OS main.c must also enable the watchdog (if required)! |
| Measured Boot | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Copies the boot data into the secure RAM, intended to be used by the secure App. |

Flash Layout

Flash Layout > TrustZone

| | | | |
|---|---|---------|--|
| Non-Secure Callable Region Size (Bytes) | Value must be an integer multiple of the 1024. | 0x0 | Size of the Non-Secure Callable region of the Secure image. |
| Non-Secure Flash Area Size (Bytes) (TrustZone Non-Secure) | Value must be an integer multiple of the largest erase size on the mcu. | 0x0 | Size of the Non-Secure region. This must be non-zero for all TrustZone projects to ensure memory is partitioned correctly, even if the Secure and Non-Secure regions are treated as a single image. If the Non-Secure region can be updated separately, this size must account for the header and trailer. |
| Non-Secure Callable RAM Region Size (Bytes) | Value must be an integer multiple of the 1024. | 0x0 | Size of the Non-Secure Callable RAM region of the Secure image. |
| Non-Secure RAM Region Size (Bytes) (TrustZone Non-Secure) | Value must be an integer multiple of the 8192. | 0x0 | Size of the Non-Secure RAM region. This must be non-zero for all TrustZone projects to ensure memory is partitioned correctly, even if the Secure and Non-Secure regions are treated as a single image. |
| Image 2 Header Size (Bytes) | Value must be an integer multiple of 0x80 (alignment required by VTOR). | 0x200 | Size of the flash reserved for the application image header for Image 2. |
| Bootloader Flash Area Size (Bytes) | Value must be an integer multiple of the largest erase size on the mcu. | 0x20000 | Size of the flash reserved for the bootloader. |
| Image 1 Header Size (Bytes) | Value must be an integer multiple of 0x80 (alignment required by VTOR). | 0x200 | Size of the flash reserved for the application image header. Must meet minimum VTOR |

alignment requirements for the core (0x100 for Cortex-M23, 0x200 for Cortex-M4 and Cortex-M33).

| | | | |
|---|---|------------|--|
| Image 1 Flash Area Size (Bytes) | Value must be an integer multiple of the largest erase size on the mcu. | 0x20000 | Size of the application image 1, including the header and trailer. For TrustZone projects, enter the combined size of the Secure and Non-Secure Callable regions if the Non-Secure image can be updated separately, or enter the size of the entire image slot if Secure, Non-Secure Callable, and Non-Secure regions are updated as a single image. |
| Scratch Flash Area Size (Bytes) | Value must be an integer multiple of the largest erase size on the mcu. | 0x0 | Size of the scratch area. Only required for swap update method. |
| Data Sharing | | | |
| Maximum Measured Boot Record Size (Bytes) | Value must be an integer. | 0x64 | Maximum size of the boot record. |
| Shared Data Size (Bytes) | Value must be an integer. | 0x380 | Size of the shared RAM area. Required for Measured Boot. |
| Shared Data Address | Value must be an integer | 0x20000000 | Shared RAM start address. Required for Measured Boot. |

Clock Configuration

- This module does not use peripheral clocks.
- For best performance it is recommended to use the fastest clock settings supported by the device in order to reduce boot times.
- **The bootloader must not disable the MOCO prior to calling the application. If the bootloader disables the MOCO, then operation cannot be guaranteed.**

Pin Configuration

This module does not use I/O pins.

Usage Notes

Getting Started: Creating an MCUboot Project

Start by creating a new project in e² studio or RASC. If the MCU supports TrustZone, select a Flat project. The bootloader resides entirely in Secure memory, but it is considered a flat project because it does not provide any Non-Secure Callable functions. On the Stacks tab, add New > Bootloader > MCUboot. Resolve any constraint errors and edit configurations as desired. Add either the example keys or generate your own key. The MCUboot key generation tool is provided at ra/mcu-tools/MCUboot/scripts/imgtool.py and documented at <https://github.com/mcu-tools/mcuboot/blob/master/docs/imgtool.md>. Install the following required python packages to use imgtool.py: <https://github.com/mcu-tools/mcuboot/blob/master/scripts/requirements.txt>.

In src/hal_entry.c, drag in Developer Assistance > HAL/Common > MCUboot > Quick Setup > Call Quick Setup. Add a call to mcuboot_quick_setup() in the application and make any desired updates.

Note

MCUboot will contain either the verification public key or its hash. During production it is necessary to permanently lock the flash region where MCUboot is programmed to prevent the keys or the code from being modified.

Getting Started: Signing Tool Prerequisite

To use the MCUboot signing tool, ensure you have Python 3.x installed on your system. Then install the Python packages required for the signing tool with the following command (modifying the path as needed depending on current directory):

```
pip3 install --user -r ra/mcu-tools/MCUboot/scripts/requirements.txt
```

Getting Started: Converting a Project to an MCUboot Image

MCUboot application images must execute from the image slot defined by the MCUboot project. They are also limited to a single downloadable flash region. All of this is handled by specifying a BootloaderDataFile in the FSP Configuration tool.

Any existing project can be converted to an MCUboot image.

1. If the project was created with a version prior to FSP v3.0.0, update the linker script to the v3.0.0 version before using it as an MCUboot application image.
2. Right click the project to convert in e² studio or RASC and select Properties.
3. Open C/C++ Build and select Build Variables.
4. Click Add...
5. For Variable Name, enter BootloaderDataFile. For Type, select File. Browse to the *.bld file created alongside the *.elf file for the associated MCUboot project.
6. Click OK, then Apply and Close.

To convert a TrustZone image, follow the steps above for both the Secure project and the Non-Secure project.

MCUboot application images must also be signed to work with MCUboot. At a minimum, this involves adding a SHA and MCUboot specific constant data called boot magic in the image trailer.

Signing can be done on the as a post-build step in e² studio. To sign the image as a post-build step:

1. If Linux is used to develop the application image, change the MCUboot property Signing > Python to python3.
2. Build the bootloader project to generate the *.bld file. Make sure to build the bootloader

project on the same computer as the application image to ensure the path to the signing script is correct.

3. Define environment variables in the Properties of the application image project in e² studio.
 - a. Right click the application image project, and select **Properties**.
 - b. Select **C/C++ Build > Environment** on the left.
 - c. Click **Add...**
 - d. Define the following environment variables one at a time:
 - **MCUBOOT_IMAGE_VERSION**: Set to the version of the application image.
 - **MCUBOOT_IMAGE_SIGNING_KEY**: Set the path to the key used for signing. If signing is not required, do not set this variable. If example keys are used, set **MCUBOOT_IMAGE_SIGNING_KEY** as follows (replace <boot_project> with the bootloader project path):
 - ECC: <boot_project>/ra/mcu-tools/MCUboot/root-ec-p256.pem
 - RSA 2K: <boot_project>/ra/mcu-tools/MCUboot/root-rsa-2048.pem
 - RSA 3K: <boot_project>/ra/mcu-tools/MCUboot/root-rsa-3072.pem
 - **MCUBOOT_IMAGE_ENC_KEY**: Set the path to the key used for encryption. If encryption is not required, do not set this variable. If example keys are used, set **MCUBOOT_IMAGE_ENC_KEY** as follows (replace <boot_project> with the bootloader project path):
 - ECIES: <boot_project>/ra/mcu-tools/MCUboot/enc-ec256-pub.pem
 - RSA 2K: <boot_project>/ra/mcu-tools/MCUboot/enc-rsa2048-pub.pem
 - **MCUBOOT_APP_BIN_CONVERTER**: Optional. Set to path to objcopy, arm-none-eabi-objcopy, fromelf, or ielftool. Not required if one of these tools is on the path.
4. Build the project.
5. The signed image is output next to the application <project>.elf file with the name <project>.bin.signed.

Getting Started: Download and Debug

For projects that do not use TrustZone, debug the MCUboot project using the default configuration. Before running, load the signed image to the address specified in the signing comment in ra_cfg/mcu-tools/include/mcuboot_config/mcuboot_config.h. This can be done with the Load Ancillary File button when debugging in e² studio. Upgrade images can be loaded to the upgrade image slots using the same method.

Note

e² studio projects targeting RA8 devices that do not use TrustZone must disable the "Set TrustZone secure/non-secure boundaries" setting (Debug Configurations > Debugger > Connection Settings > TrustZone > Set TrustZone secure/non-secure boundaries).

For TrustZone projects, debug using the Secure project to ensure the IDAU is partitioned correctly when debugging in e² studio. Make the following modifications before debugging in e² studio:

1. In the Debug Configurations for your project, on the Startup tab, click Add... to add the MCUboot project *.elf file (Image and Symbols), and optionally the Non-Secure project *.elf file.
2. For the Secure and Non-Secure project *.elf file, load Symbols Only.
3. After starting to debug, load the signed Secure image and the signed Non-Secure image into the addresses specified in the signing comment in ra_cfg/mcu-tools/include/mcuboot_config/mcuboot_config.h. This can be done with the Load Ancillary

File button when debugging in e² studio. Upgrade images can be loaded to the upgrade image slots using the same method.

Confirming Upgrade in Swap Mode

In Swap Mode operation, if the upgrade image is signed with the `-pad` option, MCUboot will install that image as a temporary update where if nothing else is done, a reboot will cause MCUboot to revert to the image version that was swapped out during the upgrade. In order for the updated image to prevent this reversion and make the update permanent, the `boot_set_confirmed()` must be called from the application.

To avail this capability in the application image, from the Stacks tab, add New > Bootloader > MCUboot Image Utilities (Swap Mode). Resolve any constraint errors and edit configurations as desired.

In `src/hal_entry.c`, drag in Developer Assistance > HAL/Common > MCUboot Image Utilities > Quick Setup > Confirm Primary Image. Add a call to `boot_set_confirmed()` in the application and confirm the image in the primary slot.

XIP Mode operation

XIP mode is enabled selecting "Direct XIP" as the Upgrade Mode option in the configurator or by defining "MCUBOOT_DIRECT_XIP" in the mcuboot config file. The linker script defines the symbol "XIP_SECONDARY_SLOT_IMAGE" by default to 0. To link an application to the secondary slot in XIP mode, set XIP_SECONDARY_SLOT_IMAGE to 1 in the application linker script. Direct XIP mode does not support TrustZone projects.

Dual Bank operation

MCUboot can be used with Dual bank mode to leverage the advantages of dual bank flash operation. When Dual Bank mode is enabled, only the XIP upgrade mode can be used.

Note

Unlike in normal XIP Mode operation, the linker script symbol "XIP_SECONDARY_SLOT_IMAGE" must be undefined in Dual Bank mode. An example flash layout in this configuration for a 1 MB is shown below. Note that there are 2 copies of the bootloader, one in Bank 0 and another in Bank 1.

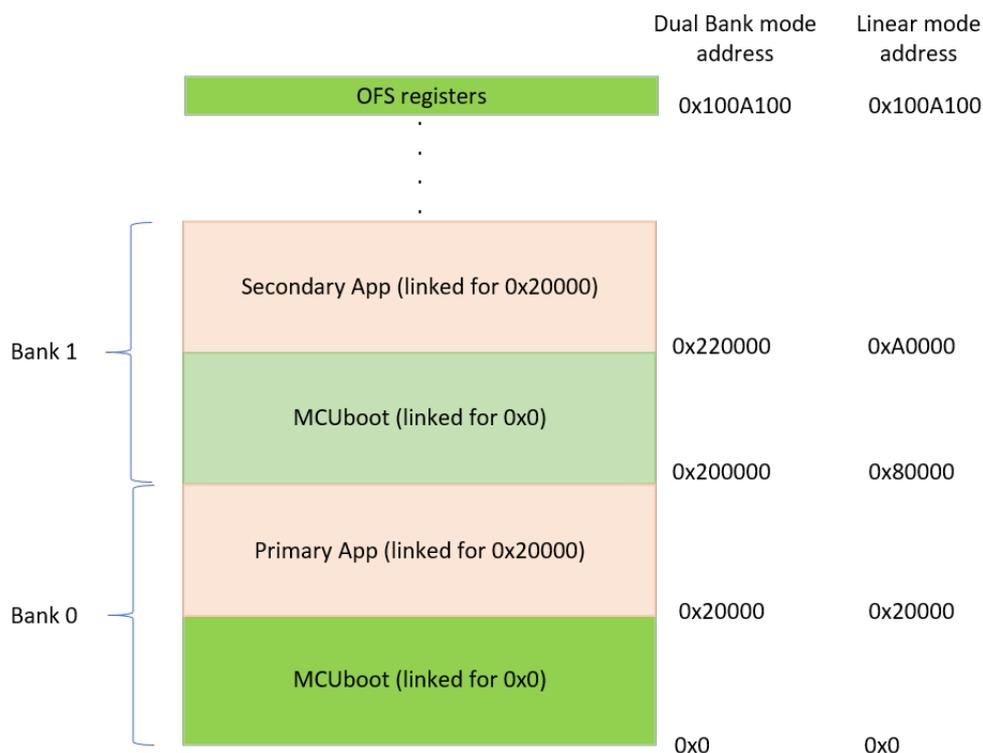

Figure 150: MCUboot Dual Bank layout for 1 MB Memory

For this example layout, the following files are generated when Dual Bank mode with XIP is enabled:

1. Bootloader Project: srec file linked to address 0 and includes the OFS region.
2. Application Project (Primary): signed bin file linked to address 0x20000.
3. Application Project (Secondary): signed bin file linked to address 0x20000.

In Dual Bank mode, the available flash memory is split into two halves and referred to as Bank 0 and 1. In this example Bank 0 would span from address 0x0 - 0x7FFFF and Bank 1 from 0x200000 - 0x27FFFF. In Linear mode, it is possible to program the Bank 1 area by programming to 0x80000 - 0xFFFFF.

Programming in Dual Bank Mode

The bootloader must be duplicated in Dual Bank mode. Bank 0 can be programmed using the srec file generated from the MCUboot project; this will also program the OFS region which contains the dual bank enable bit, so it must either be programmed last if each file is programmed independently. Another option is to combine all images: MCUboot in Bank 0, primary image, MCUboot in Bank 1 (no OFS), and secondary image (optional). To program MCUboot to Bank 1, offset MCUboot by half the flash size and cut off the OFS region (0x0100A100 to address 0x0100A2FF on CM33 MCUs that support dual bank). Using srec-cat for a 1 MB flash MCU (0x80000 flash per bank), an example command to create the bootloader image for Bank 1: "srec_cat MCUboot_dualbank.srec -crop 0 0x80000 -offset 0x80000 -o MCUboot_dualbank_offset.srec". The application project for Bank 1 can be similarly offset using srec_cat: "srec_cat app1.bin.signed -binary -offset 0xA0000 -o app1_offset.srec", where 0xA0000 is 0x80000 (half the flash) + 0x20000 (MCUboot size). The signed binary file for Bank 0 can be converted to srec format using srec_cat: "srec_cat app0.bin.signed -binary -offset 0x20000 -o app0.srec"

To combine all the files into one srec file, use "srec_cat MCUboot_dualbank.srec

```
MCUboot_dualbank_offset.srec app0.srec app1_offset.srec -o combined_srec".
```

External Memory Support

QSPI support for secondary image storage can be enabled in the configurator. The bootloader expects the QSPI memory to be pre-configured by user code in the bootloader for read/write operation. The bootloader code operates under the assumption that the user has configured the QSPI in Extended-SPI mode and that `R_QSPI_Open()` has been called prior to invoking `boot_go()`. For example, on the EK_RA6M4 which has the MX25L25645G QSPI flash, after adding the QSPI module to the project, calling the following snippet will configure the QSPI for read/write operation:

```
/* Status Register (SREG) payload size */
# define SREG_SIZE 0x03
# define QSPI_COMMAND_WRITE_STATUS_REGISTER 0x01
# define QSPI_DEFAULT_SR1 0x40
# define QSPI_DEFAULT_SR2 0x00
/* Status register payload */
uint8_t data_sreg[SREG_SIZE] = {QSPI_COMMAND_WRITE_STATUS_REGISTER,
QSPI_DEFAULT_SR1, QSPI_DEFAULT_SR2};
R_QSPI_Open(&g_qspi0_ctrl, &g_qspi0_cfg);
/* Configure for Extended SPI Read/Write Mode */
R_QSPI_DirectWrite(&g_qspi0_ctrl, &(g_qspi0_cfg.write_enable_command), 1, false);
R_QSPI_DirectWrite(&g_qspi0_ctrl, data_sreg, SREG_SIZE, false);
```

For a more detailed example on how to initialize the QSPI device, refer to the QSPI module. The QSPI sector size must be the same as that of the MCU internal flash (`BSP_FEATURE_FLASH_HP_CF_REGION1_BLOCK_SIZE`) for swap mode operation.

MCUboot Memory Map

For single image projects with no external memory support, the default memory map looks like:

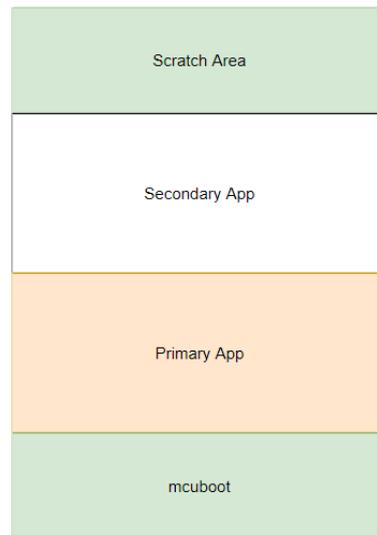

Figure 151: MCUboot Memory Map

For projects with 2 separately updateable images (used for TrustZone applications where the Secure and Non-Secure images can be updated separately), the default memory map with no external memory support looks like:

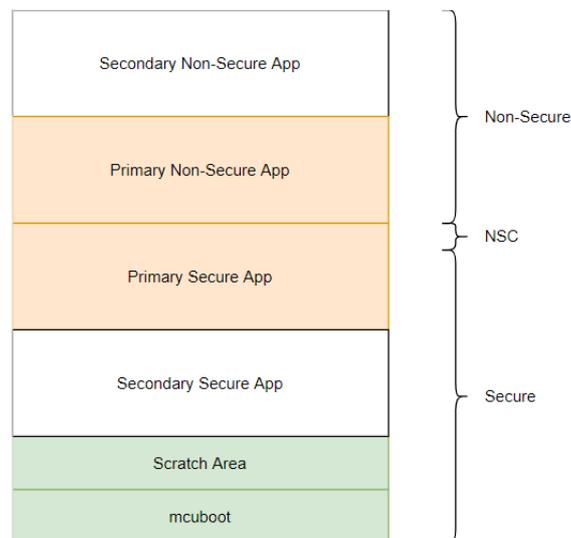

Figure 152: MCUboot Memory Map (TrustZone)

For single image projects with QSPI, the default memory map looks like:

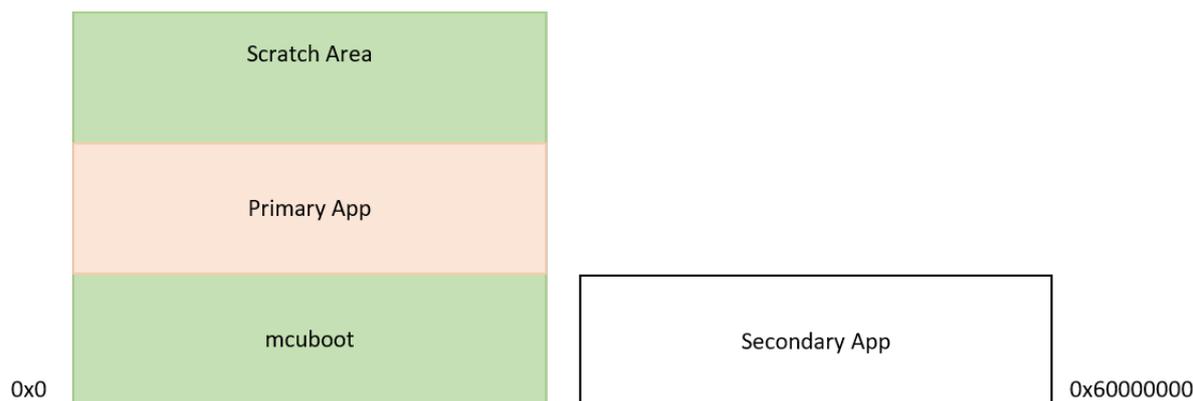

Figure 153: MCUboot Memory Map with QSPI

MCUboot verification options

MCUboot in FSP supports the following secure image verification options

1. Hash verification only (SHA256).
2. Hash and signature verification (ECDSA-P256, RSA-2048 and RSA-3072).
3. Hash, signature verification and image encryption (ECIES-P256 and RSA-OAEP-2048 with AES-128).
4. Hash and image encryption only.

MCUboot also supports signature verification using EdDSA-25519 and image encryption using AES-KW-128 and AES-KW-256 but those are currently not supported in FSP.

Notes

When encryption is enabled, MCUboot requires the image in the primary slot to be unencrypted. Only the image loaded in the secondary slot can be encrypted.

MCUboot Crypto Stack Options

The following crypto stacks can be used with MCUboot in FSP:

1. MbedTLS, which is hardware accelerated on all RA devices. On the RA2 which has an AES engine only, ECC/RSA/SHA operations are in software.
2. TinyCrypt (S/W Only) can be used with all devices.
3. TinyCrypt (H/W Accelerated) has AES operations accelerated for the RA2 family only. When using MCUboot without encryption there is no difference between using this or the S/W only version.
4. SCE9 Protected Mode on devices that have the SCE9 (eg: RA6M4, RA4M3, RA4M2)

MbedTLS provides the best performance for MCUboot signature verification on the RA6 and RA4 devices but has a much larger code footprint compared to TinyCrypt. For RA2 devices TinyCrypt is the best option.

MCUboot boot time

The time from Reset to executing the application will depend on how quickly MCUboot finishes execution. This is dependent on a variety of factors including

1. The crypto algorithms chosen for image verification and whether hardware acceleration is enabled. Hardware accelerated SHA256 will be the fastest while encryption enabled modes will be the slowest.
2. The operating clock speeds.
3. Whether flash programming was required.

Reducing boot time on SCE9 devices

On devices that have the SCE9, it is possible to reduce the time taken for EC-P256 signature verification by setting the Initialization property for the SCE9 module to only initialize the crypto primitives required for EC-P256 verification. Note that this feature is only supported for EC-P256 currently. Enabling it for any other algorithm will cause a runtime failure.

Using SCE9 Protected Mode Crypto Stack

Using this crypto stack with MCUboot provides additional security by ensuring that any keys that are used were securely provisioned for the specific device. The Application Note "Installing and Updating Secure Keys for RA Family" (R11AN0496) provides detailed steps on how to go about installing these keys. Since the section "Preparing Keys for Installation and Update Using RFP" document currently only provides information on how to install an AES key, this section will provide information on how to install an ECC public key. These steps can be used to install the public keys used for image verification or the keys used for image encryption.

Note

When using the SCE9 Protected Mode Stack with MCUboot it is required that the public keys in the format described in the "MCUboot Example Keys" module in the stack is also provided in the project.

Installing public keys used for signature verification

1. Generate an ECC key pair. There are various ways to do this but you can use openssl to do so: "openssl ecparam -name secp256k1 -genkey -noout -out my_ecc_secp256k1_key.pem".
2. Once the key is generated, in order to install the public key using RFP (Renesas Flash Programmer) the user needs to have their own UFPK (User Factory Programming Key) and W-UFPK (Wrapped User Factory Programming Key). Refer to R11AN0496 on how to obtain these keys.
3. Once the UFPK and W-UFPK are available, we need to extract the public key from the pem file. The public key can be viewed by using "openssl ec -noout -text -in my_ecc_secp256k1_key.pem". Note that when the ECC public key is printed out this way, it will contain a 0x04 ASN.1 prefix at the start, which should be discarded.
4. Use the rfp-util.exe utility from the RFP installation folder to wrap the public key using the UFPK and W-UFPK into a format that can be installed by RFP and the factory bootloader on the MCU.
5. Use RFP as described in R11AN0496 to install the key to the location of mcuboot_sce9_key section.

These are examples that install the default keys provided with MCUboot in ra/mcu-tools/MCUboot/. The examples assume that UFPK and W-UFPK are already available.

```
//Print out the EC-P256 Public Key using openssl
C:\ openssl ec -noout -text -in root-ec-p256.pem
read EC key
Private-Key: (256 bit)
```

```

// From the bootloader map file determine the address of mcuboot_sce9_key section
Use RFP to install "RSA_3072_pub_install.rkey" as described in "Installing and
Updating Secure Keys for RA Family" (R11AN0496) to the address where the
mcuboot_sce9_key section is located.
```

Examples

Basic Example

This is an example of using MCUboot in an application.

```
void rm_mcuboot_port_example (void)
{
#ifdef MCUBOOT_USE_MBED_TLS
/* Initialize mbedtls. */
mbedtls_platform_context ctx = {0};
assert(0 == mbedtls_platform_setup(&ctx));
```

```
#elif defined(MCUBOOT_USE_TINYCRYPT)
/* Initialize TinyCrypt port. */
assert(FSP_SUCCESS == RM_TINYCRYPT_PORT_Init());
#else
/* Initialize SCE9 Protected Mode driver. */
sce_instance_ctrl_t sce_ctrl;
const sce_cfg_t     sce_cfg =
    {.lifecycle = SCE_SSD};
assert(FSP_SUCCESS == R_SCE_Open(&sce_ctrl, &sce_cfg));
#endif
/* (Optional) To check for updates, call boot_set_pending. */
bool update = 0;
if (update)
{
    boot_set_pending(0);
}
/* Verify the boot image and get its location. */
struct boot_rsp rsp;
assert(0 == boot_go(&rsp));
/* Enter the application. */
RM_MCUBOOT_PORT_BootApp(&rsp);
}
```

5.2.5 CapTouch

Modules

Detailed Description

CapTouch Modules.

Modules

CTSU (r_cts)

This HAL driver supports the Capacitive Touch Sensing Unit (CTSUS). It implements the [CTSUS Interface](#).

Touch (rm_touch)

This module supports the Capacitive Touch Sensing Unit (CTSUS). It implements the [Touch Middleware Interface](#).

5.2.5.1 CTSU (r_ctsu)

Modules » [CapTouch](#)

Functions

`fsp_err_t` [R_CTSU_Open](#) (`ctsu_ctrl_t *const p_ctrl, csu_cfg_t const *const p_cfg`)

Opens and configures the CTSU driver module. Implements [ctsu_api_t::open](#). [More...](#)

`fsp_err_t` [R_CTSU_ScanStart](#) (`ctsu_ctrl_t *const p_ctrl`)

This function should be called each time a periodic timer expires. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Before starting the next scan, first get the data with [R_CTSU_DataGet\(\)](#). If a different control block scan should be run, check the scan is complete before executing. Implements [ctsu_api_t::scanStart](#). [More...](#)

`fsp_err_t` [R_CTSU_DataGet](#) (`ctsu_ctrl_t *const p_ctrl, uint16_t *p_data`)

This function gets the sensor values as scanned by the CTSU. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Implements [ctsu_api_t::dataGet](#). [More...](#)

`fsp_err_t` [R_CTSU_OffsetTuning](#) (`ctsu_ctrl_t *const p_ctrl`)

This function tunes the offset register(SO). Call after the measurement is completed. If the return value is `FSP_ERR_CTSU_INCOMPLETE_TUNING`, tuning is not complete. Execute the measurement and this function call routine until the return value becomes `FSP_SUCCESS`. It is recommended to run this routine after [R_CTSU_Open\(\)](#). It can be recalled and tuned again. When the automatic judgement is enabled, after the offset tuning is completed, the baseline initialization bit flag is set. Implements [ctsu_api_t::offsetTuning](#). [More...](#)

`fsp_err_t` [R_CTSU_ScanStop](#) (`ctsu_ctrl_t *const p_ctrl`)

This function scan stops the sensor as scanning by the CTSU. Implements [ctsu_api_t::scanStop](#). [More...](#)

`fsp_err_t R_CTSU_CallbackSet (ctsu_ctrl_t *const p_api_ctrl, void(*p_callback)(ctsu_callback_args_t *), void const *const p_context, ctsu_callback_args_t *const p_callback_memory)`

`fsp_err_t R_CTSU_Close (ctsu_ctrl_t *const p_ctrl)`
Disables specified CTSU control block. Implements [ctsu_api_t::close](#).
[More...](#)

`fsp_err_t R_CTSU_SpecificDataGet (ctsu_ctrl_t *const p_ctrl, uint16_t *p_specific_data, ctsu_specific_data_type_t specific_data_type)`
This function gets the sensor specific data values as scanned by the CTSU. Call this function after calling the [R_CTSU_DataGet\(\)](#) function.
[More...](#)

`fsp_err_t R_CTSU_DataInsert (ctsu_ctrl_t *const p_ctrl, uint16_t *p_insert_data)`
This function inserts the value of the second argument as the measurement result value. Call this function after calling the [R_CTSU_DataInsert\(\)](#) function. Implements [ctsu_api_t::dataInsert](#).
[More...](#)

`fsp_err_t R_CTSU_Diagnosis (ctsu_ctrl_t *const p_ctrl)`
Diagnosis the CTSU peripheral. Implements [ctsu_api_t::diagnosis](#).
[More...](#)

Detailed Description

This HAL driver supports the Capacitive Touch Sensing Unit (CTSU). It implements the [CTSU Interface](#).

Overview

The capacitive touch sensing unit HAL driver (r_ctsu) provides an API to control the CTSU peripheral. This module performs capacitance measurement based on various settings defined by the configuration. This module is configured via the [QE for Capacitive Touch](#).

Features

- Supports multiple scan modes
 - Self-capacitance multi scan mode (CTSU2 support active shield)
 - Mutual-capacitance full scan mode
 - Mutual-capacitance parallel scan mode (CTSU2)
 - Current Measurement mode (CTSU2)
 - Diagnosis scan mode

- Scans may be started by software or an external trigger
- Returns measured capacitance data on scan completion
- Support DTC transfer of scanned data
- Supports TrustZone
- Corrects accuracy for temperature drift (CTS2)

Configuration

Note

This module is configured via the [QE for Capacitive Touch](#). For information on how to use the QE tool, once the tool is installed click [Help](#) -> [Help Contents in e² studio](#) and search for "QE".

Build Time Configurations for r_cts

The following build time configurations are defined in fsp_cfg/r_cts_cfg.h:

| Configuration | Options | Default | Description |
|--------------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Support for using DTC | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Enable DTC support for the CTSU module. |
| Interrupt priority level | MCU Specific Options | | Priority level of all CTSU interrupt (CSTU_WR, CTSU_RD, CTSU_FN) |

Configurations for CapTouch > CTSU (r_cts)

This module can be added to the Stacks tab via New Stack > CapTouch > CTSU (r_cts). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|--------------------|----------------------|---------|--------------------------------|
| Scan Start Trigger | MCU Specific Options | | CTSU Scan Start Trigger Select |

Interrupt Configuration

The first [R_CTSU_Open](#) function call sets CTSU peripheral interrupts. The user should provide a callback function to be invoked at the end of the CTSU scan sequence. The callback argument will contain information about the scan status.

Clock Configuration

The CTSU peripheral module uses PCLKB as its clock source. You can set the PCLKB frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

Note

The CTSU Drive pulse will be calculated and set by the tooling depending on the selected transfer rate.

Pin Configuration

The TSn pins are sensor pins for the CTSU.

The TSCAP pin is used for an internal low-pass filter and must be connected to an external decoupling capacitor.

Usage Notes

The CTSU module is a CTSU driver for the Touch module. The CTSU module assumes the access from the Touch middleware layer, and it is also accessible from an user application.

CTSU and CTSU2 are functionally different, so CTSU and CTSU2 are described in this application note as below.

Common description for CTSU and CTSU2 -> CTSU

Description only for CTSU -> CTSU1

Description only for CTSU2 -> CTSU2

Without mention, it means the common description for CTSU and CTSU2.

Functions

The CTSU module supports the following functions.

Touch Judgment Mode

CTSU2 has two modes, which differ in processing and output data.

It is common to get three raw value for each element and calculate CCO correction, and then performs different processing.

1. Value Majority Mode(VMM)

Calculate three frequency correction value from three CCO correction values. Calculate the sum of the two closest values of the three frequency correction value. Outputs the moving average of this added value.

Figure 154: Value Majority Mode (VMM)

2. Judgement Majority Mode (JMM)

This mode is supported from FSP V5.1.0 or later.

Outputs the moving average of three CCO correction values.

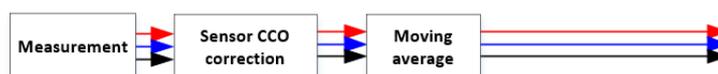

Figure 155: Judgement Majority Mode (JMM)

Measurements and Obtaining Data

Measurements can be started by a software trigger or by an external event triggered by the Event

Link Controller (ELC).

As the measurement process is carried out by the CTSU2 peripheral, it does not use up main processor processing time.

The CTSU module processes INTCTSUWR and INTCTSURD if generated during a measurement. The data transfer controller (DTC) can also be used for these processes.

When the measurement complete interrupt (INTCTSUFN) process is complete, the application is notified in a callback function. Make sure you obtain the measurement results before the next measurement is started as internal processes are also executed when a measurement is completed. Start the measurement with API function [R_CTSU_ScanStart\(\)](#).

Obtain the measurement results with API function [R_CTSU_DataGet\(\)](#).

The number of arrays in the second argument of [R_CTSU_DataGet\(\)](#) is different between VMM and JMM.

VMM returns one measurement result for each element.

JMM returns three measurement results for each element.

Sensor CCO Correction function

The CTSU2 peripheral has a built-in correction circuit to handle the potential microvariations related to the manufacturing process of the sensor CCO MCU.

The module temporarily transitions to the correction process during initialization after power is turned on. In the correction process, the correction circuit is used to generate a correction coefficient (factor) to ensure accurate sensor measurement values.

When temperature correction is enabled, an external resistor connected to a TS terminal is used to periodically update the correction coefficient. By using an external resistor that is not dependent on temperature, you can even correct the temperature drift of the sensor CCO.

In CTSU2's Majority Value Mode, there is only one type of CCO correction, but in Majority Judgment Mode, three types of CCO correction are performed for each three frequencies.

Initial Offset Adjustment

The CTSU2 peripheral was designed with a built-in offset current circuit in consideration of the amount of change in current due to touch. The offset current circuit cancels enough of the parasitic capacitance for it to fit within the sensor CCO dynamic range.

This module automatically adjusts the offset current setting. As the adjustment uses the normal measurement process, the combination of [R_CTSU_ScanStart\(\)](#) and [R_CTSU_DataGet\(\)](#) or the combination of [R_CTSU_ScanStart\(\)](#) and [R_CTSU_OffsetTuning\(\)](#) must be repeated several times after startup. Because the `ctsu_element_cfg_t` member "so" is the starting point for adjustments, you can set the appropriate value for "so" in order to reduce the number of times the two functions must be run to complete the adjustment. Normally, the value used for "so" is a value adjusted by QE for Capacitive Touch.

[R_CTSU_OffsetTuning\(\)](#) was added in FSP 3.8.0. This API can also be used for initial offset adjustment, and offset adjustment can be performed again at any time. See example code of [R_CTSU_OffsetTuning\(\)](#) for details.

| Mode | CTSU1 target value | CTSU2 target value |
|--------------------------------------|--------------------|--------------------|
| Self-capacitance | 15360 (37.5%) | 15360 (50%) |
| Self-capacitance using active shield | - | 6144 (20%) |
| Mutual-capacitance | 10240 (20%) | 10240 (33.3%) |

The percentage is for the CCO's input limit. In CTSU1, 100% is the measured value 40960. In CTSU2, 100% is the measured value 30720.

The target value is based on 526us(CTSU1) or 256us(CTSU2).

When the measurement time is changed, the target value is adjusted by the ratio with the base time.

Example of target value in combination of CTSUSNUM and CTSUSDPA.

CTSU1 (CTSU clock = 32MHz, Self-capacitance mode)

| Target value | CTSUSNUM | CTSUSDPA | Measurement time |
|--------------|----------|----------|------------------|
| 15360 | 0x3 | 0x7 | 526usec |
| 30720 | 0x7 | 0x7 | 1052usec |
| 30720 | 0x3 | 0xF | 1052usec |
| 7680 | 0x1 | 0x7 | 263usec |
| 7680 | 0x3 | 0x3 | 263usec |

The measurement time changes depending on the combination of CTSUSNUM and CTSUSDPA. In the above table, CTSUPRRATIO is the recommended value of 3, and CSTUPRMODE is the recommended value of 2.

When changing CTSUPRRATIO and CTSUPRMODE from the recommended values, follow the Hardware Manual for the measurement time.

CTSU2 (Self-capacitance mode)

| Target value | Target value (multi frequency) | CTSUSNUM | Measurement time |
|--------------|--------------------------------|----------|------------------|
| 7680 | 15360 (128us + 128us) | 0x7 | 128usec |
| 15360 | 30720 (256us + 256us) | 0xF | 256usec |
| 3840 | 7680 (64us + 64us) | 0x3 | 64usec |

The measurement time changes depending on CTSUSNUM.

If STCLK cannot be set to 0.5MHz, it will not support the table above.

When setting STCLK to other than 0.5MHz because the CTSU clock is not an integer, follow the hardware manual for the measurement time.

Random Pulse Frequency Measurement (CTSU1)

The CTSU1 peripheral measures at one drive frequency.

The drive frequency determines the amperage to the electrode and generally uses the value tuned with QE for Capacitive Touch.

The drive frequency is calculated as below.

It is determined by PCLK frequency input to CTSU, CTSU Count Source Select bit(CTSUCLK), and CTSU Sensor Drive pulse Division Control bit(CTSUSDPA). For example, If it is set PCLK =32MHz, CTSUCLK = PLCK/2, and CTSUSDPA = 1/16, then drive frequency is 0.5MHz. CTSUSDPA can change for each TS port.

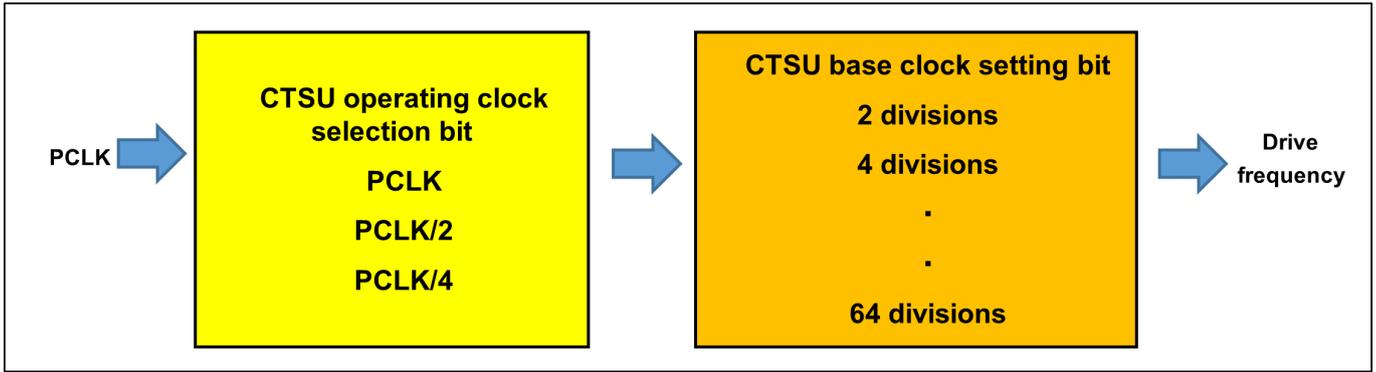

Figure 156: Drive Frequency Settings

The actual drive pulse is phase-shifted and frequency-spread with respect to the clock based on the drive frequency as a measure against external environmental noise. This module is fixed at initialization and sets the following.

CTSUSOFF = 0, CTSUSSMOD = 0, CTSUSSCNT = 3

Multi-frequency Measurements (CTSU2)

The CTSU2 peripheral can measure in one of four drive frequencies to avoid synchronous noise. With the default settings, the module takes measurements at three different frequencies. This data are called raw data. And calculate CCO correction. This data are called CCO correction data. In VMM, After standardizing the results obtained at the three frequencies in accordance with the first frequency reference value, the measured value is determined based on majority in a process referred to as "normalization."

The three values standardized to the first frequency reference value are called frequency correction data.

You can get the three correction data with `R_CTSU_SpecificDataGet()`.

In VMM, three raw data, CCO correction data, and frequency correction data can be obtained with `R_CTSU_SpecificDataGet()`.

In JMM, three raw data and three CCO correction data can be obtained with `R_CTSU_SpecificDataGet()`.

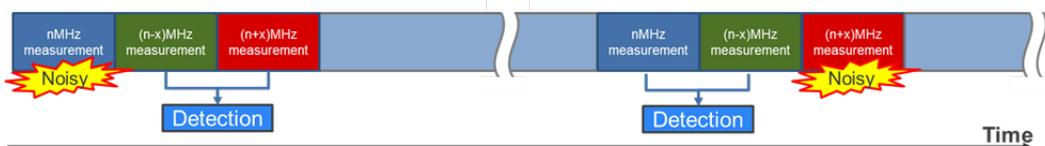

Figure 157: Multi-frequency Measurements

Drive frequency is determined based on the config settings. The module sets registers according to the config settings, and sets the three drive frequencies.

Drive frequency is calculated in the following equation:

$$(PCLKB \text{ frequency} / CLK / STCLK) \times SUMULTIn / 2 / SDPA : n = 0, 1, 2$$

The figure below shows the settings for generating a 2MHz drive frequency when the PCLKB frequency is 32 MHz. SDPA can be set for each touch interface configuration.

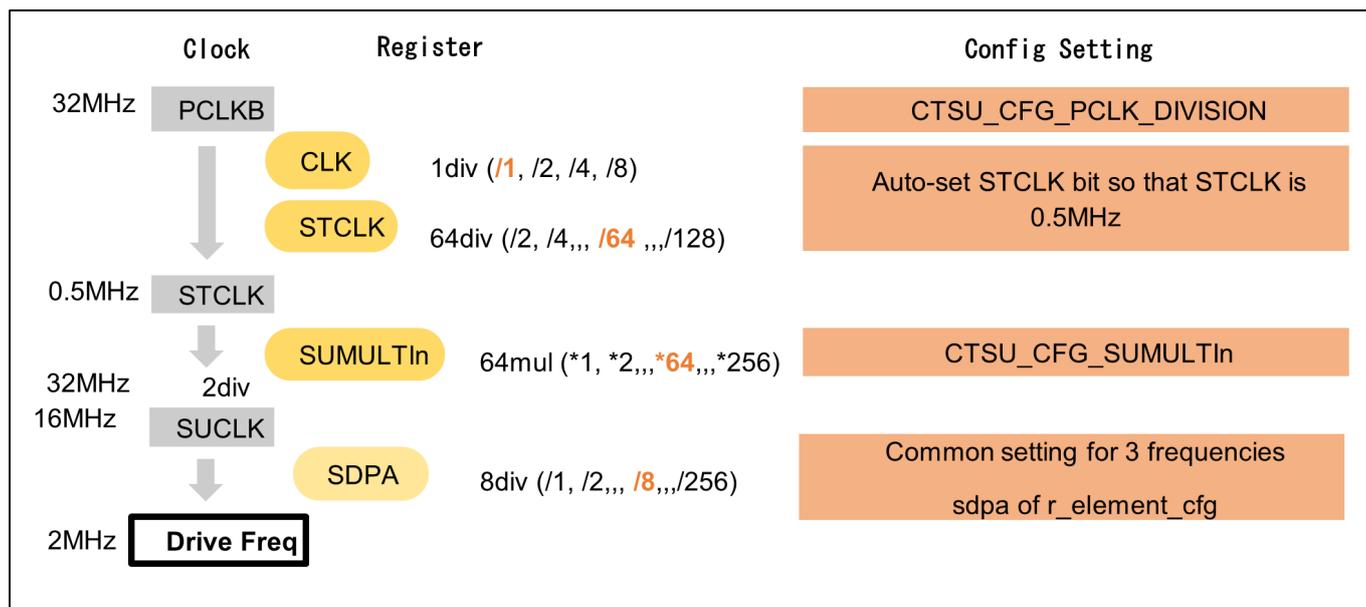

Figure 158: Drive Frequency Settings

Shield Function(CTS2)

The CTSU2 peripheral has a built-in function that outputs a shield signal in phase with the drive pulse from the shield terminal and the non-measurement terminal in order to shield against external influences while suppressing any increase in parasitic capacitance. This function can only be used during self-capacitance measurements.

This module allows the user to set a shield for each touch interface configuration.

For example, for the electrode configuration shown in , the members of `ctsu_cfg_t` should be set as follows. Other members have been omitted for the example.

```
.txvsel = CTSU_TXVSEL_INTERNAL_POWER,
.txvsel2 = CTSU_TXVSEL_MODE,
.md = CTSU_MODE_SELF_MULTI_SCAN,
.posel = CTSU_POSEL_SAME_PULSE,
.ctsuchac0 = 0x0F,
.ctsuchtrc0 = 0x08,
```

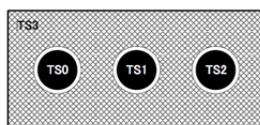

Figure 159: Example of Shield Electrode Structure

Measurement Error Message

When the CTSU2 peripheral detects an abnormal measurement, it sets the status register bit to 1. In the measurement complete interrupt process, the module reads ICOMP1, ICOMP0, and SENSOVF of the status register and notifies the results in the callback function. The status register is reset after the contents are read. For more details on abnormal measurements, refer to "member event" in the `ctsu_callback_args_t` callback function argument.

Moving Average

This function calculates the moving average of the measured results.
Set the number of times the moving average should be calculated in the config settings.

Diagnosis Function

The CTSU peripheral has a built-in function that diagnoses its own inner circuit. This diagnosis function provides the API for diagnosing the inner circuit.

The diagnostic requirements are different for CTSU1 and CTSU2 providing 5 types of diagnosis for CTSU1 and 9 types for CTSU2.

The diagnosis function is executed by calling the API function. This is executed independently from the other measurements and does not affect them.

To enable the diagnosis function, set `CTSU_CFG_DIAG_SUPPORT_ENABLE` to 1.

For CTSU1, a 27pF condenser should be connected externally.

For CTSU2, Diagnosis function uses the ADC module.

If an error occurs in the ADC module used for Diagnosis mode, return `FSP_ERR_ABORTED` as the return value of `R_CTSU_DataGet()`.

If an ADC error is returned, exit the function so as not to measure or close the ADC.

See ADC (r_adc) for ADC module errors.

Please pay particular attention to the following three points.

1. Be sure to measure the ADC module when using the Diagnosis mode function of the CTSU module. Therefore, in order for the user to use it with Diagnosis, please close the user's ADC. After closing, please use the Diagnosis mode function of the CTSU module.
2. When creating an application with RTOS, please be careful about the scheduling of the CTSU module's Diagnosis mode function task and the user's ADC task.
3. If `FSP_ERR_ABORTED` occurs, please call the user's ADC again when using the user's ADC.

Measurement Mode

This module supports all three modes offered by the CTSU2 peripheral: self-capacitance, mutual-capacitance, and current measurement modes. The temperature correction mode is also offered as a mode for updating the correction coefficient.

Self-capacitance Mode

The self-capacitance mode is used to measure the capacitance of each terminal (TS).

The CTSU2 peripheral measures the terminals in ascending order according to the TS numbers, then stores the data. For example, even if you want to use TS5, TS8, TS2, TS3 and TS6 in your application in that order, they will still be measured and stored in the order of TS2, TS3, TS5, TS6, and TS8.

Therefore, you will need to reference buffer indexes [2], [4], [0], [1], and [3].

VMM returns one measurement result for each element.

JMM returns three measurement results for each element.

[CTSU1]

In default settings, the measurement period for each TS is wait-time plus approximately 526us.

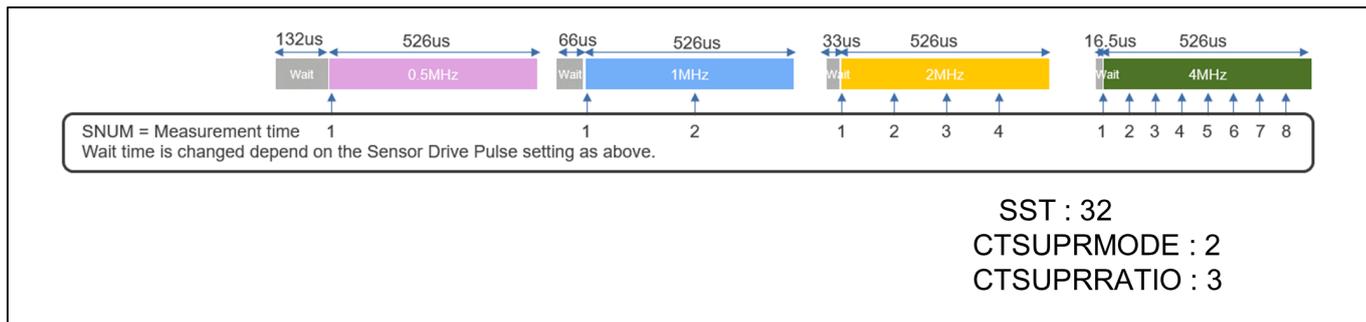

Figure 160: Self-capacitance Measurement Period (CTS1)

[CTS2]

In default settings, the measurement period for each TS is approximately 576us.

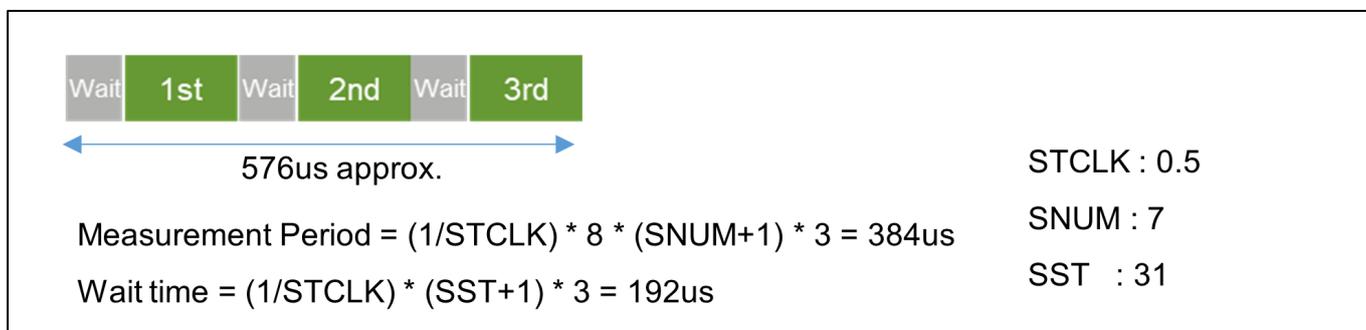

Figure 161: Self-capacitance Measurement Period (CTS2)

Mutual-Capacitance Mode

The mutual-capacitance mode is used to measure the capacitance generated between the receive TS (Rx) and transmit TS (Tx), and therefore requires at least two terminals.

The CTSU2 peripheral measures all specified combinations of Rx and Tx. For example, when Rx is TS1 and TS3, and Tx is TS2, TS7 and TS4, the combinations are measured in the following order and the data is stored.

TS3-TS2, TS3-TS4, TS3-TS7, TS10-TS2, TS10-TS4, TS10-TS7

To measure the mutual-capacitance generated between electrodes, the CTSU2 peripheral performs the measurement process on the same electrode twice.

The mutual-capacitance is obtained by inverting the phase relationship of the pulse output and switched capacitor in the primary and secondary measurements, and calculating the difference between the two measurements. This module does not calculate the difference, but outputs the secondary measured result.

VMM returns two measurement results for each element.

JMM returns six measurement results for each element.

[CTS1]

In default settings, the measurement period for each TS is twice of wait-time plus approximately 526us.

[CTS2]

In default settings, the measurement period for each TS is approximately 1152us.

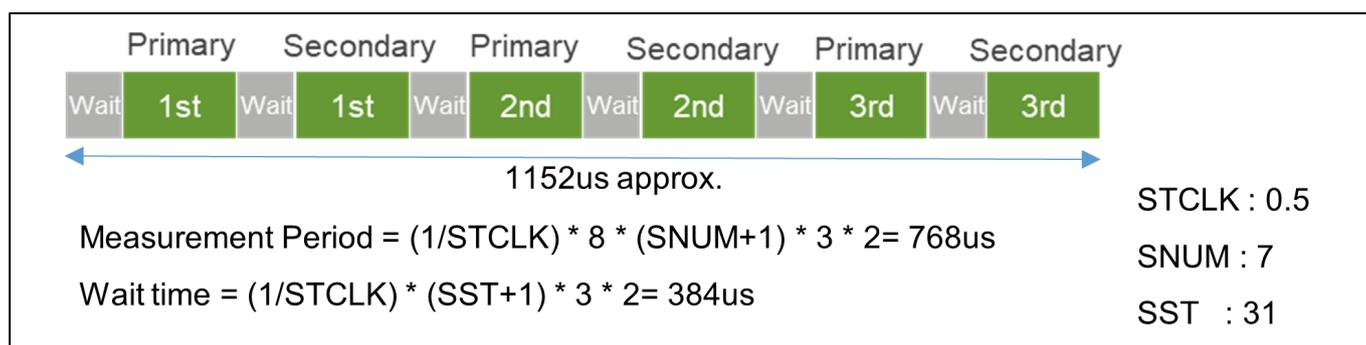

Figure 162: Mutual-capacitance Measurement Period

Mutual-capacitance parallel scan mode(CTS2)

This mode provides fast measurement time by parallel scanning the RX lines with a CFC circuit. Operation is otherwise identical to normal CTSU mutual scanning.

- Scan Order
 - The hardware scans all RX pins simultaneously for each TX pin.
 - For example, if sensors TS10, TS11, and TS03 are specified as RX sensors, and sensors TS02, TS07, and TS04 are specified as TX sensors, the hardware will scan them in the following sensor-pair order:
TS02-(TS03, TS10, TS11), TS04-(TS03, TS10, TS11), TS07-(TS03, TS10, TS11)
- Element
 - An element refers to the index of a sensor-pair within the scan order. Using the previous example, TS07-TS10 is element 7.
- Scan Time
 - Because the RX lines are scanned in parallel, CFC mutual-capacitance scan is the same amount of times faster than a basic mutual matrix scan as the number of RX lines. In other words, on a matrix with N receive lines, CFC mutual scanning is N times faster than basic mutual scanning. Set CTSU_MODE_MUTUAL_CFC_SCAN to "md" of [cts_u_cfg_t](#).
Also, add the number of matrix used for this measurement to CTSU_CFG_NUM_MUTUAL_ELEMENTS. In addition, set the number of CTSU_CFG_NUM_CFC and CTSU_CFG_NUM_CFC_TX.
For details, refer to the configuration and sample application output by QE for Capacitive Touch.

Current Measurement Mode(CTS2)

The current measurement mode is used to measure the minute current input to the TS terminal. The order of measurement and data storage is the same as that of the self-capacitance mode. As this does not involve the switched capacitor operation, the measurement is only performed once. The measurement period for one TS under default settings is approximately 256us. The current measurement mode requires a longer stable wait time than the other modes, so the SST is set to 63.

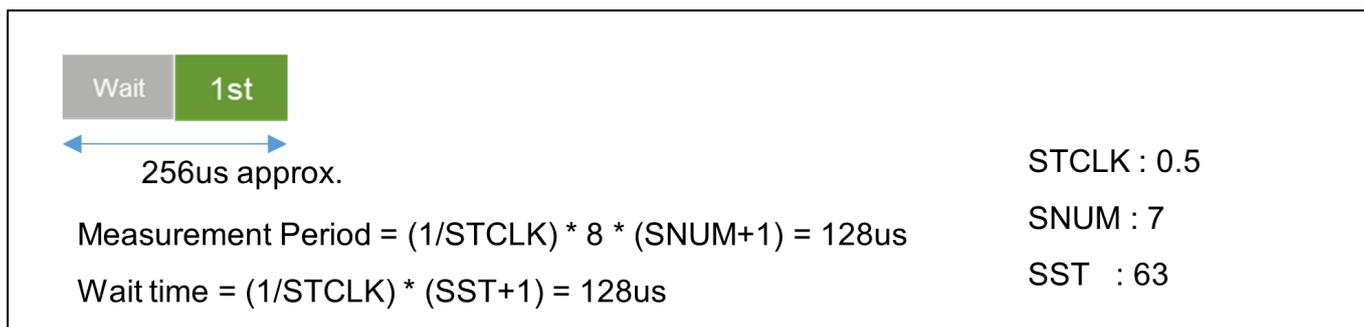

Figure 163: Current Measurement Period

Temperature Correction Mode(CTS2)

The temperature correction mode is used to periodically update the correction coefficient using an external resistor connected to a TS terminal. This involves three processes as described below. Also refer to the timing chart in Figure of Temperature Correction Measurement Timing Chart.

1. Measure the correction circuit. One set comprises twelve measurements.
2. Measure the current when TSCAP voltage is applied to the external resistor to create a correction coefficient based on an external resistor that does not depend on temperature. Execute the next measurement after the previous measurement set is completed (as described in step 1).
3. Flow offset current to the external resistor and measure the voltage with the ADC. This will adjust the RTRIM register and handle the temperature drift of the internal reference resistor. In the config settings, set the number of times step 2 should be executed before carrying out this measurement.

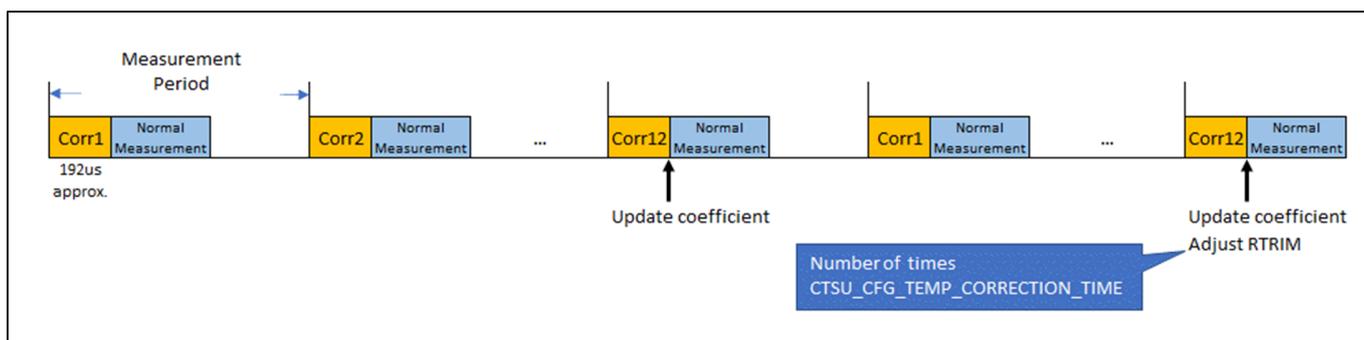

Figure 164: Temperature Correction Measurement Timing Chart

Temperature correction uses the ADC module.

If an error occurs in the ADC module used for temperature correction, return `FSP_ERR_ABORTED` as the return value of `R_CTSU_DataGet()`.

If an ADC error is returned, exit the function so as not to measure or close the ADC.

See ADC (r_adc) for ADC module errors.

Please pay particular attention to the following three points.

1. When using the temperature correction of the CTSU module, be sure to measure the ADC

module. Therefore, please close the user's ADC for use in temperature correction. After closing, please use temperature correction of CTSU module.

2. When creating an RTOS, please be careful about the scheduling of the CTSU module's temperature correction task and the user's ADC task when creating an application.
3. If FSP_ERR_ABORTED occurs, please call the user's ADC again when using the user's ADC.

Diagnosis Mode

The diagnosis mode is a mode in which various internal measurement values are scanned by using this diagnosis function [R_CTSU_Diagnosis\(\)](#).

Measurement Timing

Measurements are initiated by a software trigger or an external event which is triggered by the Event Link Controller (ELC).

The most common method is using a timer to carry out periodic measurements. Make sure to set the timer interval to allow the measurement and internal value update processes to complete before the next measurement period. The measurement period differs according to touch interface configuration and measurement mode.

The execution timing of software triggers and external triggers differ slightly.

Since a software trigger sets the start flag after setting the touch interface configuration with [R_CTSU_ScanStart\(\)](#), there is a slight delay after the timer event occurrence. However, as the delay is much smaller than the measurement period, a software trigger is recommended for most instances as it is easy to set.

An external trigger is recommended for applications in which this slight delay is not acceptable or that require low-power consumption operations. When using an external trigger with multiple touch interface configurations, use [R_CTSU_ScanStart\(\)](#) to set another touch interface configuration after one measurement is completed.

TrustZone Support

In `r_cts` and `rm_touch` module, Non-Secure Callable Guard Functions are only generated from QE for Capacitive Touch. QE can be used for tuning in secure or flat project, but not in non-secure project. If you want to use in non-secure project, copy the output file from secure or flat project. Refer to QE Help for more information.

Data flow

The flow of storing data in RAM is as follows.

(CTSU1)

1. Read registers and stored in RAM as raw data.
2. ICO correction calculation of raw data and stored in RAM as correction data.
3. The correction data is calculated by moving average and stored in RAM as measurement results.

(CTSU2 VMM)

1. Reads a register and stores raw data measured at three different frequencies in RAM.
2. Calculate CCO correction from three raw data and stored three CCO correction values in RAM.

3. Calculate three frequency correction values from three CCO correction values.
4. Three frequency correction data are calculated by majority decision and moving average, and stored in RAM as measurement results.

(CTSU2 JMM)

1. Reads a register and stores raw data measured at three different frequencies in RAM.
2. Calculate CCO correction from three raw data and stored three CCO correction values in RAM.
3. three CCO correction data is calculated by moving average and stored three measurement results in RAM.

Add user's filter

There are two ways to add the user's filter.

1. Instead of filter calculation of [R_CTSU_DataGet\(\)](#), perform user filter calculation and use [R_CTSU_DataInsert\(\)](#) to input user filter calculation result.
[R_CTSU_DataInsert\(\)](#)
In VMM, the second argument `p_insert_data` stores one data for each element.
In JMM, the second argument `p_insert_data` stores three data for each element.
2. Using the correction data obtained by [R_CTSU_SpecificDataGet\(\)](#), instead of majority decision calculation and filter calculation of [R_CTSU_DataGet\(\)](#), perform user majority decision calculation & filter calculation and use [R_CTSU_DataInsert\(\)](#) to input user majority decision calculation & filter calculation result.

Please check example.

[User's filter additional Example](#)

Examples

Basic Example

This is a basic example of minimal use of the CTSU in an application.

```
volatile bool g_scan_flag = false;

void ctsu_callback (ctsu_callback_args_t * p_args)
{
    if (CTSU_EVENT_SCAN_COMPLETE == p_args->event)
    {
        g_scan_flag = true;
    }
}

void ctsu_basic_example (void)
{
```

```
fsp_err_t err = FSP_SUCCESS;

uint16_t data[CTSU_CFG_NUM_SELF_ELEMENTS];

err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

while (true)
{
    err = R_CTSU_ScanStart(&g_ctsu_ctrl);
    assert(FSP_SUCCESS == err);

while (!g_scan_flag)
{
    /* Wait for scan end callback */
}

    g_scan_flag = false;
    err = R_CTSU_DataGet(&g_ctsu_ctrl, data);

if (FSP_SUCCESS == err)
{
    /* Application specific data processing. */
}
}
}
```

Multi-configuration Example

This is an optional example of using both Self-capacitance and Mutual-capacitance configurations in the same project.

```
void ctsu_optional_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    uint16_t data[CTSU_CFG_NUM_SELF_ELEMENTS + (CTSU_CFG_NUM_MUTUAL_ELEMENTS * 2)];

    err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);
    assert(FSP_SUCCESS == err);

    err = R_CTSU_Open(&g_ctsu_ctrl_mutual, &g_ctsu_cfg_mutual);
    assert(FSP_SUCCESS == err);
}
```

```
while (true)
{
R_CTSU_ScanStart(&g_ctsu_ctrl);
while (!g_scan_flag)
{
/* Wait for scan end callback */
}
g_scan_flag = false;
R_CTSU_ScanStart(&g_ctsu_ctrl_mutual);
while (!g_scan_flag)
{
/* Wait for scan end callback */
}
g_scan_flag = false;
err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
assert(FSP_SUCCESS == err);
if (FSP_SUCCESS == err)
{
/* Application specific data processing. */
}
err = R_CTSU_DataGet(&g_ctsu_ctrl_mutual, data);
assert(FSP_SUCCESS == err);
if (FSP_SUCCESS == err)
{
/* Application specific data processing. */
}
}
}
```

Offset Adjustment Example

This is an example of offset adjustment using `R_CTSU_OffsetTuning()`.

After completing `R_CTSU_Open()`, perform initial offset adjustment.

Offset adjustment is performed again when the parasitic capacitance changes significantly due to changes in the surrounding environment and the count value becomes an abnormal value.

```
void ctsu_offsettuning_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    uint16_t data[CTSU_CFG_NUM_SELF_ELEMENTS];

    err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);
    assert(FSP_SUCCESS == err);

    /* Initial offset tuning */
    do
    {
        R_CTSU_ScanStart(&g_ctsu_ctrl);
        while (!g_scan_flag)
        {
            /* Wait for scan end callback */
        }
        g_scan_flag = false;
        err = R_CTSU_OffsetTuning(&g_ctsu_ctrl);
    } while (FSP_SUCCESS != err);

    while (true)
    {
        R_CTSU_ScanStart(&g_ctsu_ctrl);
        while (!g_scan_flag)
        {
            /* Wait for scan end callback */
        }
        g_scan_flag = false;
        err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
        assert(FSP_SUCCESS == err);

        if (FSP_SUCCESS == err)
        {
            /* Re-offset tuning is performed when the parasitic capacitance changes
            significantly due */
            /* to changes in the surrounding environment and the count value becomes an abnormal
            value. */
            /*
            */

```

```
        */
/* if (abnormal value detection
conditions) */
/* {
        */
/* Re-offset tuning */
do
    {
R_CTSU_ScanStart(&g_ctsu_ctrl);
while (!g_scan_flag)
    {
/* Wait for scan end callback */
    }
    g_scan_flag = false;
    err = R_CTSU_OffsetTuning(&g_ctsu_ctrl);
    } while (FSP_SUCCESS != err);
/* }
        */
    }
}
```

Diagnosis function Example

This is a Diagnosis function example of using the configuration in the basic example.

```
void ctsu_diag_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    uint16_t data[CTSU_CFG_NUM_SELF_ELEMENTS];
    uint16_t dummy;

    R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);
    assert(FSP_SUCCESS == err);

    R_CTSU_Open(&g_ctsu_ctrl_diagnosis, &g_ctsu_cfg_diagnosis);
    assert(FSP_SUCCESS == err);
}
```

```
while (true)
{
R_CTSU_ScanStart(&g_ctsu_ctrl);
while (!g_scan_flag)
{
/* Wait for scan end callback */
}
g_scan_flag = false;
err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
assert(FSP_SUCCESS == err);
R_CTSU_ScanStart(&g_ctsu_ctrl_diagnosis);
while (!g_scan_flag)
{
/* Wait for scan end callback */
}
g_scan_flag = false;
err = R_CTSU_DataGet(&g_ctsu_ctrl_diagnosis, &dummy);
assert(FSP_SUCCESS == err);
if (FSP_SUCCESS == err)
{
err = R_CTSU_Diagnosis(&g_ctsu_ctrl_diagnosis);
assert(FSP_SUCCESS == err);
if (FSP_SUCCESS == err)
{
break;
}
}
}
}
```

User's filter additional Example

This is a user's filter additional example of using the configuration in the basic example. To perform user's filter calculation, change the num_moving_average of the element in the target

`ctsu_cfg_t` to 1.

Perform user filter calculation and use `R_CTSU_DataInsert()` to input user filter calculation result.

```
void ctSU_user_filter_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    uint16_t data[CTSUS_CFG_NUM_SELF_ELEMENTS];
    uint16_t filter_data[CTSUS_CFG_NUM_SELF_ELEMENTS];

    /* If you want to make a touch judgment, call RM_TOUCH_Open() instead of the
following. */
    err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    while (true)
    {
        /* If you want to make a touch judgment, call RM_TOUCH_ScanStart() instead of the
following. */
        err = R_CTSU_ScanStart(&g_ctsu_ctrl);
        assert(FSP_SUCCESS == err);

        while (!g_scan_flag)
        {
            /* Wait for scan end callback */
        }

        g_scan_flag = false;
        err = R_CTSU_DataGet(&g_ctsu_ctrl, data);

        if (FSP_SUCCESS == err)
        {
            /* User original function. */
            ctSU_user_filter(data, filter_data);
            err = R_CTSU_DataInsert(&g_ctsu_ctrl, filter_data);
            assert(FSP_SUCCESS == err);

            /* Call RM_TOUCH_DataGet() to make a touch decision. */
        }
    }
}
```

```
}
```

Using the correction data obtained by [R_CTSU_SpecificDataGet\(\)](#). Perform user majority decision calculation & filter calculation and use [R_CTSU_DataInsert\(\)](#) to input user majority decision calculation & filter calculation result.

```
void ctsu_user_majority_decition_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    uint16_t data[CTSU_CFG_NUM_SELF_ELEMENTS];
    uint16_t corr_data[CTSU_CFG_NUM_SELF_ELEMENTS * CTSU_CFG_NUM_SUMULTI];
    uint16_t filter_data[CTSU_CFG_NUM_SELF_ELEMENTS];

    /* If you want to make a touch judgment, call RM_TOUCH_Open()instead of the
following. */
    err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    while (true)
    {
        /* If you want to make a touch judgment, call RM_TOUCH_ScanStart()instead of the
following. */
        err = R_CTSU_ScanStart(&g_ctsu_ctrl);
        assert(FSP_SUCCESS == err);

        while (!g_scan_flag)
        {
            /* Wait for scan end callback */
        }

        g_scan_flag = false;
        err = R_CTSU_DataGet(&g_ctsu_ctrl, data);

        if (FSP_SUCCESS == err)
        {
            err = R_CTSU_SpecificDataGet(&g_ctsu_ctrl, corr_data,
CTSU_SPECIFIC_CCO_CORRECTION_DATA);

            assert(FSP_SUCCESS == err);

            /* User original function */
```

```

    ctsu_user_filter(corr_data, filter_data);

    err = R_CTSU_DataInsert(&g_ctsu_ctrl, filter_data);

    assert(FSP_SUCCESS == err);
/* Call RM_TOUCH_DataGet() to make a touch decision. */
    }
}
}
}

```

| uint16_t | first_val | 1st correction value |
| uint16_t | second_val | 2nd correction value |
| uint32_t | first_coefficient | 1st correction coefficient |
| uint32_t | second_coefficient | 2nd correction coefficient |
| uint32_t | ctsu_clock | CTSU clock [MHz]. |

◆ **ctsu_instance_ctrl_t**

| struct ctsu_instance_ctrl_t | | |
|--|----------------------|--------------------------------|
| CTSU private control block. DO NOT MODIFY. Initialization occurs when R_CTSU_Open() is called. | | |
| Data Fields | | |
| uint32_t | open | |
| | | Whether or not driver is open. |

| | |
|---------------------------------------|--|
| | |
| volatile ctsu_state_t | state |
| | CTSU run state. |
| | |
| ctsu_cap_t | cap |
| | CTSU Scan Start Trigger Select. |
| | |
| ctsu_md_t | md |
| | CTSU Measurement Mode Select(copy to cfg) |
| | |
| ctsu_tuning_t | tuning |
| | CTSU Initial offset tuning status. |
| | |
| uint16_t | num_elements |
| | Number of elements to scan. |
| | |
| uint16_t | wr_index |
| | Word index into ctsuwr register array. |
| | |
| uint16_t | rd_index |
| | Word index into scan data buffer. |
| | |
| uint8_t * | p_element_complete_flag |
| | Pointer to complete flag of each element. g_ctsu_element_complete_flag[] is set by Open API. |
| | |
| int32_t * | p_tuning_diff |
| | Pointer to difference from base value of each element. g_ctsu_tuning_diff[] is set by Open API. |

| | |
|-------------------------------------|---|
| | |
| uint16_t | average |
| | CTSU Moving average counter. |
| | |
| uint16_t | num_moving_average |
| | Copy from config by Open API. |
| | |
| uint8_t | ctsucr1 |
| | Copy from (atune1 << 3, md << 6) by Open API. CLK, ATUNE0, CSW, and PON is set by HAL driver. |
| | |
| ctsu_ctsuwr_t * | p_ctsuwr |
| | CTSUWR write register value. g_ctsu_ctsuwr[] is set by Open API. |
| | |
| ctsu_self_buf_t * | p_self_raw |
| | Pointer to Self raw data. g_ctsu_self_raw[] is set by Open API. |
| | |
| uint16_t * | p_self_corr |
| | Pointer to Self correction data. g_ctsu_self_corr[] is set by Open API. |
| | |
| ctsu_data_t * | p_self_data |
| | Pointer to Self moving average data. g_ctsu_self_data[] is set by Open API. |
| | |
| ctsu_mutual_buf_t * | p_mutual_raw |
| | Pointer to Mutual raw data. g_ctsu_mutual_raw[] is set by Open API. |
| | |
| uint16_t * | p_mutual_pri_corr |
| | Pointer to Mutual primary correction data. g_ctsu_self_corr[] is set by Open API. |

| | |
|---------------------------------------|--|
| <code>uint16_t *</code> | <code>p_mutual_snd_corr</code> |
| | Pointer to Mutual secondary correction data. <code>g_ctsu_self_corr[]</code> is set by Open API. |
| <code>ctsu_data_t *</code> | <code>p_mutual_pri_data</code> |
| | Pointer to Mutual primary moving average data. <code>g_ctsu_mutual_pri_data[]</code> is set by Open API. |
| <code>ctsu_data_t *</code> | <code>p_mutual_snd_data</code> |
| | Pointer to Mutual secondary moving average data. <code>g_ctsu_mutual_snd_data[]</code> is set by Open API. |
| <code>ctsu_correction_info_t *</code> | <code>p_correction_info</code> |
| | Pointer to correction info. |
| <code>ctsu_txvsel_t</code> | <code>txvsel</code> |
| | CTSU Transmission Power Supply Select. |
| <code>ctsu_txvsel2_t</code> | <code>txvsel2</code> |
| | CTSU Transmission Power Supply Select 2 (CTS2 Only) |
| <code>uint8_t</code> | <code>ctsuchac0</code> |
| | TS00-TS07 enable mask. |
| <code>uint8_t</code> | <code>ctsuchac1</code> |
| | TS08-TS15 enable mask. |
| <code>uint8_t</code> | <code>ctsuchac2</code> |
| | TS16-TS23 enable mask. |

| | |
|----------|---|
| | |
| uint8_t | ctsuchac3 |
| | TS24-TS31 enable mask. |
| | |
| uint8_t | ctsuchac4 |
| | TS32-TS39 enable mask. |
| | |
| uint8_t | ctsuchtrc0 |
| | TS00-TS07 mutual-tx mask. |
| | |
| uint8_t | ctsuchtrc1 |
| | TS08-TS15 mutual-tx mask. |
| | |
| uint8_t | ctsuchtrc2 |
| | TS16-TS23 mutual-tx mask. |
| | |
| uint8_t | ctsuchtrc3 |
| | TS24-TS31 mutual-tx mask. |
| | |
| uint8_t | ctsuchtrc4 |
| | TS32-TS39 mutual-tx mask. |
| | |
| uint16_t | self_elem_index |
| | self element index number for Current instance. |
| | |
| uint16_t | mutual_elem_index |
| | mutual element index number for Current instance. |
| | |

| | |
|--|---|
| uint16_t | ctsu_elem_index |
| | CTSU element index number for Current instance. |
| | |
| ctsu_cfg_t const * | p_ctsu_cfg |
| | Pointer to initial configurations. |
| | |
| IRQn_Type | write_irq |
| | Copy from config by Open API. CTSU_CTSUWR interrupt vector. |
| | |
| IRQn_Type | read_irq |
| | Copy from config by Open API. CTSU_CTSURD interrupt vector. |
| | |
| IRQn_Type | end_irq |
| | Copy from config by Open API. CTSU_CTSUFN interrupt vector. |
| | |
| void(* | p_callback)(ctsu_callback_args_t *) |
| | Callback provided when a CTSUFN occurs. |
| | |
| uint8_t | interrupt_reverse_flag |
| | Flag in which read interrupt and end interrupt are reversed. |
| | |
| ctsu_event_t | error_status |
| | error status variable to send to QE for serial tuning. |
| | |
| ctsu_callback_args_t * | p_callback_memory |
| | Pointer to non-secure memory that can be used to pass arguments to a callback in non-secure memory. |
| | |
| | |

| | |
|--------------|--|
| void const * | p_context |
| | Placeholder for user data. |
| | |
| bool | serial_tuning_enable |
| | Flag of serial tuning status. |
| | |
| uint16_t | serial_tuning_mutual_cnt |
| | Word index into ctsuwr register array. |
| | |
| uint16_t | tuning_self_target_value |
| | Target self value for initial offset tuning. |
| | |
| uint16_t | tuning_mutual_target_value |
| | Target mutual value for initial offset tuning. |
| | |

Enumeration Type Documentation

◆ [ctsu_state_t](#)

| | |
|-----------------------------------|---------------|
| enum ctsu_state_t | |
| CTSU run state | |
| Enumerator | |
| CTSU_STATE_INIT | Not open. |
| CTSU_STATE_IDLE | Opened. |
| CTSU_STATE_SCANNING | Scanning now. |
| CTSU_STATE_SCANNED | Scan end. |

◆ **ctsu_tuning_t**

| | |
|------------------------------------|-----------------------------------|
| enum ctsu_tuning_t | |
| CTSU Initial offset tuning status | |
| Enumerator | |
| CTSU_TUNING_INCOMPLETE | Initial offset tuning incomplete. |
| CTSU_TUNING_COMPLETE | Initial offset tuning complete. |

◆ **ctsu_correction_status_t**

| | |
|---|----------------------------|
| enum ctsu_correction_status_t | |
| CTSU Correction status | |
| Enumerator | |
| CTSU_CORRECTION_INIT | Correction initial status. |
| CTSU_CORRECTION_RUN | Correction scan running. |
| CTSU_CORRECTION_COMPLETE | Correction complete. |
| CTSU_CORRECTION_ERROR | Correction error. |

◆ **ctsu_range_t**

| | |
|-----------------------------------|-----------------|
| enum ctsu_range_t | |
| CTSU range definition | |
| Enumerator | |
| CTSU_RANGE_20UA | 20uA mode |
| CTSU_RANGE_40UA | 40uA mode |
| CTSU_RANGE_80UA | 80uA mode |
| CTSU_RANGE_160UA | 160uA mode |
| CTSU_RANGE_NUM | number of range |

Function Documentation

◆ **R_CTSU_Open()**

```
fsp_err_t R_CTSU_Open ( ctsu_ctrl_t *const p_ctrl, ctsu_cfg_t const *const p_cfg )
```

Opens and configures the CTSU driver module. Implements `ctsu_api_t::open`.

Example:

```
err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | CTSU successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

Note

In the first Open, measurement for correction works, and it takes several tens of milliseconds.

◆ R_CTSU_ScanStart()

`fsp_err_t R_CTSU_ScanStart (ctsu_ctrl_t *const p_ctrl)`

This function should be called each time a periodic timer expires. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Before starting the next scan, first get the data with `R_CTSU_DataGet()`. If a different control block scan should be run, check the scan is complete before executing. Implements `ctsu_api_t::scanStart`.

Example:

```
while (true)
{
    err = R_CTSU_ScanStart(&g_ctsu_ctrl);
    assert(FSP_SUCCESS == err);
while (!g_scan_flag)
{
    /* Wait for scan end callback */
}
    g_scan_flag = false;
    err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
if (FSP_SUCCESS == err)
{
    /* Application specific data processing. */
}
}
```

Return values

| | |
|---------------------------|--|
| FSP_SUCCESS | CTSU successfully configured. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_CTSU_SCANNING | Scanning this instance or other. |
| FSP_ERR_CTSU_NOT_GET_DATA | The previous data has not been retrieved by DataGet. |

◆ **R_CTSU_DataGet()**

```
fsp_err_t R_CTSU_DataGet ( ctsu_ctrl_t *const p_ctrl, uint16_t * p_data )
```

This function gets the sensor values as scanned by the CTSU. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Implements [ctsu_api_t::dataGet](#).

Example:

```
while (true)
{
    err = R_CTSU_ScanStart(&g_ctsu_ctrl);
    assert(FSP_SUCCESS == err);
while (!g_scan_flag)
{
    /* Wait for scan end callback */
}
    g_scan_flag = false;
    err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
if (FSP_SUCCESS == err)
{
    /* Application specific data processing. */
}
}
```

Return values

| | |
|--------------------------------|---|
| FSP_SUCCESS | CTSU successfully configured. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_CTSU_SCANNING | Scanning this instance. |
| FSP_ERR_CTSU_INCOMPLETE_TUNING | Incomplete initial offset tuning. |
| FSP_ERR_CTSU_DIAG_NOT_YET | Diagnosis of data collected no yet. |
| FSP_ERR_ABORTED | Operate error of Diagnosis ADC data collection ,since ADC use other |

◆ R_CTSU_OffsetTuning()

```
fsp_err_t R_CTSU_OffsetTuning ( ctsu_ctrl_t *const p_ctrl)
```

This function tunes the offset register(SO). Call after the measurement is completed. If the return value is FSP_ERR_CTSU_INCOMPLETE_TUNING, tuning is not complete. Execute the measurement and this function call routine until the return value becomes FSP_SUCCESS. It is recommended to run this routine after [R_CTSU_Open\(\)](#). It can be recalled and tuned again. When the automatic judgement is enabled, after the offset tuning is completed, the baseline initialization bit flag is set. Implements [ctsu_api_t::offsetTuning](#).

Example:

```
/* Initial offset tuning */
do
{
R_CTSU_ScanStart(&g_ctsu_ctrl);
while (!g_scan_flag)
{
/* Wait for scan end callback */
}
g_scan_flag = false;
err = R_CTSU_OffsetTuning(&g_ctsu_ctrl);
} while (FSP_SUCCESS != err);
while (true)
{
R_CTSU_ScanStart(&g_ctsu_ctrl);
while (!g_scan_flag)
{
/* Wait for scan end callback */
}
g_scan_flag = false;
err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
assert(FSP_SUCCESS == err);
if (FSP_SUCCESS == err)
{
/* Re-offset tuning is performed when the parasitic capacitance changes
significantly due */
/* to changes in the surrounding environment and the count value becomes an abnormal
```

```

value. */
/*
    */
/* if (abnormal value detection
conditions) */
/* {
    */
/* Re-offset tuning */
do
    {
R_CTSU_ScanStart(&g_ctsu_ctrl);
while (!g_scan_flag)
    {
/* Wait for scan end callback */
    }
    g_scan_flag = false;
    err = R_CTSU_OffsetTuning(&g_ctsu_ctrl);
    } while (FSP_SUCCESS != err);
/* }
    */
    }
}
}

```

Return values

| | |
|--------------------------------|-------------------------------------|
| FSP_SUCCESS | CTSU successfully configured. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_CTSU_SCANNING | Scanning this instance. |
| FSP_ERR_CTSU_INCOMPLETE_TUNING | Incomplete initial offset tuning. |

◆ **R_CTSU_ScanStop()**

```
fsp_err_t R_CTSU_ScanStop ( ctsu_ctrl_t *const p_ctrl)
```

This function scan stops the sensor as scanning by the CTSU. Implements `ctsu_api_t::scanStop`.

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | CTSU successfully scan stop. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **R_CTSU_CallbackSet()**

```
fsp_err_t R_CTSU_CallbackSet ( ctsu_ctrl_t *const p_api_ctrl, void(*) (ctsu_callback_args_t *)
p_callback, void const *const p_context, ctsu_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `ctsu_api_t::callbackSet`

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

◆ **R_CTSU_Close()**

```
fsp_err_t R_CTSU_Close ( ctsu_ctrl_t *const p_ctrl)
```

Disables specified CTSU control block. Implements `ctsu_api_t::close`.

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | CTSU successfully configured. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ R_CTSU_SpecificDataGet()

```
fsp_err_t R_CTSU_SpecificDataGet ( ctsu_ctrl_t *const p_ctrl, uint16_t * p_specific_data,
ctsu_specific_data_type_t specific_data_type )
```

This function gets the sensor specific data values as scanned by the CTSU. Call this function after calling the [R_CTSU_DataGet\(\)](#) function.

By setting the third argument to CTSU_SPECIFIC_RAW_DATA, RAW data can be output from the second argument.

By setting the third argument to CTSU_SPECIFIC_CCO_CORRECTION_DATA, the cco corrected data can be output from the second argument.

By setting the third argument to CTSU_SPECIFIC_CORRECTION_DATA, the frequency corrected data can be output from the second argument.

By setting the third argument to CTSU_SPECIFIC_SELECTED_FREQ, Get bitmap of the frequency values used in majority decision from the second argument.(CTSU2 Only) The bitmap is shown as follows. ||2bit | 1bit | 0bit || ||3rd frequency value | 2nd frequency value | 1st frequency value ||

Implements [ctsu_api_t::specificDataGet](#).

Example:

```
err = R_CTSU_SpecificDataGet(&g_ctsu_ctrl, corr_data,
CTSU_SPECIFIC_CCO_CORRECTION_DATA);
```

Return values

| | |
|--------------------------------|--|
| FSP_SUCCESS | CTSU successfully configured. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_CTSU_SCANNING | Scanning this instance. |
| FSP_ERR_CTSU_INCOMPLETE_TUNING | Incomplete initial offset tuning. |
| FSP_ERR_NOT_ENABLED | CTSU_SPECIFIC_SELECTED_FREQ is not enabled in CTSU1.(CTSU2 Only) |

◆ R_CTSU_DataInsert()

```
fsp_err_t R_CTSU_DataInsert ( ctsu_ctrl_t *const p_ctrl, uint16_t * p_insert_data )
```

This function inserts the value of the second argument as the measurement result value. Call this function after calling the [R_CTSU_DataInsert\(\)](#) function. Implements [ctsu_api_t::dataInsert](#).

Example:

```
err = R_CTSU_DataInsert(&g_ctsu_ctrl, filter_data);
```

Return values

| | |
|--------------------------------|-------------------------------------|
| FSP_SUCCESS | CTSU successfully configured. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_CTSU_SCANNING | Scanning this instance. |
| FSP_ERR_CTSU_INCOMPLETE_TUNING | Incomplete initial offset tuning. |

◆ R_CTSU_Diagnosis()

`fsp_err_t R_CTSU_Diagnosis (ctsu_ctrl_t *const p_ctrl)`

Diagnosis the CTSU peripheral. Implements `ctsu_api_t::diagnosis`.

Example:

```
err = R_CTSU_Diagnosis(&g_ctsu_ctrl_diagnosis);
assert(FSP_SUCCESS == err);
```

Return values

| | |
|------------------------------------|--|
| FSP_SUCCESS | CTSU successfully configured. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_CTSU_NOT_GET_DATA | The previous data has not been retrieved by DataGet. |
| FSP_ERR_CTSU_DIAG_LDO_OVER_VOLTAGE | Diagnosis of LDO over voltage failed. |
| FSP_ERR_CTSU_DIAG_CCO_HIGH | Diagnosis of CCO into 19.2uA failed. |
| FSP_ERR_CTSU_DIAG_CCO_LOW | Diagnosis of CCO into 2.4uA failed. |
| FSP_ERR_CTSU_DIAG_SSCG | Diagnosis of SSCG frequency failed. |
| FSP_ERR_CTSU_DIAG_DAC | Diagnosis of non-touch count value failed. |
| FSP_ERR_CTSU_DIAG_OUTPUT_VOLTAGE | Diagnosis of LDO output voltage failed. |
| FSP_ERR_CTSU_DIAG_OVER_VOLTAGE | Diagnosis of over voltage detection circuit failed. |
| FSP_ERR_CTSU_DIAG_OVER_CURRENT | Diagnosis of over current detection circuit failed. |
| FSP_ERR_CTSU_DIAG_LOAD_RESISTANCE | Diagnosis of LDO internal resistance value failed. |
| FSP_ERR_CTSU_DIAG_CURRENT_SOURCE | Diagnosis of LDO internal resistance value failed. |
| FSP_ERR_CTSU_DIAG_SENSCLK_GAIN | Diagnosis of SENSCLK frequency gain failed. |
| FSP_ERR_CTSU_DIAG_SUCLK_GAIN | Diagnosis of SUCLK frequency gain failed. |
| FSP_ERR_CTSU_DIAG_CLOCK_RECOVERY | Diagnosis of SUCLK clock recovery function failed. |
| FSP_ERR_CTSU_DIAG_CFC_GAIN | Diagnosis of CFC oscillator gain failed. |

5.2.5.2 Touch (rm_touch)

Modules » CapTouch

Functions

`fsp_err_t` [RM_TOUCH_Open](#) (`touch_ctrl_t *const p_ctrl`, `touch_cfg_t const *const p_cfg`)

Opens and configures the TOUCH Middle module. Implements [touch_api_t::open](#). [More...](#)

`fsp_err_t` [RM_TOUCH_ScanStart](#) (`touch_ctrl_t *const p_ctrl`)

This function should be called each time a periodic timer expires. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Before starting the next scan, first get the data with [RM_TOUCH_DataGet\(\)](#). If a different control block scan should be run, check the scan is complete before executing. Implements [touch_api_t::scanStart](#). [More...](#)

`fsp_err_t` [RM_TOUCH_DataGet](#) (`touch_ctrl_t *const p_ctrl`, `uint64_t *p_button_status`, `uint16_t *p_slider_position`, `uint16_t *p_wheel_position`)

Gets the 64-bit mask indicating which buttons are pressed. Also, this function gets the current position of where slider or wheel is being pressed. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Implements [touch_api_t::dataGet](#). [More...](#)

`fsp_err_t` [RM_TOUCH_PadDataGet](#) (`touch_ctrl_t *const p_ctrl`, `uint16_t *p_pad_rx_coordinate`, `uint16_t *p_pad_tx_coordinate`, `uint8_t *p_pad_num_touch`)

This function gets the current position of pad is being pressed. Implements [touch_api_t::padDataGet](#) , [g_touch_on_ctsu](#). [More...](#)

`fsp_err_t` [RM_TOUCH_ScanStop](#) (`touch_ctrl_t *const p_ctrl`)

Scan stop specified TOUCH control block. Implements [touch_api_t::scanStop](#). [More...](#)

`fsp_err_t` [RM_TOUCH_CallbackSet](#) (`touch_ctrl_t *const p_api_ctrl`, `void(*p_callback)(touch_callback_args_t *)`, `void const *const p_context`, `touch_callback_args_t *const p_callback_memory`)

`fsp_err_t` [RM_TOUCH_Close](#) (`touch_ctrl_t *const p_ctrl`)

Disables specified TOUCH control block. Implements [touch_api_t::close](#). [More...](#)

`fsp_err_t` `RM_TOUCH_SensitivityRatioGet` (`touch_ctrl_t *const p_ctrl`,
`touch_sensitivity_info_t *p_touch_sensitivity_info`)

Get the touch sensitivity ratio. Implements `touch_api_t::sensitivityRatioGet`. [More...](#)

`fsp_err_t` `RM_TOUCH_ThresholdAdjust` (`touch_ctrl_t *const p_ctrl`,
`touch_sensitivity_info_t *p_touch_sensitivity_info`)

Adjust the touch judgment threshold. Implements `touch_api_t::thresholdAdjust`. [More...](#)

`fsp_err_t` `RM_TOUCH_DriftControl` (`touch_ctrl_t *const p_ctrl`, `uint16_t`
`input_drift_freq`)

Control drift correction. Implements `touch_api_t::driftControl`. [More...](#)

Detailed Description

This module supports the Capacitive Touch Sensing Unit (CTSUS). It implements the [Touch Middleware Interface](#).

Overview

The Touch Middleware uses the [CTSUS \(r_ctsu\)](#) API and provides application-level APIs for scanning touch buttons, sliders, and wheels. This module is configured via the [QE for Capacitive Touch](#).

Features

- Supports touch buttons (Self and Mutual), sliders, and wheels
- Can retrieve the status of up to 64 buttons at once
- Software and external triggering
- Callback on scan end
- Collects and calculates usable scan results:
 - Slider position from 1 to 100 (percent)
 - Wheel position from 1 to 360 (degrees)
- Dynamic touch-judgment-threshold adjustment
- Calculate the XY coordinates of the pad(CTSUS2)
- Optional (build time) support for real-time monitoring functionality through the QE tool over UART
- Optional (build time) support for tuning function through the QE Standalone Version tool over UART
- TrustZone Support

Configuration

Note

This module is configured via the [QE for Capacitive Touch](#). For information on how to use the QE tool, once the tool is installed click [Help](#) -> [Help Contents in e² studio](#) and search for "QE".

This module supports the QE monitor function. The monitor determines whether to use debugger or serial communications, determines the type of the information from QE and sends only the necessary information. This module supports the serial tuning function with the standalone version of QE. Generates a configuration configuration file by UART communication with QE.

Note

Multiple configurations can be defined within a single project allowing for different scan procedures or button layouts.

Build Time Configurations for rm_touch

The following build time configurations are defined in fsp_cfg/rm_touch_cfg.h:

| Configuration | Options | Default | Description |
|--------------------------------------|--|---|--|
| Parameter Checking | <ul style="list-style-type: none"> Default (BSP) Enabled Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Support for QE monitoring using UART | <ul style="list-style-type: none"> Enabled Disabled | Disabled | Enable SCI_UART support for QE monitoring. |
| Support for QE Tuning using UART | <ul style="list-style-type: none"> Enabled Disabled | Disabled | Enable SCI_UART support for QE Tuning. |
| Type of chattering suppression | <ul style="list-style-type: none"> TypeA : Counter of exceed threshold is hold within hysteresis range TypeB : Counter of exceed threshold is reset within hysteresis range. | TypeA : Counter of exceed threshold is hold within hysteresis range | TypeA of chattering suppression : Counter of exceed threshold is hold within hysteresis range. / TypeB of chattering suppression : Counter of exceed threshold is reset within hysteresis range. |

Configurations for CapTouch > Touch (rm_touch)

This module can be added to the Stacks tab via New Stack > CapTouch > Touch (rm_touch). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupt Configuration

Refer to the [CTSU \(r_ctsu\)](#) section for details.

Clock Configuration

Refer to the [CTSU \(r_ctsu\)](#) section for details.

Pin Configuration

Refer to the [CTSU \(r_ctsu\)](#) section for details.

Usage Notes

Measurements and Data Processing

The module determines whether the button has been touched based on the change in capacitance and detects the position of the slider or wheel. This requires continued periodic measurements of capacitance. When developing your application, make sure to periodically call [RM_TOUCH_ScanStart\(\)](#) and [RM_TOUCH_DataGet\(\)](#). For more details, refer to the sample application.

Button Touch Determination

Touch judgment method

Touch detection has two modes in CTSU2.

1. Value Majority Mode (VMM)

Touch module obtains one measurement result for each button from CTSU module and outputs the touch judgment result.

The measurement results has been noise-reduced in [CTSU \(r_ctsu\)](#) module.

Figure 165: Value Majority Mode (VMM)

2. Judgement Majority Mode (JMM)

This mode supported from FSP V5.1.0 or later.

Touch module obtains three measurement results for each button from CTSU module, judges each touch, and outputs the final touch judgement result by majority vote.

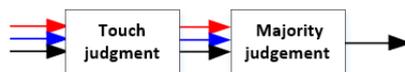

Figure 166: Judgement Majority Mode (JMM)

Creating reference value and threshold

A touch button is not a mechanical button in which the ON/OFF state is switched by hardware. The ON/OFF state is determined via software.

First, a reference value is created based on measurement results in the non-touch state. The initial reference value is the first measured value. The threshold is then determined with an arbitrary offset. If a measured value exceeds the threshold, the button is determined to be in the ON state, if it does not exceed the threshold, it is in the OFF state.

Processing for self-capacitance and mutual capacitance are basically the same. However, because the amount of capacitance decreases when a mutual capacitance button is touched, the user needs to set the threshold based on decreasing measured values to determine the ON/OFF state.

You can set the threshold for each button separately in the configuration settings (threshold in [touch_button_cfg_t](#)). The following functions are also included to deal with issues such as chattering

suppression and changes in the external environment which affect actual touch recognition.

VMM : Creates one reference value and one threshold value for each button.

JMM : Creates three reference values and three threshold values for each button.

Positive Noise Filter/Negative Noise Filter

As a chattering countermeasure, you can confirm the ON/OFF state after a set number of consecutive ON or OFF determinations.

In the configuration settings (on_freq and off_freq in [touch_cfg_t](#)) set the number of consecutive ON or OFF states. You can do this for all buttons in the touch interface configuration. Be aware that, although this is an effective solution to improving chattering, the greater the number of consecutive states, the slower the response to actual touch.

Hysteresis

This is another chattering countermeasure. Offset the constant to the threshold after the state goes to ON, and prevent chattering by using hysteresis as the OFF-to-ON and ON-to-OFF threshold.

You can set the hysteresis value for each button in the configuration settings (hysteresis in [touch_button_cfg_t](#)). The larger the hysteresis, the more effective the countermeasure is in suppressing chattering. However, keep in mind that this will make it more difficult to return the state from ON-to-OFF or OFF-to-ON.

VMM : One hysteresis for each button.

JMM : Three hysteresis for each button.

Drift Correction Process

As a countermeasure for changes in the external environment, the drift correction process refreshes the reference value.

After averaging the measured value in the OFF state over a set period, if the button is in the touch OFF state after a set period, the reference value is refreshed. The drift correction is only executed in the OFF state and is cleared when touch ON is determined.

Set the period in the configuration settings (drift_freq in [touch_cfg_t](#)). You can do this for all buttons in the touch interface configuration. This allows you to adjust the ability to determine the touch state despite changes in the external environment.

VMM : Drift corrects one baseline value per button.

JMM : Drift corrects three baseline value per button.

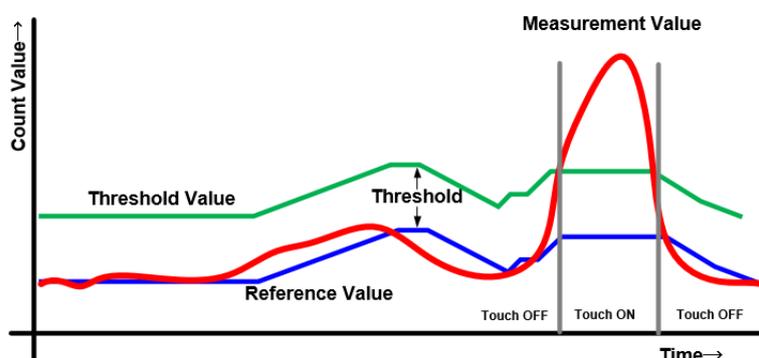

Figure 167: Button Touch Determination

Press and hold cancel

Strong noise or other sudden environment changes can disable the drift correction process, preventing return from the ON state. The press and hold cancel function implements the drift correction process and returns the button from the ON state by forcibly turning the state to OFF after a certain number of consecutive ON state periods.

Set the number of consecutive ON periods required for the press and hold cancel function to return the button to the OFF state in the configuration settings (cancel_freq in touch_cfg_t). You can do this for all buttons in the touch interface configuration.

Chattering suppression type (Build option)

This build option is a function to supplement the above functions (Positive Noise Filter/Negative Noise Filter and Hysteresis) for performing touch judgment.

This build option changes the processing method for Counter of exceed threshold to TypeA or TypeB.

TypeA of chattering suppression : Counter of exceed threshold is hold within hysteresis range.

TypeB of chattering suppression : Counter of exceed threshold is reset within hysteresis range.

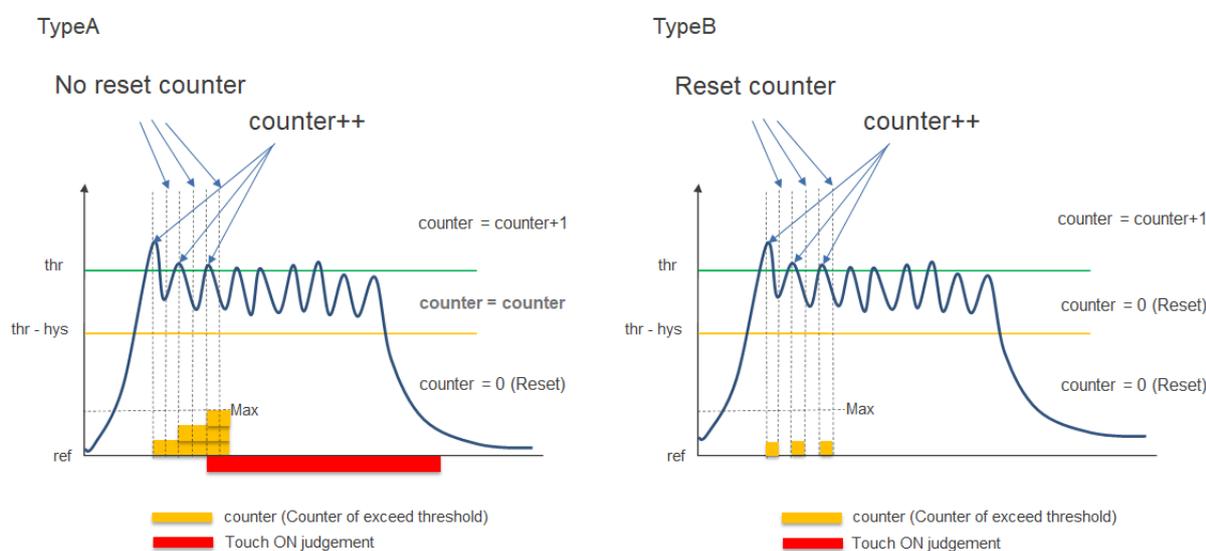

Figure 168: Chattering suppression type

Touch Position Detection of Slider/Wheel

Configure a slider with multiple terminals to be measured (TS) physically arranged in a straight line. Configure a wheel with multiple terminals physically arranged in a circle.

The touch position is calculated from the measured values of the TS in the configuration. The calculation method for sliders and wheels is fundamentally the same.

Touch judgement mode of Slider/Wheel.

Slider and wheel coordinate calculation has two modes in CTSU2.

1. VMM

Touch module gets the measurement result of each slider and wheel from the CTSU module and calculate the coordinate.

The measurement results has been noise-reduced in CTSU module.

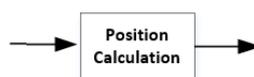

Figure 169: Value Majority Mode (Slider, Wheel)

2. JMM

Touch module get three measurement results for each slider and wheel from the CTSU module, calculate the coordinates for each, select two coordinates by judgement majority, and average the two coordinate results.

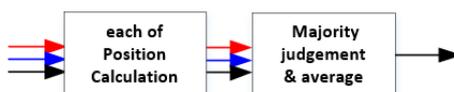

Figure 170: Judgement Majority Mode (Slider, Wheel)

Touch Position calculation of Slider/Wheel

1. Detect the maximum value (TS_MAX) among the terminals in the configuration.
2. Calculate the difference (d1, d2) between TS_MAX and the terminals on either side. (If the TS_MAX terminal is at one end of the slider, use the values of the two terminals to the right or left, accordingly.)
3. If the total of d1 and d2 exceeds the threshold, position calculation is initiated. If the total amount does not exceed the threshold, the position calculation process is ended.
4. With TS_MAX as the middle position, the ratio of d1 to d2 is used to calculate the position. The slider has a range of 1 to 100, and the while has a range of 1 to 360.

| | Slider | Wheel |
|-----------------------------|-----------------------|-----------------------|
| Electrode type | Self capacitance only | Self capacitance only |
| Number of electrodes | 3-10 | 4+ |
| Touch position output range | 1-100 | 1-360 |
| Default value (no touch) | 0xFFFF | 0xFFFF |

Tuning the Touch Determination Adjustment

When QE tuning, a measurement is performed with a finger touching the button and the tuned parameters are output in the configuration file. The setting value of the threshold is 60% of the touch sensitivity between touch and non-touch state, and the setting value of the hysteresis coefficient is 5% of the threshold.

This module provides the functions for dynamic adjusting of these threshold and hysteresis coefficient.

They are two functions as below.

Adjusting the threshold and hysteresis coefficient to an arbitrary ratio.

Use **RM_TOUCH_ThresholdAdjust()**.

When changing the touch determination threshold ratio from 60% QE set to 70% user specified, the

touch determination thresholds are as below.

If you want to make this setting, set the member of the second argument as follows. It is also necessary to set the ratio of the amount of touch change and the hysteresis value.

```
*p_touch_sensitivity_ratio = 100,  
old_threshold_ratio = 60,  
new_threshold_ratio = 70,  
new_hysteresis_ratio = 5
```

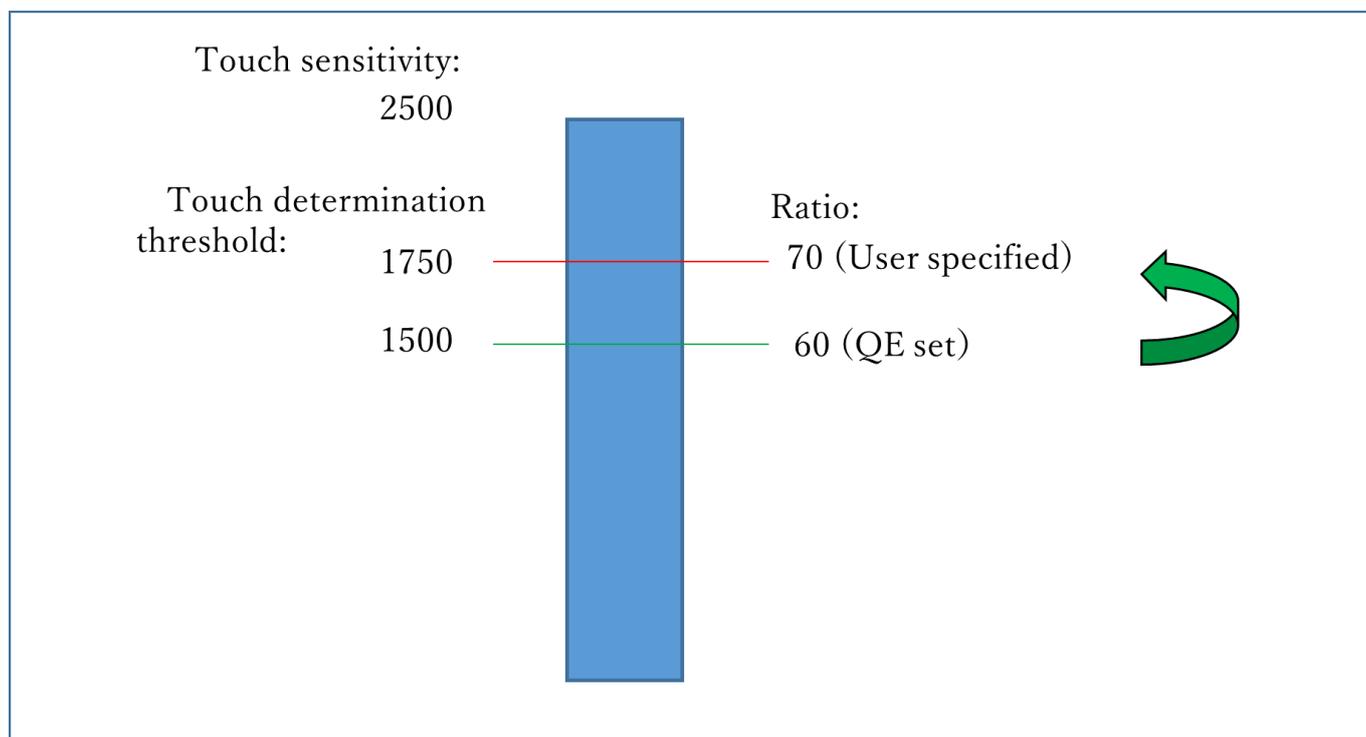

Figure 171: Example of changing the threshold ratio

Adjusting the threshold and hysteresis coefficient according to the current touch sensitivity.

Use [RM_TOUCH_SensitivityRatioGet\(\)](#), [RM_TOUCH_ThresholdAdjust\(\)](#), and [RM_TOUCH_DriftControl\(\)](#).

When changing the kind of the overlay panel, the touch sensitivity differs from the one QE tuned. Wanting to use the software as it is without re-tuning. If you use a thicker overlay than that at QE tuning, the touch sensitivity decreases, and a touch may not be determined because of the same touch determination threshold. This function adjusts the touch determination threshold based on the ratio of the touch sensitivity after changing the overlay to the touch sensitivity at the QE tuning.

[RM_TOUCH_SensitivityRatioGet\(\)](#) outputs the ratio of the current touch sensitivity assuming that the touch sensitivity at the QE setting is 100%.

The following figure shows the case where an overlay panel is thinner and the touch sensitivity increases.

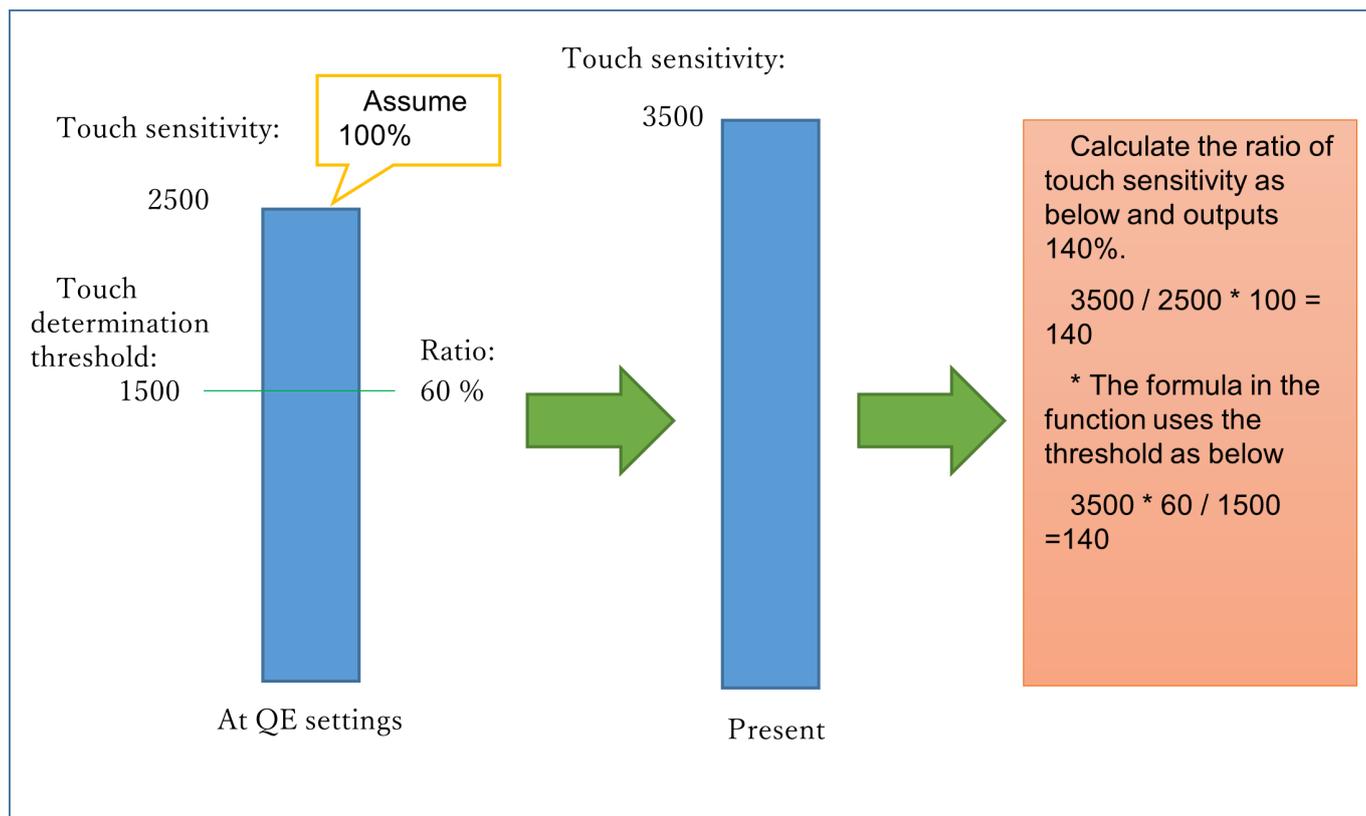

Figure 172: Example of increase touch sensitivity for thin overlay panels

Following figure shows the case where an overlay panel is thicker and the touch sensitivity decreases.

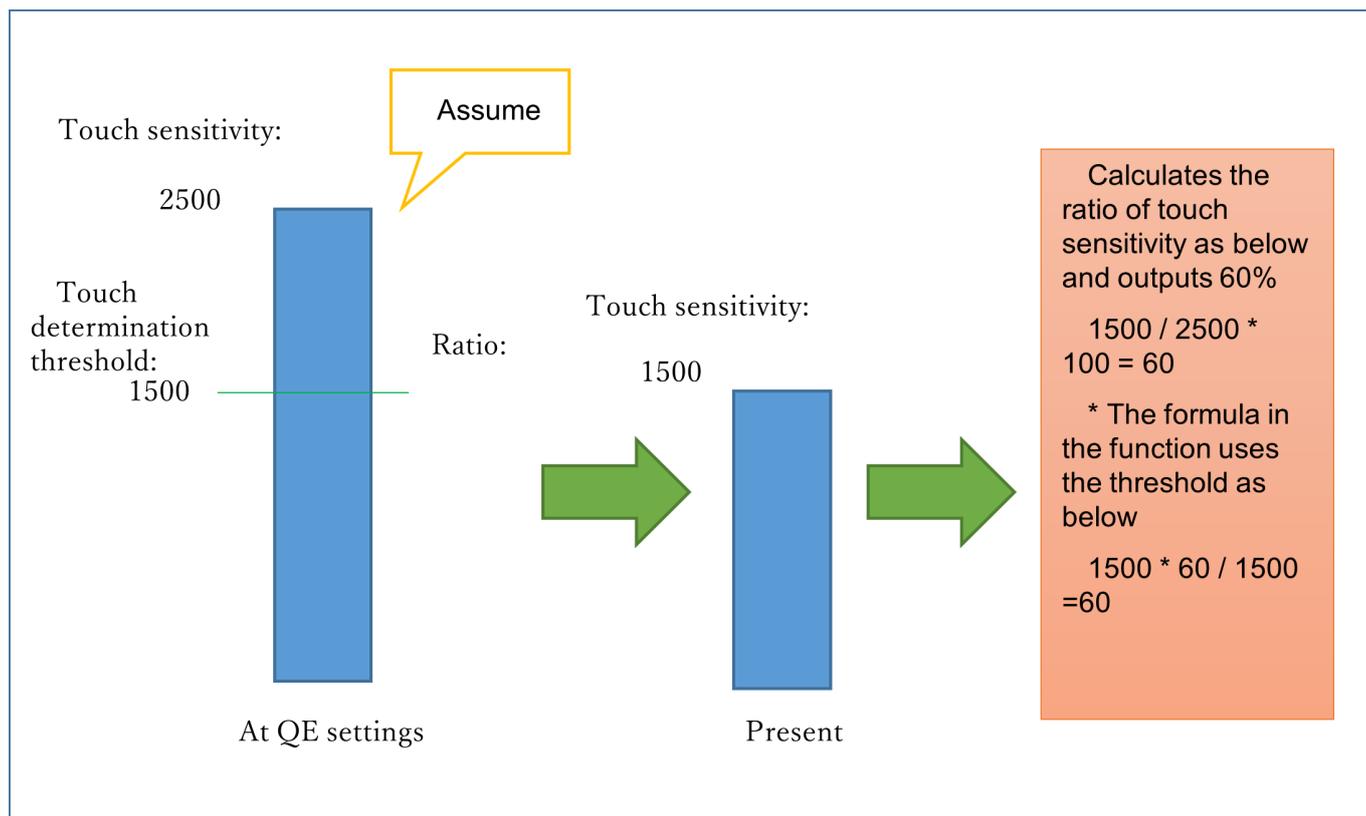

Figure 173: Example of decrease touch sensitivity for thicker overlay panels

[RM_TOUCH_ThresholdAdjust\(\)](#) sets the new touch determination threshold and the hysteresis value by using the touch sensitivity ratio obtained with [RM_TOUCH_SensitivityRatioGet\(\)](#) as arguments.

Example of calculation 1:

The touch sensitivity ratio is 140%, and the threshold set by QE is 1500.

Threshold = $140 * 1500 / 100 = 2100$

*p_touch_sensitivity_ratio = 140,

old_threshold_ratio = 60,

new_threshold_ratio = 60,

new_hysteresis_ratio = 5

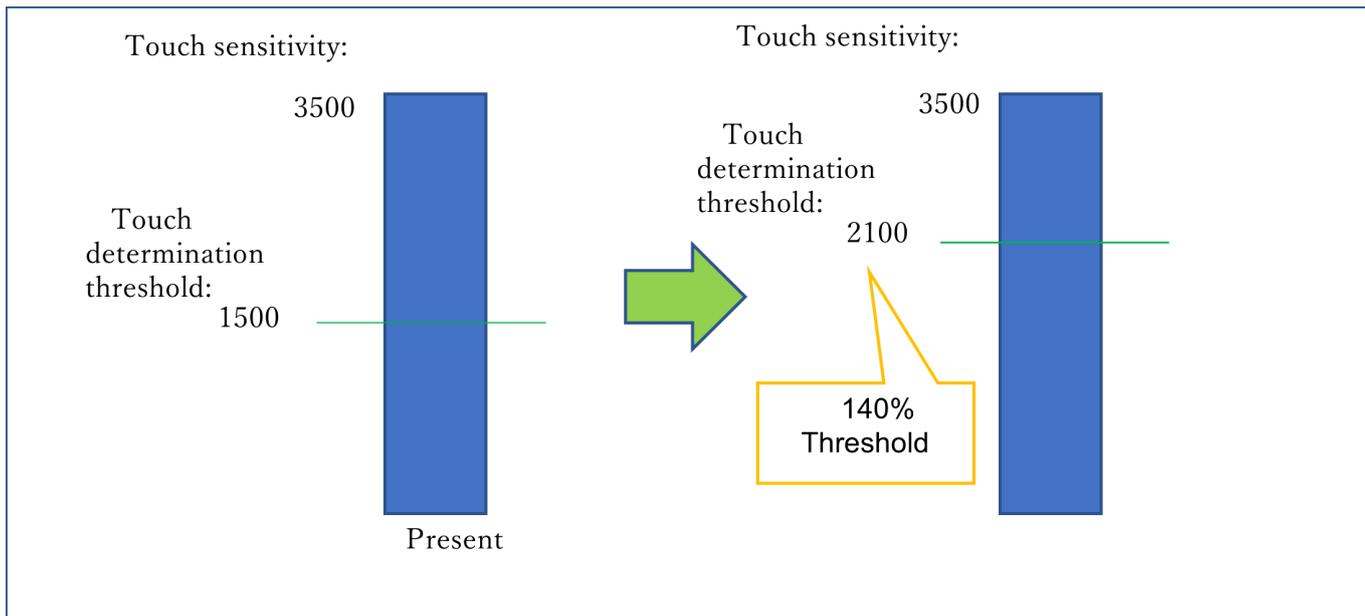

Figure 174: Example of calculation 1

Example of calculation 2:

The touch sensitivity ratio is 60%, and the threshold set by QE is 1500.
 $\text{Threshold} = 60 * 1500 / 100 = 900$

*p_touch_sensitivity_ratio = 60,
 old_threshold_ratio = 60,
 new_threshold_ratio = 60,
 new_hysteresis_ratio = 5

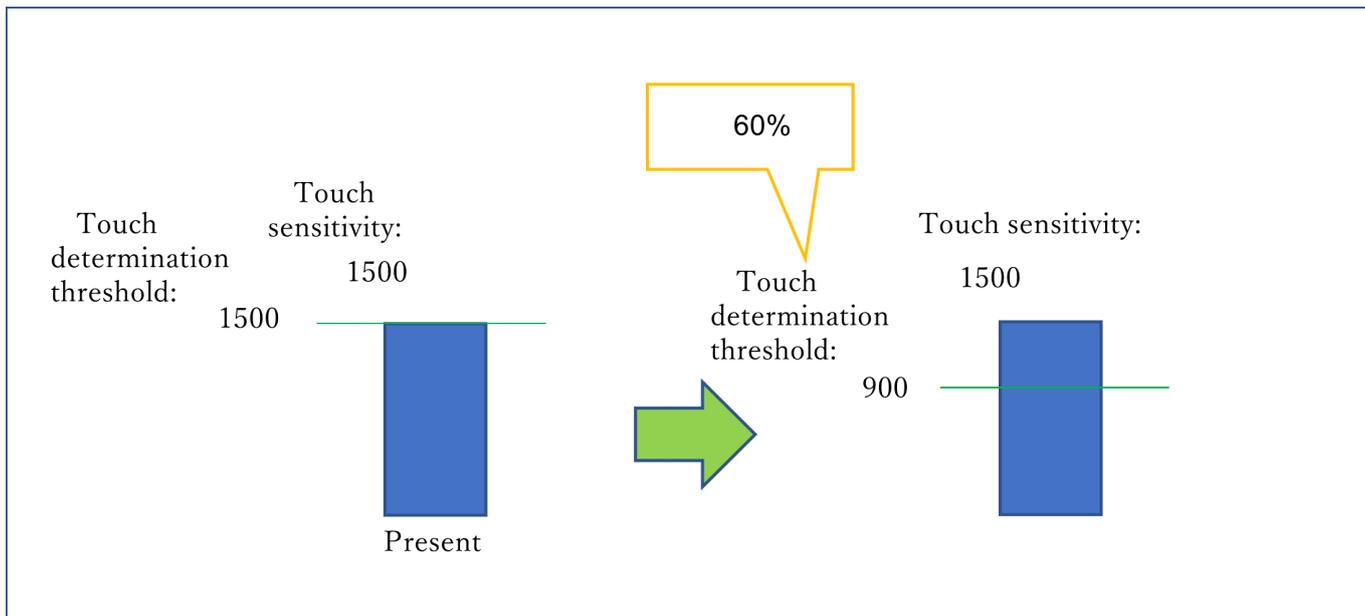

Figure 175: Example of calculation 2

RM_TOUCH_DriftControl() set the second argument to 0 to stop the drift correction function.

When calculating the ratio of the touch change amount using `RM_TOUCH_SensitivityRatioGet()`, the touch change amount decreases due to the thick overlay, and the threshold value is not exceeded even if touched. Prevents the reference value from drifting.

Example of the application for adjustment using data flash without re-tuning or software rewriting

Enable UART communication to PC and 'tuning mode'. In tuning mode, the MCU transmits the ratio of the touch sensitivity in the touch state to the PC in real time. A user sends a command to decide the ratio while monitoring on the PC. The MCU stores the received ratio in the data flash. Make sure that the ratio stored in the data flash is read at the software activation, and the touch determination threshold is adjusted based on this stored value.

Pad

Configure a pad with multiple terminals physically arranged in cross.

The current position is Calculated from the measured values of the CTSU mutual scanning in the configuration.

Use `RM_TOUCH_PadDataGet()`.

Pad is subject so some limitations:

| | Pad |
|-----------------------------|---|
| Electrode type | CFC mutual capacitance only |
| Number of electrodes | RX(TS-CFC)3+, TX(Any TS)3+ |
| Touch position output range | rx_coodinate:(0 ~ rx_pixel), tx_coodinate:(0 ~ tx_pixsel) |
| Default value (no touch) | rx_coodinate:0xFFFF, tx_coodinate:0xFFFF |
| Pixel range | rx_pixel:(1 ~ 65535), tx_pixsel:(1 ~ 65535) |

Pitch for each terminal can be set with QE. Pitch's default value is 64.

The relationship between pixel and pitch : $\text{Pixel} = \text{Pitch} \times \text{number of TS} - 1$

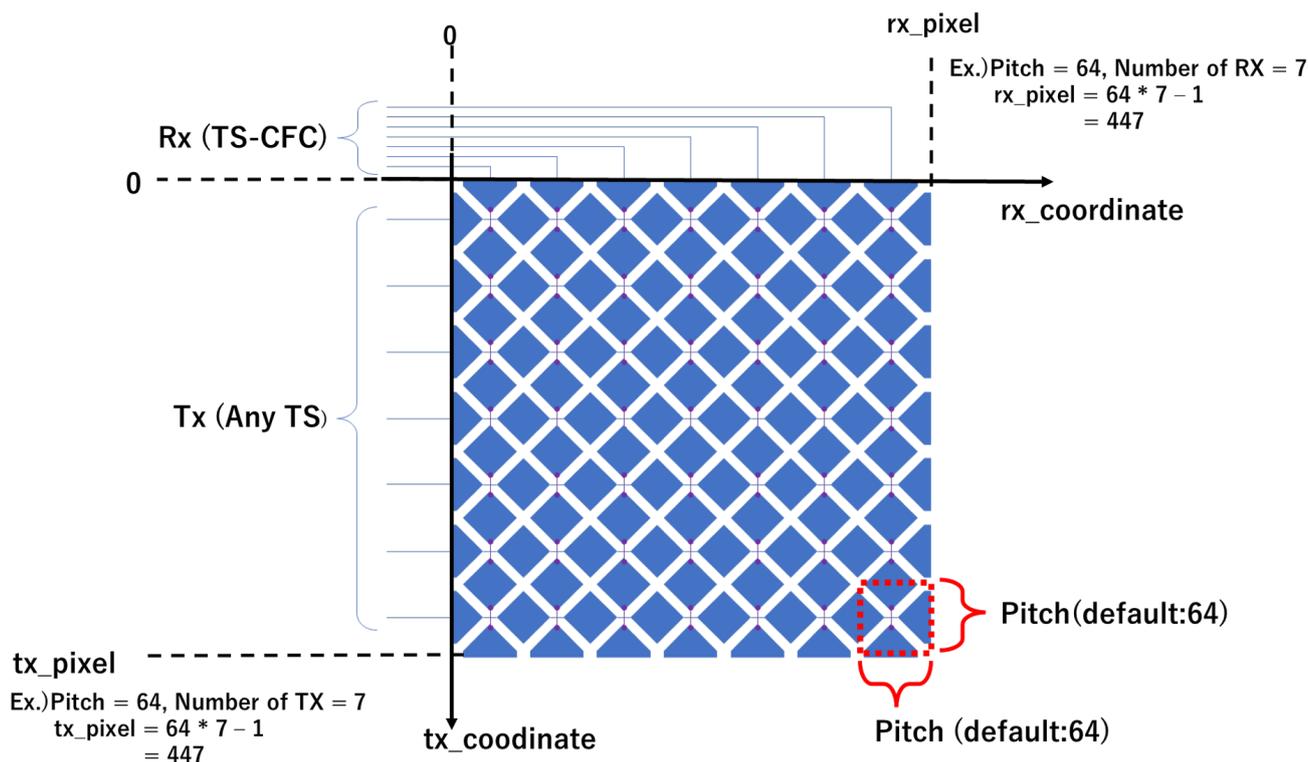

Figure 176: Example of Pad

TrustZone Support

In `r_ctsu` and `rm_touch` module, Non-Secure Callable Guard Functions are only generated from QE for Capacitive Touch. QE can be used for tuning in secure or flat project, but not in non-secure project. If you want to use in non-secure project, copy the output file from secure or flat project. Refer to QE Help for more information.

Examples

Basic Example

This is a basic example of minimal use of the TOUCH in an application.

```
void touch_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    err = RM_TOUCH_Open(&g_touch_ctrl, &g_touch_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    while (true)
    {
        RM_TOUCH_ScanStart(&g_touch_ctrl);
    }
}
```

```
while (0 == g_flag)
{
/* Wait scan end callback */
}
g_flag = 0;
err = RM_TOUCH_DataGet(&g_touch_ctrl, &button, slider, wheel);
if (FSP_SUCCESS == err)
{
/* Application specific data processing. */
}
}
}
```

Multi Mode Example

This is an optional example of using both Self-capacitance and Mutual-capacitance. Refer to the Multi Mode Example in CTSU usage notes.

```
void touch_optional_example (void)
{
fsp_err_t err = FSP_SUCCESS;
err = RM_TOUCH_Open(&g_touch_ctrl, &g_touch_cfg);
assert(FSP_SUCCESS == err);
err = RM_TOUCH_Open(&g_touch_ctrl_mutual, &g_touch_cfg_mutual);
assert(FSP_SUCCESS == err);
while (true)
{
RM_TOUCH_ScanStart(&g_touch_ctrl);
while (0 == g_flag)
{
/* Wait scan end callback */
}
g_flag = 0;
RM_TOUCH_ScanStart(&g_touch_ctrl_mutual);
while (0 == g_flag)
```

```

    {
    /* Wait scan end callback */
    }
    g_flag = 0;
    err = RM_TOUCH_DataGet(&g_touch_ctrl, &button, slider, wheel);
    if (FSP_SUCCESS == err)
    {
    /* Application specific data processing. */
    }
    err = RM_TOUCH_DataGet(&g_touch_ctrl_mutual, &button, slider, wheel);
    if (FSP_SUCCESS == err)
    {
    /* Application specific data processing. */
    }
    }
}

```

Data Structures

struct [touch_wheel_info_t](#)

struct [touch_pad_info_t](#)

struct [touch_instance_ctrl_t](#)

Data Structure Documentation

◆ touch_button_info_t

| struct touch_button_info_t | | |
|----------------------------|-------------|---|
| Information of button | | |
| Data Fields | | |
| uint64_t | status | Touch result bitmap. |
| uint16_t* | p_threshold | Pointer to Threshold value array. g_touch_button_threshold[] is set by Open API. |

| | | |
|------------|---------------|---|
| uint16_t * | p_hysteresis | Pointer to Hysteresis value array. g_touch_button_hysteresis[] is set by Open API. |
| uint16_t * | p_reference | Pointer to Reference value array. g_touch_button_reference[] is set by Open API. |
| uint16_t * | p_on_count | Continuous touch counter. g_touch_button_on_count[] is set by Open API. |
| uint16_t * | p_off_count | Continuous non-touch counter. g_touch_button_off_count[] is set by Open API. |
| uint32_t * | p_drift_buf | Drift reference value. g_touch_button_drift_buf[] is set by Open API. |
| uint16_t * | p_drift_count | Drift counter. g_touch_button_drift_count[] is set by Open API. |
| uint8_t | on_freq | Copy from config by Open API. |
| uint8_t | off_freq | Copy from config by Open API. |
| uint16_t | drift_freq | Copy from config by Open API. |
| uint16_t | cancel_freq | Copy from config by Open API. |

◆ touch_slider_info_t

| | | |
|----------------------------|-------------|---|
| struct touch_slider_info_t | | |
| Information of slider | | |
| Data Fields | | |
| uint16_t * | p_position | Calculated Position data. g_touch_slider_position[] is set by Open API. |
| uint16_t * | p_threshold | Copy from config by Open API. g_touch_slider_threshold[] is set by Open API. |

◆ touch_wheel_info_t

| | | |
|---------------------------|------------|---|
| struct touch_wheel_info_t | | |
| Information of wheel | | |
| Data Fields | | |
| uint16_t * | p_position | Calculated Position data. g_touch_wheel_position[] is set by Open API. |

| | | |
|------------|-------------|---|
| uint16_t * | p_threshold | Copy from config by Open API. g_touch_wheel_threshold[] is set by Open API. |
|------------|-------------|---|

◆ touch_pad_info_t

| | | |
|-------------------------|-----------------|---|
| struct touch_pad_info_t | | |
| Information of pad | | |
| Data Fields | | |
| uint16_t * | p_rx_coordinate | RX coordinate. |
| uint16_t * | p_tx_coordinate | TX coordinate. |
| uint16_t * | p_num_touch | number of touch |
| uint16_t * | p_threshold | Coordinate calculation threshold value. |
| uint16_t * | p_base_buf | ScanData Base Value Buffer. |
| uint16_t * | p_rx_pixel | X coordinate resolution. |
| uint16_t * | p_tx_pixel | Y coordinate resolution. |
| uint8_t * | p_max_touch | Maximum number of touch judgments used by the pad. |
| int32_t * | p_drift_buf | Drift reference value. g_touch_button_drift_buf[] is set by Open API. |
| uint16_t * | p_drift_count | Drift counter. g_touch_button_drift_count[] is set by Open API. |
| uint8_t | num_drift | Copy from config by Open API. |

◆ touch_instance_ctrl_t

| | | |
|---|----------------------|------------------------------------|
| struct touch_instance_ctrl_t | | |
| TOUCH private control block. DO NOT MODIFY. Initialization occurs when RM_TOUCH_Open() is called. | | |
| Data Fields | | |
| uint32_t | open | Whether or not driver is open. |
| touch_button_info_t | binfo | Information of button. |
| touch_slider_info_t | sinfo | Information of slider. |
| touch_wheel_info_t | winfo | Information of wheel. |
| bool | serial_tuning_enable | Flag of serial tuning status. |
| touch_pad_info_t | pinfo | Information of pad. |
| touch_cfg_t const * | p_touch_cfg | Pointer to initial configurations. |
| ctsu_instance_t const * | p_ctsu_instance | Pointer to CTSU instance. |

Function Documentation

◆ RM_TOUCH_Open()

```
fsp_err_t RM_TOUCH_Open ( touch_ctrl_t *const p_ctrl, touch_cfg_t const *const p_cfg )
```

Opens and configures the TOUCH Middle module. Implements `touch_api_t::open`.

Example:

```
err = RM_TOUCH_Open(&g_touch_ctrl, &g_touch_cfg);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | TOUCH successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

◆ RM_TOUCH_ScanStart()

```
fsp_err_t RM_TOUCH_ScanStart ( touch_ctrl_t *const p_ctrl)
```

This function should be called each time a periodic timer expires. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Before starting the next scan, first get the data with `RM_TOUCH_DataGet()`. If a different control block scan should be run, check the scan is complete before executing. Implements `touch_api_t::scanStart`.

Return values

| | |
|---------------------------|--|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_CTSU_SCANNING | Scanning this instance or other. |
| FSP_ERR_CTSU_NOT_GET_DATA | The previous data has not been retrieved by DataGet. |

◆ **RM_TOUCH_DataGet()**

```
fsp_err_t RM_TOUCH_DataGet ( touch_ctrl_t*const p_ctrl, uint64_t* p_button_status, uint16_t*
p_slider_position, uint16_t* p_wheel_position )
```

Gets the 64-bit mask indicating which buttons are pressed. Also, this function gets the current position of where slider or wheel is being pressed. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Implements [touch_api_t::dataGet](#).

Note

FSP v4.0.0 or later,

- The value of 'Secondary - Primary' is modified from `uint16_t` to `int16_t`. When the value of 'Secondary - Primary' is larger than 32767 and less than -32767, this API return `FSP_ERR_INVALID_DATA`.
- An upper limit is set for the value of Secondary. When the value of Secondary is larger than 45000, this API return `FSP_ERR_INVALID_DATA`.

Return values

| | |
|--------------------------------|-------------------------------------|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_DATA | Accuracy of data is not guaranteed. |
| FSP_ERR_CTSU_SCANNING | Scanning this instance. |
| FSP_ERR_CTSU_INCOMPLETE_TUNING | Incomplete initial offset tuning. |

◆ **RM_TOUCH_PadDataGet()**

```
fsp_err_t RM_TOUCH_PadDataGet ( touch_ctrl_t*const p_ctrl, uint16_t* p_pad_rx_coordinate,
uint16_t* p_pad_tx_coordinate, uint8_t* p_pad_num_touch )
```

This function gets the current position of pad is being pressed. Implements [touch_api_t::padDataGet](#) , [g_touch_on_ctsu](#).

Note

FSP v4.0.0 or later,

- The value of 'Secondary - Primary' is modified from `uint16_t` to `int16_t`. When the value of 'Secondary - Primary' is larger than 32767 and less than -32767, this API return `FSP_ERR_INVALID_DATA`.
- An upper limit is set for the value of Secondary. When the value of Secondary is larger than 45000, this API return `FSP_ERR_INVALID_DATA`.

Return values

| | |
|-----------------------|-------------------------------------|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_DATA | Accuracy of data is not guaranteed. |
| FSP_ERR_CTSU_SCANNING | Scanning this instance. |

◆ **RM_TOUCH_ScanStop()**

```
fsp_err_t RM_TOUCH_ScanStop ( touch_ctrl_t *const p_ctrl)
```

Scan stop specified TOUCH control block. Implements [touch_api_t::scanStop](#).

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_TOUCH_CallbackSet()**

```
fsp_err_t RM_TOUCH_CallbackSet ( touch_ctrl_t *const p_api_ctrl, void(*) (touch_callback_args_t *)
p_callback, void const *const p_context, touch_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [touch_api_t::callbackSet](#)

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |

◆ **RM_TOUCH_Close()**

```
fsp_err_t RM_TOUCH_Close ( touch_ctrl_t *const p_ctrl)
```

Disables specified TOUCH control block. Implements [touch_api_t::close](#).

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_TOUCH_SensitivityRatioGet()**

```
fsp_err_t RM_TOUCH_SensitivityRatioGet ( touch_ctrl_t *const p_ctrl, touch_sensitivity_info_t *
p_touch_sensitivity_info )
```

Get the touch sensitivity ratio. Implements `touch_api_t::sensitivityRatioGet`.

Return values

| | |
|--------------------------------|---|
| FSP_SUCCESS | Successfully touch sensitivity ratio got. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_CTSU_SCANNING | Scanning this instance. |
| FSP_ERR_CTSU_INCOMPLETE_TUNING | Incomplete initial offset tuning. |

◆ **RM_TOUCH_ThresholdAdjust()**

```
fsp_err_t RM_TOUCH_ThresholdAdjust ( touch_ctrl_t *const p_ctrl, touch_sensitivity_info_t *
p_touch_sensitivity_info )
```

Adjust the touch judgment threshold. Implements `touch_api_t::thresholdAdjust`.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Successfully touch judgment threshold was adjusted. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_TOUCH_DriftControl()**

```
fsp_err_t RM_TOUCH_DriftControl ( touch_ctrl_t *const p_ctrl, uint16_t input_drift_freq )
```

Control drift correction. Implements `touch_api_t::driftControl`.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Successfully drift correction was controlled. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

5.2.6 Connectivity

Modules

Detailed Description

Connectivity Modules.

Modules

Azure RTOS USBX Port (rm_usbx_port)

CAN (r_can)

Driver for the CAN peripheral on RA MCUs. This module implements the [CAN Interface](#).

CAN FD (r_canfd)

Driver for the CANFD peripheral on RA MCUs. This module implements the [CAN Interface](#).

CEC (r_cec)

Driver for the CEC peripheral on RA MCUs. This module implements the [CEC Interface](#).

I2C Communication Device (rm_comms_i2c)

Middleware to implement the I2C communications interface. This module implements the [Communicatons Middleware Interface](#).

I2C Master (r_iic_b_master)

I2C Driver for the IIC/I3C peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

I2C Master (r_iic_master)

Driver for the IIC peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

I2C Master (r_sau_i2c)

Driver for the SAU peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

I2C Master (r_sci_b_i2c)

Driver for the SCI_B peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

I2C Master (r_sci_i2c)

Driver for the SCI peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

I2C Slave (r_iic_b_slave)

Driver for the IIC/I3C peripheral on RA MCUs. This module implements the [I2C Slave Interface](#).

I2C Slave (r_iic_slave)

Driver for the IIC peripheral on RA MCUs. This module implements the [I2C Slave Interface](#).

I2S (r_ssi)

Driver for the SSIE peripheral on RA MCUs. This module implements the [I2S Interface](#).

I3C (r_i3c)

Driver for the I3C peripheral on RA MCUs. This module implements the [I3C Interface](#).

LIN (r_sci_b_lin)

Driver for the SCI peripheral on RA MCUs. This module implements the [LIN Interface](#).

SMCI (r_sci_smci)

Driver for the SCI peripheral on RA MCUs. This module implements the [SMCI Interface](#).

SPI (r_sau_spi)

Driver for the SAU peripheral on RA MCUs. This module implements the [SPI Interface](#).

SPI (r_sci_b_spi)

Driver for the SCI peripheral on RA MCUs. This module implements the [SPI Interface](#).

[SPI \(r_sci_spi\)](#)

Driver for the SCI peripheral on RA MCUs. This module implements the [SPI Interface](#).

[SPI \(r_spi\)](#)

Driver for the SPI peripheral on RA MCUs. This module implements the [SPI Interface](#).

[SPI \(r_spi_b\)](#)

Driver for the SPI peripheral on RA MCUs. This module implements the [SPI Interface](#).

[UART \(r_sau_uart\)](#)

UART driver for the SAU peripheral on RA MCUs. This module implements the [UART Interface](#).

[UART \(r_sci_b_uart\)](#)

Driver for the SCI peripheral on RA MCUs. This module implements the [UART Interface](#).

[UART \(r_sci_uart\)](#)

Driver for the SCI peripheral on RA MCUs. This module implements the [UART Interface](#).

[UART \(r_uarta\)](#)

Driver for the UARTA peripheral on RA MCUs. This module implements the [UART Interface](#).

[UART Communication Device \(rm_comms_uart\)](#)

Middleware to implement a generic communications interface over UART. This module implements the [Communicatons Middleware Interface](#).

[USB \(r_usb_basic\)](#)

Driver for the USB peripheral on RA MCUs. This module implements the [USB Interface](#).

USB Composite (r_usb_composite)

USB HCDC (r_usb_hcdc)

This module provides a USB Host Communications Device Class (HCDC) driver. It implements the [USB HCDC Interface](#).

USB HHID (r_usb_hhid)

This module provides a USB Host Human Interface Device Class Driver (HHID). It implements the [USB HHID Interface](#).

USB HMSC (r_usb_hmsc)

This module provides a USB Host Mass Storage Class (HMSC) driver. It implements the [USB HMSC Interface](#).

USB Host Vendor class (r_usb_hvnd)

USB PCDC (r_usb_pcdc)

This module provides a USB Peripheral Communications Device Class Driver (PCDC). It implements the [USB PCDC Interface](#).

USB PHID (r_usb_phid)

This module is USB Peripheral Human Interface Device Class Driver (PHID). It implements the [USB PHID Interface](#).

USB PMSC (r_usb_pmsc)

This module provides a USB Peripheral Mass Storage Class (PMSC) driver. It implements the [USB PMSC Interface](#).

USB PPRN (r_usb_pprn)

This module is USB Peripheral Printer Device Class Driver (PPRN). It implements the [USB PPRN Interface](#).

USB Peripheral Vendor class (r_usb_pvnd)

5.2.6.1 Azure RTOS USBX Port (rm_usbx_port)

Modules » Connectivity

Functions

Refer to [USB \(r_usb_basic\)](#) for the common API (r_usb_basic) to be called from the application.

Overview

This USB driver works by combining USBX and r_usb_basic module.

How to Configuration

Using a class other than HMSC and OTG.

The following describes how to configure USBX using PCDC as an example.

- Select [New Stack]->[Connectivity]->[Azure RTOS PCDC]

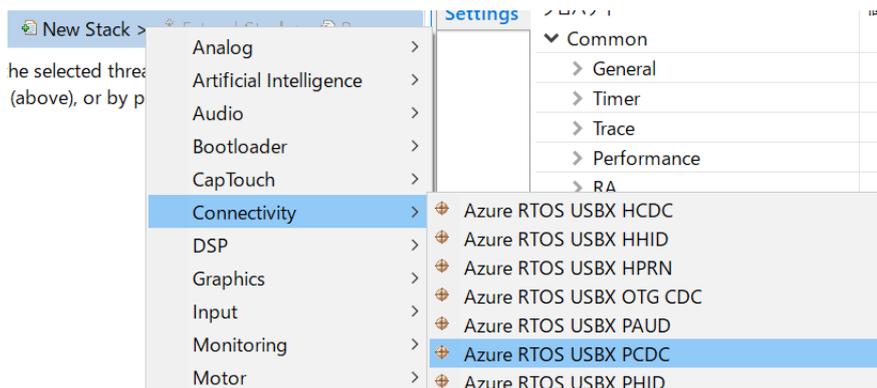

Figure 177: Select USB Device Class

- Select the USB pipe to use.

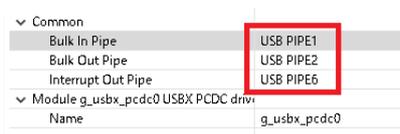

Figure 178: Select using USB Pipe

Using HMSC.

Since HMSC is used in a different way from other USBX modules, the usage is described below.

- Select [New Stack]->[Storage]->[Azure RTOS FileX on USBX]

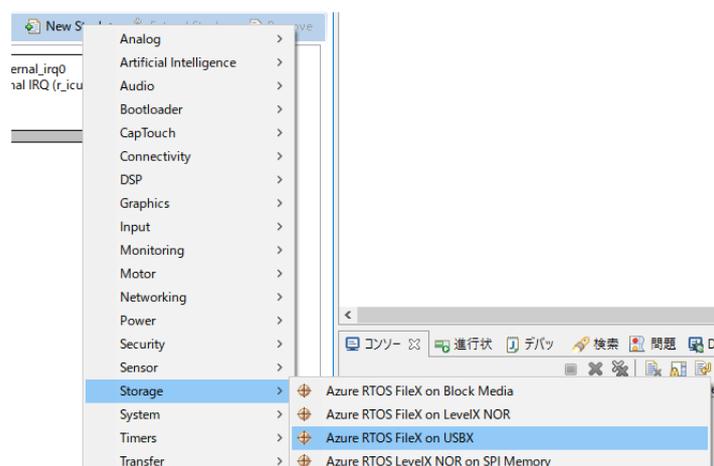

Figure 179: Select USB Device Class

- The following is displayed when selecting FileX on USBX.

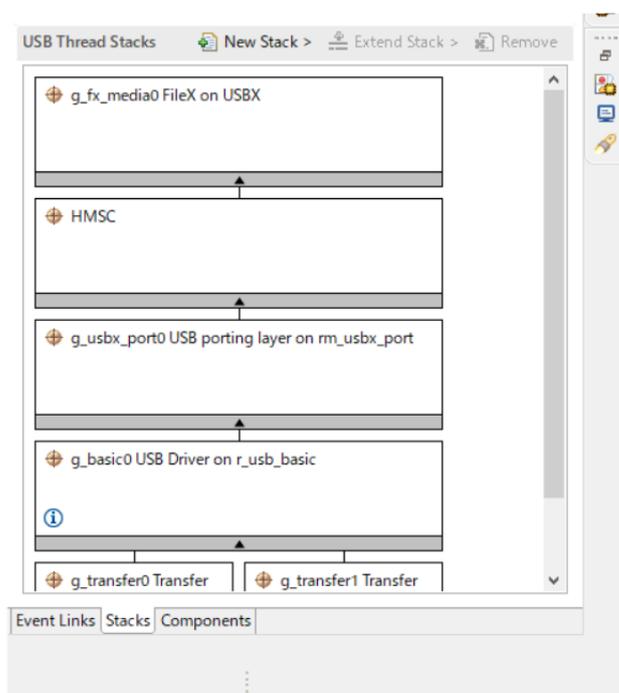

Figure 180: FileX on USBX Stack

Using OTG.

The following describes how to configure USBX OTG.

- When using CDC / HID class
 - [New Stack]->[Connectivity]->[Azure RTOS USBX OTG CDC] or [Azure RTOS USBX OTG HID]
- When using MSC class
 - [New Stack]->[Storage]->[Azure RTOS FileX on USBX]
 - [New]->[Azure RTOS USBX OTG MSC]

- Select [New Stack]->[Input] -> [External IRQ(r_icu)]

Be sure to select "r_icu" in OTG. The "r_icu" is used to detect the attaching of A cable.

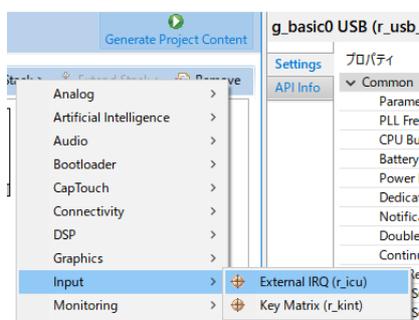

Figure 181: Select USB Device Class for OTG

- Be sure to set the following to each item in "r_icu".
 - Set "7" to "Channel" item.
 - Set "Both Edges" to "Trigger" item.
 - Set "Enabled" to "Digital Filtering" item.
 - Set "usb_otg_irq_callback" to "Callback" item.

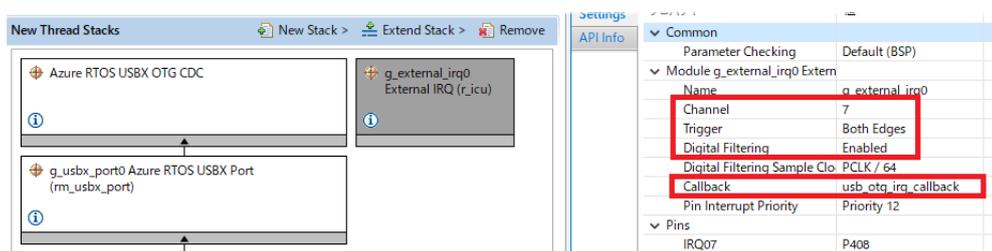

Figure 182: Select USB Device Class for OTG

- Be sure to set the following to each item in "r_usb_basic".
 - Set "Full Speed" to "USB Speed" item.
 - Set "USB_IP0 Port" to "USB Module Number".
 - Set "Not Supported" to "USBFS Resume Priority".

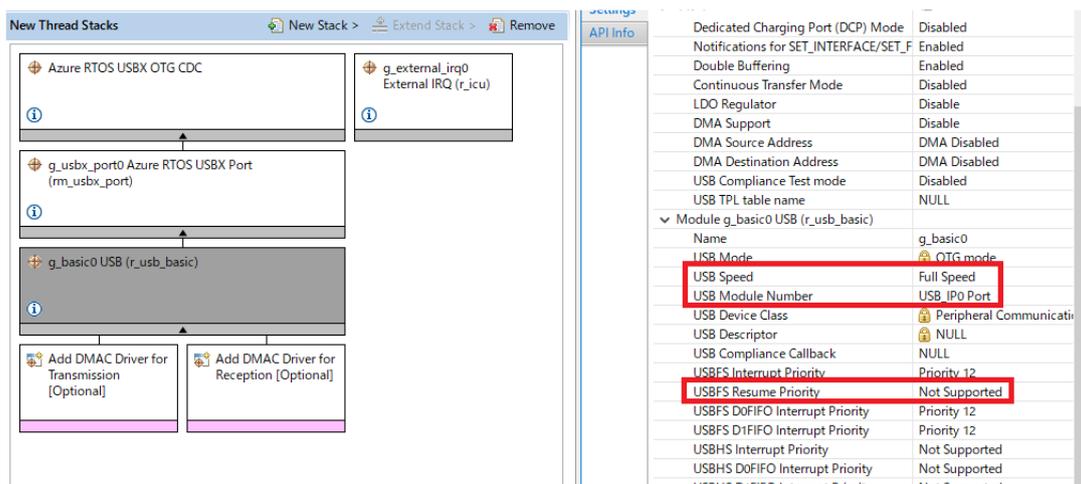

Figure 183: Select USB Device Class

- Set the following pins for USB (r_usb_basic)
 - VBUSEN
 - VBUS
 - EXICEN

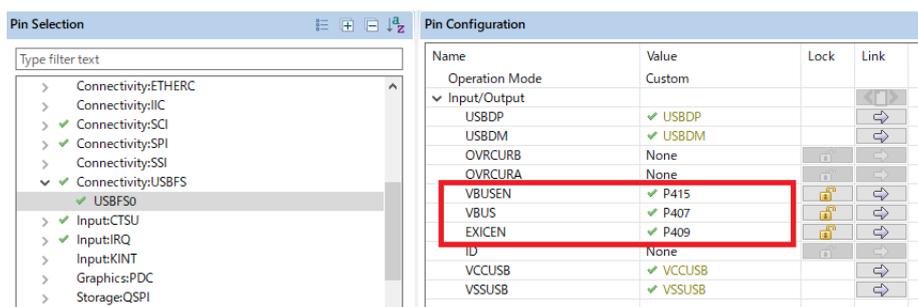

Figure 184: USB Pin Setting

- Set the following pins for IRQ (r_icu)
 - IRQ07

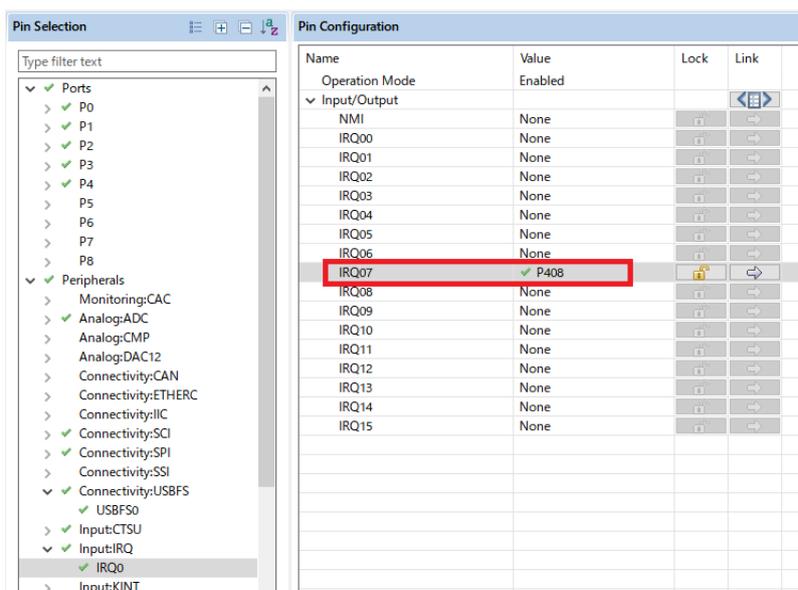

Figure 185: IRQ Pin Setting

Using Hub

- When the user uses the following device class, the user can use USB Hub.
 - Host Communication Device Class (HCDC)
 - Host Human Interface Device Class (HHID)
 - Host Mass Storage Class (HMSC)
 - Host Printer Class (HPRN)
- Also be sure to set the pipe number to the following items. Can not specify "NO USE" to the following items when using Hub.
 - Bulk In Pipe 2
 - Bulk Out Pipe 2
 - Interrupt In Pipe 2
 - Interrupt In Pipe 3

Note

- Please ignore the suspend or resume event occurs when attaching or detaching the USB cable.
- The following are notes on using the `ux_host_class_cdc_acm_read` function or the `ux_device_class_cdc_acm_read` function
 - Please specify a multiple of `MaxPacketSize` to the 3rd argument(`requested_length`) since if the value of the 3rd argument is not multiple of `MaxPacketSize`, all data sent by USB Host or USB Peripheral may not be received correctly.
 - Please specify start address of the area allocated a size larger than 3rd argument(`requested_length`) to the 2nd argument(`data_pointer` or `buffer`).
- There is no stack for the Hub; please select the stack for USB Host even when using the Hub.
- Depending on the Hub used, it may be necessary to supply power to the Hub.
- HUVC does not support USB Hub.

HMSC uses FileX.

For more information on FileX, please refer to the following URL.

<https://docs.microsoft.com/en-us/azure/rtos/filex/>

OTG

- Be able to set UX_OTG_HOST_REQUEST_FLAG in USB Peripheral mode or call ux_host_stack_role_swap() function in USB Host mode when data other than control transfer is not being transferred.
- Register the callback function for the application using R_USB_OtgCallbackSet() function. This callback function is called when switching the operation mode(UX_OTG_MODE_IDLE/UX_OTG_MODE_SLAVE/UX_OTG_MODE_HOST).
- Use R_USB_OtgSRP() function when doing SRP(Session Request Protocol). The R_USB_OtgSRP() function does not support VBUS pulsing.
- After starting up MCU, USB is initialized as USB peripheral mode until connecting A cable.
- Please ignore the suspend or resume event occurs when attaching or detaching the USB cable.
- When A cable is connected, USB module is initialized as USB Host mode.
- Call R_ICU_ExternallrqOpen() and R_ICU_ExternallrqEnable() function in the application program since the IRQ interrupt is used to detect attaching or detaching of A cable.
- Add the OTG descriptor in the configuration descriptor in each descriptor file.

| Offset | Field | Size | Value | Description |
|--------|------------------|------|--------|------------------------------------|
| 0 | bLength | 1 | 5 | Size of Descriptor |
| 1 | bDescriptor Type | 1 | 9 | OTG type = 9 |
| 2 | bmAttribute | 1 | 3 or 2 | D1: HNP support D0: SRP support |
| 3 | bcdOTG | 2 | 0x200 | Binary Code Decimal |

Known Issues

- There is compatibility issue for FileX on USBX stack in FSP 5.0.0 while importing from FSP 4.6.0 or earlier. Please refer to "GitHub Issue" about this workaround.

Limitations

- This USB driver does not support the multiple device class in Host mode.
- Please call the initialization function in the application program.

Please be sure to call R_USB_Open() function after calling the following functions.

- Peripheral
 - PCDC / PHID / PAUD / PPRN / DFU / OTG
 - ux_system_initialize
 - ux_device_stack_initialize
 - ux_device_stack_class_register
 - PMSC
 - ux_system_initialize
 - ux_device_stack_initialize
- Host
 - HCDC / HHID / HPRN / HUVC / OTG

- ux_system_initialize
- ux_host_stack_initialize
- HMSC
 - ux_system_initialize
 - ux_host_stack_initialize
 - fx_system_initialize
- Set the value for 1000 Ticks per second in the "Timer Ticks Per Second" item.

| Property | Value |
|-------------------------|----------|
| Common | |
| General | |
| Timer | |
| Timer Ticks Per Second | 1000 |
| Timer Thread Stack Size | 1024 |
| Timer Thread Priority | 0 |
| Timer Process In ISR | Enabled |
| Reactivate Inline | Disabled |
| Timer | Enabled |

Figure 186: Specify value of Timer Ticks Per Second

- Set the Thread priority to a value of 21.

| Thread | |
|-------------------------------|-------------|
| Symbol | usb_thread0 |
| Name | USB Thread |
| Stack size (bytes) | 1024 |
| Priority | 21 |
| Auto start | Enabled |
| Time slicing interval (ticks) | 1 |

Figure 187: Specify value of Thread priority

- Call the following functions in the following order after calling the `R_USB_Close()` function.
 - Peripheral
 - PCDC / PHID / PPRN
 - ux_device_stack_class_unregister
 - ux_device_stack_uninitialize
 - PMSC
 - ux_device_stack_uninitialize
 - Host
 - ux_host_stack_uninitialize
- The FAT file format that HMSC supports is FAT32, FAT16 and FAT12.
- When using USBX HMSC, please be sure to check the "fx" checkbox(red frame) of the pack the user is using in the "Components" tab(green frame) as shown below.

| | | |
|-----------|-----------------|------------------|
| Microsoft | | |
| Azure | | |
| EWF | | |
| FileX | | |
| fx | 6.2.0+fsp.4.3.0 | Azure RTOS FileX |
| GUIX | | |
| Summary | BSP | Clocks |
| | Pins | Interrupts |
| | Event Links | Stacks |
| | Components | |

Figure 188: Check the fx checkbox

- When using USBX HPRN, if the internal buffer of the printer is full, USB data transfer speed drops significantly.

- When using USBX HHID, please use Wired device.
- USBX HUVC driver does not support Full-speed.
- USBX HUVC driver does not support the following APIs.
 - `ux_host_class_video_transfer_buffers_add`
 - `ux_host_class_video_read`
- Note the following when using `ux_host_class_video_transfer_buffer_add` function (USBX HUVC API)
 - Please call `ux_host_class_video_transfer_buffer_add` function after confirming that the callback function for data reception completion is called when calling this API again. This callback function is registered by `ux_host_class_video_transfer_callback_set` function in the application program.
 - Please specify a 4-byte alignment address for the 2nd argument (`buffer`) of `ux_host_class_video_transfer_buffer_add` function when using DMA transfer.
- Note the following when using `ux_host_class_video_start` function (USBX HUVC API)
 - Please be sure to confirm return value of the `ux_host_class_video_max_payload_get` function is less than or equal to 1024. If the return value is greater than 1024, start video streaming by referring to the following.

```
channel.ux_host_class_video_parameter_channel_bandwidth_selection = 1024;
status = ux_host_class_video_ioctl(video, UX_HOST_CLASS_VIDEO_IOCTL_CHANNEL_START, &channel);
```

- This module does not support the MCU(RA4M1 and RA2A1) since the RAM size is small.
- Please specify the correct framework size to the 2nd argument(`device_framework_length_high_speed`) and the 4th argument(`device_framework_length_full_speed`) in "ux_device_stack_initialize" function. If incorrect size is specified, USB driver does not work properly.
- The following is the limitation when using OTG.
 - The user can not use High-speed module(USB_IP1).
 - The DMA transfer is not supported.
 - The MSC is not supported.
 - The user can not use USB Hub.
- The followings are the limitation when using USB Hub.
 - The USB driver allocates USB PIPE9 for USB Hub. The user can not specify "USB PIPE9" when using USB Hub.
 - The user can not connect the Hub device under the Hub down port.
 - For HCDC, the user can not connect more than 2 CDC devices to USB Hub.
 - For HPRN, the user can not connect more than 2 PRN devices to USB Hub.
 - For HHID, the user can not connect more than 3 HID devices to USB Hub.
 - For HMSC, the user can not connect more than 3 MSC devices to USB Hub.
- The user can not use USB PIPE1, PIPE2, PIPE3, PIPE8 and PIPE9 when using the following MCU.
 - RA6E2
 - RA4E2
- Please use USB Host DFU tool described in the chapter "USB Device DFU Class" in the following page.

<https://learn.microsoft.com/en-us/azure/rtos/usb/usb-device-stack-supplemental-2>

- USBX DFU can upgrade the firmware only once after resetting MCU.

- USBX DFU does not support the upload feature.
- ux_device_class_cdc_acm_read() API, throughput/speed may be similar in following cases.
 - Read operation in double buffer mode when compared to single buffer mode.
 - Read operation in continuous transfer mode when compared to non-continuous transfer mode.

Because of the USBX CDC device stack limits the read transfer size buffer to single packet (ie. wMaxPacketSize as per Full-speed or High-speed USB port). Please refer Azure RTOS USBX documentation for more information.

- ux_host_class_cdc_acm_write() and ux_host_class_cdc_acm_read() API, throughput/speed on high-speed port may be similar for CPU read and write operation in double buffer mode when compared to single buffer mode because of the FSP driver limits the maximum transfer request length size to 512 bytes (UX_FSP_MAX_BULK_PAYLOAD).
- ux_host_class_cdc_acm_write() and ux_host_class_cdc_acm_read() API, throughput/speed may be less for DMA read and write operation when compared to CPU mode because of the FSP driver limits the maximum transfer request length size to 512 bytes (UX_FSP_MAX_BULK_PAYLOAD).
- ux_host_class_cdc_acm_write() and ux_host_class_cdc_acm_read() API, throughput/speed may be less for DMA read and write operation compared to USB FreeRTOS HCD DMA because of the FSP driver limits the maximum transfer request length size to 512 bytes (UX_FSP_MAX_BULK_PAYLOAD).

Descriptor

Templates for USBX descriptors can be found in ra/fsp/src/rm_usbx_port folder. Also, please be sure to use your vendor ID.

Change the descriptor.c.template file for each class as follows if High-speed mode is used.

- rm_usbx_pcdc_descriptor.c.template
 - Comment on lines 108 and 243.
 - Delete the "//" on lines 109 and 242.
- rm_usbx_pmsc_descriptor.c.template
 - Comment on lines 78 and 153.
 - Delete the "//" on lines 79 and 152.
- rm_usbx_paud_descriptor.c.template
 - Comment on lines 167 and 485.
 - Delete the "//" on lines 168 and 486.

There are two types of templates for PHID descriptor.

Keyboard templates should be referred to rm_usbx_phid_descriptor_keyboard.c.template.

Mouse templates should be referred to rm_usbx_phid_descriptor_mouse.c.template.

Examples

USBX PCDC Example

PCDC loopback example is as follows.

```
#define VALUE_105 (105)
#define VALUE_2 (2)
#define VALUE_103 (103)
#define VALUE_93 (93)
/*****

&g_actual_length);
}
```

```

    }
    }
    }
}

/*****
 * End of function usbx_pcdc_sample
 *****/

```

USBX HCDC Example

The main functions of the HCDC loopback example are as follows:

1. Virtual UART control settings are configured by transmitting the class request SET_LINE_CODING to the CDC device.
2. Sends receive (Bulk In transfer) requests to a CDC peripheral device and receives data.
3. Loops received data back to the peripheral by means of Bulk Out transfers.

The main loop performs loopback processing in which data received from a CDC peripheral device is transmitted unaltered back to the peripheral.

```

#define VALUE_100 (100)

UINT ux_host_usr_event_notification (ULONG event, UX_HOST_CLASS * host_class, VOID *
instance)
{
    FSP_PARAMETER_NOT_USED(host_class);

Detailed Description

Driver for the CAN peripheral on RA MCUs. This module implements the [CAN Interface](#).

Overview

The Controller Area network (CAN) HAL module provides a high-level API for CAN applications and supports the CAN peripherals available on RA microcontroller hardware. A user-callback function must be defined that the driver will invoke when transmit, receive or error interrupts are received. The callback is passed a parameter which indicates the channel, mailbox and event as well as the received data (if available).

Features

- Supports both standard (11-bit) and extended (29-bit) messaging formats
- Supports speeds upto 1 Mbps
- Support for bit timing configuration as defined in the CAN specification
- Supports up to 32 transmit or receive mailboxes with standard or extended ID frames
- Optional support for a 4-stage transmit and receive FIFO
- Receive mailboxes can be configured to capture either data or remote CAN Frames
- Receive mailboxes can be configured to receive a range of IDs using mailbox masks
- Mailboxes can be configured with Overwrite or Overrun mode
- Supports a user-callback function when transmit, receive, or error interrupts are received

Configuration

Build Time Configurations for r_can

The following build time configurations are defined in fsp_cfg/r_can_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| FIFO Support | <ul style="list-style-type: none"> • Disabled • Enabled | Disabled | When FIFOs are enabled, a transmit FIFO replaces mailboxes 24-27 and a receive FIFO replaces mailboxes 28-31. |

Configurations for Connectivity > CAN (r_can)

This module can be added to the Stacks tab via New Stack > Connectivity > CAN (r_can). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---------------|-------------------------------|---------|---------------------------------|
| General | | | |
| Name | Name must be a valid C symbol | g_can0 | Module name. |
| Channel | Channel should be 0 or 1 | 0 | Specify the CAN channel to use. |

| | | | |
|---|--|------------------|---|
| Clock Source | MCU Specific Options | | Select the CAN clock source. |
| Overwrite/Overrrun Mode | <ul style="list-style-type: none"> • Overwrite Mode • Overrrun Mode | Overwrite Mode | Select whether receive mailbox will be overwritten or overrun if data is not read in time. |
| Global ID Mode | <ul style="list-style-type: none"> • Standard ID Mode • Extended ID Mode • Mixed ID Mode | Standard ID Mode | Select whether the driver will use CAN Standard IDs, Extended IDs or a mix of both. |
| Number of Mailboxes | <ul style="list-style-type: none"> • 4 Mailboxes • 8 Mailboxes • 16 Mailboxes • 24 Mailboxes • 32 Mailboxes | 32 Mailboxes | Select 4, 8, 16, 24 or 32 mailboxes. In FIFO mailbox mode up to 24 mailboxes are available. |
| Baud Rate Settings | | | |
| Baud Rate Settings > Auto-generated Settings | | | |
| Sample-Point (%) | Must be a valid integer between 0 and 100. Ignore when Override Baud Settings is Enabled. | 75 | Sample-Point = (TSEG1 + 1) / (TSEG1 + TSEG2 + 1). |
| CAN Baud Rate (Hz) | Must be a valid integer configurable upto maximum 1MHz. Ignore when Override Baud Settings is Enabled. | 500000 | Specify baud rate in Hz. If the requested baud rate cannot be achieved, the settings with the largest possible baud rate that is less than or equal to the requested baud rate is used. If multiple combinations would result in the best baud rate, the combination with the least absolute error for the ratio is chosen. The theoretical calculated baud rate and ratio are printed in a comment in the generated can_bit_timing_cfg_t structure. |
| Baud Rate Settings > Override Auto-generated Settings | | | |
| Override Baud Settings | <ul style="list-style-type: none"> • Enabled | Disabled | Override calculated |

| | | | |
|------------------------------|---|---------------|--|
| | <ul style="list-style-type: none"> • Disabled | | baudrate parameters and instead use the ones specified below. This option ignores the parameters specified under Sample-Point (%) and CAN Baud Rate (Hz) |
| Baud Rate Prescaler | Value must be a non-negative integer between 1 and 1024. | 1 | Specify division value of baud rate prescaler (baud rate prescaler + 1). |
| Time Segment 1 | Refer to the RA Configuration tool for available options. | 4 Time Quanta | Select the time segment 1 value. (4-16). Check module usage notes for how to calculate this value. |
| Time Segment 2 | <ul style="list-style-type: none"> • 2 Time Quanta • 3 Time Quanta • 4 Time Quanta • 5 Time Quanta • 6 Time Quanta • 7 Time Quanta • 8 Time Quanta | 2 Time Quanta | Select the time segment 2 value (2-8). Check module usage notes for how to calculate this value. |
| Synchronization Jump Width | <ul style="list-style-type: none"> • 1 Time Quanta • 2 Time Quanta • 3 Time Quanta • 4 Time Quanta | 1 Time Quanta | Select the Synchronization Jump Width value (1-4). Check module usage notes for how to calculate this value. |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | can_callback | A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time any interrupt occurs. |
| Interrupt Priority Level | MCU Specific Options | | Transmit/Receive/Error interrupt priority. |
| Transmit FIFO Interrupt Mode | <ul style="list-style-type: none"> • Every Message • Empty | Every Message | Select whether the receive FIFO should throw an interrupt on every received message or when it becomes empty. |
| Input | | | |
| Input > Receive FIFO | | | |

Input > Receive FIFO > Receive ID 1

| | | | |
|------------|--|----------------|--|
| ID | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 0 | Select the first ID for the receive FIFO, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. |
| ID Mode | <ul style="list-style-type: none"> • Standard ID • Extended ID | Standard ID | Select whether the receive FIFO is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'. |
| Frame Type | <ul style="list-style-type: none"> • Data Mailbox • Remote Mailbox | Remote Mailbox | Select whether the receive FIFO is used to capture data frames or remote frames. |
| Mask | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 0x1FFFFFFF | Select the Mask for the receive FIFO. In Mixed ID Mode the Standard ID mask is the upper 11 bits of the full 29-bit mask value. |

Input > Receive FIFO > Receive ID 2

| | | | |
|------------|--|----------------|--|
| ID | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 0 | Select the second ID for the receive FIFO, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. |
| ID Mode | <ul style="list-style-type: none"> • Standard ID • Extended ID | Standard ID | Select whether the receive FIFO is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'. |
| Frame Type | <ul style="list-style-type: none"> • Data Mailbox • Remote Mailbox | Remote Mailbox | Select whether the receive FIFO is used to capture data frames or remote frames. |
| Mask | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 0x1FFFFFFF | Select the Mask for the receive FIFO. In Mixed ID Mode the Standard |

ID mask is the upper 11 bits of the full 29-bit mask value.

Clock Configuration

The CAN peripheral uses the CANMCLK (main-clock oscillator) or PCLKB as its clock source (fCAN, CAN System Clock.) The default CAN configuration will provide a CAN bit rate of 500 Kbit using CANMCLK as the clock source. To set the PCLKB frequency, use the **Clocks** tab of the RA Configuration editor. To change the clock frequency at run-time, use the CGC Interface. Refer to the CGC module guide for more information on configuring clocks.

Warning

RA2 devices only support CANMCLK (MOSC/XTAL) for the CAN clock source. If MOSC is not used as the main clock source it will not be started automatically. In this case, be sure to start it before opening the CAN driver.

Clock Limitations

The following clock limitations apply when using the CAN peripheral:

- When using the main oscillator (CANMCLK) as the clock source:
 - $f_{PCLKB} \geq f_{CANCLK}$ ($f_{CANCLK} = XTAL / \text{Baud Rate Prescaler}$)
 - The user application must start the main-clock oscillator (XTAL) at run-time using the CGC Interface if it has not already started (for example, if it is not used as the MCU clock source.)
- When using PCLKB as the clock source:
 - For RA6 and RA4 MCUs, the source of the peripheral module clocks must be PLL for the CAN HAL module.
- For RA4M1 and RA4W1 MCUs, the clock frequency ratio of PCLKA and PCLKB must be 2:1 when using the CAN HAL module. Operation is not guaranteed for other settings.
- For RA2 MCUs only CANMCLK (XTAL) may be used as a clock source. The clock frequency ratio of ICLK and PCLKB must be 2:1 when using the CAN HAL module. Operation is not guaranteed for other settings.

Note

When using CANMCLK (XTAL) as the CAN clock source while running at a reduced main clock speed (under 2x XTAL) be sure to confirm that the XTAL frequency divided by the baud rate prescaler is equal to or less than PCLKB.

Pin Configuration

The CAN peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. A CAN channel would consist of two pins - CRX and CTX for data transmission/reception.

Usage Notes

Bit Rate Calculation

For convenience, the baudrate of the CAN peripheral is automatically set through the RA Configuration editor using a best effort approach. If the auto-generated baud settings cause deviation that is not tolerable by the application, the user can override the auto-generated settings and put in manually calculated values through RA Configuration editor. For more details on how the baudrate is set refer to section 37.4 "Data Transfer Rate Configuration" of the RA6M3 User's Manual (R01UH0886EJ0100).

FIFO Support

When FIFO Support is enabled, mailboxes 24-27 form a 4-stage transmit FIFO and mailboxes 28-31 form a 4-stage receive FIFO. The receive FIFO supports two independent ID/mask settings for acceptance filtering.

Note

Only the base mailbox of each FIFO may be accessed. When writing to the TX FIFO it is recommended to use CAN_MAILBOX_ID_TX_FIFO.

Limitations

Developers should be aware of the following limitations when using CAN:

- The `can_frame_t::id_mode` field is only used when Global ID Mode is set to Mixed ID. It is

ignored in all other modes.

Examples

Basic Example

This is a basic example of minimal use of the CAN in an application.

```
can_frame_t g_can_tx_frame;
can_frame_t g_can_rx_frame;
volatile bool g_rx_flag = false;
volatile bool g_tx_flag = false;
volatile bool g_err_flag = false;
volatile uint32_t g_rx_id;
void can_callback (can_callback_args_t * p_args)
{
    switch (p_args->event)
    {
        case CAN_EVENT_RX_COMPLETE: /* Receive complete event. */
        {
            g_rx_flag = true;
            g_rx_id = p_args->frame.id;
            /* Read received frame */
            g_can_rx_frame = p_args->frame;
        }
        break;
        case CAN_EVENT_TX_COMPLETE: /* Transmit complete event. */
        {
            g_tx_flag = true;
        }
        break;
        case CAN_EVENT_ERR_BUS_OFF: /* Bus error event. (bus off) */
        case CAN_EVENT_ERR_PASSIVE: /* Bus error event. (error passive) */
        case CAN_EVENT_ERR_WARNING: /* Bus error event. (error warning) */
        case CAN_EVENT_BUS_RECOVERY: /* Bus error event. (bus recovery) */
        case CAN_EVENT_MAILBOX_MESSAGE_LOST: /* Overwrite/overrun error */
        {
```

```
/* Set error flag */
    g_err_flag = true;

break;
    }
default:
    {
break;
    }
}

void basic_example (void)
{
    fsp_err_t err;
    uint32_t i;
    uint32_t timeout_ms = CAN_BUSY_DELAY;

/* Initialize the CAN module */
    err = R_CAN_Open(&g_can0_ctrl, &g_can0_cfg);

/* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    g_can_tx_frame.id                = CAN_DESTINATION_DEVICE_MAILBOX_NUMBER; /* CAN
Destination Device ID */

    g_can_tx_frame.type              = CAN_FRAME_TYPE_DATA;
    g_can_tx_frame.data_length_code = CAN_FRAME_TRANSMIT_DATA_BYTES;

/* Write some data to the transmit frame */
    for (i = 0; i < sizeof(g_can_tx_frame.data); i++)
    {
        g_can_tx_frame.data[i] = (uint8_t) i;
    }

/* Send data on the bus */
    g_tx_flag = false;
    g_err_flag = false;

    err = R_CAN_Write(&g_can0_ctrl, CAN_MAILBOX_NUMBER_31, &g_can_tx_frame);
    assert(FSP_SUCCESS == err);

/* Since there is nothing else to do, block until Callback triggers*/
```

```
while ((true != g_tx_flag) && timeout_ms)
{
    R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;
}
if (true == g_err_flag)
{
    __BKPT(0);
}
}
```

External Loop-back Test

This example requires the CTX and CRX pins to be connected. If a CAN transceiver is onboard a 120 Ohm resistor should be connected across CANH and CANL instead. The mailbox numbers are arbitrarily chosen.

```
void can_external_loopback_example (void)
{
    fsp_err_t          err;
    uint32_t          timeout_ms    = CAN_BUSY_DELAY;
    can_operation_mode_t operation_mode = CAN_OPERATION_MODE_NORMAL;
    can_test_mode_t   test_mode     = CAN_TEST_MODE_LOOPBACK_EXTERNAL;
    int               diff = 0;
    uint32_t i          = 0;
    err = R_CAN_Open(&g_can0_ctrl, &g_can0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    err = R_CAN_ModeTransition(&g_can0_ctrl, operation_mode, test_mode);
    assert(FSP_SUCCESS == err);
    /* Clear the data part of receive frame */
    memset(g_can_rx_frame.data, 0, CAN_FRAME_TRANSMIT_DATA_BYTES);
    /* CAN Destination Device ID, in this case it is the same device with another
    mailbox */
    g_can_tx_frame.id          = CAN_MAILBOX_NUMBER_4;
    g_can_tx_frame.type        = CAN_FRAME_TYPE_DATA;
}
```

```
g_can_tx_frame.data_length_code = CAN_FRAME_TRANSMIT_DATA_BYTES;
/* Write some data to the transmit frame */
for (i = 0; i < sizeof(g_can_tx_frame.data); i++)
{
    g_can_tx_frame.data[i] = (uint8_t) i;
}
/* Send data on the bus */
g_rx_flag = false;
g_err_flag = false;
err = R_CAN_Write(&g_can0_ctrl, CAN_MAILBOX_NUMBER_31, &g_can_tx_frame);
assert(FSP_SUCCESS == err);
/* Since there is nothing else to do, block until Callback triggers*/
while ((true != g_rx_flag) && timeout_ms)
{
    R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;
}
if (true == g_err_flag)
{
    __BKPT(0);
}
/* Verify received data */
diff = memcmp(&g_can_rx_frame.data[0], &g_can_tx_frame.data[0],
CAN_FRAME_TRANSMIT_DATA_BYTES);
if (0 != diff)
{
    __BKPT(0);
}
}
```

| uint32_t * | p_mailbox_mask | Mailbox mask, one for every 4 mailboxes. |
| can_mailbox_t * | p_mailbox | Pointer to mailboxes. |
| can_global_id_mode_t | global_id_mode | Standard or Extended ID mode. |
| uint32_t | mailbox_count | Number of mailboxes. |
| can_message_mode_t | message_mode | Overwrite message or overrun. |
| can_fifo_interrupt_cfg_t const * | p_fifo_int_cfg | Pointer to FIFO interrupt configuration. |
| can_rx_fifo_cfg_t * | p_rx_fifo_cfg | Pointer to RX FIFO configuration. |

Enumeration Type Documentation

◆ **can_status_t**

| enum <code>can_status_t</code> | |
|--|--|
| CAN Status | |
| Enumerator | |
| <code>CAN_STATUS_NEW_DATA</code> | New Data status flag. |
| <code>CAN_STATUS_SENT_DATA</code> | Sent Data status flag. |
| <code>CAN_STATUS_RECEIVE_FIFO</code> | Receive FIFO status flag. |
| <code>CAN_STATUS_TRANSMIT_FIFO</code> | Transmit FIFO status flag. |
| <code>CAN_STATUS_NORMAL_MBOX_MESSAGE_LOST</code> | Normal mailbox message lost status flag. |
| <code>CAN_STATUS_FIFO_MBOX_MESSAGE_LOST</code> | FIFO mailbox message lost status flag. |
| <code>CAN_STATUS_TRANSMISSION_ABORT</code> | Transmission abort status flag. |
| <code>CAN_STATUS_ERROR</code> | Error status flag. |
| <code>CAN_STATUS_RESET_MODE</code> | Reset mode status flag. |
| <code>CAN_STATUS_HALT_MODE</code> | Halt mode status flag. |
| <code>CAN_STATUS_SLEEP_MODE</code> | Sleep mode status flag. |
| <code>CAN_STATUS_ERROR_PASSIVE</code> | Error-passive status flag. |
| <code>CAN_STATUS_BUS_OFF</code> | Bus-off status flag. |

◆ **can_error_t**

| | |
|--------------------------------------|------------------------------|
| enum <code>can_error_t</code> | |
| CAN Error Code | |
| Enumerator | |
| <code>CAN_ERROR_STUFF</code> | Stuff Error. |
| <code>CAN_ERROR_FORM</code> | Form Error. |
| <code>CAN_ERROR_ACK</code> | ACK Error. |
| <code>CAN_ERROR_CRC</code> | CRC Error. |
| <code>CAN_ERROR_BIT_RECESSIVE</code> | Bit Error (recessive) Error. |
| <code>CAN_ERROR_BIT_DOMINANT</code> | Bit Error (dominant) Error. |
| <code>CAN_ERROR_ACK_DELIMITER</code> | ACK Delimiter Error. |

◆ **can_mailbox_number_t**

| |
|--|
| enum <code>can_mailbox_number_t</code> |
| CAN Mailbox IDs (MB + FIFO) |

◆ **can_mailbox_send_receive_t**

| | |
|--|---------------------------|
| enum <code>can_mailbox_send_receive_t</code> | |
| CAN Mailbox type | |
| Enumerator | |
| <code>CAN_MAILBOX_RECEIVE</code> | Mailbox is for receiving. |
| <code>CAN_MAILBOX_TRANSMIT</code> | Mailbox is for sending. |

◆ **can_global_id_mode_t**

| | |
|--|--------------------------------------|
| enum <code>can_global_id_mode_t</code> | |
| Global CAN ID mode settings | |
| Enumerator | |
| <code>CAN_GLOBAL_ID_MODE_STANDARD</code> | Standard IDs of 11 bits used. |
| <code>CAN_GLOBAL_ID_MODE_EXTENDED</code> | Extended IDs of 29 bits used. |
| <code>CAN_GLOBAL_ID_MODE_MIXED</code> | Both Standard and Extended IDs used. |

◆ **can_message_mode_t**

| | |
|---|---|
| enum <code>can_message_mode_t</code> | |
| CAN Message Modes | |
| Enumerator | |
| <code>CAN_MESSAGE_MODE_OVERWRITE</code> | Receive data will be overwritten if not read before the next frame. |
| <code>CAN_MESSAGE_MODE_OVERRUN</code> | Receive data will be retained until it is read. |

◆ **can_clock_source_t**

| | |
|---------------------------------------|---|
| enum <code>can_clock_source_t</code> | |
| CAN Source Clock | |
| Enumerator | |
| <code>CAN_CLOCK_SOURCE_PCLKB</code> | PCLKB is the source of the CAN Clock. |
| <code>CAN_CLOCK_SOURCE_CANMCLK</code> | CANMCLK is the source of the CAN Clock. |

◆ **can_fifo_interrupt_mode_t**

| | |
|---|--|
| enum <code>can_fifo_interrupt_mode_t</code> | |
| CAN FIFO Interrupt Modes | |

Function Documentation

◆ **R_CAN_Open()**

```
fsp_err_t R_CAN_Open ( can_ctrl_t *const p_api_ctrl, can_cfg_t const *const p_cfg )
```

Open and configure the CAN channel for operation.

Example:

```
/* Initialize the CAN module */
err = R_CAN_Open(&g_can0_ctrl, &g_can0_cfg);
```

Return values

| | |
|-------------------------|-------------------------------|
| FSP_SUCCESS | Channel opened successfully |
| FSP_ERR_ALREADY_OPEN | Driver already open. |
| FSP_ERR_CAN_INIT_FAILED | Channel failed to initialize. |
| FSP_ERR_ASSERTION | Null pointer presented. |

◆ **R_CAN_Close()**

```
fsp_err_t R_CAN_Close ( can_ctrl_t *const p_api_ctrl)
```

Close the CAN channel.

Return values

| | |
|-------------------|------------------------------|
| FSP_SUCCESS | Channel closed successfully. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_ASSERTION | Null pointer presented. |

◆ **R_CAN_Write()**

```
fsp_err_t R_CAN_Write ( can_ctrl_t *const p_api_ctrl, uint32_t mailbox, can_frame_t *const p_frame )
```

Write data to the CAN channel. Write up to eight bytes to the channel mailbox.

Example:

```
err = R_CAN_Write(&g_can0_ctrl, CAN_MAILBOX_NUMBER_31, &g_can_tx_frame);
assert(FSP_SUCCESS == err);
```

Return values

| | |
|--------------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_CAN_TRANSMIT_NOT_READY | Transmit in progress, cannot write data at this time. |
| FSP_ERR_CAN_TRANSMIT_FIFO_FULL | Transmit FIFO is full. |
| FSP_ERR_CAN_RECEIVE_MAILBOX | Mailbox is setup for receive and cannot send. |
| FSP_ERR_INVALID_ARGUMENT | Data length or frame type invalid. |
| FSP_ERR_ASSERTION | Null pointer presented |

◆ **R_CAN_Read()**

```
fsp_err_t R_CAN_Read ( can_ctrl_t *const p_api_ctrl, uint32_t mailbox, can_frame_t *const p_frame )
```

Read data from a mailbox or FIFO.

Note

This function is not supported.

Return values

| | |
|---------------------|-------------------------|
| FSP_ERR_UNSUPPORTED | Function not supported. |
|---------------------|-------------------------|

◆ **R_CAN_ModeTransition()**

```
fsp_err_t R_CAN_ModeTransition ( can_ctrl_t *const p_api_ctrl, can_operation_mode_t
operation_mode, can_test_mode_t test_mode )
```

CAN Mode Transition is used to change CAN driver state.

Example:

```
err = R_CAN_ModeTransition(&g_can0_ctrl, operation_mode, test_mode);
assert(FSP_SUCCESS == err);
```

Return values

| | |
|-------------------|-------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_ASSERTION | Null pointer presented |

◆ **R_CAN_InfoGet()**

```
fsp_err_t R_CAN_InfoGet ( can_ctrl_t *const p_api_ctrl, can_info_t *const p_info )
```

Get CAN state and status information for the channel.

Return values

| | |
|-------------------|-------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_ASSERTION | Null pointer presented |

◆ R_CAN_CallbackSet()

```
fsp_err_t R_CAN_CallbackSet ( can_ctrl_t *const p_api_ctrl, void (*)(can_callback_args_t *)
p_callback, void const *const p_context, can_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `can_api_t::callbackSet`.

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | <code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL. |

5.2.6.3 CAN FD (r_canfd)

Modules » [Connectivity](#)

Functions

```
fsp_err_t R_CANFD_Open (can_ctrl_t *const p_api_ctrl, can_cfg_t const *const
p_cfg)
```

```
fsp_err_t R_CANFD_Close (can_ctrl_t *const p_api_ctrl)
```

```
fsp_err_t R_CANFD_Write (can_ctrl_t *const p_api_ctrl, uint32_t buffer,
can_frame_t *const p_frame)
```

```
fsp_err_t R_CANFD_Read (can_ctrl_t *const p_api_ctrl, uint32_t buffer,
can_frame_t *const p_frame)
```

```
fsp_err_t R_CANFD_ModeTransition (can_ctrl_t *const p_api_ctrl,
can_operation_mode_t operation_mode, can_test_mode_t test_mode)
```

```
fsp_err_t R_CANFD_InfoGet (can_ctrl_t *const p_api_ctrl, can_info_t *const
p_info)
```

```
fsp_err_t R_CANFD_CallbackSet (can_ctrl_t *const p_api_ctrl,
void (*p_callback)(can_callback_args_t *), void const *const
p_context, can_callback_args_t *const p_callback_memory)
```

Detailed Description

Driver for the CANFD peripheral on RA MCUs. This module implements the [CAN Interface](#).

Overview

The CANFD module can be used to communicate over CAN networks, optionally using Flexible Data (CAN-FD) to accelerate the data phase. A variety of message filtering and buffer options are available.

Features

Common Features

- Compatibility
 - Send and receive CAN 2.0 and CAN-FD frames on the same channel
 - Bitrate up to 1 Mbps with FD data phase speeds up to 5-8 Mbps
 - ISO 11898-1 Support
- Buffers
 - 32 global receive Message Buffers (RX MBs)
 - 2-8 global receive FIFOs (RX FIFOs)
 - 4-16 transmit Message Buffers (TX MBs) per channel
- Filtering
 - Each filter rule can be individually configured to accept messages based on:
 - ID
 - Standard or Extended ID (IDE bit)
 - Data or Remote Frame (RTR bit)
 - ID/IDE/RTR mask
 - Minimum DLC (data length) value
- Interrupts
 - Configurable Global RX FIFO Interrupt
 - Configurable per FIFO
 - Interrupt at a certain depth or on every received message
 - Configurable Common FIFO RX Interrupt
 - Configurable per FIFO
 - Interrupt at a certain depth or on every received message
 - Channel TX Interrupt
 - Interrupt on every transmitted message or when a Common FIFO is empty
 - Global Error
 - DLC Check
 - Message Lost
 - FD Payload Overflow
 - Channel Error
 - Bus Error
 - Error Warning
 - Error Passive
 - Bus-Off Entry
 - Bus-Off Recovery
 - Overload
 - Bus Lock
 - Arbitration Loss
 - Transmission Aborted

Per-MCU Specifications

| | RA6M5 | RA6T2 | RA8M1 |
|--|-------|-------|-------|
| | | | |

| | | | |
|---------------------|------------|------------|------------|
| Channels | 2 | 1 | 2 |
| Max nominal bitrate | 1 Mbps | 1 Mbps | 1 Mbps |
| Max data bitrate | 5 Mbps | 5 Mbps | 8 Mbps |
| Filter rules | 128 | 32 | 16/ch |
| TX message buffers | 16/ch | 4 | 4/ch |
| RX message buffers | 32 | 32 | 16/ch |
| RX FIFOs | 8 | 2 | 2/ch |
| RX Buffer RAM | 4864 bytes | 1216 bytes | 1216 bytes |
| Common FIFOs | 3/ch | 1 | 1/ch |

Note

Each message buffer comprises 12 header bytes plus data length (8-64 bytes). The above buffer RAM values therefore correspond to the following capacities:

| | RA6M5 | RA6T2 | RA8M1 |
|---------------------|--------------|-------------|-------------|
| Max 64-byte storage | 64 messages | 16 messages | 16 messages |
| Max 8-byte storage | 243 messages | 60 messages | 60 messages |

Each Common FIFO buffer can support the following message capacities:

| | RA6M5 | RA6T2 | RA8M1 |
|----------------------|--------------|-------------|-------------|
| Maximum payload size | 64 bytes | 64 bytes | 64 bytes |
| Maximum FIFO depth | 128 messages | 48 messages | 48 messages |

Configuration

Build Time Configurations for r_canfd

The following build time configurations are defined in fsp_cfg/r_canfd_cfg.h:

| Configuration | Options | Default | Description |
|------------------------|----------------------|---------|--|
| Global Error Interrupt | | | |
| Callback Channel | MCU Specific Options | | Specify which channel callback should be called to handle global errors. When starting the driver this channel must be opened first. |
| Priority | MCU Specific Options | | This interrupt is fired for each of the error sources selected below. |
| Sources | • DLC Check | 0U | Select which errors |

- Message Lost
- FD Payload Overflow

should trigger an interrupt.

Reception

Reception > FIFOs

Reception > FIFOs > FIFO 0

| | | | |
|----------------------------|---|----------|---|
| Enable | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | Enable or disable RX FIFO 0. |
| Interrupt Mode | MCU Specific Options | | Set the interrupt mode for RX FIFO 0. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below. |
| Interrupt Threshold | MCU Specific Options | | Set the interrupt threshold value for RX FIFO 0. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'. |
| Payload Size | MCU Specific Options | | Select the message payload size for RX FIFO 0. |
| Depth | MCU Specific Options | | Select the number of stages for RX FIFO 0. |

| Interrupt Threshold | MCU Specific Options | | Set the interrupt threshold value for RX FIFO 7. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'. |
| Payload Size | MCU Specific Options | | Select the message payload size for RX FIFO 7. |
| Depth | MCU Specific Options | | Select the number of |

stages for RX FIFO 7.

This priority level will apply to all FIFO interrupts globally.

Interrupt Priority

MCU Specific Options

Reception > Message Buffers

Number of Buffers

RX Message Buffer number must be an integer between 0 and 32.

Number of message buffers available for reception.

As there is no interrupt for message buffer reception it is recommended to use RX FIFOs instead. Set this value to 0 to disable RX Message Buffers.

Payload Size

- 8 bytes
- 12 bytes
- 16 bytes
- 20 bytes
- 24 bytes
- 32 bytes
- 48 bytes
- 64 bytes

8 bytes

Payload size for all RX Message Buffers.

Reception > Acceptance Filtering

Channel 0 Rule Count

The number of AFL rules must be a positive integer.

32

Number of acceptance filter list rules dedicated to Channel 0.

Channel 1 Rule Count

The number of AFL rules must be a positive integer.

0

Number of acceptance filter list rules dedicated to Channel 1.

Flexible Data (FD)

Protocol Exceptions

- Enabled (ISO 11898-1)
- Disabled

Enabled (ISO 11898-1)

Select whether to enter the protocol exception handling state when a RES bit is sampled recessive as defined in ISO 11898-1.

Payload Overflow

- Reject
- Truncate

Reject

Configure whether received messages larger than the destination buffer should be truncated or rejected.

Common FIFOs

Common FIFOs > FIFO 0

| | | | |
|---------------------|---|-----------------|--|
| Enable | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Enable or disable Common FIFO 0. |

Configurations for Connectivity > CAN FD (r_canfd)

This module can be added to the Stacks tab via New Stack > Connectivity > CAN FD (r_canfd). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---------------------|-------------------------------|----------|---------------------------------|
| General | | | |
| Name | Name must be a valid C symbol | g_canfd0 | Module name. |
| Channel | Channel should be 0 or 1 | 0 | Specify the CAN channel to use. |
| Bitrate | | | |
| Bitrate > Automatic | | | |

| | | | |
|----------------------------|--|---------|---|
| Nominal Rate (bps) | Must be a valid integer with a maximum of 1MHz. | 500000 | Specify nominal bitrate in bits per second. |
| FD Data Rate (bps) | Must be a valid integer with a minimum of 1MHz. | 2000000 | Specify data bitrate in bits per second. This value is not used when sending messages without the FD and BRS bits enabled and should be left at the default setting if only Classical CAN will be used. |
| Sample Point (%) | Must be a valid integer between 60 and 99. | 75 | Specify desired sample point. |
| Bitrate > Manual | | | |
| Bitrate > Manual > Nominal | | | |
| Prescaler (divisor) | Value must be a non-negative integer between 1 and 1024. | 1 | Specify clock divisor for nominal bitrate. |
| Time Segment 1 (Tq) | Value must be a non-negative integer between 2 and 256. | 29 | Select the Time Segment 1 value. Check module usage notes for how to calculate this value. |
| Time Segment 2 (Tq) | Value must be a non-negative integer between 2 and 128. | 10 | Select the Time Segment 2 value. Check module usage notes for how to calculate this value. |
| Sync Jump Width (Tq) | Value must be a non-negative integer between 1 and 128. | 4 | Select the Synchronization Jump Width value. Check module usage notes for how to calculate this value. |
| Bitrate > Manual > Data | | | |
| Prescaler (divisor) | Value must be a non-negative integer between 1 and 256. | 1 | Specify clock divisor for data bitrate. |
| Time Segment 1 (Tq) | Value must be a non-negative integer between 2 and 32. | 5 | Select the Time Segment 1 value. Check module usage notes for how to calculate this value. |
| Time Segment 2 (Tq) | Value must be a non-negative integer | 2 | Select the Time Segment 2 value. |

| | | | |
|----------------------------------|---|-----------------|---|
| | between 2 and 16. | | Check module usage notes for how to calculate this value. |
| Sync Jump Width (Tq) | Value must be a non-negative integer between 1 and 16. | 1 | Select the Synchronization Jump Width value. Check module usage notes for how to calculate this value. |
| Use manual settings | <ul style="list-style-type: none"> • Yes • No | No | Select whether or not to override automatic baudrate generation and instead use the values specified here. |
| Delay Compensation | <ul style="list-style-type: none"> • Enable • Disable | Enable | When enabled the CANFD module will automatically compensate for any transceiver or bus delay between transmitted and received bits. When manually supplying bit timing values with delay compensation enabled be sure the data prescaler is 2 or smaller for correct operation. |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | canfd0_callback | A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time any interrupt occurs. |
| Channel Interrupt Priority Level | MCU Specific Options | | Channel Error/Transmit interrupt priority. |
| Transmit Interrupts | MCU Specific Options | | Select which TX Message Buffers should trigger an interrupt when transmission is complete. |
| Channel Error Interrupts | <ul style="list-style-type: none"> • Error Warning • Error Passive • Bus-Off Entry • Bus-Off Recovery • Overload | 0U | Select which channel error interrupt sources to enable. |

| | | | |
|-------------------|-------------------------------|--------------|--|
| Filter List Array | Name must be a valid C symbol | p_canfd0_afl | Acceptance Filter List (AFL) rule array symbol name. |
|-------------------|-------------------------------|--------------|--|

Clock Configuration

The CANFD peripheral uses PLL or PLL2 as its clock source. The RA Configuration editor will attempt to get as close as possible to the supplied bitrate with the configured clock source. To achieve an exact bitrate the CANFD source clock or divisor may need to be adjusted to meet the criteria in the formula below:

```
bitrate = canfd_clock_hz / ((time_segment_1 + time_segment_2 + 1) * prescalar)
```

For CANFD, the possible values for each element are as follows:

| Element | Min | Max (Nominal) | Max (Data) |
|-----------------|------|----------------|----------------|
| Bitrate | - | 1 Mbps | 5-8 Mbps* |
| Time Segment 1 | 2 Tq | 256 Tq | 32 Tq |
| Time Segment 2 | 2 Tq | 128 Tq | 16 Tq |
| Sync Jump Width | 1 Tq | Time Segment 2 | Time Segment 2 |
| Prescalar | 1 | 1024 | 256 |

- RA6 devices support up to 5 Mbps; RA8 devices support up to 8 Mbps.

Use the **Clocks** tab of the RA Configuration editor to configure the CANFD clock source/divisor as well as to set the frequency of PLL or PLL2. To change the clock frequency at run-time, use the CGC Interface. Refer to the CGC module guide for more information on configuring clocks.

Pin Configuration

CANFD channels each control two pins: CRX (receive) and CTX (transmit).

Usage Notes

Buffers

The CANFD driver provides four types of buffers: Transmit Message Buffers (TX MBs), Receive Message Buffers (RX MBs), Receive FIFOs (RX FIFOs), and Common FIFOs (RX/TX Common FIFOs).

TX Message Buffers

TX MBs are used for transmission only. Refer to the hardware manual for your device for information on which TX MBs are available.

Note

The CANFD peripheral continually scans TX MBs for new data. Depending on the provided clock it may be possible to write to multiple TX MBs before transmission begins. In this case, messages will be sent in the priority specified by the Transmission Priority option in the RA Configuration editor.

RX Message Buffers

RX MBs are for reception only and may only hold one message at a time. The number of available RX MBs varies per device.

On RA6M5, RX MBs are shared between channels and no interrupts are provided. Use [R_CANFD_InfoGet](#) and [R_CANFD_Read](#) to poll and read them, respectively.

RX FIFOs

RX FIFOs provide interrupt-driven queue functionality for receiving messages. All FIFOs have the following capabilities:

- Up to 64 byte payloads
- Up to 128 messages (RA6M5) or 48 messages for all other MCUs.
- Interrupt events:
 - On every received frame OR when filled to a specified fraction of its capacity
 - When a message is overwritten (message received on full FIFO)

Once an interrupt is fired it will continue to fire until the FIFO is emptied and all messages have been passed to user code via the callback. When using the threshold interrupt mode a FIFO can be checked for data and read between interrupts by calling [R_CANFD_InfoGet](#) and [R_CANFD_Read](#), respectively.

Note

On the RA6M5, FIFOs are shared across all channels.

RX Buffer Pool

The CANFD peripheral has a limited amount of buffer pool RAM available for allocating RX MBs and FIFO stages. The RA Configuration editor will provide a warning when the limit is exceeded.

The number of bytes used by RX MBs and individual FIFOs can be calculated as follows:

```
Total RX MB bytes used = (number of RX MBs enabled) * (RX MB payload size + 12 header bytes)
```

```
RX FIFO bytes used = (number of FIFO stages) * (FIFO payload size + 12 header bytes)
```

Common FIFOs

Common FIFOs provide interrupt-driven queue functionality for receiving or transmitting messages. Unlike RX FIFOs, Common FIFOs are individual to each channel. Refer to the hardware manual for your device for information on how many Common FIFOs are available. Common FIFOs support the following capabilities:

- Either TX or RX behavior can be configured.
 - Each Common FIFO can only be configured as one or the other. It cannot operate in both TX and RX modes at the same time.
- Up to 64 byte payloads
- Up to 128 messages (RA6M5) or 48 messages on all other MCUs
- Interrupt events:
 - On every message received or when filled to a specified fraction of its capacity

- On every message transmitted or when all messages have been transmitted and the FIFO is empty

Once an interrupt is fired it will continue to fire until the FIFO is emptied and all messages have been passed to user code via the callback. When using the threshold interrupt mode a FIFO can be checked for data and read between interrupts by calling `R_CANFD_InfoGet` and `R_CANFD_Read`, respectively.

Users should be aware of the total memory allocated in the internal CAN-FD RAM area for Common FIFOs. Allocating too many FIFOs or entries can lead to unexpected behavior.

Message Filtering (Acceptance Filter List)

To filter messages to the desired message buffer or FIFO the CANFD peripheral uses an Acceptance Filter List (AFL). Each entry in the AFL provides a rule to check a message against along with destination and other filtering information. When a message is received the CANFD peripheral internally checks against every configured AFL rule for the channel. If a match is found the message is transferred to the destination(s) specified in the rule. The default template with one entry is shown below:

```
static const canfd_afl_entry_t p_canfd0_afl[CANFD_CFG_AFL_CHO_RULE_NUM] =
{
    {
        .id =
        {
            /* Specify the ID, ID type and frame type to accept. */
            .id          = 0x00000000,
            .frame_type = CAN_FRAME_TYPE_DATA,
            .id_mode     = CAN_ID_MODE_EXTENDED,
        },
        .mask =
        {
            /* These values mask which ID/mode bits to compare when filtering messages. */
            .mask_id          = 0x1FFFFFFF,
            .mask_frame_type = 1,
            .mask_id_mode    = 1,
        },
        .destination =
        {
            /* If DLC checking is enabled any messages shorter than the below setting will be
            rejected. */
            .minimum_dlc = CANFD_MINIMUM_DLC_0,
```

```

/* Optionally specify a Receive Message Buffer (RX MB) to store accepted frames. RX
MBs do not have an
* interrupt or overwrite protection and must be checked with R_CANFD_InfoGet and
R_CANFD_Read. */

    .rx_buffer    = CANFD_RX_MB_NONE,

/* Specify which FIFO(s) to send filtered messages to. Multiple FIFOs can be OR'd
together. */

    .fifo_select_flags = CANFD_RX_FIFO_0,

}

}

};
    
```

AFL templates can be easily added to a project using the Developer Assistance feature in e² studio. Once the CANFD module is added to a project, drag and drop the elements circled below to build a filter list:

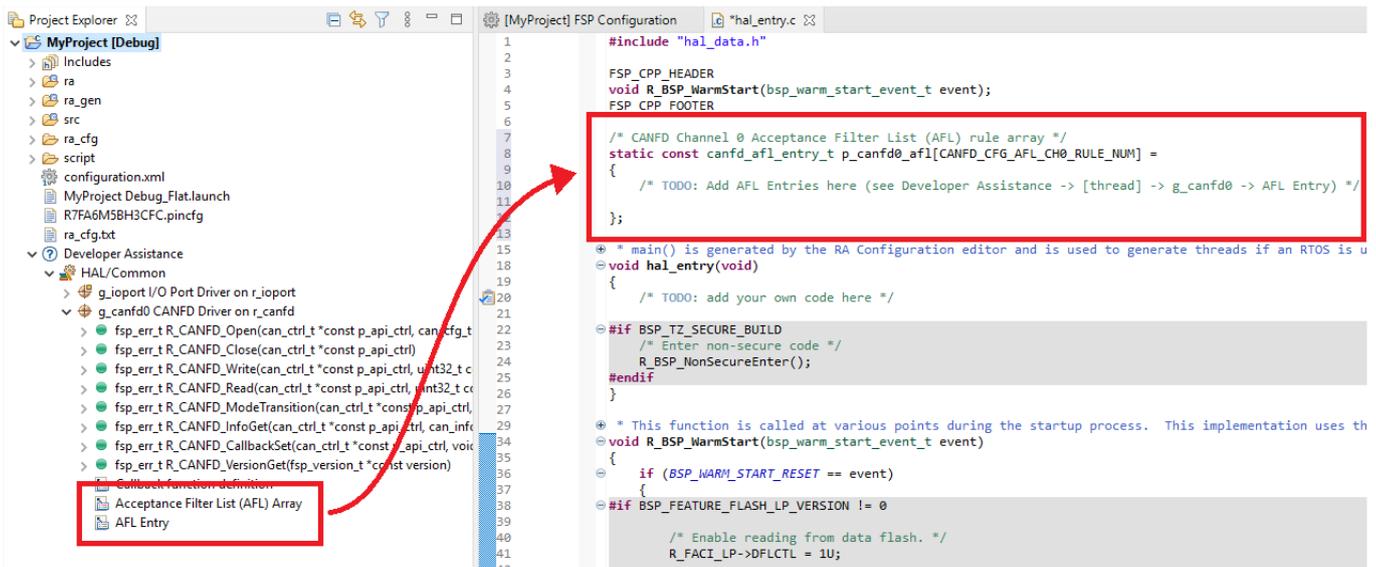

Figure 189: CANFD Developer Assistance AFL Templates

For an example configuration refer to the [AFL Example](#) below.

Flexible Data (FD)

Flexible Data is an extension of the CAN protocol allowing for messages up to 64 bytes and higher data bitrates, among other features. The CANFD driver supports the following:

- Sending and receiving FD messages
- Bitrate switching for data phase

- Manual and automatic setting of the error state (ESI) bit

To specify one or more of these options when transmitting set `can_frame_t::options` with combined values from `canfd_frame_options_t`. Received messages will automatically have this field filled, if applicable.

```
/* Configure a frame to write 64 bytes with bitrate switching (BRS) enabled */
g_can_tx_frame.id           = CAN_EXAMPLE_ID;
g_can_tx_frame.id_mode     = CAN_ID_MODE_STANDARD;
g_can_tx_frame.type        = CAN_FRAME_TYPE_DATA;
g_can_tx_frame.data_length_code = CAN_EXAMPLE_64_BYTES;
g_can_tx_frame.options     = CANFD_FRAME_OPTION_FD | CANFD_FRAME_OPTION_BRS;
```

Note

When using bitrate switching be sure to configure the Data Bitrate as desired in the RA Configuration editor.

Bit Rate Calculation

For convenience, the baudrate of the CANFD peripheral is automatically set through the RA Configuration editor using a best effort approach.

Enabling Delay Compensation instructs the CANFD peripheral to measure TX to RX transceiver delay and automatically adjust for it, improving the reliability of high-speed FD messages. This option may severely limit available bitrate settings depending on the source clock; it is highly recommended to check the generated values when enabled.

If the auto-generated baud settings cause deviation that is not tolerable by the application the user can override the auto-generated settings and put in manually calculated values through the RA Configuration editor. For more details on how the bitrate is calculated refer to the [Clock Configuration](#) section above.

Sync Jump Width

The Sync Jump Width option specifies the maximum number of time quanta that the sample point may be delayed by to account for differences in oscillators on the bus. It should be set to a value between 1 and the configured Time Segment 2 value depending on the maximum permissible clock error.

Error Handling

The CANFD peripheral provides two types of error interrupts: Channel and Global. As the names imply, each channel has its own Channel Error interrupt but there is only one Global Error interrupt. Only the configured channel will receive callbacks for Global Errors.

Error interrupt callbacks will pass either `CAN_EVENT_ERR_CHANNEL` or `CAN_EVENT_ERR_GLOBAL` in the `can_callback_args_t::event` field. A second field, `can_callback_args_t::error`, provides the actual error code as `canfd_error_t`. Cast to this enum to retrieve the error condition. See the callback in the [Basic Example](#) below for a demonstration.

DLC Checking

When DLC Checking is enabled messages are checked against the `destination.minimum_dlc` value of each AFL rule. If the data length of a message is less than this value the message will be rejected. When DLC checking is set to "Enabled w/truncate" in the RA Configuration editor any data in excess of the minimum DLC setting will be truncated and the DLC value for the frame will be set to match.

FD Payload Overflow

When an FD message is received with a DLC larger than the destination buffer an FD Payload Overflow interrupt is thrown (if configured). When Payload Overflow is set to "Truncate" the message will still be accepted but only data up to the buffer capacity will be preserved. The DLC value is unchanged in this case; any data beyond this value in the `can_frame_t::data` array should not be used.

Test Modes

The CANFD peripheral provides three basic test modes: Listen Only, Internal Loopback and External Loopback. Use [R_CANFD_ModeTransition](#) to switch to a test mode.

On some MCUs an additional "Internal Bus" test mode is available that allows connecting both CANFD channels together on an internal bus, effectively creating an internal CAN network. See the [Internal Bus](#) example below for details.

Limitations

Developers should be aware of the following limitations when using CANFD:

- On RA6M5, RX Message Buffers do not have an associated interrupt. To use them in an application one of the following is recommended:
 - Use [R_CANFD_InfoGet](#) to determine if any RX MBs have received data, then use [R_CANFD_Read](#) to obtain it
 - Select an RX FIFO as an additional destination for the relevant filter rules and configure the FIFO interrupt/callback as desired
- The CANFD peripheral has a limited amount of buffer pool RAM available for allocating RX MBs and FIFO stages. See the [RX Buffer Pool](#) section above for more information.
- When switching modes with [R_CANFD_ModeTransition](#) a delay of up to several CAN frames may be incurred. Consult Section 32.3.4.2 "Timing of Channel Mode Change" in the RA6M5 User's Manual (R01UH0891EJ0100) for details.
- Only one channel will receive callbacks for Global Errors. If a different channel is opened first these error interrupts will be suppressed until the specified handler channel is opened.

Examples

AFL Example

The below is an example Acceptance Filter List (AFL) declaration with two rules.

```
const canfd_afl_entry_t p_canfd0_afl[CANFD_CFG_AFL_CH1_RULE_NUM] =
{
    /* Store all data frames with at least 4 bytes from Standard IDs 0x40-0x4F in RX
    FIFO 0 and RX FIFO 1 */
```

```
{
    .id =
    {
        .id          = 0x40,
        .frame_type = CAN_FRAME_TYPE_DATA,
        .id_mode     = CAN_ID_MODE_STANDARD
    },
    .mask =
    {
        .mask_id      = 0x7F0,
        .mask_frame_type = 1,
        .mask_id_mode  = 1
    },
    .destination =
    {
        .minimum_dlc    = CANFD_MINIMUM_DLC_4,
        .rx_buffer       = CANFD_RX_MB_NONE,
        .fifo_select_flags = (canfd_rx_fifo_t) (CANFD_RX_FIFO_0 |
CANFD_RX_FIFO_1)
    }
},
/* Store all frames from Extended ID 0x1100 in RX FIFO 2 and RX MB 0 */
{
    .id =
    {
        .id          = 0x1100,
        .frame_type = CAN_FRAME_TYPE_DATA, // This setting is ignored by the mask
        .id_mode     = CAN_ID_MODE_EXTENDED
    },
    .mask =
    {
        .mask_id      = 0x1FFFFFFF,
        .mask_frame_type = 0,
        .mask_id_mode  = 1
    }
}
```

```
    },
    .destination =
    {
        .minimum_dlc      = CANFD_MINIMUM_DLC_0,
        .rx_buffer        = CANFD_RX_MB_0,
        .fifo_select_flags = CANFD_RX_FIFO_2
    }
}
};
```

Basic Example

This is a basic example of minimal use of the CANFD module in an application.

Note

On RA6M5 it is recommended to use RX FIFOs for reception as there are no interrupts for RX message buffers.

```
#define CAN_EXAMPLE_ID (0x20)
can_frame_t g_can_tx_frame;
can_frame_t g_can_rx_frame;
volatile canfd_error_t g_err_status = (canfd_error_t) 0;
void canfd_callback (can_callback_args_t * p_args)
{
    switch (p_args->event)
    {
        case CAN_EVENT_RX_COMPLETE: /* Receive complete event. */
        {
            /* Read received frame */
            memcpy(&g_can_rx_frame, &p_args->frame, sizeof(can_frame_t));
            /* Handle event */
            break;
        }
        case CAN_EVENT_TX_COMPLETE: /* Transmit complete event. */
        {
            /* Handle event */
            break;
        }
    }
}
```

```
    }
case CAN_EVENT_ERR_GLOBAL:                /* Global error. */
case CAN_EVENT_ERR_CHANNEL:              /* Channel error. */
    {
/* Get error status */
        g_err_status = (canfd_error_t) p_args->error; /* Check error code with
canfd_error_t. */
/* Handle event */
break;
    }
default:
    {
break;
    }
}
}
void canfd_basic_example (void)
{
    fsp_err_t err;
/* Initialize the CAN module */
    err = R_CANFD_Open(&g_canfd0_ctrl, &g_canfd0_cfg);
/* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
/* Setup frame to write to CAN ID 0x20 */
    g_can_tx_frame.id           = CAN_EXAMPLE_ID;
    g_can_tx_frame.id_mode      = CAN_ID_MODE_STANDARD;
    g_can_tx_frame.type         = CAN_FRAME_TYPE_DATA;
    g_can_tx_frame.data_length_code = 8;
    g_can_tx_frame.options      = 0;
/* Write some data to the transmit frame */
for (uint32_t i = 0; i < 8; i++)
    {
        g_can_tx_frame.data[i] = (uint8_t) i;
    }
}
```

```
/* Send data on the bus */
err = R_CANFD_Write(&g_canfd0_ctrl, CANFD_TX_MB_0, &g_can_tx_frame);
assert(FSP_SUCCESS == err);

/* Wait for a transmit callback event */
}
```

Flexible Data

This example demonstrates sending an FD message with bitrate switching over external loopback. The CTX and CRX pins must be connected when using external loopback, though if a CAN transceiver is onboard a 120 Ohm resistor should be connected across CANH and CANL instead.

```
#define CAN_EXAMPLE_64_BYTES 64

void canfd_fd_loopback_example (void)
{
    fsp_err_t err;

    err = R_CANFD_Open(&g_canfd0_ctrl, &g_canfd0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Switch to external loopback mode */
    err = R_CANFD_ModeTransition(&g_canfd0_ctrl, CAN_OPERATION_MODE_NORMAL,
CAN_TEST_MODE_LOOPBACK_EXTERNAL);
    assert(FSP_SUCCESS == err);
    /* Configure a frame to write 64 bytes with bitrate switching (BRS) enabled */
    g_can_tx_frame.id = CAN_EXAMPLE_ID;
    g_can_tx_frame.id_mode = CAN_ID_MODE_STANDARD;
    g_can_tx_frame.type = CAN_FRAME_TYPE_DATA;
    g_can_tx_frame.data_length_code = CAN_EXAMPLE_64_BYTES;
    g_can_tx_frame.options = CANFD_FRAME_OPTION_FD | CANFD_FRAME_OPTION_BRS;
    /* Write some data to the transmit frame */
    for (uint32_t i = 0; i < CAN_DATA_BUFFER_LENGTH; i++)
    {
        g_can_tx_frame.data[i] = (uint8_t) i;
    }
    /* Send data on the bus */
    err = R_CANFD_Write(&g_canfd0_ctrl, CANFD_TX_MB_0, &g_can_tx_frame);
```

```

assert(FSP_SUCCESS == err);

/* Wait for a transmit and/or receive callback event */
}

```

Internal Bus

In this example two CANFD channels are connected to the Internal Bus test mode. API error checking has been omitted for clarity.

Note

Internal Bus mode is only available on MCUs with more than one CANFD channel. In addition, use of Global Modes for any other purpose is not recommended without consulting the device User's Manual.

| CANFD Extended Configuration | | |
| Data Fields | | |
| canfd_afl_entry_t const * | p_afl | AFL rules list. |
| uint64_t | txmb_txi_enable | Array of TX Message Buffer enable bits. |
| uint32_t | error_interrupts | Error interrupt enable bits. |
| can_bit_timing_cfg_t * | p_data_timing | FD Data Rate (when bitrate switching is used) |
| uint8_t | delay_compensation | FD Transceiver Delay Compensation (enable or disable) |
| canfd_global_cfg_t * | p_global_cfg | Global configuration (global error callback channel only) |

Enumeration Type Documentation

◆ **canfd_status_t**

| enum <code>canfd_status_t</code> | |
|---|---|
| CANFD Status | |
| Enumerator | |
| <code>CANFD_STATUS_RESET_MODE</code> | Channel in Reset mode. |
| <code>CANFD_STATUS_HALT_MODE</code> | Channel in Halt mode. |
| <code>CANFD_STATUS_SLEEP_MODE</code> | Channel in Sleep mode. |
| <code>CANFD_STATUS_ERROR_PASSIVE</code> | Channel in error-passive state. |
| <code>CANFD_STATUS_BUS_OFF</code> | Channel in bus-off state. |
| <code>CANFD_STATUS_TRANSMITTING</code> | Channel is transmitting. |
| <code>CANFD_STATUS_RECEIVING</code> | Channel is receiving. |
| <code>CANFD_STATUS_READY</code> | Channel is ready for communication. |
| <code>CANFD_STATUS_ESI</code> | At least one CAN-FD message was received with the ESI flag set. |

◆ **canfd_error_t**

| enum <code>canfd_error_t</code> | |
|---|---|
| CANFD Error Code | |
| Enumerator | |
| <code>CANFD_ERROR_CHANNEL_BUS</code> | Bus Error. |
| <code>CANFD_ERROR_CHANNEL_WARNING</code> | Error Warning (TX/RX error count over 0x5F) |
| <code>CANFD_ERROR_CHANNEL_PASSIVE</code> | Error Passive (TX/RX error count over 0x7F) |
| <code>CANFD_ERROR_CHANNEL_BUS_OFF_ENTRY</code> | Bus-Off State Entry. |
| <code>CANFD_ERROR_CHANNEL_BUS_OFF_RECOVERY</code> | Recovery from Bus-Off State. |
| <code>CANFD_ERROR_CHANNEL_OVERLOAD</code> | Overload. |
| <code>CANFD_ERROR_CHANNEL_BUS_LOCK</code> | Bus Locked. |
| <code>CANFD_ERROR_CHANNEL_ARBITRATION_LOSS</code> | Arbitration Lost. |

| | |
|-------------------------------------|------------------------------|
| CANFD_ERROR_CHANNEL_STUFF | Stuff Error. |
| CANFD_ERROR_CHANNEL_FORM | Form Error. |
| CANFD_ERROR_CHANNEL_ACK | ACK Error. |
| CANFD_ERROR_CHANNEL_CRC | CRC Error. |
| CANFD_ERROR_CHANNEL_BIT_RECESSIVE | Bit Error (recessive) Error. |
| CANFD_ERROR_CHANNEL_BIT_DOMINANT | Bit Error (dominant) Error. |
| CANFD_ERROR_CHANNEL_ACK_DELIMITER | ACK Delimiter Error. |
| CANFD_ERROR_GLOBAL_DLC | DLC Error. |
| CANFD_ERROR_GLOBAL_MESSAGE_LOST | Message Lost. |
| CANFD_ERROR_GLOBAL_PAYLOAD_OVERFLOW | FD Payload Overflow. |
| CANFD_ERROR_GLOBAL_TXQ_OVERWRITE | TX Queue Message Overwrite. |
| CANFD_ERROR_GLOBAL_TXQ_MESSAGE_LOST | TX Queue Message Lost. |
| CANFD_ERROR_GLOBAL_CH0_SCAN_FAIL | Channel 0 RX Scan Failure. |
| CANFD_ERROR_GLOBAL_CH1_SCAN_FAIL | Channel 1 RX Scan Failure. |
| CANFD_ERROR_GLOBAL_CH0_ECC | Channel 0 ECC Error. |
| CANFD_ERROR_GLOBAL_CH1_ECC | Channel 1 ECC Error. |

◆ canfd_tx_buffer_t

| |
|--|
| enum canfd_tx_buffer_t |
| CANFD Transmit Buffer (MB + CFIFO) |

◆ canfd_tx_mb_t

| |
|---------------------------------------|
| enum canfd_tx_mb_t |
| CANFD Transmit Message Buffer (TX MB) |

◆ **canfd_rx_buffer_t**enum `canfd_rx_buffer_t`

CANFD Receive Buffer (MB + FIFO + CFIFO)

◆ **canfd_rx_mb_t**enum `canfd_rx_mb_t`

CANFD Receive Message Buffer (RX MB)

◆ **canfd_rx_fifo_t**enum `canfd_rx_fifo_t`

CANFD Receive FIFO (RX FIFO)

◆ **canfd_minimum_dlc_t**enum `canfd_minimum_dlc_t`

CANFD AFL Minimum DLC settings

◆ **canfd_frame_options_t**enum `canfd_frame_options_t`

CANFD Frame Options

Enumerator

CANFD_FRAME_OPTION_ERROR

Error state set (ESI).

CANFD_FRAME_OPTION_BRS

Bit Rate Switching (BRS) enabled.

CANFD_FRAME_OPTION_FD

Flexible Data frame (FDF).

Function Documentation

◆ **R_CANFD_Open()**

```
fsp_err_t R_CANFD_Open ( can_ctrl_t *const p_api_ctrl, can_cfg_t const *const p_cfg )
```

Open and configure the CANFD channel for operation.

Example:

```
/* Initialize the CAN module */
err = R_CANFD_Open(&g_canfd0_ctrl, &g_canfd0_cfg);
```

Return values

| | |
|--------------------------------|--|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ALREADY_OPEN | Driver already open. |
| FSP_ERR_IN_USE | Channel is already in use. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | Channel does not exist on this MCU. |
| FSP_ERR_ASSERTION | A required pointer was NULL. |
| FSP_ERR_CAN_INIT_FAILED | The provided nominal or data bitrate is invalid. |
| FSP_ERR_CLOCK_INACTIVE | CANFD source clock is disabled (PLL or PLL2). |

◆ **R_CANFD_Close()**

```
fsp_err_t R_CANFD_Close ( can_ctrl_t *const p_api_ctrl)
```

Close the CANFD channel.

Return values

| | |
|-------------------|------------------------------|
| FSP_SUCCESS | Channel closed successfully. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_ASSERTION | Null pointer presented. |

◆ **R_CANFD_Write()**

```
fsp_err_t R_CANFD_Write ( can_ctrl_t *const p_api_ctrl, uint32_t buffer, can_frame_t *const p_frame )
```

Write data to the CANFD channel.

Example:

```
/* Send data on the bus */
err = R_CANFD_Write(&g_canfd0_ctrl, CANFD_TX_MB_0, &g_can_tx_frame);
assert(FSP_SUCCESS == err);
```

Return values

| | |
|--------------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_CAN_TRANSMIT_NOT_READY | Transmit in progress, cannot write data at this time. |
| FSP_ERR_INVALID_ARGUMENT | Data length or buffer number invalid. |
| FSP_ERR_INVALID_MODE | An FD option was set on a non-FD frame. |
| FSP_ERR_ASSERTION | One or more pointer arguments is NULL. |
| FSP_ERR_UNSUPPORTED | FD is not supported on this MCU. |

◆ **R_CANFD_Read()**

```
fsp_err_t R_CANFD_Read ( can_ctrl_t *const p_api_ctrl, uint32_t buffer, can_frame_t *const p_frame )
```

Read data from a CANFD Message Buffer or FIFO.

Example: snippet r_canfd_example.c R_CANFD_Read

Return values

| | |
|--------------------------|--------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_ARGUMENT | Buffer number invalid. |
| FSP_ERR_ASSERTION | p_api_ctrl or p_frame is NULL. |
| FSP_ERR_BUFFER_EMPTY | Buffer or FIFO is empty. |

◆ **R_CANFD_ModeTransition()**

```
fsp_err_t R_CANFD_ModeTransition ( can_ctrl_t *const p_api_ctrl, can_operation_mode_t
operation_mode, can_test_mode_t test_mode )
```

Switch to a different channel, global or test mode.

Example:

```
/* Switch to external loopback mode */
err = R_CANFD_ModeTransition(&g_canfd0_ctrl, CAN_OPERATION_MODE_NORMAL,
CAN_TEST_MODE_LOOPBACK_EXTERNAL);
assert(FSP_SUCCESS == err);
```

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_ASSERTION | Null pointer presented |
| FSP_ERR_INVALID_MODE | Cannot change to the requested mode from the current global mode. |

◆ **R_CANFD_InfoGet()**

```
fsp_err_t R_CANFD_InfoGet ( can_ctrl_t *const p_api_ctrl, can_info_t *const p_info )
```

Get CANFD state and status information for the channel.

Return values

| | |
|-------------------|-------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_ASSERTION | Null pointer presented |

◆ R_CANFD_CallbackSet()

```
fsp_err_t R_CANFD_CallbackSet ( can_ctrl_t *const p_api_ctrl, void(*) (can_callback_args_t *)
p_callback, void const *const p_context, can_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `can_api_t::callbackSet`.

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | <code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL. |

5.2.6.4 CEC (r_cec)

```

Detailed Description

Driver for the CEC peripheral on RA MCUs. This module implements the [CEC Interface](#).

Overview

The HDMI CEC HAL module provides a high-level API for CEC applications and supports the CEC peripheral available on RA microcontroller hardware. A user-callback function must be defined that the driver will invoke when data received, transmission complete, or error interrupts are received. The callback is passed a parameter which indicates the event as well as received data (if available).

Features

- Conforms to High Definition Multimedia Interface (HDMI) Consumer Electronics Control (CEC) standard Ver. 1.4b.
- Full range of local address settings (TV, Recording Device, Playback Device, etc.)
- Data filtering based on matching destination address and local address.
- Supports a user-callback function (required), invoked when transmit, receive, or error interrupts are received.

Configuration

Build Time Configurations for r_cec

The following build time configurations are defined in fsp_cfg/r_cec_cfg.h:

| Configuration | Options | Default | Description |
|---------------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| CEC Message Max Data Size | Manual Entry | 14 | Maximum Data Size for CEC Message Transmission/Reception. |

Configurations for Connectivity > CEC (r_cec)

This module can be added to the Stacks tab via New Stack > Connectivity > CEC (r_cec). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|-----------------------|---|--------------------|--------------------------------|
| General | | | |
| Name | Name must be a valid C symbol | g_cec0 | Module name |
| Callback Function | Manual Entry | g_rm_cec0_callback | Callback function |
| Control Configuration | | | |
| Clock Select | <ul style="list-style-type: none"> • PCLKB / 32 • PCLKB / 64 • PCLKB / 128 • PCLKB / 256 • PCLKB / 512 • PCLKB / 1024 • CECCLK • CECCLK / 256 | PCLKB / 1024 | CEC Clock Select Configuration |

| | | | |
|--|---|------------------|---|
| Ack Bit Timing Error Enable | <ul style="list-style-type: none"> Disabled Enabled | Enabled | CEC Ack Bit Timing Error Enable |
| Signal-Free Time Bit Width | <ul style="list-style-type: none"> 3-data bit width 5-data bit width 7-data bit width Does not detect signal-free time. | 7-data bit width | Signal-Free Time Data Bit Width Select |
| Start Bit Error Detection Enable | <ul style="list-style-type: none"> Disabled Enabled | Enabled | Enable to detect timing errors during start bit reception. |
| Bus Lock Detection Enable | <ul style="list-style-type: none"> Disabled Enabled | Enabled | Enable to detect sticking of receive data to high or low. |
| Digital Filter Enable | <ul style="list-style-type: none"> Disabled Enabled | Enabled | Enable to use a digital filter. |
| Long Bit Width Error Pulse Output Enable | <ul style="list-style-type: none"> Disabled Enabled | Disabled | Enable to output an error handling pulse when a long bit width error is detected. |
| Start Detection Reception Restart Enable | <ul style="list-style-type: none"> Disabled Enabled | Enabled | Enable to restart reception after a start bit error is detected. |
| Bit Width Timing | | | |
| Bit Width Timing > Transmit | | | |
| Start Bit Low Time | CEC transmission start bit low width setting must be a positive integer. | 180 | CEC transmission start bit low width setting (CEC Clock Cycles). |
| Start Bit High Time | CEC transmission start bit high width setting must be a positive integer. | 220 | CEC transmission start bit high width setting (CEC Clock Cycles). |
| Logical Zero Low Time | CEC transmission logical zero low width setting must be a positive integer. | 73 | CEC transmission logical zero low width setting (CEC Clock Cycles). |
| Logical One Low Time | CEC transmission logical one low width setting must be a positive integer. | 29 | CEC transmission logical one low width setting (CEC Clock Cycles). |
| Overall Bit Width Time | CEC transmission overall data bit width time setting must be a positive integer. | 117 | CEC transmission overall data bit width time setting (CEC Clock Cycles). |
| Bit Width Timing > Receive | | | |

| | | | |
|---------------------------|--|-----|--|
| Data Sample Time | CEC reception data sampling time must be a positive integer. | 49 | CEC reception data sampling time setting (CEC Clock Cycles). |
| Data Bit Reference Width | CEC reception data sampling time must be a positive integer. | 117 | CEC data bit reference width setting (CEC Clock Cycles). |
| Start Bit Low Min Time | CEC reception start bit minimum low width setting must be a positive integer. | 171 | CEC reception start bit minimum low width setting (CEC Clock Cycles). Not used when Start Bit Error Detection and restart Rx on Error are not enabled. |
| Start Bit Low Max Time | CEC reception start bit maximum low width setting must be a positive integer. | 190 | CEC reception start bit maximum low width setting (CEC Clock Cycles). Not used when Start Bit Error Detection and restart Rx on Error are not enabled. |
| Start Bit Min Time | CEC start bit minimum time setting must be a positive integer. | 210 | CEC start bit minimum time setting (CEC Clock Cycles). Not used when Start Bit Error Detection and restart Rx on Error are not enabled. |
| Start Bit Max Time | CEC reception start bit maximum time setting must be a positive integer. | 229 | CEC start bit maximum time setting (CEC Clock Cycles). Not used when Start Bit Error Detection and restart Rx on Error are not enabled. |
| Logical Zero Low Min Time | CEC reception logical zero minimum low width setting must be a positive integer. | 64 | CEC reception logical zero minimum low width setting (CEC Clock Cycles). |
| Logical Zero Low Max Time | CEC reception logical zero maximum low width setting must be a positive integer. | 83 | CEC reception logical zero maximum low width setting (CEC Clock Cycles). |
| Logical One Low Min Time | CEC reception logical one minimum low width setting must be a positive integer. | 20 | CEC reception logical one minimum low width setting (CEC Clock Cycles). |
| Logical One Low Max Time | CEC reception logical | 39 | CEC reception logical |

| | | | |
|---|---|---------------------------------------|---|
| Time | one maximum low width setting must be a positive integer. | | one maximum low width (CEC Clock Cycles). |
| Overall Bit Width Min Time | CEC reception overall minimum bit width setting must be a positive integer. | 100 | CEC reception overall minimum bit width setting (CEC Clock Cycles). |
| Overall Bit Width Max Time | CEC reception overall maximum bit width setting must be a positive integer. | 134 | CEC reception overall maximum bit width setting (CEC Clock Cycles). |
| Interrupts | | | |
| Interrupt Priority Level | MCU Specific Options | | Error/Data/Message interrupt priority level. |
| Communication Complete Interrupt Timing | <ul style="list-style-type: none"> • After Last Frame and Signal Free Time • After Last Frame • After Signal Free Time | After Last Frame and Signal Free Time | Communication Complete Interrupt (INTCE) Generation Timing Select |
| Address Mismatch Interrupt Enable | <ul style="list-style-type: none"> • Disabled • Enabled | Disabled | Enable to generate an interrupt when the addresses do not match. |
| Data Interrupt Timing Selection | <ul style="list-style-type: none"> • EOM timing (9th bit of data) • ACK Timing (10th bit of data) | EOM timing (9th bit of data) | INTDA reception interrupt timing selection (EOM or ACK). |

Clock Configuration

The CEC peripheral uses the CECCLK or PCLKB as its clock source. To set the PCLKB frequency, use the Clocks tab of the RA Configuration editor.

Note

The selected clock and configured divider must be configured in the range of 23.4375 to 78.125 kHz.

Pin Configuration

A CEC channel uses one data pin - CECIO for data transmission and reception.

The output type for each pin should be set to **n-ch open drain** for most hardware designs. This can be configured in **Pins** tab of the RA Configuration editor by selecting the pin under Pin Selection->Ports.

Usage Notes

CEC Device Addresses

The CEC standard provides 13 device addresses that may be requested based on a device's primary function. Use `R_CEC_MediaInit` to request a specific address before starting communication with other devices.

Note

Address 0 is always the primary display (TV). Do not attempt to allocate this address unless your device is intended to function as a display.

Limitations

Developers should be aware of the following limitations when using the CEC module:

- `R_CEC_MediaInit` may return `FSP_ERR_IN_USE` for up to 45 milliseconds after `R_CEC_Open` while the hardware initializes.
- The CECIO pin must be set to n-ch open drain mode.

Examples

Basic Example

This is a basic example of minimal use of the CEC in an application.

```
/*
*****
*****
* Application defined callback
* - May be assigned at compile-time via the e2 studio configuration tool or set at
run-time via R_CEC_CallbackSet()
*****
*****/
void cec_callback (cec_callback_args_t * p_args)
{
    switch (p_args->event)
    {
        case CEC_EVENT_READY:
            {
                /* Application processing for address allocation success. */
                break;
            }
        case CEC_EVENT_TX_COMPLETE:
            {
                /* Any required processing after transmission has completed. */
            }
    }
}
```

```
break;
    }
case CEC_EVENT_ERR:
    {
/* Error processing. See cec_error_t for possible errors. */
break;
    }
case CEC_EVENT_RX_DATA:
    {
/* Application to store and process received data bytes. */
break;
    }
case CEC_EVENT_RX_COMPLETE:
    {
/* Application processing for message reception complete. */
    }
}

/*****
*****
* Basic example
*****
*****/

#define CEC_TIMEOUT_MS (50)
#define CEC_MSG_STANDBY (0X36) /* See CEC Specification for message definitions */
void basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
/* Open the CEC module */
    err = R_CEC_Open(&g_cec0_ctrl, &g_cec0_cfg);
    assert(FSP_SUCCESS == err);
/* Initialize the CEC module and allocate an address */
    uint32_t timeout_ms = CEC_TIMEOUT_MS;
do
```

```
{
/* R_CEC_MediaInit may return FSP_ERR_IN_USE for up to 45 milliseconds after calling
R_CEC_Open */
    err = R_CEC_MediaInit(&g_cec0_ctrl, CEC_ADDR_TV);
R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_MILLISECONDS);
} while ((FSP_ERR_IN_USE == err) && --timeout_ms);
assert(timeout_ms);
assert(FSP_SUCCESS == err);
/* Wait for local address allocation and CEC bus to be free */
cec_status_t status;
err = R_CEC_StatusGet(&g_cec0_ctrl, &status);
while ((FSP_SUCCESS == err) && (CEC_STATE_READY != status.state))
{
    err = R_CEC_StatusGet(&g_cec0_ctrl, &status);
    assert(FSP_SUCCESS == err);
}
cec_message_t cec_msg;
uint8_t      total_transmit_size;
cec_msg.destination = CEC_ADDR_BROADCAST;          /* For this example, send message
to all devices on the bus */
cec_msg.opcode      = CEC_MSG_STANDBY;            /* Send Standby Request */
memset(cec_msg.data, 0U, sizeof(cec_msg.data)); /* See CEC Specification for
other message data structures */
total_transmit_size = 2U;                          /* Total message size, including
header, opcode, and data */
/* Send asynchronous message.
* - Application will then be free for other processing while message is being sent.
* - Do not modify the message buffer until transmission has completed. */
err = R_CEC_Write(&g_cec0_ctrl, &cec_msg, total_transmit_size);
assert(FSP_SUCCESS == err);
}
```

Function Documentation

◆ R_CEC_Open()

```
fsp_err_t R_CEC_Open ( cec_ctrl_t *const p_ctrl, cec_cfg_t const *const p_cfg )
```

Open and configure the CEC module for operation.

Example:

```
/* Open the CEC module */  
err = R_CEC_Open(&g_cec0_ctrl, &g_cec0_cfg);  
assert(FSP_SUCCESS == err);
```

Return values

| | |
|--------------------------|---------------------------------|
| FSP_SUCCESS | CEC Module opened successfully. |
| FSP_ERR_ALREADY_OPEN | Driver already open. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_IRQ_BSP_DISABLED | Interrupts are not enabled. |

◆ **R_CEC_MediaInit()**

```
fsp_err_t R_CEC_MediaInit ( cec_ctrl_t*const p_ctrl, cec_addr_t local_address )
```

Allocate provided CEC Local Address and Initialize the CEC module for operation.

Note

After calling R_CEC_Open this function may return FSP_ERR_IN_USE for up to 45 milliseconds.

Example:

```
/* Initialize the CEC module and allocate an address */
uint32_t timeout_ms = CEC_TIMEOUT_MS;
do
{
/* R_CEC_MediaInit may return FSP_ERR_IN_USE for up to 45 milliseconds after calling
R_CEC_Open */
err = R_CEC_MediaInit(&g_cec0_ctrl, CEC_ADDR_TV);
R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_MILLISECONDS);
} while ((FSP_ERR_IN_USE == err) && --timeout_ms);
assert(timeout_ms);
assert(FSP_SUCCESS == err);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | CEC Module Initialized successfully. |
| FSP_ERR_ASSERTION | An input argument is invalid or callback has not been set. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_IN_USE | HDMI CEC Bus is currently in use. Try again later. |

◆ **R_CEC_Close()**

```
fsp_err_t R_CEC_Close ( cec_ctrl_t*const p_ctrl)
```

Close the CEC module.

Return values

| | |
|-------------------|---------------------------------|
| FSP_SUCCESS | CEC Module closed successfully. |
| FSP_ERR_ASSERTION | An input argument is invalid. |

◆ R_CEC_Write()

```
fsp_err_t R_CEC_Write ( cec_ctrl_t *const p_ctrl, cec_message_t const *const p_message, uint32_t message_size )
```

Write data to the CEC bus. Data transmission is asynchronous. Provided message buffer should not be modified until transmission is complete.

Data Transmission follows the pattern defined by the HDMI CEC Specification:

| Data | Description | Size |
|--------------|---------------------------------|-------------------------------|
| Start Bit | Managed by Hardware, per config | N/A |
| Header Block | Source/Destination Identifier | 1 Byte |
| Data Block 1 | Opcode Value (Optional) | 1 Byte |
| Data Block 2 | Operands (Optional) | Variable (0-14 Bytes Typical) |

Example:

```
cec_message_t cec_msg;

uint8_t total_transmit_size;

cec_msg.destination = CEC_ADDR_BROADCAST; /* For this example, send message
to all devices on the bus */

cec_msg.opcode = CEC_MSG_STANDBY; /* Send Standby Request */

memset(cec_msg.data, 0U, sizeof(cec_msg.data)); /* See CEC Specification for
other message data structures */

total_transmit_size = 2U; /* Total message size, including
header, opcode, and data */

/* Send asynchronous message.
* - Application will then be free for other processing while message is being sent.
* - Do not modify the message buffer until transmission has completed. */

err = R_CEC_Write(&g_cec0_ctrl, &cec_msg, total_transmit_size);

assert(FSP_SUCCESS == err);
```

Return values

| | |
|-------------------------|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_NOT_INITIALIZED | Module has not been successfully initialized. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_INVALID_SIZE | Invalid message size. |
| FSP_ERR_IN_USE | HDMI CEC Bus is currently in use. Try again |

later.

◆ **R_CEC_StatusGet()**

```
fsp_err_t R_CEC_StatusGet ( cec_ctrl_t *const p_ctrl, cec_status_t *const p_status )
```

Provides the state and status information according to the provided CEC control instance.

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_ASSERTION | An input argument is invalid. |

◆ **R_CEC_CallbackSet()**

```
fsp_err_t R_CEC_CallbackSet ( cec_ctrl_t *const p_ctrl, void(*) (cec_callback_args_t *) p_callback, void const *const p_context, cec_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `cec_api_t::callbackSet`.

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | <code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL. |

fsp_err_t RM_COMMS_I2C_Open ( rm_comms_ctrl_t *const p_api_ctrl, rm_comms_cfg_t const *const p_cfg)
```

Opens and configures the Communications Middle module. Implements `rm_comms_api_t::open`. [More...](#)

`fsp_err_t` [RM_COMMS_I2C_Close](#) (`rm_comms_ctrl_t *const p_api_ctrl`)
Disables specified Communications Middle module. Implements [rm_comms_api_t::close](#). [More...](#)

`fsp_err_t` [RM_COMMS_I2C_Read](#) (`rm_comms_ctrl_t *const p_api_ctrl`, `uint8_t *const p_dest`, `uint32_t const bytes`)
Performs a read from the I2C device. Implements [rm_comms_api_t::read](#). [More...](#)

`fsp_err_t` [RM_COMMS_I2C_Write](#) (`rm_comms_ctrl_t *const p_api_ctrl`, `uint8_t *const p_src`, `uint32_t const bytes`)
Performs a write from the I2C device. Implements [rm_comms_api_t::write](#). [More...](#)

`fsp_err_t` [RM_COMMS_I2C_WriteRead](#) (`rm_comms_ctrl_t *const p_api_ctrl`, `rm_comms_write_read_params_t const write_read_params`)
Performs a write to, then a read from the I2C device. Implements [rm_comms_api_t::writeRead](#). [More...](#)

`void` [rm_comms_i2c_callback](#) (`i2c_master_callback_args_t *p_args`)
Common callback function called in the I2C driver callback function.

Detailed Description

Middleware to implement the I2C communications interface. This module implements the [Communicatons Middleware Interface](#).

Overview

Features

The implementation of the I2C communications interface has the following key features:

- Reading data from, writing data to I2C bus
- Writes to I2C bus, then reads with restart
- A single I2C bus used by multiple I2C devices

Limitations

- [RM_COMMS_I2C_WriteRead\(\)](#) is not supported when [I2C Master \(r_sau_i2c\)](#) is selected for I2C bus interface. Please refer to [Limitations of I2C Master \(r_sau_i2c\)](#).

Configuration

Build Time Configurations for rm_comms_i2c

The following build time configurations are defined in fsp_cfg/rm_comms_i2c_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> Default (BSP) Enabled Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Connectivity > I2C Shared Bus (rm_comms_i2c)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Shared Bus (rm_comms_i2c).

| Configuration | Options | Default | Description |
|-------------------------------------|---|------------------|--|
| Name | Name must be a valid C symbol | g_comms_i2c_bus0 | Module name. |
| Bus Timeout | Value must be a non-negative integer less than or equal to 0xFFFFFFFF | 0xFFFFFFFF | Set timeout for locking bus in using RTOS. |
| Semaphore for Blocking (RTOS only) | <ul style="list-style-type: none"> Unuse Use | Use | Set Semaphore for blocking in using RTOS. |
| Recursive Mutex for Bus (RTOS only) | <ul style="list-style-type: none"> Unuse Use | Use | Set Mutex for locking bus in using RTOS. |

Configurations for Connectivity > I2C Communication Device (rm_comms_i2c)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Communication Device (rm_comms_i2c).

| Configuration | Options | Default | Description |
|-------------------------------|---|---------------------|---|
| Name | Name must be a valid C symbol | g_comms_i2c_device0 | Module name. |
| Semaphore Timeout (RTOS only) | Value must be a non-negative integer less than or equal to 0xFFFFFFFF | 0xFFFFFFFF | Set timeout for blocking in using RTOS. |
| Slave Address | Value must be non-negative | 0x00 | Specify the slave address. |
| Address Mode | <ul style="list-style-type: none"> 7-Bit 10-Bit | 7-Bit | Select the I2C address mode. |
| Callback | Name must be a valid C symbol | comms_i2c_callback | A user callback function can be provided. |

Pin Configuration

This module uses SDA and SCL pins of I2C Master, SCI I2C and SAU I2C.

Usage Notes

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
 - If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.
- If an RTOS is used and blocking and bus lock is enabled, [RM_COMMS_I2C_Write\(\)](#), [RM_COMMS_I2C_Read\(\)](#) and [RM_COMMS_I2C_WriteRead\(\)](#) cannot be called in callback.

Bus Initialization

The I2C communications interface expects a bus instance to be opened before opening any specific I2C comms device. The communications interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate [I2C Master Interface](#) open call.

Examples

Basic Example

This is a basic example of minimal use of I2C communications implementation in an application.

```
void rm_comms_i2c_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Open the I2C bus if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_extend =
(rm_comms_i2c_bus_extended_cfg_t *) g_comms_i2c_cfg.p_extend;
    i2c_master_instance_t * p_driver_instance = (i2c_master_instance_t *)
p_extend->p_driver_instance;
    p_driver_instance->p_api->open(p_driver_instance->p_ctrl,
p_driver_instance->p_cfg);
#ifdef BSP_CFG_RTOS
    /* Create a semaphore for blocking if a semaphore is not NULL */
    if (NULL != p_extend->p_blocking_semaphore)
    {
#ifdef BSP_CFG_RTOS == 1 // AzureOS
        tx_semaphore_create(p_extend->p_blocking_semaphore->p_semaphore_handle,
p_extend->p_blocking_semaphore->p_semaphore_name,
(ULONG) 0);

```

```
#elif BSP_CFG_RTOS == 2 // FreeRTOS
    *(p_extend->p_blocking_semaphore->p_semaphore_handle) =
        xSemaphoreCreateCountingStatic((UBaseType_t) 1,
                                        (UBaseType_t) 0,
                                        p_extend->p_blocking_semaphore->p_semaphore_memory);
#endif
}
/* Create a recursive mutex for bus lock if a recursive mutex is not NULL */
if (NULL != p_extend->p_bus_recursive_mutex)
{
    #if BSP_CFG_RTOS == 1 // AzureOS
        tx_mutex_create(p_extend->p_bus_recursive_mutex->p_mutex_handle,
                        p_extend->p_bus_recursive_mutex->p_mutex_name,
                        TX_INHERIT);
    #elif BSP_CFG_RTOS == 2 // FreeRTOS
        *(p_extend->p_bus_recursive_mutex->p_mutex_handle) =
            xSemaphoreCreateRecursiveMutexStatic(p_extend->p_bus_recursive_mutex->p_m
mutex_memory);
    #endif
}
#endif

err = RM_COMMS_I2C_Open(&g_comms_i2c_ctrl, &g_comms_i2c_cfg);
/* Handle any errors. This function should be defined by the user. */
handle_error(err);

while (true)
{
    g_flag = 0;
    /* Send data to an I2C device. */
    RM_COMMS_I2C_Write(&g_comms_i2c_ctrl, &write_data, 1);
    while (0 == g_flag)
    {
        /* Wait callback */
    }
}
```

```

    g_flag = 0;

    /* Receive data from an I2C device. */
    RM_COMMS_I2C_Read(&g_comms_i2c_ctrl, &read_data, 1);

    while (0 == g_flag)
    {
        /* Wait callback */
    }
}

```

Function Documentation

◆ RM_COMMS_I2C_Open()

```
fsp_err_t RM_COMMS_I2C_Open ( rm_comms_ctrl_t *const p_api_ctrl, rm_comms_cfg_t const *const p_cfg )
```

Opens and configures the Communications Middle module. Implements [rm_comms_api_t::open](#).

Example:

```
err = RM_COMMS_I2C_Open(&g_comms_i2c_ctrl, &g_comms_i2c_cfg);
```

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Communications Middle module successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_COMMS_BUS_NOT_OPEN | I2C driver is not open. |

◆ **RM_COMMS_I2C_Close()**

```
fsp_err_t RM_COMMS_I2C_Close ( rm_comms_ctrl_t *const p_api_ctrl)
```

Disables specified Communications Middle module. Implements `rm_comms_api_t::close`.

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_COMMS_I2C_Read()**

```
fsp_err_t RM_COMMS_I2C_Read ( rm_comms_ctrl_t *const p_api_ctrl, uint8_t *const p_dest,
uint32_t const bytes )
```

Performs a read from the I2C device. Implements `rm_comms_api_t::read`.

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_COMMS_I2C_Write()**

```
fsp_err_t RM_COMMS_I2C_Write ( rm_comms_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t
const bytes )
```

Performs a write from the I2C device. Implements `rm_comms_api_t::write`.

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Successfully writing data . |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ RM_COMMS_I2C_WriteRead()

```
fsp_err_t RM_COMMS_I2C_WriteRead ( rm_comms_ctrl_t *const p_api_ctrl,
rm_comms_write_read_params_t const write_read_params )
```

Performs a write to, then a read from the I2C device. Implements `rm_comms_api_t::writeRead`.

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

```

Detailed Description

I2C Driver for the IIC/I3C peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

Overview

The I2C master on IIC/I3C HAL module supports transactions with an I2C Slave device. Callbacks must be provided which are invoked when a transmit or receive operation has completed. The callback argument will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

Features

- Supports multiple transmission rates
 - Standard Mode Support with up to 100-kHz transaction rate.
 - Fast Mode Support with up to 400-kHz transaction rate.
 - Fast Mode Plus Support with up to 1-MHz transaction rate.
- I2C Master Read from a slave device.
- I2C Master Write to a slave device.
- Abort any in-progress transactions.
- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.
- Additional build-time features
 - Optional (build time) DTC support for read and write respectively.
 - Optional (build time) support for 10-bit slave addressing.

Configuration

Build Time Configurations for r_iic_b_master

The following build time configurations are defined in fsp_cfg/r_iic_b_master_cfg.h:

| Configuration | Options | Default | Description |
|-----------------------------------|--|---------------|--|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| DTC on Transmission and Reception | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | If enabled, DTC instances will be included in the build for both transmission and reception. |
| 10-bit slave addressing | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | If enabled, the driver will support 10-bit slave addressing mode along with the default 7-bit slave addressing mode. |

Configurations for Connectivity > I2C Master (r_iic_b_master)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Master (r_iic_b_master). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

| | | | |
|------------------------|---|--------------------------|--|
| Name | Name must be a valid C symbol | g_i2c_master0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Specify the IIC channel. |
| Rate | <ul style="list-style-type: none"> Standard Fast-mode Fast-mode plus | Standard | <p>Select the transfer rate.</p> <p>If the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated transfer rate and duty cycle are printed in a comment in the generated iic_b_master_extended_cfg_t structure.</p> |
| Rise Time (ns) | Value must be a non-negative integer | 120 | Set the rise time (tr) in nanoseconds. |
| Fall Time (ns) | Value must be a non-negative integer | 120 | Set the fall time (tf) in nanoseconds. |
| Duty Cycle (%) | Value must be an integer between 0 and 100 | 50 | Set the SCL duty cycle. |
| Slave Address | Value must be non-negative | 0x00 | Specify the slave address. |
| Address Mode | <ul style="list-style-type: none"> 7-Bit 10-Bit | 7-Bit | Select the slave address mode. Ensure 10-bit slave addressing is enabled in the configuration to use 10-Bit setting here. |
| Timeout Mode | <ul style="list-style-type: none"> Short Mode Long Mode | Short Mode | Select the timeout mode to detect bus hang. |
| Timeout during SCL Low | <ul style="list-style-type: none"> Enabled Disabled | Enabled | Select if the timeout can occur when SCL is held low for a duration longer than what is set in the timeout mode. |
| Callback | Name must be a valid C symbol | g_iic_b_master0_callback | A user callback function must be provided. This will be called from the |

interrupt service routine (ISR) upon IIC transaction completion reporting the transaction status.

Select the interrupt priority level. This is set for TXI, RXI, TEI and ERI interrupts.

Interrupt Priority Level MCU Specific Options

Clock Configuration

The I3C peripheral module uses the IICCLK or PCLKD (based on the MCU) as its clock source for the bus clock. The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate. If the clocks are configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

Pin Configuration

The I3C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

Usage Notes

Interrupt Configuration

- The IIC error (EEI), receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel used must be enabled in the properties of the selected device.
- Set equal priority levels for all the interrupts mentioned above. Setting the interrupts to different priority levels could result in improper operation.

IIC Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current IICCLK/PCLKD (based on the MCU) settings is calculated and used.
- If a valid clock rate could not be calculated, an error is returned by the tool.

Enabling DTC with the IIC

- DTC transfer support is configurable and is disabled from the build by default. IIC driver provides two DTC instances for transmission and reception respectively. The DTC instances can be enabled individually during configuration.
- DTC is helpful for minimizing interrupts during large transactions. Many I2C applications have shorter transactions. These applications will likely not see any improvement with DTC. I2C often runs at a much slower speed than the CPU core clock. Some applications with longer transactions may prefer servicing the interrupts at the I2C bitrate to the overhead of bringing in the DTC driver.
- For further details on DTC please refer [Transfer \(r_dtc\)](#)

Multiple Devices on the Bus

- A single IIC instance can be used to communicate with multiple slave devices on the same channel by using the SlaveAddressSet API.

Multi-Master Support

- If multiple masters are connected on the same bus, the I2C Master is capable of detecting bus busy state before initiating the communication.

Restart

- IIC master can hold the the bus after an I2C transaction by issuing a repeated start condition.

Examples

Basic Example

This is a basic example of minimal use of the r_iic_master in an application. This example shows how this driver can be used for basic read and write operations.

```
iic_b_master_instance_ctrl_t g_i2c_device_ctrl_1;
i2c_master_cfg_t g_i2c_device_cfg_1 =
{
    .channel          = I2C_CHANNEL,
    .rate             = I2C_MASTER_RATE_FAST,
    .slave            = I2C_SLAVE_EEPROM,
    .addr_mode        = I2C_MASTER_ADDR_MODE_7BIT,
    .p_callback       = i2c_callback,    // Callback
    .p_context        = &g_i2c_device_ctrl_1,
    .p_transfer_tx    = NULL,
    .p_transfer_rx    = NULL,
    .p_extend         = &g_iic_b_master_cfg_extend
};
void i2c_callback (i2c_master_callback_args_t * p_args)
{
    g_i2c_callback_event = p_args->event;
}
void basic_example (void)
{
    fsp_err_t err;
    uint32_t i;
```

```
uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
/* Initialize the IIC module */
err = R_IIC_B_MASTER_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
/* Write some data to the transmit buffer */
for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
{
    g_i2c_tx_buffer[i] = (uint8_t) i;
}
/* Send data to I2C slave */
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
err = R_IIC_B_MASTER_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
assert(FSP_SUCCESS == err);
/* Since there is nothing else to do, block until Callback triggers*/
while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
{
    R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;
}
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
    __BKPT(0);
}
/* Read data back from the I2C slave */
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
err = R_IIC_B_MASTER_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
assert(FSP_SUCCESS == err);
/* Since there is nothing else to do, block until Callback triggers*/
while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
{
```

```
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);

    timeout_ms--;

}

if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)

{

    __BKPT(0);

}

/* Verify the read data */

if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))

{

    __BKPT(0);

}

}
```

Multiple Slave devices on the same channel (bus)

This example demonstrates how a single IIC driver can be used to communicate with different slave devices which are on the same channel.

Note

The callback function from the first example applies to this example as well.

```
iic_b_master_instance_ctrl_t g_i2c_device_ctrl_2;
i2c_master_cfg_t g_i2c_device_cfg_2 =
{
    .channel          = I2C_CHANNEL,
    .rate             = I2C_MASTER_RATE_STANDARD,
    .slave            = I2C_SLAVE_TEMP_SENSOR,
    .addr_mode        = I2C_MASTER_ADDR_MODE_7BIT,
    .p_callback       = i2c_callback,    // Callback
    .p_context        = &g_i2c_device_ctrl_2,
    .p_transfer_tx    = NULL,
    .p_transfer_rx    = NULL,
    .p_extend         = &g_iic_b_master_cfg_extend
};

void single_channel_multi_slave (void)
{
```

```
fsp_err_t err;

uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;

err = R_IIC_B_MASTER_Open(&g_i2c_device_ctrl_2, &g_i2c_device_cfg_2);

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

/* Clear the receive buffer */
memset(g_i2c_rx_buffer, '0', I2C_BUFFER_SIZE_BYTES);

/* Read data from I2C slave */
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;

err = R_IIC_B_MASTER_Read(&g_i2c_device_ctrl_2, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);

assert(FSP_SUCCESS == err);

while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
{
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);

    timeout_ms--;
}

if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
    __BKPT(0);
}

/* Send data to I2C slave on the same channel */
err = R_IIC_B_MASTER_SlaveAddressSet(&g_i2c_device_ctrl_2,
I2C_SLAVE_DISPLAY_ADAPTER, I2C_MASTER_ADDR_MODE_7BIT);

assert(FSP_SUCCESS == err);

g_i2c_tx_buffer[0] = 0xAA; // NOLINT
g_i2c_tx_buffer[1] = 0xBB; // NOLINT

g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;

timeout_ms = I2C_TRANSACTION_BUSY_DELAY;

err = R_IIC_B_MASTER_Write(&g_i2c_device_ctrl_2, &g_i2c_tx_buffer[0], 2U, false);

assert(FSP_SUCCESS == err);

while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
{

R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
```

```

        timeout_ms--;
    }
    if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {

Function Documentation

◆ **R_IIC_B_MASTER_Open()**

```
fsp_err_t R_IIC_B_MASTER_Open ( i2c_master_ctrl_t *const p_api_ctrl, i2c_master_cfg_t const
*const p_cfg )
```

Opens the I2C device.

Return values

| | |
|--------------------------------|--|
| FSP_SUCCESS | Requested clock rate was set exactly. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | Channel is not available on this MCU. |
| FSP_ERR_ASSERTION | Parameter check failure due to one or more reasons below: <ol style="list-style-type: none"> 1. p_api_ctrl or p_cfg is NULL. 2. extended parameter is NULL. 3. Callback parameter is NULL. 4. Set the rate to fast mode plus on a channel which does not support it. 5. Invalid IRQ number assigned |

◆ **R_IIC_B_MASTER_Read()**

```
fsp_err_t R_IIC_B_MASTER_Read ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_dest,
uint32_t const bytes, bool const restart )
```

Performs a read from the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_RX_COMPLETE in the callback.

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | p_api_ctrl, p_dest or bytes is NULL. |
| FSP_ERR_INVALID_SIZE | Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer. |
| FSP_ERR_IN_USE | Bus busy condition. Another transfer was in progress. |
| FSP_ERR_NOT_OPEN | Handle is not initialized. Call R_IIC_B_MASTER_Open to initialize the control block. |

◆ **R_IIC_B_MASTER_Write()**

```
fsp_err_t R_IIC_B_MASTER_Write ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_src,
uint32_t const bytes, bool const restart )
```

Performs a write to the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_TX_COMPLETE in the callback.

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | p_api_ctrl or p_src is NULL. |
| FSP_ERR_INVALID_SIZE | Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer. |
| FSP_ERR_IN_USE | Bus busy condition. Another transfer was in progress. |
| FSP_ERR_NOT_OPEN | Handle is not initialized. Call R_IIC_B_MASTER_Open to initialize the control block. |

◆ **R_IIC_B_MASTER_Abort()**

```
fsp_err_t R_IIC_B_MASTER_Abort ( i2c_master_ctrl_t *const p_api_ctrl)
```

Safely aborts any in-progress transfer and forces the IIC peripheral into ready state.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Channel was reset successfully. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Handle is not initialized. Call R_IIC_B_MASTER_Open to initialize the control block. |

Note

A callback will not be invoked in case an in-progress transfer gets aborted by calling this API.

◆ **R_IIC_B_MASTER_SlaveAddressSet()**

```
fsp_err_t R_IIC_B_MASTER_SlaveAddressSet ( i2c_master_ctrl_t *const p_api_ctrl, uint32_t const slave, i2c_master_addr_mode_t const addr_mode )
```

Sets address and addressing mode of the slave device. This function is used to set the device address and addressing mode of the slave without reconfiguring the entire bus.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Address of the slave is set correctly. |
| FSP_ERR_ASSERTION | Pointer to control structure is NULL. |
| FSP_ERR_IN_USE | Another transfer was in-progress. |
| FSP_ERR_NOT_OPEN | Handle is not initialized. Call R_IIC_B_MASTER_Open to initialize the control block. |

◆ **R_IIC_B_MASTER_CallbackSet()**

```
fsp_err_t R_IIC_B_MASTER_CallbackSet ( i2c_master_ctrl_t *const p_api_ctrl, void(*) (i2c_master_callback_args_t *) p_callback, void const *const p_context, i2c_master_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `i2c_master_api_t::callbackSet`

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

◆ **R_IIC_B_MASTER_StatusGet()**

```
fsp_err_t R_IIC_B_MASTER_StatusGet ( i2c_master_ctrl_t *const p_api_ctrl, i2c_master_status_t *
p_status )
```

Provides driver status.

Return values

| | |
|-------------------|----------------------------|
| FSP_SUCCESS | Status stored in p_status. |
| FSP_ERR_ASSERTION | NULL pointer. |

◆ **R_IIC_B_MASTER_Close()**

```
fsp_err_t R_IIC_B_MASTER_Close ( i2c_master_ctrl_t *const p_api_ctrl)
```

Closes the I2C device. May power down IIC peripheral. This function will safely terminate any in-progress I2C transfers.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Device closed without issue. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Handle is not initialized. Call R_IIC_B_MASTER_Open to initialize the control block. |

Note

A callback will not be invoked in case an in-progress transfer gets aborted by calling this API.

```

Detailed Description

Driver for the IIC peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

Overview

The I2C master on IIC HAL module supports transactions with an I2C Slave device. Callbacks must be provided which are invoked when a transmit or receive operation has completed. The callback argument will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

Features

- Supports multiple transmission rates
 - Standard Mode Support with up to 100-kHz transaction rate.
 - Fast Mode Support with up to 400-kHz transaction rate.
 - Fast Mode Plus Support with up to 1-MHz transaction rate.
- I2C Master Read from a slave device.
- I2C Master Write to a slave device.
- Abort any in-progress transactions.
- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.
- Additional build-time features
 - Optional (build time) DTC support for read and write respectively.
 - Optional (build time) support for 10-bit slave addressing.

Configuration

Build Time Configurations for r_iic_master

The following build time configurations are defined in fsp_cfg/r_iic_master_cfg.h:

| Configuration | Options | Default | Description |
|-----------------------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| DTC on Transmission and Reception | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | If enabled, DTC instances will be |

included in the build for both transmission and reception.

10-bit slave addressing • Enabled Disabled
 • Disabled

If enabled, the driver will support 10-bit slave addressing mode along with the default 7-bit slave addressing mode.

Configurations for Connectivity > I2C Master (r_iic_master)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Master (r_iic_master). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|----------------|---|---------------|---|
| Name | Name must be a valid C symbol | g_i2c_master0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Specify the IIC channel. |
| Rate | <ul style="list-style-type: none"> Standard Fast-mode Fast-mode plus | Standard | Select the transfer rate. If the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated transfer rate and duty cycle are printed in a comment in the generated iic_master_extended_cfg_t structure. |
| Rise Time (ns) | Value must be a non-negative integer | 120 | Set the rise time (tr) in nanoseconds. |
| Fall Time (ns) | Value must be a non-negative integer | 120 | Set the fall time (tf) in nanoseconds. |
| Duty Cycle (%) | Value must be an integer between 0 and 100 | 50 | Set the SCL duty cycle. |
| Slave Address | Value must be non-negative | 0x00 | Specify the slave address. |
| Address Mode | <ul style="list-style-type: none"> 7-Bit | 7-Bit | Select the slave |

| | | | |
|--------------------------|-------------------------------|------------|---|
| | • 10-Bit | | address mode. Ensure 10-bit slave addressing is enabled in the configuration to use 10-Bit setting here. |
| Timeout Mode | • Short Mode • Long Mode | Short Mode | Select the timeout mode to detect bus hang. |
| Timeout during SCL Low | • Enabled • Disabled | Enabled | Select if the timeout can occur when SCL is held low for a duration longer than what is set in the timeout mode. |
| Callback | Name must be a valid C symbol | NULL | A user callback function must be provided. This will be called from the interrupt service routine (ISR) upon IIC transaction completion reporting the transaction status. |
| Interrupt Priority Level | MCU Specific Options | | Select the interrupt priority level. This is set for TXI, RXI, TEI and ERI interrupts. |

Clock Configuration

The IIC peripheral module uses the PCLKB as its clock source. The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate. If the PCLKB is configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

Pin Configuration

The IIC peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

Usage Notes

Interrupt Configuration

- The IIC error (EEI), receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel used must be enabled in the properties of the selected device.
- Set equal priority levels for all the interrupts mentioned above. Setting the interrupts to different priority levels could result in improper operation.

IIC Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the

configured transfer rate. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLKB settings is calculated and used.

- If a valid clock rate could not be calculated, an error is returned by the tool.

Enabling DTC with the IIC

- DTC transfer support is configurable and is disabled from the build by default. IIC driver provides two DTC instances for transmission and reception respectively. The DTC instances can be enabled individually during configuration.
- DTC is helpful for minimizing interrupts during large transactions. Many I2C applications have shorter transactions. These applications will likely not see any improvement with DTC. I2C often runs at a much slower speed than the CPU core clock. Some applications with longer transactions may prefer servicing the interrupts at the I2C bitrate to the overhead of bringing in the DTC driver.
- For further details on DTC please refer [Transfer \(r_dtc\)](#)

Multiple Devices on the Bus

- A single IIC instance can be used to communicate with multiple slave devices on the same channel by using the SlaveAddressSet API.

Multi-Master Support

- If multiple masters are connected on the same bus, the I2C Master is capable of detecting bus busy state before initiating the communication.

Restart

- IIC master can hold the the bus after an I2C transaction by issuing a repeated start condition.

Examples

Basic Example

This is a basic example of minimal use of the r_iic_master in an application. This example shows how this driver can be used for basic read and write operations.

```
iic_master_instance_ctrl_t g_i2c_device_ctrl_1;
i2c_master_cfg_t g_i2c_device_cfg_1 =
{
    .channel          = I2C_CHANNEL,
    .rate             = I2C_MASTER_RATE_FAST,
    .slave            = I2C_SLAVE_EEPROM,
    .addr_mode        = I2C_MASTER_ADDR_MODE_7BIT,
    .p_callback       = i2c_callback,    // Callback
    .p_context        = &g_i2c_device_ctrl_1,
    .p_transfer_tx    = NULL,
}
```

```
.p_transfer_rx = NULL,
.p_extend      = &g_iic_master_cfg_extend
};
void i2c_callback (i2c_master_callback_args_t * p_args)
{
    g_i2c_callback_event = p_args->event;
}
void basic_example (void)
{
    fsp_err_t err;
    uint32_t i;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
    /* Initialize the IIC module */
    err = R_IIC_MASTER_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Write some data to the transmit buffer */
    for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
    {
        g_i2c_tx_buffer[i] = (uint8_t) i;
    }
    /* Send data to I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_IIC_MASTER_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
    /* Since there is nothing else to do, block until Callback triggers*/
    while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
        R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;
    }
    if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
```

```

    __BKPT(0);
}

/* Read data back from the I2C slave */
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
timeout_ms          = I2C_TRANSACTION_BUSY_DELAY;
err = R_IIC_MASTER_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
assert(FSP_SUCCESS == err);

/* Since there is nothing else to do, block until Callback triggers*/
while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
{
    R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;
}
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
    __BKPT(0);
}
/* Verify the read data */
if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))
{
    __BKPT(0);
}
}

```

Multiple Slave devices on the same channel (bus)

This example demonstrates how a single IIC driver can be used to communicate with different slave devices which are on the same channel.

Note

The callback function from the first example applies to this example as well.

```

iic_master_instance_ctrl_t g_i2c_device_ctrl_2;
i2c_master_cfg_t g_i2c_device_cfg_2 =
{
    .channel          = I2C_CHANNEL,

```

```
.rate          = I2C_MASTER_RATE_STANDARD,
.slave         = I2C_SLAVE_TEMP_SENSOR,
.addr_mode    = I2C_MASTER_ADDR_MODE_7BIT,
.p_callback   = i2c_callback,    // Callback
.p_context    = &g_i2c_device_ctrl_2,
.p_transfer_tx = NULL,
.p_transfer_rx = NULL,
.p_extend     = &g_iic_master_cfg_extend
};

void single_channel_multi_slave (void)
{
    fsp_err_t err;

    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
    err = R_IIC_MASTER_Open(&g_i2c_device_ctrl_2, &g_i2c_device_cfg_2);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Clear the receive buffer */
    memset(g_i2c_rx_buffer, '0', I2C_BUFFER_SIZE_BYTES);
    /* Read data from I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_IIC_MASTER_Read(&g_i2c_device_ctrl_2, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
    while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
        R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;
    }
    if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
        __BKPT(0);
    }
    /* Send data to I2C slave on the same channel */
    err = R_IIC_MASTER_SlaveAddressSet(&g_i2c_device_ctrl_2,
```

```

I2C_SLAVE_DISPLAY_ADAPTER, I2C_MASTER_ADDR_MODE_7BIT);

assert(FSP_SUCCESS == err);

g_i2c_tx_buffer[0] = 0xAA; // NOLINT
g_i2c_tx_buffer[1] = 0xBB; // NOLINT

g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
timeout_ms = I2C_TRANSACTION_BUSY_DELAY;

err = R_IIC_MASTER_Write(&g_i2c_device_ctrl_2, &g_i2c_tx_buffer[0], 2U, false);
assert(FSP_SUCCESS == err);

while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
{
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);

    timeout_ms--;
}

if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
    __BKPT(0);
}
}

Performs a read from the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_RX_COMPLETE in the callback.

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | p_api_ctrl, p_dest or bytes is NULL. |
| FSP_ERR_INVALID_SIZE | Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer. |
| FSP_ERR_IN_USE | Bus busy condition. Another transfer was in progress. |
| FSP_ERR_NOT_OPEN | Handle is not initialized. Call R_IIC_MASTER_Open to initialize the control block. |

◆ **R_IIC_MASTER_Write()**

```
fsp_err_t R_IIC_MASTER_Write ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t
const bytes, bool const restart )
```

Performs a write to the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_TX_COMPLETE in the callback.

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | p_api_ctrl or p_src is NULL. |
| FSP_ERR_INVALID_SIZE | Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer. |
| FSP_ERR_IN_USE | Bus busy condition. Another transfer was in progress. |
| FSP_ERR_NOT_OPEN | Handle is not initialized. Call R_IIC_MASTER_Open to initialize the control block. |

◆ **R_IIC_MASTER_Abort()**

```
fsp_err_t R_IIC_MASTER_Abort ( i2c_master_ctrl_t *const p_api_ctrl)
```

Safely aborts any in-progress transfer and forces the IIC peripheral into ready state.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Channel was reset successfully. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Handle is not initialized. Call R_IIC_MASTER_Open to initialize the control block. |

Note

A callback will not be invoked in case an in-progress transfer gets aborted by calling this API.

◆ **R_IIC_MASTER_SlaveAddressSet()**

```
fsp_err_t R_IIC_MASTER_SlaveAddressSet ( i2c_master_ctrl_t *const p_api_ctrl, uint32_t const slave, i2c_master_addr_mode_t const addr_mode )
```

Sets address and addressing mode of the slave device. This function is used to set the device address and addressing mode of the slave without reconfiguring the entire bus.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Address of the slave is set correctly. |
| FSP_ERR_ASSERTION | Pointer to control structure is NULL. |
| FSP_ERR_IN_USE | Another transfer was in-progress. |
| FSP_ERR_NOT_OPEN | Handle is not initialized. Call R_IIC_MASTER_Open to initialize the control block. |

◆ **R_IIC_MASTER_CallbackSet()**

```
fsp_err_t R_IIC_MASTER_CallbackSet ( i2c_master_ctrl_t *const p_api_ctrl, void(*) (i2c_master_callback_args_t *) p_callback, void const *const p_context, i2c_master_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `i2c_master_api_t::callbackSet`

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | <code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL. |

◆ **R_IIC_MASTER_StatusGet()**

```
fsp_err_t R_IIC_MASTER_StatusGet ( i2c_master_ctrl_t *const p_api_ctrl, i2c_master_status_t *
p_status )
```

Provides driver status.

Return values

| | |
|-------------------|----------------------------|
| FSP_SUCCESS | Status stored in p_status. |
| FSP_ERR_ASSERTION | NULL pointer. |

◆ **R_IIC_MASTER_Close()**

```
fsp_err_t R_IIC_MASTER_Close ( i2c_master_ctrl_t *const p_api_ctrl)
```

Closes the I2C device. May power down IIC peripheral. This function will safely terminate any in-progress I2C transfers.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Device closed without issue. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Handle is not initialized. Call R_IIC_MASTER_Open to initialize the control block. |

Note

A callback will not be invoked in case an in-progress transfer gets aborted by calling this API.

```

Detailed Description

Driver for the SAU peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

Overview

The Simple I2C master on SAU HAL module supports transactions with an I2C Slave device. Callbacks must be provided which would be invoked when a transmission or receive has been completed. The callback arguments will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

Features

- Supports multiple transmission rates
 - Standard Mode Support with up to 100 kHz transaction rate.
 - Fast Mode Support with up to 400 kHz transaction rate.
 - Fast Mode Plus Support with up to 1-MHz transaction rate.
- I2C Master Read from a slave device.
- I2C Master Write to a slave device.
- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.
- Additional build-time features
 - Optional (build time) DTC support for read and write respectively.

Configuration

Build Time Configurations for r_sau_i2c

The following build time configurations are defined in fsp_cfg/r_sau_i2c_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

| | | | |
|-------------------------|--|----------|---|
| Enable Critical Section | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Critical section needs to be enabled if multiple channels on the same SAU unit are configured for I2C |
| Manual Start-Stop | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | If selected, users need to manually call the stop/start conditional function. |
| Enable Single Channel | <ul style="list-style-type: none"> • 00 • 20 • Disabled | Disabled | Enable single channel to reduce code size if only channel 00 or 20 is to be configured for SAU I2C. |
| DTC Support | <ul style="list-style-type: none"> • Enable • Disable | Disable | Enable DTC support for the SAU I2C module. |

Configurations for Connectivity > I2C Master (r_sau_i2c)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Master (r_sau_i2c).

| Configuration | Options | Default | Description |
|---------------------------|---|----------|--|
| Name | Name must be a valid C symbol | g_i2c0 | Module name. |
| Channel | MCU Specific Options | | Select the SAU channel. |
| Operation clock | <ul style="list-style-type: none"> • CK0 • CK1 | CK0 | Select the I2C option clock. |
| Slave Address | Value must be a non-negative integer | 0x00 | Specify the slave address. |
| Rate | <ul style="list-style-type: none"> • Standard • Fast mode • Fast mode plus | Standard | Select the I2C data rate. If the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated transfer rate is printed in a comment in the generated sau_i2c_extended_cfg_t structure. |
| Delay time (Microseconds) | Value must be a non-negative integer | 5 | Hold SDA (or SCK) for delay time to meet the |

I2C start (or stop) condition. Needs to be specified according to slave devices.

| | | | |
|---------------------------------|-------------------------------|-------------------------|--|
| Callback | Name must be a valid C symbol | sau_i2c_master_callback | A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR). |
| Transfer end interrupt priority | MCU Specific Options | | Select transfer end interrupt priority. This is set for TEI interrupt. |

Clock Configuration

The SAU clock is based on the peripheral module clock which is the system clock (ICLK).

Pin Configuration

The SAU I2C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

Usage Notes

Enabling Single Channel By User With The SAU I2C

- Single Channel is configurable and disabled by default in the driver code. Enable single channel to reduce code size if only channel 00 or 20 is to be configured for SAU I2C
 - Channel 00 is supported by SAU0
 - Channel 20 is supported by SAU1

Enabling Start/Stop Condition By User With The SAU I2C

- Manual triggering of start/stop conditions is configurable and disabled by default in the driver code. Because the software delay in start/stop will block ISR, users can decide the appropriate calling time for start/stop conditions by setting this item to enable.

Interrupt Configuration

- Transmit end interrupt (TEI) for the selected channel used must be enabled in the properties of the selected device.

SAU I2C Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate and operating clock. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLK settings is calculated and used.
- If a valid clock rate could not be calculated, an error is returned by the tool.

Enabling DTC with the SAU I2C

- DTC transfer support is configurable and is disabled from the build by default. SAU I2C driver provides one DTC instances for transmission and reception.
- DTC is helpful for minimizing interrupts during large transactions. Many I2C applications have shorter transactions. These applications will likely not see any improvement with DTC. I2C often runs at a much slower speed than the CPU core clock. Some applications with longer transactions may prefer servicing the interrupts at the I2C bitrate to the overhead of bringing in the DTC driver.
- For further details on DTC please refer [Transfer \(r_dtc\)](#)

Multiple Channels Being Used In Same Unit

- SAU I2C instance can use multiple channels in the same unit, user shall take care to not close the module if a channel is still being used.

Multiple Devices On The Bus

- A single SAU I2C instance can be used to communicate with multiple slave devices on the same channel by using the SlaveAddressSet API.

Single Channel Use Case

- If only SAU channel 00 is to be used for I2C or SPI or UARTA, enable single channel can reduce the code size.

Limitations

- When multiple channels on the same SAU unit need to be used, and one is configured as I2C, then critical section property needs to be enabled.

Examples

Basic Example

This is a basic example of minimal use of the r_sau_i2c in an application. This example shows how this driver can be used for basic read and write operations.

```
void basic_example (void)
{
    fsp_err_t err;

    uint32_t i;

    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;

    /* Initialize the I2C module */
    err = R_SAU_I2C_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Write some data to the transmit buffer */
```

```
for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
{
    g_i2c_tx_buffer[i] = (uint8_t) i;
}

/* Send data to I2C slave */
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
err = R_SAU_I2C_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
assert(FSP_SUCCESS == err);

/* Since there is nothing else to do, block until Callback triggers*/
while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
{
    R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;;
}
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
    __BKPT(0);
}

/* Read data back from the I2C slave */
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
timeout_ms          = I2C_TRANSACTION_BUSY_DELAY;
err = R_SAU_I2C_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
assert(FSP_SUCCESS == err);

/* Since there is nothing else to do, block until Callback triggers*/
while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
{
    R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;;
}
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
    __BKPT(0);
}
```

```
    }  
    /* Verify the read data */  
    if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))  
    {  
        __BKPT(0);  
    }  
}
```

Enabling Start/Stop Condition By User

This example demonstrates how to write code for SAU I2C communication when the call start/stop condition by user is enabled.

```
void manual_trigger_condition_example (void)  
{  
    fsp_err_t err;  
    uint32_t i;  
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;  
    /* Initialize the I2C module */  
    err = R_SAU_I2C_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);  
    /* Handle any errors. This function should be defined by the user. */  
    assert(FSP_SUCCESS == err);  
    /* Write some data to the transmit buffer */  
    for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)  
    {  
        g_i2c_tx_buffer[i] = (uint8_t) i;  
    }  
    /* Send data to I2C slave */  
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;  
    err = R_SAU_I2C_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],  
I2C_BUFFER_SIZE_BYTES, false);  
    assert(FSP_SUCCESS == err);  
    R_SAU_I2C_Start(&g_i2c_device_ctrl_1);  
    /* Since there is nothing else to do, block until Callback triggers*/  
    while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms
```

```
{
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;
}
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
    __BKPT(0);
}
R_SAU_I2C_Stop(&g_i2c_device_ctrl_1);
/* Read data back from the I2C slave */
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
timeout_ms          = I2C_TRANSACTION_BUSY_DELAY;
err = R_SAU_I2C_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
R_SAU_I2C_Start(&g_i2c_device_ctrl_1);
/* Since there is nothing else to do, block until Callback triggers*/
while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
{
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;
}
R_SAU_I2C_Stop(&g_i2c_device_ctrl_1);
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
    __BKPT(0);
}
/* Verify the read data */
if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))
{
    __BKPT(0);
}
}
```

Multiple Slave Devices On The Same Channel (Bus)

This example demonstrates how a single SAU I2C driver can be used to communicate with different slave devices which are on the same channel.

```
void single_channel_multi_slave (void)
{
    fsp_err_t err;

    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
    err = R_SAU_I2C_Open(&g_i2c_device_ctrl_2, &g_i2c_device_cfg_2);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Clear the receive buffer */
    memset(g_i2c_rx_buffer, '0', I2C_BUFFER_SIZE_BYTES);
    /* Read data from I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_SAU_I2C_Read(&g_i2c_device_ctrl_2, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
    while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
        R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;
    }
    if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
        __BKPT(0);
    }
    /* Send data to I2C slave on the same channel */
    err = R_SAU_I2C_SlaveAddressSet(&g_i2c_device_ctrl_2, I2C_SLAVE_DISPLAY_ADAPTER,
I2C_MASTER_ADDR_MODE_7BIT);
    assert(FSP_SUCCESS == err);
    g_i2c_tx_buffer[0] = (uint8_t) I2C_EXAMPLE_DATA_1;
    g_i2c_tx_buffer[1] = (uint8_t) I2C_EXAMPLE_DATA_2;
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
}
```

```

err = R_SAU_I2C_Write(&g_i2c_device_ctrl_2, &g_i2c_tx_buffer[0], 2U, false);
assert(FSP_SUCCESS == err);

while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
{
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;
}

if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
    __BKPT(0);
}
}

```

Function Documentation

◆ R_SAU_I2C_Open()

| | |
|---|---|
| fsp_err_t R_SAU_I2C_Open (i2c_master_ctrl_t *const p_api_ctrl, i2c_master_cfg_t const *const p_cfg) | |
| Opens the SAU device. | |
| Return values | |
| FSP_SUCCESS | Requested clock rate was set exactly. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_ASSERTION | Parameter check failure due to one or more reasons below: <ul style="list-style-type: none"> 1. p_api_ctrl or p_cfg is NULL. 2. extended parameter is NULL. 3. Callback parameter is NULL. 4. Clock rate requested is greater than 400KHz 5. Invalid IRQ number assigned |

◆ **R_SAU_I2C_Read()**

```
fsp_err_t R_SAU_I2C_Read ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t
const bytes, bool const restart )
```

Performs a read from the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_RX_COMPLETE in the callback.

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | The parameter p_api_ctrl, p_dest is NULL, bytes is 0. |
| FSP_ERR_INVALID_SIZE | Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer. |
| FSP_ERR_NOT_OPEN | Device was not even opened. |

◆ **R_SAU_I2C_Write()**

```
fsp_err_t R_SAU_I2C_Write ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t
const bytes, bool const restart )
```

Performs a write to the I2C device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C write operation will begin. When no callback is provided by the user, this function performs a blocking write. Otherwise, the write operation is non-blocking and the caller will be notified when the operation has finished by an I2C_EVENT_TX_COMPLETE in the callback.

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | p_api_ctrl, p_src is NULL. |
| FSP_ERR_INVALID_SIZE | Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer. |
| FSP_ERR_NOT_OPEN | Device was not even opened. |

◆ **R_SAU_I2C_Abort()**

```
fsp_err_t R_SAU_I2C_Abort ( i2c_master_ctrl_t *const p_api_ctrl)
```

Aborts any in-progress transfer and forces the I2C peripheral into a ready state.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Transaction was aborted without issue. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Device was not even opened. |

◆ **R_SAU_I2C_SlaveAddressSet()**

```
fsp_err_t R_SAU_I2C_SlaveAddressSet ( i2c_master_ctrl_t *const p_api_ctrl, uint32_t const slave,
i2c_master_addr_mode_t const addr_mode )
```

Sets address of the slave device.

This function is used to set the device address of the slave without reconfiguring the entire bus.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Address of the slave is set correctly. |
| FSP_ERR_ASSERTION | p_ctrl or address is NULL. |
| FSP_ERR_NOT_OPEN | Device was not even opened. |
| FSP_ERR_IN_USE | An I2C Transaction is in progress. |

◆ **R_SAU_I2C_CallbackSet()**

```
fsp_err_t R_SAU_I2C_CallbackSet ( i2c_master_ctrl_t *const p_api_ctrl,
void(*) (i2c_master_callback_args_t *) p_callback, void const *const p_context,
i2c_master_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `i2c_master_api_t::callbackSet`

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |

◆ **R_SAU_I2C_StatusGet()**

```
fsp_err_t R_SAU_I2C_StatusGet ( i2c_master_ctrl_t *const p_api_ctrl, i2c_master_status_t *
p_status )
```

Provides driver status.

Return values

| | |
|-------------------|----------------------------|
| FSP_SUCCESS | Status stored in p_status. |
| FSP_ERR_ASSERTION | NULL pointer. |

◆ **R_SAU_I2C_Close()**

```
fsp_err_t R_SAU_I2C_Close ( i2c_master_ctrl_t *const p_api_ctrl)
```

Closes the I2C device. Power down I2C peripheral.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Device closed without issue. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Device was not even opened. |

◆ **R_SAU_I2C_Start()**

```
void R_SAU_I2C_Start ( saui2c_instance_ctrl_t *const p_ctrl)
```

This function starts/restarts the IIC condition.

Parameters

| | | |
|------|--------|-----------------------------|
| [in] | p_ctrl | Instance control structure. |
|------|--------|-----------------------------|

◆ **R_SAU_I2C_Stop()**

```
void R_SAU_I2C_Stop ( saui2c_instance_ctrl_t *const p_ctrl)
```

This function stops the IIC condition.

Parameters

| | | |
|------|--------|-----------------------------|
| [in] | p_ctrl | Instance control structure. |
|------|--------|-----------------------------|

```

Detailed Description

Driver for the SCI_B peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

Overview

The Simple I2C master on SCI_B HAL module supports transactions with an I2C Slave device. Callbacks must be provided which would be invoked when a transmission or receive has been completed. The callback arguments will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

Features

- Supports multiple transmission rates
 - Standard Mode Support with up to 100 kHz transaction rate.
 - Fast Mode Support with up to 400 kHz transaction rate.
- SDA Delay in nanoseconds can be specified as a part of the configuration.
- I2C Master Read from a slave device.
- I2C Master Write to a slave device.
- Abort any in-progress transactions.
- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.
- Additional build-time features
 - Optional (build time) DTC support for read and write respectively.
 - Optional (build time) support for 10-bit slave addressing.

Configuration

Build Time Configurations for r_sci_b_i2c

The following build time configurations are defined in fsp_cfg/r_sci_b_i2c_cfg.h:

| Configuration | Options | Default | Description |
|-----------------------------------|--|---------------|--|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| DTC on Transmission and Reception | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | If enabled, DTC instances will be included in the build for both transmission and reception. |
| 10-bit slave addressing | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | If enabled, the driver will support 10-bit slave addressing mode along with the default 7-bit slave addressing mode. |

Configurations for Connectivity > I2C Master (r_sci_b_i2c)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Master (r_sci_b_i2c). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---------------------------------|---|---|---|
| Name | Name must be a valid C symbol | g_i2c0 | Module name. |
| Channel | Value must be an integer between 0 and 9 | 0 | Select the SCI channel. |
| Slave Address | Value must be a hex value | 0x00 | Specify the slave address. |
| Address Mode | <ul style="list-style-type: none"> 7-Bit 10-Bit | 7-Bit | Select the address mode. |
| Rate | <ul style="list-style-type: none"> Standard Fast-mode | Standard | Select the I2C data rate. If the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated transfer rate and SDA delay are printed in a comment in the generated sci_b_i2c_extended_cfg_t structure. |
| SDA Output Delay (nano seconds) | Must be a valid non-negative integer with maximum configurable value of 300 | 300 | Specify the SDA output delay in nanoseconds. |
| Noise Filter Clock Select | <ul style="list-style-type: none"> The on-chip baud rate generator source clock divided by 1 The on-chip baud rate generator source clock divided by 2 The on-chip baud rate | The on-chip baud rate generator source clock divided by 1 | Select the on-chip baud rate generator source clock division setting for the digital noise filter |

| | | | | |
|---|---|---|--|---|
| | | generator source clock divided by 4 | | |
| | | <ul style="list-style-type: none"> The on-chip baud rate generator source clock divided by 8 | | |
| Clock Source | MCU Specific Options | | | Select the clock source for the SCI I2C module. |
| Bit Rate Modulation | <ul style="list-style-type: none"> Enable Disable | Enable | | Enabling bitrate modulation reduces the percent error of the actual bitrate with respect to the requested baud rate. It does this by modulating the number of cycles per clock output pulse, so the clock is no longer a square wave. |
| Callback | Name must be a valid C symbol | sci_b_i2c_master_callback | | A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR). |
| Interrupt Priority Level | MCU Specific Options | | | Select the interrupt priority level. This is set for TXI, RXI (if used), TEI interrupts. |
| RX Interrupt Priority Level [Only used when DTC is enabled] | MCU Specific Options | | | Select the interrupt priority level. This is set for RXI only when DTC is enabled. |

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

| MCU Group | Peripheral Clock |
|-----------|------------------|
| RA6T2 | PCLKA |
| RA8D1 | PCLKA |
| RA8M1 | PCLKA |
| RA8T1 | PCLKA |

The actual I2C transfer rate can be derived from either SCISPICK or the peripheral clock (PCLK)¹, and will be calculated and set by the tooling depending on the selected transfer rate and the SDA delay. If the selected clock is configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

Note

1. See Figure 26.2 in the RA6T2 manual for more information.

Pin Configuration

The SCI_B I2C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

Usage Notes

Interrupt Configuration

- Receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel used must be enabled in the properties of the selected device.
- Set equal priority levels for all the interrupts mentioned above. Setting the interrupts to different priority levels could result in improper operation.

SCI_B I2C Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate and SDA Delay. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLK settings is calculated and used.
- If a valid clock rate could not be calculated, an error is returned by the tool.

Enabling DTC with the SCI_B I2C

- DTC transfer support is configurable and is disabled from the build by default. SCI_B I2C driver provides two DTC instances for transmission and reception respectively.
- DTC is helpful for minimizing interrupts during large transactions. Many I2C applications have shorter transactions. These applications will likely not see any improvement with DTC. I2C often runs at a much slower speed than the CPU core clock. Some applications with longer transactions may prefer servicing the interrupts at the I2C bitrate to the overhead of bringing in the DTC driver.
- For further details on DTC please refer [Transfer \(r_dtc\)](#)

Multiple Devices on the Bus

- A single SCI_B I2C instance can be used to communicate with multiple slave devices on the same channel by using the SlaveAddressSet API.

Restart

- SCI_B_I2C can hold the the bus after an I2C transaction by issuing a repeated start condition.

Examples

Basic Example

This is a basic example of minimal use of the r_sci_b_i2c in an application. This example shows how this driver can be used for basic read and write operations.

```
void basic_example (void)
{
    fsp_err_t err;
    uint32_t i;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
    /* Initialize the I2C module */
    err = R_SCI_B_I2C_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Write some data to the transmit buffer */
    for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
    {
        g_i2c_tx_buffer[i] = (uint8_t) i;
    }
    /* Send data to I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_SCI_B_I2C_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
    /* Since there is nothing else to do, block until Callback triggers*/
    while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
        R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;
    }
    if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
        __BKPT(0);
    }
    /* Read data back from the I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
```

```

    timeout_ms          = I2C_TRANSACTION_BUSY_DELAY;

    err = R_SCI_B_I2C_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);

    assert(FSP_SUCCESS == err);

    /* Since there is nothing else to do, block until Callback triggers*/
    while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);

        timeout_ms--;
    }
    if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
        __BKPT(0);
    }

    /* Verify the read data */
    if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))
    {
        __BKPT(0);
    }
}

```

Multiple Slave devices on the same channel (bus)

This example demonstrates how a single SCI_B I2C driver can be used to communicate with different slave devices which are on the same channel.

```

void single_channel_multi_slave (void)
{
    fsp_err_t err;

    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;

    err = R_SCI_B_I2C_Open(&g_i2c_device_ctrl_2, &g_i2c_device_cfg_2);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Clear the receive buffer */
    memset(g_i2c_rx_buffer, '0', I2C_BUFFER_SIZE_BYTES);
}

```

```
/* Read data from I2C slave */
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
err = R_SCI_B_I2C_Read(&g_i2c_device_ctrl_2, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
assert(FSP_SUCCESS == err);
while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
{
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;
}
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
    __BKPT(0);
}
/* Send data to I2C slave on the same channel */
err = R_SCI_B_I2C_SlaveAddressSet(&g_i2c_device_ctrl_2,
I2C_SLAVE_DISPLAY_ADAPTER, I2C_MASTER_ADDR_MODE_7BIT);
assert(FSP_SUCCESS == err);
g_i2c_tx_buffer[0] = (uint8_t) I2C_EXAMPLE_DATA_1;
g_i2c_tx_buffer[1] = (uint8_t) I2C_EXAMPLE_DATA_2;
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
err = R_SCI_B_I2C_Write(&g_i2c_device_ctrl_2, &g_i2c_tx_buffer[0], 2U, false);
assert(FSP_SUCCESS == err);
while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
{
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;
}
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
    __BKPT(0);
}
}
```

Function Documentation

◆ R_SCI_B_I2C_Open()

```
fsp_err_t R_SCI_B_I2C_Open ( i2c_master_ctrl_t *const p_api_ctrl, i2c_master_cfg_t const *const p_cfg )
```

Opens the I2C device.

Return values

| | |
|--------------------------------|---|
| FSP_SUCCESS | Requested clock rate was set exactly. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | Channel is not available on this MCU. |
| FSP_ERR_ASSERTION | Parameter check failure due to one or more reasons below: <ol style="list-style-type: none"> 1. p_api_ctrl or p_cfg is NULL. 2. extended parameter is NULL. 3. Callback parameter is NULL. 4. Clock rate requested is greater than 400KHz 5. Invalid IRQ number assigned |

◆ **R_SCI_B_I2C_Read()**

```
fsp_err_t R_SCI_B_I2C_Read ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t
const bytes, bool const restart )
```

Performs a read from the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_RX_COMPLETE in the callback.

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | The parameter p_ctrl, p_dest is NULL, bytes is 0. |
| FSP_ERR_INVALID_SIZE | Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer. |
| FSP_ERR_NOT_OPEN | Device was not even opened. |

◆ **R_SCI_B_I2C_Write()**

```
fsp_err_t R_SCI_B_I2C_Write ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t
const bytes, bool const restart )
```

Performs a write to the I2C device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C write operation will begin. When no callback is provided by the user, this function performs a blocking write. Otherwise, the write operation is non-blocking and the caller will be notified when the operation has finished by an I2C_EVENT_TX_COMPLETE in the callback.

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | p_ctrl, p_src is NULL. |
| FSP_ERR_INVALID_SIZE | Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer. |
| FSP_ERR_NOT_OPEN | Device was not even opened. |

◆ **R_SCI_B_I2C_Abort()**

```
fsp_err_t R_SCI_B_I2C_Abort ( i2c_master_ctrl_t *const p_api_ctrl)
```

Aborts any in-progress transfer and forces the I2C peripheral into a ready state.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Transaction was aborted without issue. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Device was not even opened. |

◆ **R_SCI_B_I2C_SlaveAddressSet()**

```
fsp_err_t R_SCI_B_I2C_SlaveAddressSet ( i2c_master_ctrl_t *const p_api_ctrl, uint32_t const slave,
i2c_master_addr_mode_t const addr_mode )
```

Sets address and addressing mode of the slave device.

This function is used to set the device address and addressing mode of the slave without reconfiguring the entire bus.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Address of the slave is set correctly. |
| FSP_ERR_ASSERTION | p_ctrl or address is NULL. |
| FSP_ERR_NOT_OPEN | Device was not even opened. |
| FSP_ERR_IN_USE | An I2C Transaction is in progress. |

◆ **R_SCI_B_I2C_CallbackSet()**

```
fsp_err_t R_SCI_B_I2C_CallbackSet ( i2c_master_ctrl_t *const p_api_ctrl,
void(*) (i2c_master_callback_args_t *) p_callback, void const *const p_context,
i2c_master_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `i2c_master_api_t::callbackSet`

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | <code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL. |

◆ **R_SCI_B_I2C_StatusGet()**

```
fsp_err_t R_SCI_B_I2C_StatusGet ( i2c_master_ctrl_t *const p_api_ctrl, i2c_master_status_t *
p_status )
```

Provides driver status.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Status stored in <code>p_status</code> . |
| FSP_ERR_ASSERTION | NULL pointer. |

◆ **R_SCI_B_I2C_Close()**

```
fsp_err_t R_SCI_B_I2C_Close ( i2c_master_ctrl_t *const p_api_ctrl)
```

Closes the I2C device. Power down I2C peripheral.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Device closed without issue. |
| FSP_ERR_ASSERTION | The parameter <code>p_ctrl</code> is NULL. |
| FSP_ERR_NOT_OPEN | Device was not even opened. |

fsp_err_t R_SCI_I2C_StatusGet (i2c_master_ctrl_t *const p_api_ctrl, i2c_master_status_t *p_status)

fsp_err_t R_SCI_I2C_Close (i2c_master_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

Overview

The Simple I2C master on SCI HAL module supports transactions with an I2C Slave device. Callbacks must be provided which would be invoked when a transmission or receive has been completed. The callback arguments will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

Features

- Supports multiple transmission rates
 - Standard Mode Support with up to 100 kHz transaction rate.
 - Fast Mode Support with up to 400 kHz transaction rate.
- SDA Delay in nanoseconds can be specified as a part of the configuration.
- I2C Master Read from a slave device.
- I2C Master Write to a slave device.
- Abort any in-progress transactions.

- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.
- Additional build-time features
 - Optional (build time) DTC support for read and write respectively.
 - Optional (build time) support for 10-bit slave addressing.

Configuration

Build Time Configurations for r_sci_i2c

The following build time configurations are defined in fsp_cfg/r_sci_i2c_cfg.h:

| Configuration | Options | Default | Description |
|-----------------------------------|--|---------------|--|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| DTC on Transmission and Reception | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | If enabled, DTC instances will be included in the build for both transmission and reception. |
| 10-bit slave addressing | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | If enabled, the driver will support 10-bit slave addressing mode along with the default 7-bit slave addressing mode. |

Configurations for Connectivity > I2C Master (r_sci_i2c)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Master (r_sci_i2c). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---------------|---|----------|--|
| Name | Name must be a valid C symbol | g_i2c0 | Module name. |
| Channel | Value must be an integer between 0 and 9 | 0 | Select the SCI channel. |
| Slave Address | Value must be a hex value | 0x00 | Specify the slave address. |
| Address Mode | <ul style="list-style-type: none"> • 7-Bit • 10-Bit | 7-Bit | Select the address mode. |
| Rate | <ul style="list-style-type: none"> • Standard • Fast-mode | Standard | Select the I2C data rate. |
| | | | If the requested transfer rate cannot be |

achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated transfer rate and SDA delay are printed in a comment in the generated [sci_i2c_extended_cfg_t](#) structure.

| | | | |
|---------------------------------|--|---|---|
| SDA Output Delay (nano seconds) | Must be a valid non-negative integer with maximum configurable value of 300 | 300 | Specify the SDA output delay in nanoseconds. |
| Noise filter setting | <ul style="list-style-type: none"> • Use clock signal divided by 1 with noise filter • Use clock signal divided by 2 with noise filter • Use clock signal divided by 4 with noise filter • Use clock signal divided by 8 with noise filter | Use clock signal divided by 1 with noise filter | Select the sampling clock for the digital noise filter |
| Bit Rate Modulation | <ul style="list-style-type: none"> • Enable • Disable | Enable | Enabling bitrate modulation reduces the percent error of the actual bitrate with respect to the requested baud rate. It does this by modulating the number of cycles per clock output pulse, so the clock is no longer a square wave. |
| Callback | Name must be a valid C symbol | sci_i2c_master_callback | A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR). |
| Interrupt Priority Level | MCU Specific Options | | Select the interrupt priority level. This is set for TXI, RXI (if used), |

TEI interrupts.

Select the interrupt priority level. This is set for RXI only when DTC is enabled.

RX Interrupt Priority Level [Only used when DTC is enabled] MCU Specific Options

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

| MCU Group | Peripheral Clock |
|-----------|------------------|
| RA2A1 | PCLKB |
| RA2A2 | PCLKB |
| RA2E1 | PCLKB |
| RA2E2 | PCLKB |
| RA2E3 | PCLKB |
| RA2L1 | PCLKB |
| RA4E1 | PCLKA |
| RA4E2 | PCLKA |
| RA4M1 | PCLKA |
| RA4M2 | PCLKA |
| RA4M3 | PCLKA |
| RA4T1 | PCLKA |
| RA4W1 | PCLKA |
| RA6E1 | PCLKA |
| RA6E2 | PCLKA |
| RA6M1 | PCLKA |
| RA6M2 | PCLKA |
| RA6M3 | PCLKA |
| RA6M4 | PCLKA |
| RA6M5 | PCLKA |
| RA6T1 | PCLKA |
| RA6T3 | PCLKA |

The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate and the SDA delay. If the PCLK is configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

Pin Configuration

The SCI I2C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

Usage Notes

Interrupt Configuration

- Receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel used must be enabled in the properties of the selected device.
- Set equal priority levels for all the interrupts mentioned above. Setting the interrupts to different priority levels could result in improper operation.

SCI I2C Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate and SDA Delay. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLK settings is calculated and used.
- If a valid clock rate could not be calculated, an error is returned by the tool.

Enabling DTC with the SCI I2C

- DTC transfer support is configurable and is disabled from the build by default. SCI I2C driver provides two DTC instances for transmission and reception respectively.
- DTC is helpful for minimizing interrupts during large transactions. Many I2C applications have shorter transactions. These applications will likely not see any improvement with DTC. I2C often runs at a much slower speed than the CPU core clock. Some applications with longer transactions may prefer servicing the interrupts at the I2C bitrate to the overhead of bringing in the DTC driver.
- For further details on DTC please refer [Transfer \(r_dtc\)](#)

Multiple Devices on the Bus

- A single SCI I2C instance can be used to communicate with multiple slave devices on the same channel by using the SlaveAddressSet API.

Restart

- SCI I2C master can hold the the bus after an I2C transaction by issuing Restart. This will mimic a stop followed by start condition.

Examples

Basic Example

This is a basic example of minimal use of the r_sci_i2c in an application. This example shows how this driver can be used for basic read and write operations.

```
void basic_example (void)
{
    fsp_err_t err;
```

```
uint32_t i;
uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
/* Initialize the I2C module */
err = R_SCI_I2C_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
/* Write some data to the transmit buffer */
for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
{
    g_i2c_tx_buffer[i] = (uint8_t) i;
}
/* Send data to I2C slave */
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
err = R_SCI_I2C_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
assert(FSP_SUCCESS == err);
/* Since there is nothing else to do, block until Callback triggers*/
while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
{
    R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;;
}
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
    __BKPT(0);
}
/* Read data back from the I2C slave */
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
err = R_SCI_I2C_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
assert(FSP_SUCCESS == err);
/* Since there is nothing else to do, block until Callback triggers*/
while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
```

```
{
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;
}
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
    __BKPT(0);
}
/* Verify the read data */
if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))
{
    __BKPT(0);
}
}
```

Multiple Slave devices on the same channel (bus)

This example demonstrates how a single SCI I2C driver can be used to communicate with different slave devices which are on the same channel.

```
void single_channel_multi_slave (void)
{
    fsp_err_t err;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
    err = R_SCI_I2C_Open(&g_i2c_device_ctrl_2, &g_i2c_device_cfg_2);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Clear the receive buffer */
    memset(g_i2c_rx_buffer, '0', I2C_BUFFER_SIZE_BYTES);
    /* Read data from I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_SCI_I2C_Read(&g_i2c_device_ctrl_2, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
    while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
```

```

    {
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;
    }
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
        __BKPT(0);
    }
/* Send data to I2C slave on the same channel */
err = R_SCI_I2C_SlaveAddressSet(&g_i2c_device_ctrl_2, I2C_SLAVE_DISPLAY_ADAPTER,
I2C_MASTER_ADDR_MODE_7BIT);
assert(FSP_SUCCESS == err);
g_i2c_tx_buffer[0] = (uint8_t) I2C_EXAMPLE_DATA_1;
g_i2c_tx_buffer[1] = (uint8_t) I2C_EXAMPLE_DATA_2;
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
err = R_SCI_I2C_Write(&g_i2c_device_ctrl_2, &g_i2c_tx_buffer[0], 2U, false);
assert(FSP_SUCCESS == err);
while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;
    }
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
        __BKPT(0);
    }
}

```

Function Documentation

◆ **R_SCI_I2C_Open()**

```
fsp_err_t R_SCI_I2C_Open ( i2c_master_ctrl_t *const p_api_ctrl, i2c_master_cfg_t const *const p_cfg )
```

Opens the I2C device.

Return values

| | |
|--------------------------------|---|
| FSP_SUCCESS | Requested clock rate was set exactly. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | Channel is not available on this MCU. |
| FSP_ERR_ASSERTION | Parameter check failure due to one or more reasons below: <ul style="list-style-type: none"> 1. p_api_ctrl or p_cfg is NULL. 2. extended parameter is NULL. 3. Callback parameter is NULL. 4. Clock rate requested is greater than 400KHz 5. Invalid IRQ number assigned |

◆ **R_SCI_I2C_Read()**

```
fsp_err_t R_SCI_I2C_Read ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const bytes, bool const restart )
```

Performs a read from the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_RX_COMPLETE in the callback.

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | The parameter p_ctrl, p_dest is NULL, bytes is 0. |
| FSP_ERR_INVALID_SIZE | Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer. |
| FSP_ERR_NOT_OPEN | Device was not even opened. |

◆ **R_SCI_I2C_Write()**

```
fsp_err_t R_SCI_I2C_Write ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t
const bytes, bool const restart )
```

Performs a write to the I2C device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C write operation will begin. When no callback is provided by the user, this function performs a blocking write. Otherwise, the write operation is non-blocking and the caller will be notified when the operation has finished by an I2C_EVENT_TX_COMPLETE in the callback.

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | p_ctrl, p_src is NULL. |
| FSP_ERR_INVALID_SIZE | Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer. |
| FSP_ERR_NOT_OPEN | Device was not even opened. |

◆ **R_SCI_I2C_Abort()**

```
fsp_err_t R_SCI_I2C_Abort ( i2c_master_ctrl_t *const p_api_ctrl)
```

Aborts any in-progress transfer and forces the I2C peripheral into a ready state.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Transaction was aborted without issue. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Device was not even opened. |

◆ **R_SCI_I2C_SlaveAddressSet()**

```
fsp_err_t R_SCI_I2C_SlaveAddressSet ( i2c_master_ctrl_t *const p_api_ctrl, uint32_t const slave,
i2c_master_addr_mode_t const addr_mode )
```

Sets address and addressing mode of the slave device.

This function is used to set the device address and addressing mode of the slave without reconfiguring the entire bus.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Address of the slave is set correctly. |
| FSP_ERR_ASSERTION | p_ctrl or address is NULL. |
| FSP_ERR_NOT_OPEN | Device was not even opened. |
| FSP_ERR_IN_USE | An I2C Transaction is in progress. |

◆ **R_SCI_I2C_CallbackSet()**

```
fsp_err_t R_SCI_I2C_CallbackSet ( i2c_master_ctrl_t *const p_api_ctrl,
void(*) (i2c_master_callback_args_t *) p_callback, void const *const p_context,
i2c_master_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `i2c_master_api_t::callbackSet`

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

◆ **R_SCI_I2C_StatusGet()**

```
fsp_err_t R_SCI_I2C_StatusGet ( i2c_master_ctrl_t *const p_api_ctrl, i2c_master_status_t * p_status )
```

Provides driver status.

Return values

| | |
|-------------------|----------------------------|
| FSP_SUCCESS | Status stored in p_status. |
| FSP_ERR_ASSERTION | NULL pointer. |

◆ **R_SCI_I2C_Close()**

```
fsp_err_t R_SCI_I2C_Close ( i2c_master_ctrl_t *const p_api_ctrl)
```

Closes the I2C device. Power down I2C peripheral.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

Return values

| | |
|-------------------|-------------------------------|
| FSP_SUCCESS | Device closed without issue. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Device was not even opened. |

```

```
fsp_err_t R_IIC_B_SLAVE_Close (i2c_slave_ctrl_t *const p_api_ctrl)
```

Detailed Description

Driver for the IIC/I3C peripheral on RA MCUs. This module implements the [I2C Slave Interface](#).

Overview

Features

- Supports multiple transmission rates
 - Standard Mode Support with up to 100-kHz transaction rate.
 - Fast Mode Support with up to 400-kHz transaction rate.
 - Fast Mode Plus Support with up to 1-MHz transaction rate.
- Reads data written by master device.
- Write data which is read by master device.
- Can accept 0x00 as slave address.
- Can be assigned a 10-bit address.
- Clock stretching is supported and can be implemented via callbacks.
- Provides Transmission/Reception transaction size in the callback.
- I2C Slave can notify the following events via callbacks: Transmission/Reception Request, Transmission/Reception Request for more data, Transmission/Reception Completion, Error Condition.
- Additional build-time features:
 - Optional (build time) DTC support for read and write respectively.

Configuration

Build Time Configurations for r_iic_b_slave

The following build time configurations are defined in fsp_cfg/r_iic_b_slave_cfg.h:

| Configuration | Options | Default | Description |
|-----------------------------------|--|---------------|--|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| DTC on Transmission and Reception | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | If enabled, DTC instances will be included in the build for both transmission and reception. |

Configurations for Connectivity > I2C Slave (r_iic_b_slave)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Slave (r_iic_b_slave). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---------------|---------|---------|-------------|
|---------------|---------|---------|-------------|

Interrupt Priority Level

| | | | |
|-------------------------------------|---|----------------|--|
| Transmit, Receive, and Transmit End | MCU Specific Options | | Select the interrupt priority level. This is set for TXI, RXI, and TEI interrupts. |
| Error | MCU Specific Options | | Select the interrupt priority level. This is set for ERI interrupt. |
| Name | Name must be a valid C symbol | g_i2c_slave0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Specify the IIC channel. |
| Rate | <ul style="list-style-type: none"> Standard Fast-mode Fast-mode plus | Standard | Select the transfer rate. If the delay for the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated delay is printed in a comment in the generated iic_b_slave_extended_cfg_t structure. |
| Internal Reference Clock | <ul style="list-style-type: none"> I2C Clock / 1 I2C Clock / 2 I2C Clock / 4 I2C Clock / 8 I2C Clock / 16 I2C Clock / 32 I2C Clock / 64 I2C Clock / 128 | I2C Clock / 1 | Select the internal reference clock for IIC slave. The internal reference clock is used only to determine the clock frequency of the noise filter samples. I2C Clock can be either IICCLK or PCLKD based on the MCU. |
| Digital Noise Filter Stage Select | Refer to the RA Configuration tool for available options. | 3-stage filter | Select the number of digital filter stages for IIC Slave. |
| Slave Address | Value must be non-negative | 0x08 | Specify the slave address. |
| General Call | <ul style="list-style-type: none"> Enabled Disabled | Disabled | Allows the slave to respond to general call address: 0x00. |
| Address Mode | <ul style="list-style-type: none"> 7-Bit | 7-Bit | Select the slave |

| | | | |
|------------------|---|-------------------------|--|
| | <ul style="list-style-type: none"> • 10-Bit | | address mode. |
| Clock Stretching | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Configure Clock Stretching. |
| Callback | Name must be a valid C symbol | g_iic_b_slave0_callback | A user callback function must be provided. This will be called from the interrupt service routine (ISR) to report I2C Slave transaction events and status. |

Clock Configuration

The IIC/I3C peripheral module uses the IICCLK or PCLKD (based on the MCU) as its clock source for the bus clock. The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate. If the clocks are configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

Pin Configuration

The IIC/I3C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

Usage Notes

Interrupt Configuration

- The IIC error (EEI), receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel must be enabled in the properties of the selected device.
- The interrupt priority of ERI can be set higher than or equal to the interrupt priorities of RXI, TXI and TEI.

Note

: During master-write slave-read type of operations if the slave device requires to perform clock stretching after the last data byte is received, a higher priority ERI will ensure that the ongoing transaction is completed (by accepting the Stop/Restart condition from the master) before the next transaction is initiated.

: To support clock stretching (Holding SCL low after the falling edge of the 9th clock cycle), 'Clock Stretching' configuration must be enabled.

Callback

- A callback function must be provided which will be invoked for the cases below:
 - An I2C Master initiates a transmission or reception: I2C_SLAVE_EVENT_TX_REQUEST; I2C_SLAVE_EVENT_RX_REQUEST
 - A Transmission or reception has been completed: I2C_SLAVE_EVENT_TX_COMPLETE; I2C_SLAVE_EVENT_RX_COMPLETE
 - An I2C Master is requesting to read or write more data: I2C_SLAVE_EVENT_TX_MORE_REQUEST; I2C_SLAVE_EVENT_RX_MORE_REQUEST
 - Error conditions: I2C_SLAVE_EVENT_ABORTED
 - An I2C Master initiates a general call by passing 0x00 as slave address:

I2C_SLAVE_EVENT_GENERAL_CALL

- The callback arguments will contain information about the transaction status/events, bytes transferred and a pointer to the user defined context.
- Clock stretching is enabled by the use of callbacks. This means that the IIC slave can hold the clock line SCL LOW to force the I2C Master into a wait state.
- The table below shows I2C Slave event handling expected in user code:

| IIC Slave Callback Event | IIC Slave API expected to be called |
|---------------------------------|---|
| I2C_SLAVE_EVENT_ABORTED | Handle event based on application |
| I2C_SLAVE_EVENT_RX_COMPLETE | Handle event based on application |
| I2C_SLAVE_EVENT_TX_COMPLETE | Handle event based on application |
| I2C_SLAVE_EVENT_RX_REQUEST | R_IIC_B_SLAVE_Read API. If the slave is a Write Only device call this API with 0 bytes to send a NACK to the master. |
| I2C_SLAVE_EVENT_TX_REQUEST | R_IIC_B_SLAVE_Write API |
| I2C_SLAVE_EVENT_RX_MORE_REQUEST | R_IIC_B_SLAVE_Read API. If the slave cannot read any more data call this API with 0 bytes to send a NACK to the master. |
| I2C_SLAVE_EVENT_TX_MORE_REQUEST | R_IIC_B_SLAVE_Write API |
| I2C_SLAVE_EVENT_GENERAL_CALL | R_IIC_B_SLAVE_Read |

- If parameter checking is enabled and R_IIC_B_SLAVE_Read API is not called for I2C_SLAVE_EVENT_RX_REQUEST and/or I2C_SLAVE_EVENT_RX_MORE_REQUEST, the slave will send a NACK to the master and would eventually timeout.
- R_IIC_B_SLAVE_Write API is not called for I2C_SLAVE_EVENT_TX_REQUEST and/or I2C_SLAVE_EVENT_TX_MORE_REQUEST:
 - Slave timeout is less than Master timeout: The slave will timeout and release the bus causing the master to read 0xFF for every remaining byte.
 - Slave timeout is more than Master timeout: The master will timeout first followed by the slave.

IIC Slave Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current I2C Clock (IICCLK or PCLKD based on the MCU) settings is calculated and used.

Limitations

- When 'Clock Stretching' configuration is enabled, the receive operation will not utilize the double buffer arrangement in hardware for a continuous read. This means that the read operation would happen in single byte units such that the active master would send the next byte only when the slave has read the current byte of data.
- When DTC is enabled, the clock frequency supply for DTC must be configured greater than the "Internal Reference Clock" of the slave.

Examples

Basic Example

This is a basic example of minimal use of the R_IIC_B_SLAVE in an application. This example shows how this driver can be used for basic read and write operations.

```
iic_b_master_instance_ctrl_t g_i2c_master_ctrl;
i2c_master_cfg_t g_i2c_master_cfg =
{
    .channel      = I2C_MASTER_CHANNEL_2,
    .rate        = I2C_MASTER_RATE_STANDARD,
    .slave       = I2C_7BIT_ADDR_IIC_SLAVE,
    .addr_mode   = I2C_MASTER_ADDR_MODE_7BIT,
    .p_callback  = i2c_master_callback, // Callback
    .p_context   = &g_i2c_master_ctrl,
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend    = &g_iic_master_cfg_extend_standard_mode
};
iic_b_slave_instance_ctrl_t g_i2c_slave_ctrl;
i2c_slave_cfg_t g_i2c_slave_cfg =
{
    .channel      = I2C_SLAVE_CHANNEL_0,
    .rate        = I2C_SLAVE_RATE_STANDARD,
    .slave       = I2C_7BIT_ADDR_IIC_SLAVE,
    .addr_mode   = I2C_SLAVE_ADDR_MODE_7BIT,
    .p_callback  = i2c_slave_callback, // Callback
    .p_context   = &g_i2c_slave_ctrl,
    .p_extend    = &g_iic_slave_cfg_extend_standard_mode
};
void i2c_master_callback (i2c_master_callback_args_t * p_args)
{
    g_i2c_master_callback_event = p_args->event;
}
void i2c_slave_callback (i2c_slave_callback_args_t * p_args)
```

```
{
    g_i2c_slave_callback_event = p_args->event;

Function Documentation

◆ **R_IIC_B_SLAVE_Open()**

```
fsp_err_t R_IIC_B_SLAVE_Open ( i2c_slave_ctrl_t *const p_api_ctrl, i2c_slave_cfg_t const *const p_cfg )
```

Opens the I2C slave device.

Return values

| | |
|--------------------------------|--|
| FSP_SUCCESS | I2C slave device opened successfully. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | Channel is not available on this MCU. |
| FSP_ERR_INVALID_ARGUMENT | Error interrupt priority is lower than Transmit, Receive and Transmit End interrupt priority |
| FSP_ERR_ASSERTION | Parameter check failure due to one or more reasons below: <ul style="list-style-type: none"> 1. p_api_ctrl or p_cfg is NULL. 2. extended parameter is NULL. 3. Callback parameter is NULL. 4. Set the rate to fast mode plus on a channel which does not support it. 5. Invalid IRQ number assigned 6. transfer instance in p_cfg is NULL when DTC support enabled |

◆ **R_IIC_B_SLAVE_Read()**

```
fsp_err_t R_IIC_B_SLAVE_Read ( i2c_slave_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const bytes )
```

Performs a read from the I2C Master device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C slave read operation will begin. The caller will be notified when the operation has finished by an I2C_SLAVE_EVENT_RX_COMPLETE in the callback. In case the master continues to write more data, an I2C_SLAVE_EVENT_RX_MORE_REQUEST will be issued via callback. In case of errors, an I2C_SLAVE_EVENT_ABORTED will be issued via callback.

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | Function executed without issue |
| FSP_ERR_ASSERTION | p_api_ctrl, bytes or p_dest is NULL. |
| FSP_ERR_IN_USE | Another transfer was in progress. |
| FSP_ERR_NOT_OPEN | Device is not open. |
| FSP_ERR_INVALID_SIZE | Invalid size when reading data via DTC. |

◆ **R_IIC_B_SLAVE_Write()**

```
fsp_err_t R_IIC_B_SLAVE_Write ( i2c_slave_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t
const bytes )
```

Performs a write to the I2C Master device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C slave write operation will begin. The caller will be notified when the operation has finished by an I2C_SLAVE_EVENT_TX_COMPLETE in the callback. In case the master continues to read more data, an I2C_SLAVE_EVENT_TX_MORE_REQUEST will be issued via callback. In case of errors, an I2C_SLAVE_EVENT_ABORTED will be issued via callback.

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | p_api_ctrl or p_src is NULL. |
| FSP_ERR_IN_USE | Another transfer was in progress. |
| FSP_ERR_NOT_OPEN | Device is not open. |
| FSP_ERR_INVALID_SIZE | Invalid size when writing data via DTC. |

◆ **R_IIC_B_SLAVE_CallbackSet()**

```
fsp_err_t R_IIC_B_SLAVE_CallbackSet ( i2c_slave_ctrl_t *const p_api_ctrl,
void(*) (i2c_slave_callback_args_t *) p_callback, void const *const p_context,
i2c_slave_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `i2c_slave_api_t::callbackSet`

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

◆ R_IIC_B_SLAVE_Close()

`fsp_err_t R_IIC_B_SLAVE_Close (i2c_slave_ctrl_t *const p_api_ctrl)`

Closes the I2C device.

Return values

| | |
|-------------------|-----------------------------|
| FSP_SUCCESS | Device closed successfully. |
| FSP_ERR_NOT_OPEN | Device not opened. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |

`fsp_err_t R_IIC_SLAVE_Close (i2c_slave_ctrl_t *const p_api_ctrl)`

Detailed Description

Driver for the IIC peripheral on RA MCUs. This module implements the [I2C Slave Interface](#).

Overview

Features

- Supports multiple transmission rates
 - Standard Mode Support with up to 100-kHz transaction rate.
 - Fast Mode Support with up to 400-kHz transaction rate.
 - Fast Mode Plus Support with up to 1-MHz transaction rate.
- Reads data written by master device.

- Write data which is read by master device.
- Can accept 0x00 as slave address.
- Can be assigned a 10-bit address.
- Clock stretching is supported and can be implemented via callbacks.
- Provides Transmission/Reception transaction size in the callback.
- I2C Slave can notify the following events via callbacks: Transmission/Reception Request, Transmission/Reception Request for more data, Transmission/Reception Completion, Error Condition.
- Additional build-time features:
 - Optional (build time) DTC support for read and write respectively.

Configuration

Build Time Configurations for r_iic_slave

The following build time configurations are defined in fsp_cfg/r_iic_slave_cfg.h:

| Configuration | Options | Default | Description |
|-----------------------------------|--|---------------|--|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| DTC on Transmission and Reception | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | If enabled, DTC instances will be included in the build for both transmission and reception. |

Configurations for Connectivity > I2C Slave (r_iic_slave)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Slave (r_iic_slave). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|-------------------------------------|---|--------------|--|
| Interrupt Priority Level | | | |
| Transmit, Receive, and Transmit End | MCU Specific Options | | Select the interrupt priority level. This is set for TXI, RXI, and TEI interrupts. |
| Error | MCU Specific Options | | Select the interrupt priority level. This is set for ERI interrupt. |
| Name | Name must be a valid C symbol | g_i2c_slave0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Specify the IIC channel. |
| Rate | <ul style="list-style-type: none"> • Standard • Fast-mode • Fast-mode plus | Standard | Select the transfer rate. |

If the delay for the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated delay is printed in a comment in the generated [iic_slave_extended_cfg_t](#) structure.

| | | | |
|-----------------------------------|---|----------------|--|
| Internal Reference Clock | <ul style="list-style-type: none"> • PCLKB / 1 • PCLKB / 2 • PCLKB / 4 • PCLKB / 8 • PCLKB / 16 • PCLKB / 32 • PCLKB / 64 • PCLKB / 128 | PCLKB / 1 | Select the internal reference clock for IIC slave. The internal reference clock is used only to determine the clock frequency of the noise filter samples. |
| Digital Noise Filter Stage Select | <ul style="list-style-type: none"> • Disabled • Single-stage filter • 2-stage filter • 3-stage filter • 4-stage filter | 3-stage filter | Select the number of digital filter stages for IIC Slave. |
| Slave Address | Value must be non-negative | 0x08 | Specify the slave address. |
| General Call | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Allows the slave to respond to general call address: 0x00. |
| Address Mode | <ul style="list-style-type: none"> • 7-Bit • 10-Bit | 7-Bit | Select the slave address mode. |
| Clock Stretching | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Configure Clock Stretching. |
| Callback | Name must be a valid C symbol | NULL | A user callback function must be provided. This will be called from the interrupt service routine (ISR) to report I2C Slave transaction events and status. |

Clock Configuration

The IIC peripheral module uses the PCLKB as its clock source. The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate. If the PCLKB is configured

in such a manner that the selected transfer rate cannot be achieved, an error will be returned.

Pin Configuration

The IIC peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

Usage Notes

Interrupt Configuration

- The IIC error (EEI), receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel must be enabled in the properties of the selected device.
- The interrupt priority of ERI can be set higher than or equal to the interrupt priorities of RXI, TXI and TEI.

Note

: During master-write slave-read type of operations if the slave device requires to perform clock stretching after the last data byte is received, a higher priority ERI will ensure that the ongoing transaction is completed (by accepting the Stop/Restart condition from the master) before the next transaction is initiated.

: To support clock stretching (Holding SCL low after the falling edge of the 9th clock cycle), 'Clock Stretching' configuration must be enabled.

Callback

- A callback function must be provided which will be invoked for the cases below:
 - An I2C Master initiates a transmission or reception:
I2C_SLAVE_EVENT_TX_REQUEST; I2C_SLAVE_EVENT_RX_REQUEST
 - A Transmission or reception has been completed:
I2C_SLAVE_EVENT_TX_COMPLETE; I2C_SLAVE_EVENT_RX_COMPLETE
 - An I2C Master is requesting to read or write more data:
I2C_SLAVE_EVENT_TX_MORE_REQUEST; I2C_SLAVE_EVENT_RX_MORE_REQUEST
 - Error conditions: I2C_SLAVE_EVENT_ABORTED
 - An I2C Master initiates a general call by passing 0x00 as slave address:
I2C_SLAVE_EVENT_GENERAL_CALL
- The callback arguments will contain information about the transaction status/events, bytes transferred and a pointer to the user defined context.
- Clock stretching is enabled by the use of callbacks. This means that the IIC slave can hold the clock line SCL LOW to force the I2C Master into a wait state.
- The table below shows I2C Slave event handling expected in user code:

| IIC Slave Callback Event | IIC Slave API expected to be called |
|-----------------------------|--|
| I2C_SLAVE_EVENT_ABORTED | Handle event based on application |
| I2C_SLAVE_EVENT_RX_COMPLETE | Handle event based on application |
| I2C_SLAVE_EVENT_TX_COMPLETE | Handle event based on application |
| I2C_SLAVE_EVENT_RX_REQUEST | R_IIC_SLAVE_Read API. If the slave is a Write Only device call this API with 0 bytes to send a NACK to the master. |

| | |
|---------------------------------|---|
| I2C_SLAVE_EVENT_TX_REQUEST | R_IIC_SLAVE_Write API |
| I2C_SLAVE_EVENT_RX_MORE_REQUEST | R_IIC_SLAVE_Read API. If the slave cannot read any more data call this API with 0 bytes to send a NACK to the master. |
| I2C_SLAVE_EVENT_TX_MORE_REQUEST | R_IIC_SLAVE_Write API |
| I2C_SLAVE_EVENT_GENERAL_CALL | R_IIC_SLAVE_Read |

- If parameter checking is enabled and R_IIC_SLAVE_Read API is not called for I2C_SLAVE_EVENT_RX_REQUEST and/or I2C_SLAVE_EVENT_RX_MORE_REQUEST, the slave will send a NACK to the master and would eventually timeout.
- R_IIC_SLAVE_Write API is not called for I2C_SLAVE_EVENT_TX_REQUEST and/or I2C_SLAVE_EVENT_TX_MORE_REQUEST:
 - Slave timeout is less than Master timeout: The slave will timeout and release the bus causing the master to read 0xFF for every remaining byte.
 - Slave timeout is more than Master timeout: The master will timeout first followed by the slave.

IIC Slave Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLKB settings is calculated and used.

Limitations

- When 'Clock Stretching' configuration is enabled, the receive operation will not utilize the double buffer arrangement in hardware for a continuous read. This means that the read operation would happen in single byte units such that the active master would send the next byte only when the slave has read the current byte of data.
- When DTC is enabled, the clock frequency supply for DTC must be configured greater than the "Internal Reference Clock" of the slave.

Examples

Basic Example

This is a basic example of minimal use of the R_IIC_SLAVE in an application. This example shows how this driver can be used for basic read and write operations.

```
iic_master_instance_ctrl_t g_i2c_master_ctrl;
i2c_master_cfg_t g_i2c_master_cfg =
{
    .channel      = I2C_MASTER_CHANNEL_2,
    .rate         = I2C_MASTER_RATE_STANDARD,
    .slave        = I2C_7BIT_ADDR_IIC_SLAVE,
    .addr_mode    = I2C_MASTER_ADDR_MODE_7BIT,
    .p_callback   = i2c_master_callback, // Callback
```

```
.p_context      = &g_i2c_master_ctrl,  
.p_transfer_tx  = NULL,  
.p_transfer_rx  = NULL,  
.p_extend       = &g_iic_master_cfg_extend_standard_mode  
};  
iic_slave_instance_ctrl_t g_i2c_slave_ctrl;  
i2c_slave_cfg_t g_i2c_slave_cfg =  
{  
    .channel      = I2C_SLAVE_CHANNEL_0,  
    .rate         = I2C_SLAVE_RATE_STANDARD,  
    .slave        = I2C_7BIT_ADDR_IIC_SLAVE,  
    .addr_mode    = I2C_SLAVE_ADDR_MODE_7BIT,  
    .p_callback   = i2c_slave_callback, // Callback  
    .p_context    = &g_i2c_slave_ctrl,  
    .p_extend     = &g_iic_slave_cfg_extend_standard_mode  
};  
void i2c_master_callback (i2c_master_callback_args_t * p_args)  
{  
    g_i2c_master_callback_event = p_args->event;  
}  
void i2c_slave_callback (i2c_slave_callback_args_t * p_args)  
{  
    g_i2c_slave_callback_event = p_args->event;  
    if ((p_args->event == I2C_SLAVE_EVENT_RX_COMPLETE) || (p_args->event ==  
I2C_SLAVE_EVENT_TX_COMPLETE))  
    {  
        /* Transaction Successful */  
    }  
    else if ((p_args->event == I2C_SLAVE_EVENT_RX_REQUEST) || (p_args->event ==  
I2C_SLAVE_EVENT_RX_MORE_REQUEST))  
    {  
        /* Read from Master */  
        err = R_IIC_SLAVE_Read(&g_i2c_slave_ctrl, g_i2c_slave_buffer,  
g_slave_transfer_length);
```

```
        assert(FSP_SUCCESS == err);
    }
    else if ((p_args->event == I2C_SLAVE_EVENT_TX_REQUEST) || (p_args->event ==
I2C_SLAVE_EVENT_TX_MORE_REQUEST))
    {
        /* Write to master */
        err = R_IIC_SLAVE_Write(&g_i2c_slave_ctrl, g_i2c_slave_buffer,
g_slave_transfer_length);
        assert(FSP_SUCCESS == err);
    }
    else
    {
        /* Error Event - reported through g_i2c_slave_callback_event */
    }
}
void basic_example (void)
{
    uint32_t i;

Function Documentation

◆ R_IIC_SLAVE_Open()

```
fsp_err_t R_IIC_SLAVE_Open ( i2c_slave_ctrl_t *const p_api_ctrl, i2c_slave_cfg_t const *const p_cfg )
```

Opens the I2C slave device.

Return values

| | |
|--------------------------------|--|
| FSP_SUCCESS | I2C slave device opened successfully. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | Channel is not available on this MCU. |
| FSP_ERR_INVALID_ARGUMENT | Error interrupt priority is lower than Transmit, Receive and Transmit End interrupt priority |
| FSP_ERR_ASSERTION | Parameter check failure due to one or more reasons below: <ul style="list-style-type: none"> 1. p_api_ctrl or p_cfg is NULL. 2. extended parameter is NULL. 3. Callback parameter is NULL. 4. Set the rate to fast mode plus on a channel which does not support it. 5. Invalid IRQ number assigned 6. transfer instance in p_cfg is NULL when DTC support enabled |

◆ **R_IIC_SLAVE_Read()**

```
fsp_err_t R_IIC_SLAVE_Read ( i2c_slave_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t
const bytes )
```

Performs a read from the I2C Master device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C slave read operation will begin. The caller will be notified when the operation has finished by an I2C_SLAVE_EVENT_RX_COMPLETE in the callback. In case the master continues to write more data, an I2C_SLAVE_EVENT_RX_MORE_REQUEST will be issued via callback. In case of errors, an I2C_SLAVE_EVENT_ABORTED will be issued via callback.

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | Function executed without issue |
| FSP_ERR_ASSERTION | p_api_ctrl, bytes or p_dest is NULL. |
| FSP_ERR_IN_USE | Another transfer was in progress. |
| FSP_ERR_NOT_OPEN | Device is not open. |
| FSP_ERR_INVALID_SIZE | Invalid size when reading data via DTC. |

◆ **R_IIC_SLAVE_Write()**

```
fsp_err_t R_IIC_SLAVE_Write ( i2c_slave_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t
const bytes )
```

Performs a write to the I2C Master device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C slave write operation will begin. The caller will be notified when the operation has finished by an I2C_SLAVE_EVENT_TX_COMPLETE in the callback. In case the master continues to read more data, an I2C_SLAVE_EVENT_TX_MORE_REQUEST will be issued via callback. In case of errors, an I2C_SLAVE_EVENT_ABORTED will be issued via callback.

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | p_api_ctrl or p_src is NULL. |
| FSP_ERR_IN_USE | Another transfer was in progress. |
| FSP_ERR_NOT_OPEN | Device is not open. |
| FSP_ERR_INVALID_SIZE | Invalid size when writing data via DTC. |

◆ **R_IIC_SLAVE_CallbackSet()**

```
fsp_err_t R_IIC_SLAVE_CallbackSet ( i2c_slave_ctrl_t *const p_api_ctrl,
void(*) (i2c_slave_callback_args_t *) p_callback, void const *const p_context,
i2c_slave_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `i2c_slave_api_t::callbackSet`

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | <code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL. |

◆ **R_IIC_SLAVE_Close()**

```
fsp_err_t R_IIC_SLAVE_Close ( i2c_slave_ctrl_t *const p_api_ctrl)
```

Closes the I2C device.

Return values

| | |
|-------------------|----------------------------------|
| FSP_SUCCESS | Device closed successfully. |
| FSP_ERR_NOT_OPEN | Device not opened. |
| FSP_ERR_ASSERTION | <code>p_api_ctrl</code> is NULL. |

```

Detailed Description

Driver for the SSIE peripheral on RA MCUs. This module implements the [I2S Interface](#).

Overview

Features

The SSI module supports the following features:

- Transmission and reception of uncompressed audio data using the standard I2S protocol in master and slave modes
- Full-duplex I2S communication (channel 0 only)
- Integration with the DTC transfer module
- Internal connection to GPT timer output to generate the audio clock
- Callback function notification when all data is loaded into the SSI FIFO

Configuration

Build Time Configurations for r_ssi

The following build time configurations are defined in fsp_cfg/r_ssi_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| DTC Support | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | If code for DTC transfer support is included in the build. |

Configurations for Connectivity > I2S (r_ssi)

This module can be added to the Stacks tab via New Stack > Connectivity > I2S (r_ssi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|--|---|-----------------|---|
| Name | Name must be a valid C symbol | g_i2s0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Specify the I2S channel. |
| Operating Mode (Master/Slave) | <ul style="list-style-type: none"> • Master Mode • Slave Mode | Master Mode | Select if the MCU is I2S master or slave. |
| Bit Depth | <ul style="list-style-type: none"> • 8 Bits • 16 Bits • 18 Bits • 20 Bits • 22 Bits • 24 Bits • 32 Bits | 16 Bits | Select the bit depth of one sample of audio data. |
| Word Length | <ul style="list-style-type: none"> • 8 Bits • 16 Bits • 24 Bits • 32 Bits • 48 Bits • 64 Bits • 128 Bits • 256 Bits | 16 Bits | Select the word length of audio data. Must be at least as large as Data bits. |
| WS Continue Mode | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Enable WS continue mode to output the word select (WS) pin even when transmission is idle. |
| Bit Clock Source(available only in Master mode) | MCU Specific Options | | Select External AUDIO_CLK for external signal to AUDIO_CLK input pin or Internal AUDIO_CLK for internal connection to MCU specific GPT channel. Please refer to the hardware manual for which GPT channel is connected to the internal signal |
| Bit Clock Divider(available only in Master mode) | Refer to the RA Configuration tool for available options. | Audio Clock / 1 | Select divider used to generate bit clock from audio clock. |
| Callback | Name must be a valid C symbol | NULL | A user callback function can be provided. If this |

callback function is provided, it will be called from all three interrupt service routines (ISR).

| | |
|-------------------------------|----------------------|
| Transmit Interrupt Priority | MCU Specific Options |
| Receive Interrupt Priority | MCU Specific Options |
| Idle/Error Interrupt Priority | MCU Specific Options |

Select the transmit interrupt priority.

Select the receive interrupt priority.

Select the Idle/Error interrupt priority.

Clock Configuration

The SSI peripheral runs on PCLKB. The PCLKB frequency can be configured on the **Clocks** tab of the RA Configuration editor. The SSI audio clock can optionally be supplied from an external source through the AUDIO_CLK pin in master mode.

Pin Configuration

The SSI uses the following pins:

- AUDIO_CLK (optional, master mode only): The AUDIO_CLK pin is used to supply the audio clock from an external source.
- SSIBCKn: Bit clock pin for channel n
- SSILRCKn/SSIFSn: Channel selection pin for channel n
- SSIRXD0: Reception pin for channel 0
- SSITXD0: Transmission pin for channel 0
- SSIDATA1: Transmission or reception pin for channel 1

Usage Notes

SSI Frames

An SSI frame is 2 samples worth of data. The frame boundary (end of previous frame, start of next frame) is on the falling edge of the SSILRCKn signal.

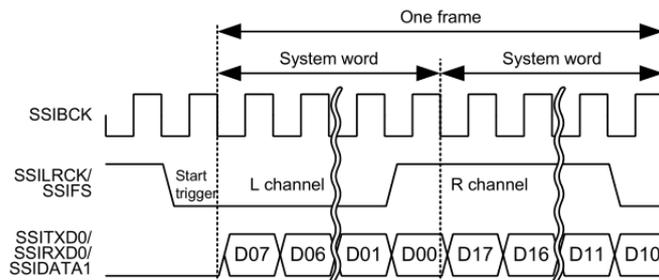

Figure 190: SSI Frame Diagram (8-bit word, 8-bit samples)

Note

If the word length is longer than the sample bit depth, padding bits (0) will be added after the sample.

Audio Data

Only uncompressed PCM data is supported.

Data arrays have the following size, alignment, and length based on the "Bit Depth" setting:

| Bit Depth | Array Data Type | Required Alignment | Required Length (bytes) |
|-----------|---------------------------------|--------------------|-------------------------|
| 8 Bits | 8-bit integer | 1 byte alignment | Multiple of 2 |
| 16 Bits | 16-bit integer | 2 byte alignment | Multiple of 4 |
| 18 Bits | 32-bit integer, right justified | 4 byte alignment | Multiple of 8 |
| 20 Bits | 32-bit integer, right justified | 4 byte alignment | Multiple of 8 |
| 22 Bits | 32-bit integer, right justified | 4 byte alignment | Multiple of 8 |
| 24 Bits | 32-bit integer, right justified | 4 byte alignment | Multiple of 8 |
| 32 Bits | 32-bit integer | 4 byte alignment | Multiple of 8 |

Note

The length of the array must be a multiple of 2 when the data type is the recommended data type. The 2 represents the frame size (left and right channel) of I2S communication. The SSIE peripheral does not support odd read/write lengths in I2S mode.

Audio Clock

The audio clock is only required for master mode.

Audio Clock Frequency

The bit clock frequency is the product of the sampling frequency and channels and bits per system word:

$$\text{bit_clock (Hz)} = \text{sampling_frequency (Hz)} * \text{channels} * \text{system_word_bits}$$

I2S data always has 2 channels.

For example, the bit clock for transmitting 2 channels of 16-bit data (using a 16-bit system word) at 44100 Hz would be:

$$44100 * 2 * 16 = 1,411,200 \text{ Hz}$$

The audio clock frequency is used to generate the bit clock frequency. It must be a multiple of the bit clock frequency. Refer to the Bit Clock Divider configuration for divider options. The input audio clock frequency must be:

$$\text{audio_clock (Hz)} = \text{desired_bit_clock (Hz)} * \text{bit_clock_divider}$$

To get a bit clock of 1.4 MHz from an audio clock of 2.8 MHz, select the divider Audio Clock / 2.

Audio Clock Source

The audio clock source can come from:

- An external source input to the AUDIO_CLK pin
- An internal connection to the GPT timer output

Note

When using the internal GPT timer output, Pin Output Support must be Enabled, and GTIOCA Output Enabled must be True.

See the SSIE section in the MCU hardware manual for information about which GPT channel may be used.

Limitations

Developers should be aware of the following limitations when using the SSI:

- When using channel 1, full duplex communication is not possible. Only transmission or reception is possible.
- SSI must go idle before changing the communication mode (between read only, write only, and full duplex)

Examples

Basic Example

This is a basic example of minimal use of the SSI in an application.

```
#define SSI_EXAMPLE_SAMPLES_TO_TRANSFER (1024)
#define SSI_EXAMPLE_TONE_FREQUENCY_HZ (800)
int16_t g_src[SSI_EXAMPLE_SAMPLES_TO_TRANSFER];
int16_t g_dest[SSI_EXAMPLE_SAMPLES_TO_TRANSFER];
void ssi_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Create a stereo sine wave. Using formula sample = sin(2 * pi * tone_frequency * t
    / sampling_frequency) */
    uint32_t freq = SSI_EXAMPLE_TONE_FREQUENCY_HZ;
    for (uint32_t t = 0; t < SSI_EXAMPLE_SAMPLES_TO_TRANSFER / 2; t += 1)
    {
        float input = (((float) (freq * t)) * (float) (M_TWOPI)) /
        SSI_EXAMPLE_AUDIO_SAMPLING_FREQUENCY_HZ;

        g_src[2 * t] = (int16_t) ((INT16_MAX * sinf(input)));
        g_src[2 * t + 1] = (int16_t) ((INT16_MAX * sinf(input)));
    }
}
```

```

/* Initialize the module. */
err = R_SSI_Open(&g_i2s_ctrl, &g_i2s_cfg);

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

/* Transfer data. */
(void) R_SSI_WriteRead(&g_i2s_ctrl,
                      (uint8_t *) &g_src[0],
                      (uint8_t *) &g_dest[0],
                      SSI_EXAMPLE_SAMPLES_TO_TRANSFER * sizeof(int16_t));
}

```

Streaming Example

This is an example of using SSI to stream audio data. This application uses a double buffer to store PCM sine wave data. It starts transmitting in the main loop, then loads the next buffer if it is ready in the callback. If the next buffer is not ready, a flag is set in the callback so the application knows to restart transmission in the main loop.

This example also checks the return code of `R_SSI_Write()` because `R_SSI_Write()` can return an error if a transmit overflow occurs before the FIFO is reloaded. If a transmit overflow occurs before the FIFO is reloaded, the SSI will be stopped in the error interrupt, and it cannot be restarted until the `I2S_EVENT_IDLE` callback is received.

```

#define SSI_STREAMING_EXAMPLE_AUDIO_SAMPLING_FREQUENCY_HZ (22050)
#define SSI_STREAMING_EXAMPLE_SAMPLES_PER_CHUNK (1024)
#define SSI_STREAMING_EXAMPLE_TONE_FREQUENCY_HZ (800)
int16_t      g_stream_src[2][SSI_EXAMPLE_SAMPLES_TO_TRANSFER];
uint32_t     g_buffer_index      = 0;
volatile bool g_send_data_in_main_loop = true;
volatile bool g_data_ready = false;

/* Example callback called when SSI is ready for more data. */
void ssi_example_callback (i2s_callback_args_t * p_args)
{
    /* Reload the FIFO if we hit the transmit watermark or restart transmission if the
    SSI is idle because it was
    * stopped after a transmit FIFO overflow. */
    if ((I2S_EVENT_TX_EMPTY == p_args->event) || (I2S_EVENT_IDLE == p_args->event))
    {

```

```
if (g_data_ready)
{
/* Reload FIFO and handle errors. */
    ssi_example_write();
}
else
{
/* Data was not ready yet, send it in the main loop. */
    g_send_data_in_main_loop = true;
}
}

/* Load the transmit FIFO and check for error conditions. */
void ssi_example_write (void)
{
/* Transfer data. This call is non-blocking. */
    fsp_err_t err = R_SSI_Write(&g_i2s_ctrl,
                                (uint8_t *) &g_stream_src[g_buffer_index][0],
                                SSI_STREAMING_EXAMPLE_SAMPLES_PER_CHUNK * sizeof
(int16_t));
    if (FSP_SUCCESS == err)
    {
/* Switch the buffer after data is sent. */
        g_buffer_index = !g_buffer_index;

◆ **R_SSI_Open()**

```
fsp_err_t R_SSI_Open ( i2s_ctrl_t *const p_ctrl, i2s_cfg_t const *const p_cfg )
```

Opens the SSI. Implements [i2s_api_t::open](#).

This function sets this clock divisor and the configurations specified in [i2s_cfg_t](#). It also opens the timer and transfer instances if they are provided.

Return values

| | |
|--------------------------------|---|
| FSP_SUCCESS | Ready for I2S communication. |
| FSP_ERR_ASSERTION | The pointer to <code>p_ctrl</code> or <code>p_cfg</code> is null. |
| FSP_ERR_ALREADY_OPEN | The control block has already been opened. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | Channel number is not available on this MCU. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::open](#)

◆ **R_SSI_Write()**

```
fsp_err_t R_SSI_Write ( i2s_ctrl_t *const p_ctrl, void const *const p_src, uint32_t const bytes )
```

Writes data buffer to SSI. Implements [i2s_api_t::write](#).

This function resets the transfer if the transfer interface is used, or writes the length of data that fits in the FIFO then stores the remaining write buffer in the control block to be written in the ISR.

`Write()` cannot be called if another `write()`, `read()` or `writeRead()` operation is in progress. `Write` can be called when the SSI is idle, or after the `I2S_EVENT_TX_EMPTY` event.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Write initiated successfully. |
| FSP_ERR_ASSERTION | The pointer to <code>p_ctrl</code> or <code>p_src</code> was null, or bytes requested was 0. |
| FSP_ERR_IN_USE | Another transfer is in progress, data was not written. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |
| FSP_ERR_UNDERFLOW | A transmit underflow error is pending. Wait for the SSI to go idle before resuming communication. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reset](#)

◆ **R_SSI_Read()**

```
fsp_err_t R_SSI_Read ( i2s_ctrl_t *const p_ctrl, void *const p_dest, uint32_t const bytes )
```

Reads data into provided buffer. Implements `i2s_api_t::read`.

This function resets the transfer if the transfer interface is used, or reads the length of data available in the FIFO then stores the remaining read buffer in the control block to be filled in the ISR.

Read() cannot be called if another write(), read() or writeRead() operation is in progress. Read can be called when the SSI is idle, or after the I2S_EVENT_RX_FULL event.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Read initiated successfully. |
| FSP_ERR_IN_USE | Peripheral is in the wrong mode or not idle. |
| FSP_ERR_ASSERTION | The pointer to p_ctrl or p_dest was null, or bytes requested was 0. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |
| FSP_ERR_OVERFLOW | A receive overflow error is pending. Wait for the SSI to go idle before resuming communication. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reset](#)

◆ **R_SSI_WriteRead()**

```
fsp_err_t R_SSI_WriteRead ( i2s_ctrl_t *const p_ctrl, void const *const p_src, void *const p_dest,
uint32_t const bytes )
```

Writes from source buffer and reads data into destination buffer. Implements [i2s_api_t::writeRead](#).

This function calls [R_SSI_Write](#) and [R_SSI_Read](#).

[writeRead\(\)](#) cannot be called if another [write\(\)](#), [read\(\)](#) or [writeRead\(\)](#) operation is in progress. [writeRead\(\)](#) can be called when the SSI is idle, or after the [I2S_EVENT_RX_FULL](#) event.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Write and read initiated successfully. |
| FSP_ERR_IN_USE | Peripheral is in the wrong mode or not idle. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |
| FSP_ERR_UNDERFLOW | A transmit underflow error is pending. Wait for the SSI to go idle before resuming communication. |
| FSP_ERR_OVERFLOW | A receive overflow error is pending. Wait for the SSI to go idle before resuming communication. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reset](#)

◆ **R_SSI_Stop()**

```
fsp_err_t R_SSI_Stop ( i2s_ctrl_t *const p_ctrl)
```

Stops SSI. Implements [i2s_api_t::stop](#).

This function disables both transmission and reception, and disables any transfer instances used.

The SSI will stop on the next frame boundary. Do not restart SSI until it is idle.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | I2S communication stop request issued. |
| FSP_ERR_ASSERTION | The pointer to p_ctrl was null. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |

Returns

See [Common Error Codes](#) or lower level drivers for other possible return codes.

◆ **R_SSI_Mute()**

```
fsp_err_t R_SSI_Mute ( i2s_ctrl_t *const p_ctrl, i2s_mute_t const mute_enable )
```

Mutes SSI on the next frame boundary. Implements `i2s_api_t::mute`.

Data is still written while mute is enabled, but the transmit line outputs zeros.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Transmission is muted. |
| FSP_ERR_ASSERTION | The pointer to <code>p_ctrl</code> was null. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |

◆ **R_SSI_StatusGet()**

```
fsp_err_t R_SSI_StatusGet ( i2s_ctrl_t *const p_ctrl, i2s_status_t *const p_status )
```

Gets SSI status and stores it in provided pointer `p_status`. Implements `i2s_api_t::statusGet`.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Information stored successfully. |
| FSP_ERR_ASSERTION | The <code>p_instance_ctrl</code> or <code>p_status</code> parameter was null. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |

◆ **R_SSI_Close()**

```
fsp_err_t R_SSI_Close ( i2s_ctrl_t *const p_ctrl)
```

Closes SSI. Implements `i2s_api_t::close`.

This function powers down the SSI and closes the lower level timer and transfer drivers if they are used.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Device closed successfully. |
| FSP_ERR_ASSERTION | The pointer to <code>p_ctrl</code> was null. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |

◆ R_SSI_CallbackSet()

```
fsp_err_t R_SSI_CallbackSet ( i2s_ctrl_t *const p_api_ctrl, void(*) (i2s_callback_args_t *) p_callback,
void const *const p_context, i2s_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [i2s_api_t::callbackSet](#)

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

```

Detailed Description

Driver for the I3C peripheral on RA MCUs. This module implements the [I3C Interface](#).

Overview

I3C is a communication protocol defined by MIPI that aims to improve on I2C by increasing the maximum transfer rate, as well as providing other features like "In-band Interrupts", "Dynamic Address Assignment", and a set of standard "Common Command Codes".

Features

- I3C Master Mode
- I3C Slave Mode
- Dynamic Address Assignment (ENTDAA/SETDASA)
- SDR Read/Write transfers
- I2C Legacy Read/Write transfers
- In-Band Interrupts (Interrupt Requests, Hot-Join Requests)
- Common Command Codes
- Clock Stalling
- Timeout Detection

Master Mode

On an I3C bus, only one device may operate in master mode at a time. The current master is responsible for initiating I2C Legacy transfers, SDR transfers, Common Command Codes, and handling IBIs (Interrupt Requests, Hot-Join Requests). In order to perform these operations, the driver has an internal device table that is used for storing configuration information for each device on the bus (See [i3c_device_table_cfg_t](#)). Each entry in the device table contains the static or dynamic address of the device, and IBI permissions for accepting or rejecting IBI requests from the device. The device table has a limited number of entries as well as one extended device entry that only contains the static or dynamic address of a device (See below).

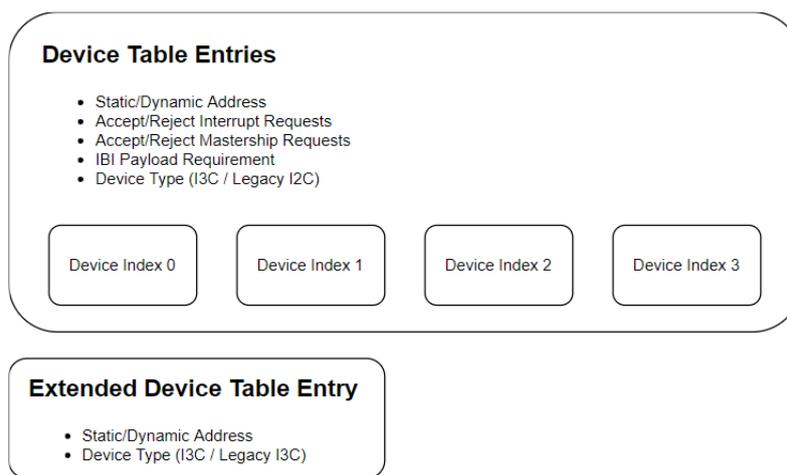

Figure 191: Master Device Table

In order to initiate I2C Legacy transfers, SDR transfers, or Common Command Codes, the master must select a device entry from the device table using `i3c_api_t::deviceSelect`. Once a device has been selected, all subsequent operations will be directed to the selected device until a new device is selected using `i3c_api_t::deviceSelect`.

The master may also receive IBI requests that are initiated by slave devices on the bus. If there is a payload, then the driver will write the data into a buffer that is provided by the application by calling `i3c_api_t::ibiRead`. If the application has not provided an IBI buffer prior to receiving an IBI, then the it will get a callback requesting an IBI buffer. Once the IBI is completed, the application will be notified by a callback.

Note

1. Even though there are only a limited number of device table entries and one extended device table entry, the application can operate on more devices by maintaining its own list of devices and updating the extended device entry as needed. Note however that devices defined in the extended device table entry will not be able to initiate IBI requests.

Main Master

The main master is responsible for configuring the dynamic address of all devices on the bus. The driver initiates this procedure by calling `i3c_api_t::dynamicAddressAssignmentStart`. Before starting address assignment, the application must configure the device table using `i3c_api_t::masterDeviceTableSet`.

Enter Dynamic Address Assignment (ENTDAA):

The application initiates the ENTDAA operation by calling `i3c_api_t::dynamicAddressAssignmentStart` with a starting index into the master device table and a count specifying the number of devices to configure. The master starts by sending the ENTDAA command. Every I3C device on the bus that has not already been initialized will acknowledge the command and attempt to write its Provisional ID, DCR, and BCR registers. The device with the smallest value in these registers will win arbitration and be assigned with the first dynamic address defined in the master device table. The master will then increment the index and repeat the process by assigning the dynamic address to the next device. The process continues until the specified number of devices have been initialized or until there are no more devices to configure.

Note

1. The IBI payload setting will automatically be updated in the master device table based on the BCR setting that was read during ENTDAAs.
2. After each device successfully writes its Provisional ID, DCR, and BCR registers, the application will get a callback that will provide the value of the registers.
3. If the starting index is set to the extended device entry, then the device count must be set to 1.
4. The main master assigns its own dynamic address with `i3c_api_t::deviceCfgSet`.

Set Dynamic Address from Static Address (SETDASA):

The application initiates the SETDASA operation by calling `i3c_api_t::dynamicAddressAssignmentStart` with an index into the master device table. The master sends the SETDASA command to the static address defined in the given device table entry, and then assigns the associated dynamic address.

Note

1. Set the count to 0 when using SETDASA.

Slave Mode

In slave mode, the device configures its static address, Provisional ID, BCR, and DCR registers using `i3c_api_t::deviceCfgSet`, and then waits for the master to initiate communication. Prior to being assigned a dynamic address, the slave will operate as an I2C device using its static address. The application will receive a callback when the master assigns it a dynamic address, after which point, the slave will operate as an I3C device until it receives the RSTDAAs command.

Depending on the capabilities defined in its BCR register, the slave may also initiate IBI Interrupt Requests, and Hot-Join Requests using `i3c_api_t::ibiWrite`

Configuration

Build Time Configurations for r_i3c

The following build time configurations are defined in `fsp_cfg/r_i3c_cfg.h`:

| Configuration | Options | Default | Description |
|--------------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Unaligned Buffer Support | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | Unaligned buffer support may be optionally disabled for improved performance. |
| Master Support | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | If only slave mode is required, disable master support to decrease code size. |
| Slave Support | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | If only master mode is required, disable slave |

support to decrease code size.

There are two different chip versions of the RA2E2 MCU (Version 1 and Version 2). Each version requires a different procedure for recovering from errors.

Error Recovery Procedure MCU Specific Options

Configurations for Connectivity > I3C (r_i3c)

This module can be added to the Stacks tab via New Stack > Connectivity > I3C (r_i3c).

| Configuration | Options | Default | Description |
|---|--|---------|---|
| Bitrate Settings | | | |
| Bitrate Settings > Standard Mode | | | |
| Bitrate Settings > Standard Mode > Open-Drain | | | |
| Logic High Period (ns) | Must be an integer greater than 0. | 167 | The Logic High period of SCL during Standard Mode Open Drain transfers. |
| Frequency | Must be an integer greater than 0. | 1000000 | The Frequency of SCL during Standard Mode Open Drain transfers. |
| Bitrate Settings > Standard Mode > Push-Pull | | | |
| Logic High Period (ns) | The Logic High Period must be greater than or equal to 24 Nanoseconds. | 167 | The Logic High period of SCL during Standard Mode Push Pull transfers. |
| Frequency | Push-Pull frequency must be greater than or equal to 10000 Hz. | 3400000 | The Frequency of SCL during Standard Mode Push-Pull transfers. |
| Bitrate Settings > Extended Mode | | | |
| Bitrate Settings > Extended Mode > Open-Drain | | | |
| Logic High Period (ns) | Must be an integer greater than 0. | 167 | The Logic High period of SCL during Extended Mode Open Drain transfers. |
| Frequency | Must be an integer greater than 0. | 1000000 | The Frequency of SCL during Extended Mode Open Drain transfers. |
| Bitrate Settings > Extended Mode > Push-Pull | | | |
| Logic High Period (ns) | The Logic High Period must be greater than | 167 | The Logic High period of SCL during Extended |

| | | | |
|------------------------------------|---|----------|---|
| | or equal to 24 Nanoseconds. | | Mode Push Pull transfers. |
| Frequency | Push-Pull frequency must be greater than or equal to 10000 Hz. | 3400000 | The Frequency of SCL during Extended Mode Push-Pull transfers. |
| Bitrate Settings > Bus Timing | | | |
| Open Drain Rising Time (ns) | Rising time must be greater than or equal to 0 nanoseconds. | 0 | The Open Drain rising time in nanoseconds. |
| Open Drain Falling Time (ns) | Falling time must be greater than or equal to 0 nanoseconds. | 0 | The Open Drain falling time in nanoseconds. |
| Push-Pull Rising Time (ns) | Rising time must be greater than or equal to 0 nanoseconds. | 0 | The Push-Pull rising time in nanoseconds. |
| Push-Pull Falling Time (ns) | Falling time must be greater than or equal to 0 nanoseconds. | 0 | The Push-Pull rising time in nanoseconds. |
| Bitrate Settings > Clock Stalling | | | |
| Address Assignment Phase | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Enable clock stalling during the Address Assignment Phase of ENTDAAs. |
| Transition Phase | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Enable clock stalling during the Transition Bit of a read transfer. |
| Parity Phase | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Enable clock stalling during the Parity Bit of a write transfer. |
| Ack Phase | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Enable clock stalling during the ACK phase of a transfer. |
| Time (us) | Must be greater than or equal to 0. | 0 | The amount of time to stall the clock during the Address Assignment Phase, Transition Phase, Parity Phase, and ACK Phase. |
| Master Mode | | | |
| ACK Hot-Join Requests | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | If enabled, the I3C instance will ACK Hot-Join Requests and notify the application. |
| Notify Rejected Hot-Join Requests. | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | If enabled, the application will get a |

| | | | |
|---|---|-----------------|---|
| Read Data Rate | <ul style="list-style-type: none"> • FSCL_MAX • 8Mhz • 6Mhz • 4Mhz • 2Mhz | 2Mhz | Set the max read data rate. |
| Clock to Data Turnaround Time | <ul style="list-style-type: none"> • 8 Nanoseconds • 9 Nanoseconds • 10 Nanoseconds • 11 Nanoseconds • 12 Nanoseconds • Greater than 12 Nanoseconds | 8 Nanoseconds | Set the clock to data turnaround time. |
| Include Max Read Turnaround Time | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Configure whether the Max Read Turnaround time will be transmitted. |
| Max Read Turnaround Time | Value must be in the range [0, 255]. | 0 | Set max read turnaround time. |
| Slave Mode > Command Response Info > GETXTIME | | | |
| Frequency Byte | Value must be in the range [0, 255]. | 0 | Set the internal oscillator frequency in increments of 0.5 Mhz. |
| Inaccuracy Byte | Value must be in the range [0, 255]. | 0 | Set the oscillator inaccuracy byte in increments of 0.5% |
| Interrupts | | | |
| Interrupt Priority | MCU Specific Options | | The interrupt priority of the RX, TX, RESPONSE, RCV_STATUS, and IBI ISRs. |
| Error and Event Interrupt Priority | MCU Specific Options | | The interrupt priority of the EEI ISR which is used to notify the application when an Internal Error, HDR Exit Pattern, or Timeout is detected. |
| Name | Name must be a valid C symbol | g_i3c0 | Module name. |
| Callback | Name must be a valid C symbol | g_i3c0_callback | A user callback function must be provided. This will be called in order to notify the application of I3C events and provide |

| | | | |
|---|--|----------|--|
| Callback Context | Name must be a valid C symbol | NULL | status information. A pointer to additional application specific information that is provided to the callback. |
| Device Type | <ul style="list-style-type: none"> • Main Master • Slave | Slave | The role that the I3C instance will take on the I3C bus. |
| Bus Free Condition Detection Time (ns) | Must be greater than or equal to 38.4 nanoseconds. | 38.4 | The minimum period occurring after a STOP and before a START. |
| Bus Available Condition Detection Time (us) | Must be greater than or equal to 1 microsecond. | 1 | The minimum period occurring after the Bus Free Condition when Slaves can initiate IBI requests. |
| Bus Idle Condition Detection Time (us) | Must be greater than or equal to 1000 microseconds. | 1000 | The minimum period occurring after the Bus Available Condition when Slaves can initiate Hot-Join requests. |
| Timeout Detection | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | If enabled, the application will get a callback if SCL is stuck at a logic high or logic low level for more than 65535 cycles of the I3C source clock. |

Clock Configuration

The following settings are used to configure the timing of SCL.

- Frequency of TCLK
- Standard Mode
 - Open Drain High Period (T_{HIGH})
 - Open Drain Frequency
 - Push-Pull High Period (T_{HIGH})
 - Push-Pull Frequency
- Extended Mode
 - Open Drain High Period (T_{HIGH})
 - Open Drain Frequency
 - Push-Pull High Period (T_{HIGH})
 - Push-Pull Frquency
- `i3c_bitrate_mode_t` (Set during `i3c_api_t::deviceSelect`)

The Standard and Extended Mode settings define two separate SCL configurations that can be selected at run-time using `i3c_api_t::deviceSelect`.

In addition to selecting between the Standard and Extended Mode settings, the base SCL period can also be multiplied using the following options:

- `I3C_BITRATE_MODE_I3C_SDR2_STDBR_X2`: Multiple the base Standard Open Drain and Push-Pull period by 2.
- `I3C_BITRATE_MODE_I3C_SDR3_EXTBR_X2`: Multiple the base Extended Open Drain and Push-Pull period by 2.
- `I3C_BITRATE_MODE_I3C_SDR4_EXTBR_X4`: Multiple the base Extended Open Drain and Push-Pull period by 4.

In order to get accurate frequency calculations, the Rising and Falling edges must be input into the calculation. These values will depend on the topology the I3C bus that will be different for every application.

Note

1. The Standard and Extended Open Drain period settings define the period to use during legacy I2C transfers (Only use the following `i3c_bitrate_mode_t` settings with I2C transfers: `I3C_BITRATE_MODE_I2C_STDBR`, `I3C_BITRATE_MODE_I2C_EXTBR`).
2. T_{HIGH} is defined in Figure 31 in the MIPI I3C Specification v1.0 and describes the Logic High period.
3. Depending on the MCU, `TCLK` is either derived from `PCLKD` or from a dedicated I3C Clock (`I3CCLK`).

Pin Configuration

The I3C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I3C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

Usage Notes

Read and Write in Slave Mode

In slave mode, calling read or write does not start a transfer. Instead, calling read or write will configure the driver to perform the next read or write transfer using the user provided buffer.

Provided that a transfer is not already in progress, `i3c_api_t::read` and `i3c_api_t::write` can be called to update the internal buffers even if the transfer has not been completed yet. Both the read and write buffers can be configured at the same time in order to prepare the driver for when the master initiates a read or a write transfer.

If there is no space remaining in a user configured read buffer, the application will get a `I3C_EVENT_READ_BUFFER_FULL` callback requesting for a new read buffer to be provided.

Event Status

When a write, read, `ibiWrite`, `ibiRead` or `commandSend`, operation is completed, the `i3c_callback_args_t::event_status` should be checked. The `event_status` will provide information about the success or failure of the operation.

The following are possible statuses:

- `I3C_EVENT_STATUS_SUCCESS`
- `I3C_EVENT_STATUS_PARITY`
- `I3C_EVENT_STATUS_FRAME`
- `I3C_EVENT_STATUS_ADDRESS_HEADER`

- [I3C_EVENT_STATUS_NACK](#)
- [I3C_EVENT_STATUS_OVERFLOW](#)
- [I3C_EVENT_STATUS_ABORTED_TO_MASTER](#)
- [I3C_EVENT_STATUS_ABORTED](#)

Note

In master mode, if the master issues a stop condition before the slave ends the transfer via the 'T' bit, the status will be [I3C_EVENT_STATUS_ABORTED](#).

In slave mode, if the master issues a stop condition before the slave ends the transfer via the 'T' bit, the status will be [I3C_EVENT_STATUS_ABORTED_TO_MASTER](#).

Direct Get Common Command Codes in Slave Mode

When an I3C slave receives a Command Code of type Direct Get, the response is automatically sent from the device Special Function Registers (SFR). The SFR contains information for each command code and can be configured during open (See [i3c_extended_cfg_t::slave_command_response_info](#)). This allows the slave to respond to Direct Get Command Codes much faster, and removes the burden of responding to these commands from the application.

The response to the GETSTATUS command can be configured at run-time using [i3c_api_t::slaveStatusSet](#).

Disabling Unaligned Buffer Support

Support for performing read and write operations on unaligned buffers can be disabled in order to improve performance. When unaligned buffer support is disabled, all buffers passed to read, `ibiRead`, write, `ibiWrite`, and `commandSend` must be aligned to 4 bytes and the size of the buffers must be a multiple of 4 bytes.

In master mode, the value of the length passed to [i3c_api_t::read](#) and [i3c_api_t::write](#) sets the total length of the operation in bytes. During the read or write operation, the driver may read or write to the last word of memory during the operation. This means that the allocated memory for the buffer passed to read and write needs to be a multiple of 4 bytes even though the transfer length is not a multiple of 4 bytes.

In slave mode, the length passed to [i3c_api_t::read](#) must be a multiple of 4 bytes. The length passed to [i3c_api_t::write](#) sets the number of bytes that the slave will write. The size of the buffer passed to write still needs to be a multiple of 4 bytes.

Max Data Speed Limitation on RA2E2 MCUs

In Slave Mode, it is highly recommended that `BCR[0]` be set to '1' in order to indicate to the master that the device doesn't support the max data speed. The master is then required to use the `GETMXDS` command to get the device specific data speed limitations.

This will allow the slave to specify its maximum supported data rate for read/write, and the maximum read turnaround time (See `GETMXDS` in the MIPI I3C Specification v1.0).

Mixed Fast Bus

The MIPI I3C Specification v1.0 defines a Mixed Fast Bus as a bus that has legacy I2C devices that all have a 50ns Spike Filter.

On Mixed Fast Buses, SCL has the following constraints during I3C SDR transfers:

- SCL High Period: $t_{DIG_H_MIXED(MIN)}$ to $t_{DIG_H_MIXED(MAX)}$
- SCL Low Period: Up to $t_{DIG_L(MAX)}$

In this case, configure the Extended Bitrate settings for I3C SDR transfers, and use the Standard Bitrate settings for I2C transfers.

Note

1. See section 5.1.2.4 in the MIPI I3C Specification v1.0.

Mixed Slow Bus

The MIPI I3C Specification v1.0 defines a Mixed Slow Bus as a bus that has legacy I2C devices that do not have a 50ns Spike Filter.

In this case, the SCL frequency is limited to I2C Fast Mode or I2C Fast Mode Plus.

Note

1. See section 5.1.2.4 in the MIPI I3C Specification v1.0.

RA2E2 MCU Version

There are two versions of the RA2E2. The version number can be identified by the part number or by reading the MCU Version Register.

| Part Number | Chip Version |
|--------------------|--------------|
| R7FA2E2A72DNK::HA0 | Version 1 |
| R7FA2E2A72DNK::HA1 | Version 2 |
| R7FA2E2A72DNK::AA0 | Version 1 |
| R7FA2E2A72DNK::AA1 | Version 2 |

The I3C peripheral on the RA2E2 Version 1 has a hardware limitation related to using dynamic address assignment in slave mode. When the ENTDA command is received, the peripheral will continue driving its PID, DCR, and BCR registers during arbitration even after its dynamic address has already been configured. This will prevent any other devices on the bus from being configured after the RA2E2 Version 1 device has been configured. One workaround for this limitation is to configure the Provisional ID to all '1's in order to ensure that the RA2E2 Version 1 device is configured last. If more than one RA2E2 Version 1 device is present on the same bus, consider initializing them using another method (Eg. SETDASA). **Note that this issue has been corrected on the RA2E2 Version 2 (Part numbers ending in #AA1 or #HA1).**

In addition to fixing this hardware limitation, the revised I3C peripheral on the RA2E2 version 2 also greatly simplifies the error recovery procedures. By default, the driver will automatically include the error recovery procedures for both versions, however, it can be configured to only support version 1 or version 2 procedures in order to reduce code size.

Limitations

Developers should be aware of the following limitations when using the I3C:

- The MIPI Reserved area and Vendor Extension area of Command Codes are not supported.
- Mixed Fast Bus topology has the following limitation on RA2E2 MCUs. The minimum SCL high period (T_{DIG_H}) is 156 nanoseconds when PCLKD is 48 Mhz, and 120 nanoseconds when

PCLKD is 64 Mhz. On a Mixed Fast Bus, the high period $T_{DIG_HIGH_MIXED}$ must be less than 45 nanoseconds in order to ensure that Legacy I2C devices do not interpret I3C signaling as valid I2C signaling (See Table 111 Push-Pull-Timing Parameters in the MIPI I3C Specification v1.1). This required high period cannot be achievable with RA2E2 MCUs.

- Secondary Master device role is not currently supported.

Examples

I3C Master Basic Example

This is a basic example of minimal use of the I3C Master in an application.

```
void i3c_master_basic_example (void)
{
    /* Initializes the module. */
    fsp_err_t status = R_I3C_Open(&g_i3c_ctrl, &g_i3c_cfg);
    assert(FSP_SUCCESS == status);

    static i3c_device_cfg_t master_device_cfg =
    {
        /* This is the Static I3C / I2C Legacy address defined by the device manufacturer.
        */
        .static_address = EXAMPLE_MASTER_STATIC_ADDRESS,
        /* If the device is a main master, it must configure its own dynamic address. */
        .dynamic_address = EXAMPLE_MASTER_DYNAMIC_ADDRESS,
    };

    status = R_I3C_DeviceCfgSet(&g_i3c_ctrl, &master_device_cfg);
    assert(FSP_SUCCESS == status);

    static i3c_device_table_cfg_t device_table_cfg =
    {
        /* This is the Static I3C / I2C Legacy address defined by the device manufacturer.
        */
        .static_address = EXAMPLE_STATIC_ADDRESS,
        /* Dynamic address is not used in I2C. */
        .dynamic_address = EXAMPLE_DYNAMIC_ADDRESS,
        /* This is the type of device. It may be either an I2C device or an I3C device. */
        .device_protocol = I3C_DEVICE_PROTOCOL_I3C,
        .ibi_accept = false,
        /* Depending on the device the IBI requests may have a data payload.
        */
    };
}
```

```
* Note that this field will be automatically updated if the device is configured
using ENTDAAs.
*/
    .ibi_payload          = false,
/* Master requests cannot be accepted because Secondary Master is not supported. */
    .master_request_accept = false,
};
/* Set the device configuration in the master device table. */
status = R_I3C_MasterDeviceTableSet(&g_i3c_ctrl, 0, &device_table_cfg);
assert(FSP_SUCCESS == status);
/* Enable the I3C device. */
status = R_I3C_Enable(&g_i3c_ctrl);
assert(FSP_SUCCESS == status);
/* Start assigning dynamic addresses to devices on the bus using the ENTDAAs command.
*/
status = R_I3C_DynamicAddressAssignmentStart(&g_i3c_ctrl,
I3C_ADDRESS_ASSIGNMENT_MODE_ENTDAAs, 0, 1);
assert(FSP_SUCCESS == status);
/* Wait for dynamic address assignment to complete. */
i3c_app_event_wait(I3C_EVENT_ADDRESS_ASSIGNMENT_COMPLETE);
/* Select the configured device and bitrate mode for the following operations. */
status = R_I3C_DeviceSelect(&g_i3c_ctrl, 0, I3C_BITRATE_MODE_I3C_SDR0_STDBR);
assert(FSP_SUCCESS == status);
/* Start a write transfer. */
static uint8_t p_write_buffer[] = {1, 2, 3, 4, 5};
status = R_I3C_Write(&g_i3c_ctrl, p_write_buffer, sizeof(p_write_buffer), false);
assert(FSP_SUCCESS == status);
/* Wait for the write transfer to complete. */
i3c_app_event_wait(I3C_EVENT_WRITE_COMPLETE);
/* Start a read transfer. */
static uint8_t p_read_buffer[16];
status = R_I3C_Read(&g_i3c_ctrl, p_read_buffer, sizeof(p_read_buffer), false);
assert(FSP_SUCCESS == status);
/* Wait for the read transfer to complete. */
```

```
    i3c_app_event_wait(I3C_EVENT_READ_COMPLETE);
}

/* This function is called by the I3C driver from ISRs in order to notify the
application of I3C events. */
void i3c_master_basic_example_callback (i3c_callback_args_t const * const p_args)
{
    switch (p_args->event)
    {
        case I3C_EVENT_ENTDAA_ADDRESS_PHASE:
            {
                /* The device PID, DCR, and BCR registers will be available in
i3c_callback_args_t::p_slave_info. */
                break;
            }
        case I3C_EVENT_ADDRESS_ASSIGNMENT_COMPLETE:
            {
                i3c_app_event_notify(I3C_EVENT_ADDRESS_ASSIGNMENT_COMPLETE);
                break;
            }
        case I3C_EVENT_WRITE_COMPLETE:
            {

}
```

I3C Slave In-band Interrupts Example

This is a basic example of writing In-band Interrupts in I3C Slave mode.

```
void i3c_slave_ibi_write_basic_example (void)  
{  
    uint8_t ibi_write_buffer[EXAMPLE_WRITE_BUFFER_SIZE] = {0};  
    /* Initiate an In-band interrupt in slave mode.  
    * Note: If the slave does not have an IBI payload or if it is a Hot-Join request,  
the write buffer should be set  
    * to NULL and the write length should be set to 0. */  
    fsp_err_t status = R_I3C_IbiWrite(&g_i3c_ctrl, I3C_IBI_TYPE_INTERRUPT,  
ibi_write_buffer, sizeof(ibi_write_buffer));  
    assert(FSP_SUCCESS == status);  
    /* Wait for the ibiWrite transfer to complete. */  
    i3c_app_event_wait(I3C_EVENT_IBI_WRITE_COMPLETE);  
}  
void i3c_slave_ibi_write_basic_example_callback (i3c_callback_args_t const * const  
p_args)  
{  
    switch (p_args->event)  
    {  
    case I3C_EVENT_IBI_WRITE_COMPLETE:  
    {  
        /* Notify the application that the IBI write is complete. */  
        i3c_app_event_notify(I3C_EVENT_IBI_WRITE_COMPLETE);  
        break;  
    }  
    }  
}
```

```
    }  
default:  
    {  
break;  
    }  
    }  
}
```

I3C Master Common Command Codes Example

This is a basic example of sending Common Command Codes in I3C Master mode.

```
void i3c_master_ccc_example (void)  
{  
    static uint8_t command_buffer[EXAMPLE_READ_BUFFER_SIZE];  
    /* Setup the command descriptor. */  
    static i3c_command_descriptor_t command_descriptor =  
        {  
            .command_code = I3C_CCC_DIRECT_GETSTATUS,  
            /* Set a buffer for storing the data read by the command. */  
            .p_buffer     = command_buffer,  
            /* The length for a GETSTATUS command is 2 bytes. */  
            .length       = 2,  
            /* Terminate the transfer with a STOP condition. */  
            .restart      = false,  
            /* The GETSTATUS command is a Direct Get Command so rnw should be true. */  
            .rnw          = true,  
        };

    fsp_err_t status = R_I3C_CommandSend(&g_i3c_ctrl, &command_descriptor);  
    assert(FSP_SUCCESS == status);  
    /* Wait for the command to complete. */  
    i3c_app_event_wait(I3C_EVENT_COMMAND_COMPLETE);  
    /* The command_buffer will have the status info that was read from the slave device.  
*/
```

```
}  
  
void i3c_master_ccc_example_callback (i3c_callback_args_t const * const p_args)  
{  
    switch (p_args->event)  
    {  
        case I3C_EVENT_COMMAND_COMPLETE:  
            {  
                /* Notify the application that the command is complete. */  
                i3c_app_event_notify(I3C_EVENT_COMMAND_COMPLETE);  
            }  
            break;  
        default:  
            {  
                break;  
            }  
    }  
}
```

I3C Slave Common Command Codes Example

This is a basic example of receiving Common Command Codes in I3C Slave mode.

```
void i3c_slave_ccc_example (void)  
{  
    static uint8_t read_buffer[EXAMPLE_READ_BUFFER_SIZE];  
    /* Broadcast and Direct Set commands will be read into the read_buffer the same way  
that  
    * a normal SDR Master Write / Slave Read transfer is read. */  
    fsp_err_t status = R_I3C_Read(&g_i3c_ctrl, read_buffer, sizeof(read_buffer), false);  
    assert(FSP_SUCCESS == status);  
    /* Wait for the command to complete. */  
    i3c_app_event_wait(I3C_EVENT_COMMAND_COMPLETE);  
}  
  
void i3c_slave_ccc_example_callback (i3c_callback_args_t const * const p_args)  
{
```

```
switch (p_args->event)
{
case I3C_EVENT_COMMAND_COMPLETE:
{
/* The command code and transfer size will be available in p_args.
* If the command code is a Broadcast or Direct Set, then data will
* be stored in the read buffer provided by i3c_api_t::read.
* If the command code is a Direct Get, then the data will be automatically
* sent from device SFR. */
i3c_app_event_notify(I3C_EVENT_COMMAND_COMPLETE);
break;
}
default:
{
break;
}
}
}
```

Macros

#define [I3C_ERROR_RECOVERY_VERSION_1](#)
Support error recovery procedure for chip version 1. [More...](#)

#define [I3C_ERROR_RECOVERY_VERSION_2](#)
Support error recovery procedure for chip version 2.

```
#define I3C_ERROR_RECOVERY_VERSION_BOTH
```

Support error recovery procedure for chip version 1 and version 2.

```
#define I3C_DEVICE_INDEX_EXTENDED_DEVICE
```

```
#define I3C_EVENT_STATUS_SUCCESS
```

The transfer was completed as expected. [More...](#)

```
#define I3C_EVENT_STATUS_PARITY
```

A parity error was detected.

```
#define I3C_EVENT_STATUS_FRAME
```

A frame error was detected.

```
#define I3C_EVENT_STATUS_ADDRESS_HEADER
```

An Address Header error was detected.

```
#define I3C_EVENT_STATUS_NACK
```

The transfer was NACK'd.

```
#define I3C_EVENT_STATUS_OVERFLOW
```

A Receive FIFO overflow or Transmit FIFO underflow occurred.

```
#define I3C_EVENT_STATUS_ABORTED_TO_MASTER
```

In slave mode, the write transfer was ended via the 'T' bit.

```
#define I3C_EVENT_STATUS_ABORTED
```

In master mode, the transfer was aborted.

```
#define I3C_EVENT_STATUS_IBI_NACK_DISABLED
```

An IBI was NACK'd and the a DISEC command was sent.

Data Structure Documentation

◆ [i3c_clock_stalling_t](#)

| struct i3c_clock_stalling_t | | |
|---|----------------------------------|--|
| Clock stalling settings. | | |
| Data Fields | | |
| uint32_t | assigned_address_phase_enable: 1 | Enable Clock Stalling during the address phase of the ENTDAAC command. |
| uint32_t | transition_phase_enable: 1 | Enable Clock Stalling during the transition bit in read transfers. |
| uint32_t | parity_phase_enable: 1 | Enable Clock Stalling during the parity bit period in write transfers. |
| uint32_t | ack_phase_enable: 1 | Enable Clock Stalling during the ACK/NACK phase. |
| uint16_t | clock_stalling_time | The amount of time to stall the clock in I3C source clock ticks. |

◆ [i3c_bitrate_settings_t](#)

| struct i3c_bitrate_settings_t | | |
|---|----------------|---|
| Bitrate settings for configuring the SCL clock frequency. | | |
| Data Fields | | |
| uint32_t | stdbr | The standard bitrate settings. |
| uint32_t | extbr | The extended bitrate settings. |
| i3c_clock_stalling_t | clock_stalling | Clock Stalling settings (See Master Clock Stalling in the MIPI I3C Specification v1.0). |

◆ [i3c_ibi_control_t](#)

| struct i3c_ibi_control_t | | |
|--|-------------------------|---------------------------------------|
| Settings for controlling the drivers behavior in response to IBIs. | | |
| Data Fields | | |
| uint32_t | hot_join_acknowledge: 1 | If false, NACK all Hot Join requests. |

| | | |
|----------|--|--|
| uint32_t | notify_rejected_hot_join_requests: 1 | Notify the application when an IBI Hot-Join request has been NACK'd. |
| uint32_t | notify_rejected_mastership_requests: 1 | Notify the application when an IBI Mastership request has been NACK'd. |
| uint32_t | notify_rejected_interrupt_requests: 1 | Notify the application when an IBI Interrupt request has been NACK'd. |

◆ i3c_slave_command_response_info_t

| struct i3c_slave_command_response_info_t | | |
|---|-----------------------------|---|
| Default configuration settings for the slave response to Direct Get Common Command Codes. | | |
| Data Fields | | |
| bool | inband_interrupt_enable | Enable IBI interrupts. Slave Event Settings (See ENEC and DISEC in the MIPI I3C Specification v1.0). |
| bool | mastership_request_enable | Enable Mastership requests. |
| bool | hotjoin_request_enable | Enable Hot-Join requests. |
| i3c_activity_state_t | activity_state | Starting Activity State (See ENTASn in the MIPI I3C Specification v1.0). |
| uint16_t | write_length | Max Write Length (See SETMWL and GETMWL in the MIPI I3C Specification v1.0). |
| uint16_t | read_length | Max Read Length (See SETMRL and GETMRL in the MIPI I3C Specification v1.0). |
| uint8_t | ibi_payload_length | Number of bytes that will be written by an IBI (See SETMRL and GETMRL in the MIPI I3C Specification v1.0). |
| i3c_data_rate_setting_t | write_data_rate | Max Write Data Rate. Max Data Rate Settings (See GETMXDS in the MIPI I3C Specification v1.0). |
| i3c_data_rate_setting_t | read_data_rate | Max Read Data Rate. |
| i3c_clock_data_turnaround_t | clock_data_turnaround | Max Data Speed Turnaround. |
| bool | read_turnaround_time_enable | Enable transmission of the of the Max Read Max Read Turnaround Time. |

| | | |
|----------|-----------------------|---|
| uint32_t | read_turnaround_time | Max Read Turnaround Time. |
| uint8_t | oscillator_frequency | This byte represents the Slave's internal oscillator frequency in increments of 0.5 MHz (500kHz), up to 127.5 MHz. (See GETXTIME in the MIPI I3C Specification v1.1). |
| uint8_t | oscillator_inaccuracy | Oscillator inaccuracy in 0.5% increments of 0% up to 25.5% (See GETXTIME in the MIPI I3C Specification v1.1). |

◆ i3c_instance_ctrl_t

| | |
|---|---|
| struct i3c_instance_ctrl_t | |
| Channel control block. DO NOT INITIALIZE. Initialization occurs when i3c_api_t::open is called. | |
| Public Member Functions | |
| i3c_slave_info_t current_slave_info | BSP_ALIGN_VARIABLE (4) The last i3c_slave_info_t read during ENTDAAs. |
| Data Fields | |
| uint32_t | open Indicates whether the open() API has been successfully called. |
| R_I3C0_Type * | p_reg Base register for this channel. |
| volatile uint32_t | internal_state Used to track the current state of the driver. |
| uint8_t | current_command_code The current Common Command Code that is being transferred. |
| uint32_t | device_index The device index selected using i3c_api_t::deviceSelect . |

| | |
|---|--|
| | |
| i3c_bitrate_mode_t | device_bitrate_mode |
| | Runtime bitrate settings to use for the next transfer. |
| | |
| uint32_t | next_word |
| | The next word that will be written to the FIFO. |
| | |
| uint32_t | ibi_next_word |
| | The next word that will be written to the IBI FIFO. |
| | |
| i3c_write_buffer_descriptor_t | write_buffer_descriptor |
| | Buffer descriptor for keeping track of a write transfer. |
| | |
| i3c_read_buffer_descriptor_t | read_buffer_descriptor |
| | Buffer descriptor for keeping track of a read transfer. |
| | |
| i3c_read_buffer_descriptor_t | ibi_buffer_descriptor |
| | Buffer descriptor for keeping track of an IBI read/write transfer. |
| | |
| volatile uint32_t | read_transfer_count_final |
| | The total number of bytes read during a read transfer. |
| | |
| volatile uint32_t | ibi_transfer_count_final |
| | The total number of bytes read during an IBI transfer. |
| | |
| i3c_cfg_t const * | p_cfg |
| | A pointer to the configuration structure provided during open. |
| | |

◆ **i3c_extended_cfg_t**

| struct i3c_extended_cfg_t | | |
|---|------------------------------|---|
| Extended configuration for r_i3c. | | |
| Data Fields | | |
| i3c_bitrate_settings_t | bitrate_settings | Bitrate settings configuring the frequency and duty cycle for SCL. |
| i3c_ibi_control_t | ibi_control | Configure the driver's behavior in response to IBIs. |
| uint32_t | bus_free_detection_time | The time in I3C reference clock ticks needed in order to detect the bus free condition (See "Bus Free Condition" in the MIPI I3C Specification v1.0). |
| uint32_t | bus_available_detection_time | The time in I3C reference clock ticks needed in order to detect the bus available condition (See "Bus Available Condition" in the MIPI I3C Specification v1.0). |
| uint32_t | bus_idle_detection_time | The time in I3C reference clock ticks needed in order to detect the bus idle condition (See "Bus Idle Condition" in the MIPI I3C Specification v1.0). |
| bool | timeout_detection_enable | Notify the application if SCL is stuck high or low. |
| i3c_slave_command_response_info_t | slave_command_response_info | Initial settings for configuring the slave's responses to received commands. |
| IRQn_Type | resp_irq | Response Queue Full IRQ number. |
| IRQn_Type | rx_irq | Receive FIFO Full IRQ number. |
| IRQn_Type | tx_irq | Transmit FIFO Empty IRQ number. |
| IRQn_Type | rcv_irq | Receive Status Queue Full IRQ number. |
| IRQn_Type | ibi_irq | IBI IRQ number. |
| IRQn_Type | eei_irq | EI IRQ number. |
| uint8_t | ipl | Interrupt Priority for Resp, Rx, Tx, and RCV IRQs. |
| uint8_t | eei_ipl | Error and Event Interrupt |

| | |
|--|-----------|
| | Priority. |
|--|-----------|

Macro Definition Documentation

◆ I3C_ERROR_RECOVERY_VERSION_1

```
#define I3C_ERROR_RECOVERY_VERSION_1
```

Support error recovery procedure for chip version 1.

There are two different versions of the RA2E2 MCU and the error recovery procedure is different for each version.

◆ I3C_DEVICE_INDEX_EXTENDED_DEVICE

```
#define I3C_DEVICE_INDEX_EXTENDED_DEVICE
```

Index for selecting the device defined in the extended address table.

◆ I3C_EVENT_STATUS_SUCCESS

```
#define I3C_EVENT_STATUS_SUCCESS
```

The transfer was completed as expected.

Event Status Provided by the callback.

Enumeration Type Documentation

◆ **i3c_bitrate_mode_t**

| enum i3c_bitrate_mode_t | |
|--|---|
| Bitrate settings that can be selected at run-time using <code>i3c_api_t::deviceSelect</code> . | |
| Enumerator | |
| I3C_BITRATE_MODE_I2C_STDBR | Use the period settings defined in STDBRH/L. |
| I3C_BITRATE_MODE_I2C_EXTBR | Use the period settings defined in EXTBRH/L. |
| I3C_BITRATE_MODE_I3C_SDR0_STDBR | Use the period settings defined in STDBRH/L (I3C Devices only). |
| I3C_BITRATE_MODE_I3C_SDR1_EXTBR | Use the period settings defined in EXTBRH/L (I3C Devices only). |
| I3C_BITRATE_MODE_I3C_SDR2_STDBR_X2 | Use the period settings defined in STDBRH/L x 2 (I3C Devices only). |
| I3C_BITRATE_MODE_I3C_SDR3_EXTBR_X2 | Use the period settings defined in EXTBRH/L x 2 (I3C Devices only). |
| I3C_BITRATE_MODE_I3C_SDR4_EXTBR_X4 | Use the period settings defined in EXTBRH/L x 4 (I3C Devices only). |

◆ **i3c_activity_state_t**

| enum i3c_activity_state_t | |
|---|---------------------------------------|
| Supported activity states for ENTASn Command (See ENTASn in the MIPI I3C Specification v1.0). | |
| Enumerator | |
| I3C_ACTIVITY_STATE_ENTAS0 | Activity Interval (1 microsecond). |
| I3C_ACTIVITY_STATE_ENTAS1 | Activity Interval (100 microseconds). |
| I3C_ACTIVITY_STATE_ENTAS2 | Activity Interval (2 milliseconds). |
| I3C_ACTIVITY_STATE_ENTAS3 | Activity Interval (50 milliseconds). |

◆ **i3c_data_rate_setting_t**

| enum i3c_data_rate_setting_t | |
|--|---------------------------------------|
| Maximum Sustained Data Rate for non-CCC messages sent by Master Device to Slave Device (See GETMXDS in the MIPI I3C Specification v1.0). | |
| Enumerator | |
| I3C_DATA_RATE_SETTING_FSCL_MAX | There is no data rate limit. |
| I3C_DATA_RATE_SETTING_8MHZ | The max sustained data rate is 8 Mhz. |
| I3C_DATA_RATE_SETTING_6MHZ | The max sustained data rate is 6 Mhz. |
| I3C_DATA_RATE_SETTING_4MHZ | The max sustained data rate is 4 Mhz. |
| I3C_DATA_RATE_SETTING_2MHZ | The max sustained data rate is 2 Mhz. |

◆ **i3c_clock_data_turnaround_t**

| enum i3c_clock_data_turnaround_t | |
|---|--|
| Clock to Data Turnaround Time (See GETMXDS in the MIPI I3C Specification v1.0). | |
| Enumerator | |
| I3C_CLOCK_DATA_TURNAROUND_8NS | Clock to turnaround time is 8 nanoseconds or less. |
| I3C_CLOCK_DATA_TURNAROUND_9NS | Clock to turnaround time is 9 nanoseconds or less. |
| I3C_CLOCK_DATA_TURNAROUND_10NS | Clock to turnaround time is 10 nanoseconds or less. |
| I3C_CLOCK_DATA_TURNAROUND_11NS | Clock to turnaround time is 11 nanoseconds or less. |
| I3C_CLOCK_DATA_TURNAROUND_12NS | Clock to turnaround time is 12 nanoseconds or less. |
| I3C_CLOCK_DATA_TURNAROUND_EXTENDED | Clock to turnaround time is greater than 12 nanoseconds. |

Function Documentation

◆ **R_I3C_Open()**

```
fsp_err_t R_I3C_Open ( i3c_ctrl_t *const p_api_ctrl, i3c_cfg_t const *const p_cfg )
```

Configure an I3C instance. Implements `i3c_api_t::open`.

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An argument was invalid. |
| FSP_ERR_ALREADY_OPEN | Open has already been called for this instance. |
| FSP_ERR_UNSUPPORTED | A selected feature is not supported with the current configuration. |

◆ **R_I3C_Enable()**

```
fsp_err_t R_I3C_Enable ( i3c_ctrl_t *const p_api_ctrl)
```

Enable the I3C device.

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An argument was NULL. |
| FSP_ERR_NOT_OPEN | This instance has not been opened yet. |
| FSP_ERR_INVALID_MODE | This instance is already enabled. |

◆ **R_I3C_DeviceCfgSet()**

```
fsp_err_t R_I3C_DeviceCfgSet ( i3c_ctrl_t *const p_api_ctrl, i3c_device_cfg_t const *const p_device_cfg )
```

Set the configuration for this device.

Return values

| | |
|---------------------|--|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An argument was NULL. |
| FSP_ERR_NOT_OPEN | This instance has not been opened yet. |
| FSP_ERR_UNSUPPORTED | The device cannot be a secondary master if master support is disabled. |

◆ **R_I3C_MasterDeviceTableSet()**

```
fsp_err_t R_I3C_MasterDeviceTableSet ( i3c_ctrl_t *const p_api_ctrl, uint32_t device_index,
i3c_device_table_cfg_t const *const p_device_table_cfg )
```

Configure an entry in the master device table. This function is called in master mode in order to configure the devices on the I3C bus. It may also be called in slave mode when the slave receives the DEFSVLS command.

Return values

| | |
|---------------------|--|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An argument was NULL. |
| FSP_ERR_NOT_OPEN | This instance has not been opened yet. |
| FSP_ERR_UNSUPPORTED | Mastership requests must be rejected is slave support is disabled. |

◆ **R_I3C_SlaveStatusSet()**

```
fsp_err_t R_I3C_SlaveStatusSet ( i3c_ctrl_t *const p_api_ctrl, i3c_device_status_t status )
```

Set the status returned to the master in response to a GETSTATUS command.

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An argument was NULL. |
| FSP_ERR_NOT_OPEN | This instance has not been opened yet. |
| FSP_ERR_INVALID_MODE | The instance is not in slave mode. |
| FSP_ERR_UNSUPPORTED | Slave support is disabled. |

◆ **R_I3C_DeviceSelect()**

```
fsp_err_t R_I3C_DeviceSelect ( i3c_ctrl_t *const p_api_ctrl, uint32_t device_index, uint32_t
bitrate_mode )
```

In master mode, select the device for the next transfer. This function is not used in slave mode.

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An argument was NULL. |
| FSP_ERR_NOT_OPEN | This instance has not been opened yet. |
| FSP_ERR_INVALID_MODE | This operation is prohibited in slave mode. |
| FSP_ERR_UNSUPPORTED | Master support is disabled. |

◆ **R_I3C_DynamicAddressAssignmentStart()**

```
fsp_err_t R_I3C_DynamicAddressAssignmentStart ( i3c_ctrl_t *const p_api_ctrl,
i3c_address_assignment_mode_t address_assignment_mode, uint32_t starting_device_index,
uint32_t device_count )
```

Start the Dynamic Address Assignment Process. Implements [i3c_api_t::dynamicAddressAssignmentStart](#).

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An argument was NULL or invalid. |
| FSP_ERR_NOT_OPEN | This instance has not been opened yet. |
| FSP_ERR_INVALID_MODE | This operation is prohibited in slave mode. |
| FSP_ERR_IN_USE | The operation could not be completed because the driver is busy. |
| FSP_ERR_UNSUPPORTED | Master support is disabled. |

◆ **R_I3C_CommandSend()**

```
fsp_err_t R_I3C_CommandSend ( i3c_ctrl_t *const p_api_ctrl, i3c_command_descriptor_t *
p_command_descriptor )
```

Send a broadcast or direct command to slave devices on the bus. Implements `i3c_api_t::commandSend`.

Return values

| | |
|---------------------------|---|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An argument was NULL. |
| FSP_ERR_NOT_OPEN | This instance has not been opened yet. |
| FSP_ERR_IN_USE | The operation could not be completed because the driver is busy. |
| FSP_ERR_INVALID_MODE | This driver is not in master mode. |
| FSP_ERR_INVALID_ALIGNMENT | The buffer must be aligned to 4 bytes. If it is a read operation, the length also be a multiple of 4 bytes. |
| FSP_ERR_UNSUPPORTED | Master support must be enabled to call this function. Slave support must be enabled when sending the GETACCMST command. |

◆ **R_I3C_Write()**

```
fsp_err_t R_I3C_Write ( i3c_ctrl_t *const p_api_ctrl, uint8_t const *const p_data, uint32_t length,
bool restart )
```

Set the write buffer for the transfer. In master mode, start the transfer. When the transfer is completed send a stop condition or a repeated-start. Implements `i3c_api_t::write`.

Return values

| | |
|---------------------------|--|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An argument was NULL. |
| FSP_ERR_NOT_OPEN | This instance has not been opened yet. |
| FSP_ERR_IN_USE | The operation could not be completed because the driver is busy. |
| FSP_ERR_INVALID_MODE | This driver is disabled. |
| FSP_ERR_INVALID_ALIGNMENT | The buffer must be aligned to 4 bytes. |

◆ **R_I3C_Read()**

```
fsp_err_t R_I3C_Read ( i3c_ctrl_t *const p_api_ctrl, uint8_t *const p_data, uint32_t length, bool restart )
```

Set the read buffer for the transfer. In master mode, start the transfer. When the transfer is completed send a stop condition or a repeated-start. Implements `i3c_api_t::read`.

Return values

| | |
|---------------------------|---|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An argument was NULL. |
| FSP_ERR_NOT_OPEN | This instance has not been opened yet. |
| FSP_ERR_IN_USE | The operation could not be completed because the driver is busy. |
| FSP_ERR_INVALID_MODE | This driver is disabled. |
| FSP_ERR_INVALID_ALIGNMENT | The buffer must be aligned to 4 bytes and the length must be a multiple of 4 bytes. |

◆ **R_I3C_IbiWrite()**

```
fsp_err_t R_I3C_IbiWrite ( i3c_ctrl_t *const p_api_ctrl, i3c_ibi_type_t ibi_type, uint8_t const *const p_data, uint32_t length )
```

Initiate an IBI write operation (This function is only used in slave mode).

Return values

| | |
|---------------------------|--|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An argument was NULL. |
| FSP_ERR_NOT_OPEN | This instance has not been opened yet. |
| FSP_ERR_IN_USE | The operation could not be completed because the driver is busy. |
| FSP_ERR_INVALID_MODE | This function is only called in slave mode. |
| FSP_ERR_INVALID_ALIGNMENT | The buffer must be aligned to 4 bytes. |
| FSP_ERR_UNSUPPORTED | Slave support is disabled. |

◆ **R_I3C_IbiRead()**

```
fsp_err_t R_I3C_IbiRead ( i3c_ctrl_t *const p_api_ctrl, uint8_t *const p_data, uint32_t length )
```

Set the read buffer for storing received IBI data (This function is only used in master mode).

Return values

| | |
|---------------------------|---|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An argument was NULL. |
| FSP_ERR_NOT_OPEN | This instance has not been opened yet. |
| FSP_ERR_INVALID_MODE | This function is only called in master mode. |
| FSP_ERR_INVALID_ALIGNMENT | The buffer must be aligned to 4 bytes and the length must be a multiple of 4 bytes. |
| FSP_ERR_UNSUPPORTED | Master support is disabled. |

◆ **R_I3C_Close()**

```
fsp_err_t R_I3C_Close ( i3c_ctrl_t *const p_api_ctrl)
```

Close the I3C instance. Implements `i3c_api_t::close`.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An argument was NULL. |
| FSP_ERR_NOT_OPEN | This instance has not been opened yet. |

Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the [LIN Interface](#).

Overview

The Simple LIN on SCI_B HAL module supports Local Interface Network (LIN) transactions in master or slave mode. A callback must be provided, and is invoked when a transmission, reception, or other event has completed or occurred. The callback arguments contain information about the transaction status, bytes transferred and a pointer to the user defined context.

Features

- Half-duplex master or slave mode LIN communication
- Interrupt-driven data transmission and reception
- Generation of the sync (0x55) and Protected Identifier fields when in master mode
- Validation of the Protected Identifier field when in slave mode
- ID filtering support in slave mode
- Optional checksum generation/validation using classic or enhanced LIN checksum
- Invoking the user-callback function with an event code (RX/TX complete, error, etc)
- Auto synchronization is supported in slave mode
- Adjustable break field length
- Adjustable break field delimiter/stop bits length
- Noise cancellation
- Abort in-progress read/write operations
- Error notifications of parity error in protected identifier, framing error, overrun error, bus collision, and counter overflow error (counter overflow error applies in slave mode only)
- Operation clock selection (PCLK or SCISPI/SCICLK)
- Configuration of all available SCI_B channels with Simple LIN mode support

Configuration

Build Time Configurations for r_sci_b_lin

The following build time configurations are defined in fsp_cfg/r_sci_b_lin_cfg.h:

| Configuration | Options | Default | Description |
|------------------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Checksum Support | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | When set to 'Disabled', code for checksum generation and validation is excluded from the build. This setting is applied globally to the project. Disable only when checksum generation and validation is not required for any LIN instance. |
| Auto Synchronization Support | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | When set to 'Disabled', code for auto synchronization is excluded from the build. This setting is applied globally to the project. Enable when at least one LIN slave instance is using auto synchronization. |

Configurations for Connectivity > LIN (r_sci_b_lin)

This module can be added to the Stacks tab via New Stack > Connectivity > LIN (r_sci_b_lin). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---------------|---|---------|--|
| General | | | |

| Transmit End Interrupt Priority | MCU Specific Options | | Select the transmit end interrupt priority. |
| Error Interrupt Priority | MCU Specific Options | | Select the error interrupt priority. |
| Break Field Detection Interrupt Priority | MCU Specific Options | | Select the break field detection interrupt priority (slave mode only). |
| Active Edge Detection Interrupt Priority | MCU Specific Options | | Select the active edge detection interrupt priority. |

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

| MCU Group | Peripheral Clock |
|-----------|------------------|
| RA6T2 | SCISPICK |
| RA8D1 | SCICK |
| RA8M1 | SCICK |
| RA8T1 | SCICK |

The clock source for the baud-rate clock generator can be selected from either SCISCP/SCICK or the peripheral clock (PCLK).

Note

1. See Figure 26.2 "Clock source selector block diagram" in the RA6T2 manual for more information.

Pin Configuration

This module uses TXD and RXD to communicate to external devices. Connect TXD and RXD to an on-board or external LIN transceiver for LIN bus communication.

An external pull up resistor is required on TXD in both master and slave mode.

Interrupt Configuration

- Receive buffer full (RXI), transmit buffer empty (TXI), transmit end (TEI), and error (ERI) interrupts for the selected channel used must be enabled in the properties of the selected device for both master and slave mode operation.
- Break field detect (BFD) must be enabled in the properties of the selected device for slave mode only.

Break Field Length/Detection Threshold Configuration

- When in master mode, this setting configures the low (dominant) time of the LIN break pattern.
- When in slave mode, this setting configures the break field detection threshold (number of bits that must be received to detect a break field).
- When configuring this setting in slave mode, take care to set the detection threshold less than the master break field length.
- The standard settings are 13 bits for master nodes and 11 bits for slave nodes, but alternate settings are supported.

Bus Conflict Detection Configuration

When Bus Conflict Detection is enabled, the TXDn pin output and the RXDn pin input are sampled by the selected bus conflict detection clock. When a mismatch occurs three times in a row, an SCIn_ERI interrupt is generated and transmission is stopped. This function only works during transmission.

Consideration of the specific application's LIN bus characteristics should be taken into account when enabling this function. If the bus collision sampling clock is too fast, the expected propagation delay through the transceiver may be erroneously detected as a bus collision (false positive). If the bus collision sampling clock is too slow, collisions may be missed (false negative).

When CCR2.ABCS = 1, setting the bus conflict clock divider to 4 is prohibited by the SCI_B

hardware.

A LIN transceiver is required to detect bus collisions.

ID Filter Configuration

The SCI performs optional hardware PID filtering in slave mode. When enabled, only start frames with PIDs that pass through the filter are received and passed to the user callback. Other start frames are ignored.

An initial configuration of the filter settings can be applied in the properties view by selecting Framing -> ID Filter and choosing the desired settings. See [sci_b_lin_id_filter_setting_t](#) for the available filter settings, as well as the examples in this document. By default, filtering is disabled and all PIDs can be received.

The filter can be updated at runtime by using [R_SCI_B_LIN_IdFilterSet](#). The current filter settings can be viewed with [R_SCI_B_LIN_IdFilterGet](#).

Usage Notes

LIN Transmission and Reception

SCI data reception is disabled until a break field is detected (slave mode) or a call to [R_SCI_B_LIN_InformationFrameRead\(\)](#) is made (master and slave mode).

Slave Mode Transmission and Reception

The start frame is detected in slave mode only. Start frame reception is interrupt driven, and is enabled after a successful call to [R_SCI_B_LIN_Open\(\)](#) in slave mode.

When the LIN break field is detected by the slave node, start frame reception begins without action from the application. When start frame reception completes, the user callback is called.

If the slave node needs to receive the information frame data, the slave node must call [R_SCI_B_LIN_InformationFrameRead\(\)](#) before the first information data is received in order to receive the data. The user callback is called when reception is complete. It is permitted to call [R_SCI_B_LIN_InformationFrameRead\(\)](#) from the callback context.

If the slave node needs to publish a response to the start frame, the slave node must call [R_SCI_B_LIN_InformationFrameWrite\(\)](#) and provide the response data and the PID of the received header in the [lin_transfer_params_t](#). The user callback is called when transmission is complete.

If the slave node neither needs to receive the information frame data, nor publish a response for a received start frame, no action is required to ignore the frame. Data reception is disabled until a new break field is detected.

Master Mode Transmission and Reception

The start frame is not detected in master mode. Information frame reception is enabled only after a call to [R_SCI_B_LIN_InformationFrameRead\(\)](#).

The start frame is transmitted by calling [R_SCI_B_LIN_StartFrameWrite\(\)](#). The user callback is called when transmission is complete.

If the master node needs to receive the information frame data response, call `R_SCI_B_LIN_InformationFrameRead()` after start frame transmission has completed and before the first information frame data is received. It is permitted to call `R_SCI_B_LIN_InformationFrameRead()` from the callback context.

If the master node needs to publish a response to its own start frame, the master node must call `R_SCI_B_LIN_InformationFrameWrite()` only after start frame transmission has completed, and provide the response data and the PID of the transmitted header in the `lin_transfer_params_t`. The user callback is called when transmission is complete.

Timeouts/Errors

The application is responsible for managing timeouts in case `R_SCI_B_LIN_InformationFrameRead()` is called, but the data is not received in the expected time period. If a timeout occurs, `R_SCI_B_LIN_CommunicationAbort()` may be called to cancel a pending read.

When an error occurs, reception is stopped and the user callback is called with the relevant error code.

Checksum Generation and Validation

- The checksum calculation is performed in software for both checksum generation and validation.
- Checksum generation and validation are both optional.
- The LIN checksum may be generated by passing `lin_transfer_params_t::LIN_CHECKSUM_TYPE_CLASSIC` or `lin_transfer_params_t::LIN_CHECKSUM_TYPE_ENHANCED` when writing the information frame data.
- The LIN checksum may be validated by passing `lin_transfer_params_t::LIN_CHECKSUM_TYPE_CLASSIC` or `lin_transfer_params_t::LIN_CHECKSUM_TYPE_ENHANCED` when reading the information frame data.
- To skip driver checksum generation/validation, pass `lin_transfer_params_t::LIN_CHECKSUM_TYPE_NONE` to the read/write functions. Instead the checksum can be included as part of the information data buffer, or omitted entirely depending on the application's needs.
- The maximum number of information frame bytes that can be transmitted per frame is 255, including the checksum byte. Thus, when checksum generation/validation is requested in the transfer parameters, the maximum number of bytes that can be specified in `transfer_params.num_bytes` is 254. When checksum generation/validation is not requested in the transfer parameters, the maximum number of bytes that can be specified in `transfer_params.num_bytes` is 255.

Auto Synchronization

Auto synchronization is optional. When it is disabled, the baud rate and break field detection threshold set in open are never updated.

This feature works in slave mode only.

- Auto synchronization is not the same as automatic baud rate detection. Auto synchronization is used for correcting small clock drift/difference in baud rate between nodes.
- Auto synchronization performs small automatic baud rate adjustments to synchronize with the master's clock by measuring the effective edges of the input signal from the RXDn pin

during reception of the LIN sync byte.

- The sync byte is measured and the baud setting and break field detection threshold are re-adjusted for every LIN sync byte received.
- If reception of the sync byte fails, or the required register settings detected would not be possible in the hardware, the baud/timer settings are not updated, and auto synchronization will be re-attempted on the next received start frame.

Limitations

- DTC/DMAC is not supported
- Automatic baud rate detection is not supported
- The SCI_B provides an interface to the LIN Physical layer and does not implement the LIN Transport Layer or LIN Application Layer. The application is responsible for handling the frame scheduling table and monitoring for Transport Layer timeouts.

Examples

Basic LIN Master Read Example

The following demonstrates a basic example of frame reception for a LIN master.

```
void r_sci_b_lin_basic_master_read_example (void)
{
    /* Open the LIN instance with initial configuration. */
    fsp_err_t err = R_SCI_B_LIN_Open(&g_master_ctrl, &g_master_cfg);
    assert(FSP_SUCCESS == err);
    /* Send the LIN start frame */
    err = R_SCI_B_LIN_StartFrameWrite(&g_master_ctrl, FRAME_ID);
    assert(FSP_SUCCESS == err);
    /* Wait for start frame transmission to complete before starting a read of the
response */
    while (!g_start_frame_tx_complete)
    {
    }
    lin_transfer_params_t read_params =
    {
        .checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
        .id             = FRAME_ID,
        .num_bytes     = TRANSFER_LENGTH,
        .p_information = g_rx_buf
    };
    /* Begin reception of the information frame data */
}
```

```
err = R_SCI_B_LIN_InformationFrameRead(&g_master_ctrl, &read_params);
assert(FSP_SUCCESS == err);

/* Wait for information frame reception to complete. The application is responsible
for
* timing out if data is not received within the expected time interval*/
while (!g_information_frame_rx_complete)
{
}

/* Close the driver */
err = R_SCI_B_LIN_Close(&g_slave_ctrl);
assert(FSP_SUCCESS == err);
}

void master_callback (lin_callback_args_t * p_args)
{
/* Handle the LIN event */
switch (p_args->event)
{
case LIN_EVENT_RX_INFORMATION_FRAME_COMPLETE:
{
g_information_frame_rx_complete = 1;
break;
}
case LIN_EVENT_TX_START_FRAME_COMPLETE:
{
g_start_frame_tx_complete = 1;
break;
}
case LIN_EVENT_TX_INFORMATION_FRAME_COMPLETE:
{
g_information_frame_tx_complete = 1;
break;
}
case LIN_EVENT_ERR_INVALID_CHECKSUM:
case LIN_EVENT_ERR_BUS_COLLISION_DETECTED:
```

```
case LIN_EVENT_ERR_FRAMING:
case LIN_EVENT_ERR_COUNTER_OVERFLOW:
case LIN_EVENT_ERR_OVERRUN:
case LIN_EVENT_ERR_PARITY:
default:
    {
/* Handle error */
    }
}
}
```

Basic LIN Master Write Example

The following demonstrates a basic example of frame transmission for a LIN master.

```
void r_sci_b_lin_basic_master_write_example (void)
{
/* Initialize transmit buffer to known data. */
for (uint8_t i = 0; i < TRANSFER_LENGTH; i++)
    {
        g_tx_buf[i] = (uint8_t) ('A' + (i % 26));
    }

/* Open the LIN instance with initial configuration. */
fsp_err_t err = R_SCI_B_LIN_Open(&g_master_ctrl, &g_master_cfg);
assert(FSP_SUCCESS == err);

/* Send the LIN start frame: break, sync, and protected identifier */
err = R_SCI_B_LIN_StartFrameWrite(&g_master_ctrl, FRAME_ID);
assert(FSP_SUCCESS == err);

/* Wait for start frame transmission to complete before sending the information
frame */
while (!g_start_frame_tx_complete)
    {
    }

lin_transfer_params_t write_params =
    {
```

```
.checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
.id            = FRAME_ID,
.num_bytes    = TRANSFER_LENGTH,
.p_information = g_tx_buf
};

/* Send the LIN information frame */
err = R_SCI_B_LIN_InformationFrameWrite(&g_master_ctrl, &write_params);
assert(FSP_SUCCESS == err);

/* Wait for information frame transmission to complete */
while (!g_information_frame_tx_complete)
{
}

/* Close the driver */
err = R_SCI_B_LIN_Close(&g_master_ctrl);
assert(FSP_SUCCESS == err);
}
```

Basic LIN Slave Example

The following demonstrates a basic example of start frame reception and information frame response for a LIN slave.

```
void r_sci_b_lin_basic_slave_example (void)
{
    /* Initialize transmit buffer to known data */
    for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
        g_tx_buf[i] = (uint8_t) ('A' + (i % 26));
    }

    /* Open the LIN instance with initial configuration. */
    fsp_err_t err = R_SCI_B_LIN_Open(&g_slave_ctrl, &g_slave_cfg);
    assert(FSP_SUCCESS == err);

    /* Wait for the header that this slave publishes the response to. */
    for ( ; ; )
    {
```

```
if (g_start_frame_rx_complete)
{
if (g_received_pid == FRAME_ID)
{
/* Frame ID of interest received */
break;
}
/* Ignore this header. No action required by slave. */
g_start_frame_rx_complete = false;
}
}

lin_transfer_params_t write_params =
{
.checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
.id           = g_received_pid,
.num_bytes    = TRANSFER_LENGTH,
.p_information = g_tx_buf
};

/* Send the LIN information frame response */
err = R_SCI_B_LIN_InformationFrameWrite(&g_slave_ctrl, &write_params);
assert(FSP_SUCCESS == err);

/* Wait for the response transmission to complete */
while (!g_information_frame_tx_complete)
{
}

/* Close the driver */
err = R_SCI_B_LIN_Close(&g_slave_ctrl);
assert(FSP_SUCCESS == err);
}

void slave_callback (lin_callback_args_t * p_args)
{
/* Handle the LIN event */
switch (p_args->event)
{

```

```
case LIN_EVENT_RX_START_FRAME_COMPLETE :
{
    g_start_frame_rx_complete = 1;
    g_received_pid           = p_args->pid;
break;
}
case LIN_EVENT_RX_INFORMATION_FRAME_COMPLETE :
{
    g_information_frame_rx_complete = 1;
break;
}
case LIN_EVENT_TX_INFORMATION_FRAME_COMPLETE :
{
    g_information_frame_tx_complete = 1;
break;
}
default:
{
    /* Handle error */
}
}
```

Basic LIN Slave ID Filtering Example

The following example demonstrates a basic example of frame ID filtering.

```
#define BASIC_FILTER_MASK (0x30)
#define BASIC_PRIORITY_FILTER_DATA (0x20)
#define BASIC_SECONDARY_FILTER_DATA (0x00) // Don't-care value in this example
#define BASIC_PRIORITY_INTERRUPT_BIT (0) // Don't-care value in this example
void r_sci_b_lin_basic_id_filtering_example (void)
{
    /* Open the LIN instance with initial configuration. */
    fsp_err_t err = R_SCI_B_LIN_Open(&g_slave_ctrl, &g_slave_cfg);
```

```
    assert(FSP_SUCCESS == err);

/* If the application is using dynamically assigned identifiers, perform
 * any required initial communications to get the identifiers for this slave */
/* Configure filter to accept only frame IDs in the range 0x20-0x2F.
 *
 * The start frame is received only when the PID bits match the bits
 * specified by the filter.
 *
 * Example: If ID 0x24 is received (PID 0x64), the filter mask (0x30) is applied
 * first (0x64 & 0x30 = 0x20) and then the result is compared to the priority
 * compare data filter (0x20). Since the result matches the filter, the start
 * frame is received and the user callback is called. Otherwise, the SCI awaits
 * the next break field, and the callback is not called.
 *
 * Note: The most significant 2 bits of the PID are the parity bits, and are
 * masked off by the filter mask in this example.
 */
sci_b_lin_id_filter_setting_t filter =
{
    .compare_data_mask           = BASIC_FILTER_MASK,
    .priority_compare_data      = BASIC_PRIORITY_FILTER_DATA,
    .secondary_compare_data     = BASIC_SECONDARY_FILTER_DATA,
    .priority_interrupt_bit_select = BASIC_PRIORITY_INTERRUPT_BIT,
    .priority_interrupt_enable   = SCI_B_LIN_PRIORITY_INTERRUPT_BIT_DISABLE,
    .compare_data_select        = SCI_B_LIN_COMPARE_DATA_SELECT_PRIORITY,
};

/* Configure the ID filter */
err = R_SCI_B_LIN_IdFilterSet(&g_slave_ctrl, &filter);
assert(FSP_SUCCESS == err);

/* Wait for a header frame which matches the filter */
while (!g_start_frame_rx_complete)
{
}

lin_transfer_params_t write_params =
```

```
{
    .checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
    .id            = g_received_pid,
    .num_bytes     = TRANSFER_LENGTH,
    .p_information = g_tx_buf
};

/* Send the LIN information frame response */
err = R_SCI_B_LIN_InformationFrameWrite(&g_slave_ctrl, &write_params);
assert(FSP_SUCCESS == err);

/* Wait for the response transmission to complete */
while (!g_information_frame_tx_complete)
{
}

/* Close the driver */
err = R_SCI_B_LIN_Close(&g_slave_ctrl);
assert(FSP_SUCCESS == err);
}
```

Advanced LIN Slave ID Filtering Example

The following example demonstrates an advanced example of frame ID filtering.

```
#define ADVANCED_FILTER_MASK (0x3E)
#define ADVANCED_PRIORITY_FILTER_DATA (0x20)
#define ADVANCED_SECONDARY_FILTER_DATA (0x08)
#define ADVANCED_PRIORITY_INTERRUPT_BIT (5)

void r_sci_b_lin_advanced_id_filtering_example (void)
{
    /* Open the LIN instance with initial configuration. */
    fsp_err_t err = R_SCI_B_LIN_Open(&g_slave_ctrl, &g_slave_cfg);
    assert(FSP_SUCCESS == err);

    /* If the application is using dynamically assigned identifiers, perform
     * any required initial communications to get the identifiers for this slave */
    /* Configure filter to accept the following frame IDs:
     *
     */
}
```

```
* - Any ID in which bit 5 is set to 1 (0x20-0x3F).
* - IDs 0x08 and 0x09
*
* The priority compare data filter is set to 0x20 (bit 5 set).
* The priority interrupt bit select function is enabled for bit 5.
*
* The secondary compare data filter is be set to 0x08. This will allow
* both 0x08 and 0x09 through the filter, even though bit 5 is not set for
* those values (0x08 & 0x3E = 0x08 and 0x09 & 0x3E = 0x08). All other
* identifiers are filtered out.
*/
sci_b_lin_id_filter_setting_t filter =
{
    .compare_data_mask           = ADVANCED_FILTER_MASK,
    .priority_compare_data      = ADVANCED_PRIORITY_FILTER_DATA,
    .secondary_compare_data     = ADVANCED_SECONDARY_FILTER_DATA,
    .priority_interrupt_bit_select = ADVANCED_PRIORITY_INTERRUPT_BIT,
    .priority_interrupt_enable  = SCI_B_LIN_PRIORITY_INTERRUPT_BIT_ENABLE,
    .compare_data_select        = SCI_B_LIN_COMPARE_DATA_SELECT_BOTH,
};
/* Configure the ID filter */
err = R_SCI_B_LIN_IdFilterSet(&g_slave_ctrl, &filter);
assert(FSP_SUCCESS == err);
/* Wait for a header frame which matches the filter */
while (!g_start_frame_rx_complete)
{
}
lin_transfer_params_t write_params =
{
    .checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
    .id            = g_received_pid,
    .num_bytes     = TRANSFER_LENGTH,
    .p_information = g_tx_buf
};
```

```
/* Send the LIN information frame response */
err = R_SCI_B_LIN_InformationFrameWrite(&g_slave_ctrl, &write_params);
assert(FSP_SUCCESS == err);

/* Wait for the response transmission to complete */
while (!g_information_frame_tx_complete)
{
}

/* Close the driver */
err = R_SCI_B_LIN_Close(&g_slave_ctrl);
assert(FSP_SUCCESS == err);
}
```

Enumeration Type Documentation

◆ sci_b_lin_priority_interrupt_bit_t

| | |
|---|-------------------------------------|
| enum <code>sci_b_lin_priority_interrupt_bit_t</code> | |
| Priority interrupt bit options for ID filtering. | |
| Enumerator | |
| <code>SCI_B_LIN_PRIORITY_INTERRUPT_BIT_DISABLE</code> | Disable the priority interrupt bit. |
| <code>SCI_B_LIN_PRIORITY_INTERRUPT_BIT_ENABLE</code> | Enable the priority interrupt bit. |

◆ sci_b_lin_compare_data_select_t

| | |
|--|--|
| enum <code>sci_b_lin_compare_data_select_t</code> | |
| Compare Data Select options for ID filtering. | |
| Enumerator | |
| <code>SCI_B_LIN_COMPARE_DATA_SELECT_PRIORITY</code> | Select the priority/primary compare data filter as the compare data. |
| <code>SCI_B_LIN_COMPARE_DATA_SELECT_SECONDARY</code> | Select the secondary compare data filter as the compare data. |
| <code>SCI_B_LIN_COMPARE_DATA_SELECT_BOTH</code> | Select both the priority/primary compare data filter and the secondary compare data filter as the compare data. The priority filter will be checked first. |

◆ sci_b_lin_clock_source_t

| | |
|---|----------------------|
| enum <code>sci_b_lin_clock_source_t</code> | |
| Source clock selection options for SCI. | |
| Enumerator | |
| <code>SCI_B_LIN_CLOCK_SOURCE_SCISPICLK</code> | SCISPI clock source. |
| <code>SCI_B_LIN_CLOCK_SOURCE_SCICLK</code> | SCI clock source. |
| <code>SCI_B_LIN_CLOCK_SOURCE_PCLK</code> | PCLK source. |

◆ **sci_b_lin_break_delimiter_bits_t**

| | |
|--|---------------------------------------|
| enum <code>sci_b_lin_break_delimiter_bits_t</code> | |
| Break field delimiter configuration. | |
| Enumerator | |
| <code>SCI_B_LIN_BREAK_DELIMITER_BITS_1</code> | 1-bit recessive break field delimiter |
| <code>SCI_B_LIN_BREAK_DELIMITER_BITS_2</code> | 2-bit recessive break field delimiter |

◆ **sci_b_lin_timer_divider_t**

| | |
|---|---------------------------------|
| enum <code>sci_b_lin_timer_divider_t</code> | |
| LIN timer configuration, used for break field generation and detection. | |
| Enumerator | |
| <code>SCI_B_LIN_TIMER_DIV_4</code> | LIN timer frequency is TCLK/4. |
| <code>SCI_B_LIN_TIMER_DIV_16</code> | LIN timer frequency is TCLK/16. |
| <code>SCI_B_LIN_TIMER_DIV_64</code> | LIN timer frequency is TCLK/64. |

◆ **sci_b_lin_synchronization_t**

| | |
|---|--|
| enum <code>sci_b_lin_synchronization_t</code> | |
| Auto synchronization setting. | |
| Enumerator | |
| <code>SCI_B_LIN_AUTO_SYNCHRONIZATION_DISABLE</code> | Disable auto synchronization during sync byte reception. |
| <code>SCI_B_LIN_AUTO_SYNCHRONIZATION_ENABLE</code> | Enable auto synchronization during sync byte reception. |

◆ sci_b_lin_noise_cancellation_t

| | |
|--------------------------------------|-----------------------------|
| enum sci_b_lin_noise_cancellation_t | |
| Noise cancellation configuration. | |
| Enumerator | |
| SCI_B_LIN_NOISE_CANCELLATION_DISABLE | Disable noise cancellation. |
| SCI_B_LIN_NOISE_CANCELLATION_ENABLE | Enable noise cancellation. |

◆ e_sci_b_lin_bus_conflict_detection_t

| | |
|---|---------------------------------|
| enum e_sci_b_lin_bus_conflict_detection_t | |
| Bus conflict detection enable. | |
| Enumerator | |
| SCI_B_LIN_BUS_CONFLICT_DETECTION_DISABLE | Disable bus conflict detection. |
| SCI_B_LIN_BUS_CONFLICT_DETECTION_ENABLE | Enable bus conflict detection. |

◆ sci_b_lin_bus_conflict_clock_t

| | |
|---|--|
| enum sci_b_lin_bus_conflict_clock_t | |
| Bus conflict detection clock selection. Base clock: 1/16 period of 1 bit period when CCR2.ABCS = 0, 1/8 period of 1 bit period when CCR2.ABCS = 1 | |
| Enumerator | |
| SCI_B_LIN_BUS_CONFLICT_DETECTION_BASE_CLOCK_DIV_1 | Bus conflict detection clock is base clock. |
| SCI_B_LIN_BUS_CONFLICT_DETECTION_BASE_CLOCK_DIV_2 | Bus conflict detection clock is base clock/2. |
| SCI_B_LIN_BUS_CONFLICT_DETECTION_BASE_CLOCK_DIV_4 | Bus conflict detection clock is base clock/4. Setting prohibited when CCR2.ABCS = 1. |

Function Documentation

◆ **R_SCI_B_LIN_Open()**

```
fsp_err_t R_SCI_B_LIN_Open ( lin_ctrl_t *const p_api_ctrl, lin_cfg_t const *const p_cfg )
```

Configures the LIN driver channel based on the input configuration.

Implements `lin_api_t::open`.

Example:

```
/* Open the LIN instance with initial configuration. */
fsp_err_t err = R_SCI_B_LIN_Open(&g_master_ctrl, &g_master_cfg);
```

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Pointer to LIN control block or configuration structure is NULL. |
| FSP_ERR_INVALID_CHANNEL | The requested channel does not exist on this MCU or the channel does not support Simple LIN mode. |
| FSP_ERR_INVALID_ARGUMENT | Break field length setting or timer divisor is invalid. |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened or channel is being used by another instance. Call <code>close()</code> then <code>open()</code> to reconfigure. |
| FSP_ERR_INVALID_MODE | Setting not supported for selected mode |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ **R_SCI_B_LIN_StartFrameWrite()**

```
fsp_err_t R_SCI_B_LIN_StartFrameWrite ( lin_ctrl_t *const p_api_ctrl, uint8_t const id )
```

Begins non-blocking transmission of a LIN start frame (break, sync and protected identifier).

On successful start frame transmission, the callback is called with event `lin_event_t::LIN_EVENT_TX_START_FRAME_COMPLETE`.

Implements `lin_api_t::startFrameWrite`.

Example:

```
/* Send the LIN start frame: break, sync, and protected identifier */
err = R_SCI_B_LIN_StartFrameWrite(&g_master_ctrl, FRAME_ID);
```

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Start frame transmission started successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_ARGUMENT | ID out of range (unprotected ID must be less than 64) |
| FSP_ERR_INVALID_MODE | Function called by slave node (not supported for slave nodes) |
| FSP_ERR_IN_USE | A transmission or reception is currently in progress. Call <code>R_SCI_B_LIN_CommunicationAbort</code> to cancel it if desired, or wait for the current transfer operation to complete before starting a new one. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ **R_SCI_B_LIN_InformationFrameWrite()**

```
fsp_err_t R_SCI_B_LIN_InformationFrameWrite ( lin_ctrl_t *const p_api_ctrl, const
lin_transfer_params_t *const p_transfer_params )
```

Begins non-blocking transmission of a LIN information frame.

On successful information frame reception, the callback is called with event `lin_event_t::LIN_EVENT_TX_INFORMATION_FRAME_COMPLETE`.

Implements `lin_api_t::informationFrameWrite`.

Example:

```
/* Send the LIN information frame */
err = R_SCI_B_LIN_InformationFrameWrite(&g_master_ctrl, &write_params);
```

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Data transmission started successfully. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ASSERTION | Pointer to LIN control block, transfer parameters, or tx/rx buffer is NULL, or 0 bytes length provided |
| FSP_ERR_IN_USE | A transmission or reception is currently in progress. Call <code>R_SCI_B_LIN_CommunicationAbort</code> to cancel it if desired, or wait for the current transfer operation to complete before starting a new one. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ R_SCI_B_LIN_InformationFrameRead()

```
fsp_err_t R_SCI_B_LIN_InformationFrameRead ( lin_ctrl_t *const p_api_ctrl, lin_transfer_params_t
*const p_transfer_params )
```

Begins non-blocking information frame reception to receive user specified number of bytes into destination buffer pointer.

The checksum type specifies the checksum type used for validation. If a non-standard algorithm is used, or the application prefers to validate the checksum outside the driver, or the application prefers to skip checksum validation, specify `lin_checksum_type_t::LIN_CHECKSUM_TYPE_NONE`. If checksum validation is skipped, the `lin_checksum_type_t::LIN_EVENT_ERR_INVALID_CHECKSUM` event is not possible. When `lin_checksum_type_t::LIN_CHECKSUM_TYPE_NONE` is used, the number of bytes specified in the receive buffer length will be received (the driver will not expect to receive an additional 1 checksum byte), so if a non-standard checksum is used, sufficient space must be allocated in the write buffer and accounted for in the provided length.

On successful information frame reception, the callback is called with event `lin_event_t::LIN_EVENT_RX_INFORMATION_FRAME_COMPLETE`.

Implements `lin_api_t::informationFrameRead`.

Example:

```
/* Begin reception of the information frame data */
err = R_SCI_B_LIN_InformationFrameRead(&g_master_ctrl, &read_params);
```

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Data reception started successfully. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ASSERTION | Pointer to LIN control block, transfer parameters, or tx/rx buffer is NULL, or 0 bytes length provided |
| FSP_ERR_IN_USE | A transmission or reception is currently in progress. Call <code>R_SCI_B_LIN_CommunicationAbort</code> to cancel it if desired, or wait for the current transfer operation to complete before starting a new one. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ **R_SCI_B_LIN_CommunicationAbort()**

```
fsp_err_t R_SCI_B_LIN_CommunicationAbort ( lin_ctrl_t *const p_api_ctrl)
```

Cancels in progress information frame read or write, or start frame read or write. Break field reception cannot be cancelled. For slave nodes, reception of a new start frame reception is still enabled after a call to this function.

Implements [lin_api_t::communicationAbort](#).

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Data transfer aborted successfully or no transfer was in progress. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ASSERTION | Pointer to LIN control block is NULL. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ **R_SCI_B_LIN_CallbackSet()**

```
fsp_err_t R_SCI_B_LIN_CallbackSet ( lin_ctrl_t *const p_api_ctrl, void(*)(lin_callback_args_t *)
p_callback, void const *const p_context, lin_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure.

Implements [lin_api_t::callbackSet](#).

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | Pointer to LIN control block or callback is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ R_SCI_B_LIN_BaudCalculate()

```
fsp_err_t R_SCI_B_LIN_BaudCalculate ( sci_b_lin_baud_params_t const *const p_baud_params,
sci_b_lin_baud_setting_t *const p_baud_setting )
```

Calculates baud rate and LIN timer (BFLW and TCSS) register settings. This function evaluates and determines the most accurate settings for the baud rate and timer related registers.

The LIN timer setting is used for break field transmission/detection. Because the timer setting is specified in terms of bits, and the duration of a bit varies depending on baud rate, the baud rate register settings and timer register settings are related. The smallest possible LIN timer divider which can achieve the desired break field bits setting at the configured baud rate is selected to provide the highest measurement accuracy.

The baud rate cannot be updated at runtime with this function. This function is provided to ease configuration of the initial baud settings.

Parameters

| | | |
|-------|----------------|--|
| [in] | p_baud_params | Parameters required to calculate the baud rate |
| [out] | p_baud_setting | If calculation succeeds, contains computed values to achieve requested baud rate. If calculation fails, the input structure is not modified. |

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Register settings updated in provided p_baud_setting |
| FSP_ERR_ASSERTION | p_baud_setting was NULL |
| FSP_ERR_INVALID_ARGUMENT | Cannot achieve combination of break field bits and baudrate with provided settings or p_baud_params->baudrate was 0 or p_baud_params->break_bits was 0 |

◆ **R_SCI_B_LIN_IdFilterSet()**

```
fsp_err_t R_SCI_B_LIN_IdFilterSet ( lin_ctrl_t *const p_api_ctrl, sci_b_lin_id_filter_setting_t const
*const p_config )
```

Set the the ID filter settings for filtering control field 1 (PID byte).

NOTE: Setting the ID filter will abort any in-progress LIN start frame reception, as the ID filter settings cannot be changed during reception of the start frame. The next start frame will be received with the new settings.

```
/* Configure the ID filter */
```

```
err = R_SCI_B_LIN_IdFilterSet(&g_slave_ctrl, &filter);
```

Parameters

| | | |
|------|------------|-----------------------------------|
| [in] | p_api_ctrl | Pointer to the LIN control block. |
| [in] | p_config | The ID filter settings to apply |

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | ID filter updated successfully. |
| FSP_ERR_ASSERTION | Pointer to LIN control block or p_config is NULL. |
| FSP_ERR_INVALID_MODE | Function called by master node (not supported for master nodes) |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ **R_SCI_B_LIN_IdFilterGet()**

```
fsp_err_t R_SCI_B_LIN_IdFilterGet ( lin_ctrl_t *const p_api_ctrl, sci_b_lin_id_filter_setting_t *const p_config )
```

Returns the currently configured ID filter settings.

Parameters

| | | |
|-------|------------|-----------------------------------|
| [in] | p_api_ctrl | Pointer to the LIN control block. |
| [out] | p_config | The current ID filter settings |

Return values

| | |
|----------------------|---|
| FSP_SUCCESS | ID filter updated successfully. |
| FSP_ERR_ASSERTION | Pointer to LIN control block or p_config is NULL. |
| FSP_ERR_INVALID_MODE | Function called by master node (not supported for master nodes) |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ **R_SCI_B_LIN_Close()**

```
fsp_err_t R_SCI_B_LIN_Close ( lin_ctrl_t *const p_api_ctrl)
```

Closes the LIN driver.

Implements [lin_api_t::close](#).

Example:

```
/* Close the driver */
err = R_SCI_B_LIN_Close(&g_master_ctrl);
```

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | Pointer to LIN control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the [SMCI Interface](#).

Overview

Features

The SCI SMCI module supports the following features:

- Abort in-progress read/write operations
- Interrupt-driven data transmission and reception

- Invoking the user-callback function with an event code (RX/TX complete, RX char, error, etc)
- Transfer mode (normal and block) and data convention type change at run time.
- All channels with SMCI support shall be configurable by the driver
- Baud-rate (and ETU) calculation and change based on ISO7816 asynchronous parameters at run-time. ETU is 1/ baud.
- Error notifications of parity error, error signal reception (guard time) and overrun.
- Clock output control

Configuration

Build Time Configurations for r_sci_smci

The following build time configurations are defined in fsp_cfg/r_sci_smci_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

| MCU Group | Peripheral Clock |
|-----------|------------------|
| RA2A1 | PCLKB |
| RA2A2 | PCLKB |
| RA2E1 | PCLKB |
| RA2E2 | PCLKB |
| RA2E3 | PCLKB |
| RA2L1 | PCLKB |
| RA4E1 | PCLKA |
| RA4E2 | PCLKA |
| RA4M1 | PCLKA |
| RA4M2 | PCLKA |
| RA4M3 | PCLKA |
| RA4T1 | PCLKA |
| RA4W1 | PCLKA |
| RA6E1 | PCLKA |
| RA6E2 | PCLKA |
| RA6M1 | PCLKA |
| RA6M2 | PCLKA |

| | |
|-------|-------|
| RA6M3 | PCLKA |
| RA6M4 | PCLKA |
| RA6M5 | PCLKA |
| RA6T1 | PCLKA |
| RA6T3 | PCLKA |

The clock source for the baud-rate clock generator is the PCLK. It is scaled by the SMR_SMCI.CKS bits to achieve the requested baud rate. This is done in R_SCI_SMCI_BaudSet routine.

Pin Configuration

This module uses TXDx and RXDx to communicate to external devices. TXDx and RXDx need to be tied together and pulled up to VCC externally via a pullup resistor and connected to the DATA line of a connected card.

The SmartCard clock signal is generated by the SMCI module on the SCKx pin. The clock frequency produced by the module is $(\text{baudrate} * F) / D$. The ISO specification defines the valid maximum frequency range as 4MHz to 20MHz; only certain combinations of Fi, Di and f(max) are allowed.

When writing the application for the driver, the application developer must also allocate a software controlled Reset line via a GPIO. This will allow the reliable receipt of the ATR message. Optionally, VCC and VPP can also be controlled by a GPIO output, so that cold starts can be forced.

Usage Notes

The SMCI module is compliant to ISO7816-3. SMCI is a half duplex interface. Direct convention in T0 mode is the default. The driver supports both direct and indirect (inverted) modes of transmission. It also supports GSM mode in which the output clock can be enabled and disabled while the interface is still active. If it is known that the device connected is a device in inverse convention, the convention can be changed with `smci_api_t::transferModeSet()` after calling open.

The MCU creates the clock for the attached SMCI device based on the initial baudrate setting. Upon reset the SmartCard device advertises the Di and Fi parameters as well as the max clock speed it can handle. The Di and Fi parameters dictate at what rate the SmartCard device can sample the data line as a function of the supplied clock generated by the RA MCU. Only certain combinations of D and F are supported by the SMCI on SCI module. Only combinations where the ratio of $S=F/D$ corresponds to a value of S of 32, 64, 93, 128, 186, 256, 372, or 512 (for example see Table 27-9 RA4M2 Group User's Manual R01UH0892EJ0110 or the relevant section for the MCU being used).

The baud rate (1/ETU) can be changed while the device is open to allow for speed negotiation based on the attached device's capabilities.

The SMCI module does not contain a FIFO, and as such the receipt of multi-byte data has to be handled by interrupt initiated callback. The application developer must develop their callback so that the receipt of data is handled sufficiently without receiver overrun. If the read routine is called with a length=0, every receive interrupt will initiate a call to the user's callback. If the read is called with a non-zero length... the interrupt will fill the user's read buffer and initiate the callback after the last byte is complete. In many cases, the user can send an event from their callback so that the reading routine can wait for the event with a timeout. If a timeout occurs, the user can return the read state machine to an idle state by calling the read routine with a length of 0.

Limitations

Examples

SCI SMCI Example

```
uint8_t g_dest[TRANSFER_LENGTH];
uint8_t g_src[TRANSFER_LENGTH];
uint8_t g_out_of_band_received[TRANSFER_LENGTH];
uint32_t g_transfer_complete = 0;
uint32_t g_receive_complete = 0;
uint32_t g_out_of_band_index = 0;
void r_sci_smci_basic_example (void)
{
    /* Initialize g_src to known data */
    for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
        g_src[i] = (uint8_t) ('A' + (i % 26));
    }

    /* Open the smci instance with initial configuration. */
    fsp_err_t err = R_SCI_SMCI_Open(&g_smci0_ctrl, &g_smci0_cfg);
    assert(FSP_SUCCESS == err);

    /* Need to have clock on inorder to receive or transmit*/
    R_SCI_SMCI_ClockControl(&g_smci0_ctrl, true);

    err = R_SCI_SMCI_Read(&g_smci0_ctrl, g_dest, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);

    err = R_SCI_SMCI_Write(&g_smci0_ctrl, g_src, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);

    while (!g_transfer_complete)
    {
    }

    while (!g_receive_complete)
    {
    }
}

void user_smci_callback (smci_callback_args_t * p_args)
{

```

```
/* Handle the SMCI event */
switch (p_args->event)
{
/* Received a character */
case SMCI_EVENT_RX_CHAR:
{
/* Only put the next character in the receive buffer if there is space for it */
if (sizeof(g_out_of_band_received) > g_out_of_band_index)
{
/* Write either the next one or two bytes depending on the receive data size */
g_out_of_band_received[g_out_of_band_index++] = p_args->data;
}
break;
}
/* Receive complete */
case SMCI_EVENT_RX_COMPLETE:
{
g_receive_complete = 1;
break;
}
/* Transmit complete */
case SMCI_EVENT_TX_COMPLETE:
{
g_transfer_complete = 1;
break;
}
default:
{
}
}
}
```

SCI SMCI Baud Set Example

```
#define SCI_SMCI_BAUDRATE_28800 (28800)
```

```
#define SCI_SMCI_BAUDRATE_ERROR_PERCENT_5 (5000)
void r_sci_smci_baud_example (void)
{
    smci_speed_params_t speed_settings;
    smci_baud_setting_t baud_setting;

    speed_settings.baudrate = SCI_SMCI_BAUDRATE_28800;
    speed_settings.fi       = SMCI_CLOCK_CONVERSION_INTEGER_512_5;
    speed_settings.di       = SMCI_BAUDRATE_ADJUSTMENT_INTEGER_4;

    fsp_err_t err = R_SCI_SMCI_BaudCalculate(&speed_settings,
SCI_SMCI_BAUDRATE_ERROR_PERCENT_5, &baud_setting);

    assert(FSP_SUCCESS == err);
    err = R_SCI_SMCI_BaudSet(&g_smci0_ctrl, (void *) &baud_setting);
    assert(FSP_SUCCESS == err);
}
```

◆ **sci_smci_extended_cfg_t**

| | | |
|----------------------------------|---------------------|--|
| struct sci_smci_extended_cfg_t | | |
| SMCI on SCI device Configuration | | |
| Data Fields | | |
| smci_baud_setting_t * | p_smci_baud_setting | Register settings for a desired baud rate. |

Function Documentation◆ **R_SCI_SMCI_Open()**

```
fsp_err_t R_SCI_SMCI_Open ( smci_ctrl_t *const p_api_ctrl, smci_cfg_t const *const p_cfg )
```

Configures the Smart Card Interface driver based on the input configurations. The interface stays in the clock-off state without enabling reception at the end of this function. ISO7816-3 default communication parameters are used to initialize SMCI port speed and parameters, as the ATR message is always sent in that format. Only if Inverse convention is expected should the transfer mode be changed after reset. Implements [smci_api_t::open](#)

Parameters

| | | |
|----------|------------|--|
| [in,out] | p_api_ctrl | Pointer to SMCI control block that is to be opened |
| [in] | p_cfg | Pointer to the config structure that shall be used to set parameters of the SMCI baud calculations needed to be done and set into p_cfg->p_extend->p_smci_baud_setting |

Return values

| | |
|--------------------------------|--|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Pointer to SMCI control block or configuration structure is NULL. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | The requested channel does not exist on this MCU. |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ **R_SCI_SMCI_Write()**

```
fsp_err_t R_SCI_SMCI_Write ( smci_ctrl_t *const p_api_ctrl, uint8_t const *const p_src, uint32_t const bytes )
```

Transmits user specified number of bytes from the source buffer pointer. Implements [smci_api_t::write](#)

Parameters

| | | |
|----------|------------|--|
| [in,out] | p_api_ctrl | Pointer to SMCI control block that is to be opened |
| [in] | p_src | Pointer to buffer that will be written out |
| [in] | bytes | Number of bytes to be transferred |

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Data transmission started successfully. |
| FSP_ERR_ASSERTION | Pointer to SMCI control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_IN_USE | A SMCI transmission is in progress |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ **R_SCI_SMCI_Read()**

```
fsp_err_t R_SCI_SMCI_Read ( smci_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const bytes )
```

Receives user specified number of bytes into destination buffer pointer. Receiving is done at the isr level as there is no FIFO. If 0 is passed in as the length, reception will always invoke the user callback. Implements [smci_api_t::read](#)

Parameters

| | | |
|----------|------------|--|
| [in,out] | p_api_ctrl | Pointer to SMCI control block that is to be opened |
| [in,out] | p_dest | Pointer to the buffer top to be read into |
| [in] | bytes | Number of bytes to copy from the SMCI receive register |

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Data reception successfully ends. |
| FSP_ERR_ASSERTION | Pointer to SMCI control block or read buffer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_IN_USE | A previous read operation is still in progress. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ **R_SCI_SMCI_TransferModeSet()**

```
fsp_err_t R_SCI_SMCI_TransferModeSet ( smci_ctrl_t *const p_api_ctrl, smci_transfer_mode_t const
*const p_transfer_mode_params )
```

Updates the settings of block transfer mode and data transfer convention. The SCMR and SMR_SMCI registers will be set according to the input arguments of protocol type, data convention type, and mode. Implements [smci_api_t::transferModeSet](#)

Parameters

| | | |
|----------|------------------------|--|
| [in,out] | p_api_ctrl | Pointer to SMCI control block that is to be modified |
| [in] | p_transfer_mode_params | Pointer to SMCI settings like protocol, convention, and gsm_mode |

Warning

This terminates any in-progress transmission and reception.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Transfer mode and data transfer direction was successfully changed. |
| FSP_ERR_IN_USE | Unable to change transfer mode as device has clock off or is actively RX or TX |
| FSP_ERR_ASSERTION | Null pointer was passed as a parameter |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ **R_SCI_SMCI_BaudSet()**

```
fsp_err_t R_SCI_SMCI_BaudSet ( smci_ctrl_t *const p_api_ctrl, void const *const p_baud_setting )
```

Updates the baud rate and clock output. `p_baud_setting` is a pointer to a `smci_baud_setting_t` structure that needs to have already been filled by `R_SCI_SMCI_BaudCalculate`. Implements `smci_api_t::baudSet`

Warning

This terminates any in-progress transmission.

Parameters

| | | |
|----------|-----------------------------|--|
| [in,out] | <code>p_api_ctrl</code> | Pointer to SMCI control block that is to be modified |
| [in] | <code>p_baud_setting</code> | Pointer to baud setting information to be written to the SMCI hardware registers |

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Baud rate was successfully changed. |
| FSP_ERR_ASSERTION | Pointer to SMCI control block or <code>p_baud_setting</code> is NUL |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_INVALID_ARGUMENT | The <code>p_baud_setting</code> does not seem to be set correctly |

◆ **R_SCI_SMCI_StatusGet()**

```
fsp_err_t R_SCI_SMCI_StatusGet ( smci_ctrl_t *const p_api_ctrl, smci_status_t *const p_status )
```

Provides the state of the driver and the # of bytes received since read was called. Implements `smci_api_t::statusGet`

Parameters

| | | |
|-------|-------------------------|---|
| [in] | <code>p_api_ctrl</code> | Pointer to SMCI control block of this SMCI instance |
| [out] | <code>p_status</code> | Pointer structure that will be filled in with status info |

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Information stored in provided <code>p_info</code> . |
| FSP_ERR_ASSERTION | Pointer to SMCI control block, or info structure is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

◆ **R_SCI_SMCI_ClockControl()**

```
fsp_err_t R_SCI_SMCI_ClockControl ( smci_ctrl_t *const p_api_ctrl, bool clock_enable )
```

Enable or disable the clock signal that is provided by interface the baud rate. When the clock is enabled, reception is enabled at the end of this function. "Clock output control as defined in section 34.6.8 "Clock Output Control in Smart Card Interface Mode" in the RA6M3 manual R01UH0886EJ0100 or the relevant section for the MCU being used. Implements [smci_api_t::clockControl](#)

Warning

This terminates any in-progress transmission and reception.

Parameters

| | | |
|----------|--------------|---|
| [in,out] | p_api_ctrl | Pointer to SMCI control block |
| [in] | clock_enable | true=Enable or false=disable the Smart Card Interface clock |

Return values

| | |
|----------------------|--|
| FSP_SUCCESS | Clock output setting was successfully changed. |
| FSP_ERR_ASSERTION | Pointer to SMCI control block is NULL |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_INVALID_MODE | Clock cannot be disabled if GSM mode isnt active |

◆ **R_SCI_SMCI_CallbackSet()**

```
fsp_err_t R_SCI_SMCI_CallbackSet ( smci_ctrl_t *const p_api_ctrl, void*(*)(smci_callback_args_t *) p_callback, void const *const p_context, smci_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [smci_api_t::callbackSet](#)

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

◆ **R_SCI_SMCI_Close()**

```
fsp_err_t R_SCI_SMCI_Close ( smci_ctrl_t *const p_api_ctrl)
```

Aborts any in progress transfers. Disables interrupts, receiver, and transmitter. Implements `smci_api_t::close`

Parameters

| | | |
|------|------------|--|
| [in] | p_api_ctrl | Pointer to SMCI control block that is requested to close |
|------|------------|--|

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | Pointer to SMCI control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

◆ **R_SCI_SMCI_BaudCalculate()**

```
fsp_err_t R_SCI_SMCI_BaudCalculate ( smci_speed_params_t const *const p_speed_params,
uint32_t baud_rate_error_x_1000, void *const p_baud_setting )
```

Calculates baud rate register settings. Evaluates and determines the best possible settings set to the baud rate related registers. And then updates the SCI registers.

Parameters

| | | |
|-------|------------------------|--|
| [in] | p_speed_params | structure including speed defining paramets, baud, F, D, and max frequency |
| [in] | baud_rate_error_x_1000 | <baud_rate_percent_error> x 1000 required for module to function. Absolute max baud_rate_error is 20000 (20%) according to the ISO spec. |
| [out] | p_baud_setting | Baud setting information stored here if successful |

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Baud rate setting calculation successful |
| FSP_ERR_ASSERTION | p_speed params or p_baud is a null pointer |
| FSP_ERR_INVALID_ARGUMENT | Baud rate is '0', freq is '0', or error in calculated baud rate is larger than 20%. |

Detailed Description

Driver for the SAU peripheral on RA MCUs. This module implements the [SPI Interface](#).

Overview

Features

- Standard SPI Modes
 - Master or Slave Mode
 - Single Transfer Mode or Continuous Transfer Mode
 - Data Phase (DAPmn)
 - DAPmn=0 Data output starts from the start of the operation of the serial clock
 - DAPmn=1 Data output starts half a clock cycle before the start of the serial clock operation
 - Clock Phase (CKPmn)
 - CKPmn=0 Non-reverse
 - CKPmn=1 Reverse
 - MSB/LSB first
- Callback Events
 - Transfer Complete

Configuration

- RX Overflow Error (The SAU shift register is copied to the data register before previous data was read)

Build Time Configurations for r_sau_spi

The following build time configurations are defined in fsp_cfg/r_sau_spi_cfg.h:

| Configuration | Options | Default | Description |
|---------------------------|---|------------------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Critical Section Guarding | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Enable critical section guarding around peripheral configuration updates. This should be enabled if the R_SAU_I2C module is being used simultaneously with this module. |
| Enable Single Channel | <ul style="list-style-type: none"> • 00 • 20 • Disabled | Disabled | Enable single channel to reduce code size if only channel 00 or 20 is to be configured for SAU SPI. |
| Transfer Operating Mode | <ul style="list-style-type: none"> • Reception • Transmission • Transmission/Reception | Transmission/Reception | Select transfer operation mode. |

Configurations for Connectivity > SPI (r_sau_spi)

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r_sau_spi).

| Configuration | Options | Default | Description |
|-----------------|---|---------|--------------------------------|
| Name | Name must be a valid C symbol | g_spi0 | Module name. |
| Channel | MCU Specific Options | | Select the SAU channel. |
| Operating Mode | <ul style="list-style-type: none"> • Master • Slave | Master | Select the SPI operating mode. |
| Operation Clock | <ul style="list-style-type: none"> • CK0 • CK1 | CK0 | Select the operating clock. |

Note: when creating

| | | | |
|---------------------------------|--|----------------------|---|
| | | | multiple stacks related to the same unit in SAU, selecting the same CK may result in unexpected deviation in baud rate. |
| Transfer Mode | <ul style="list-style-type: none"> • Single transfer mode • Continuous transfer mode | Single transfer mode | Select transfer mode in transfer end interrupt. But buffer empty interrupt (in continuous transfer mode) cannot be selected in Slave Reception. |
| Bit Order | <ul style="list-style-type: none"> • MSB First • LSB First | MSB First | Select of data transfer sequence. |
| Data Phase | <ul style="list-style-type: none"> • From the start • Half a clock cycle before | From the start | Select when data output shall start compared with the serial clock operation. |
| Clock Phase | <ul style="list-style-type: none"> • Non-reverse • Reverse | Non-reverse | Select clock phase. |
| Bitrate | Value must be an integer greater than 0 | 500000 | Enter the desired bitrate. If the requested bitrate cannot be achieved, the settings with the default value the requested bitrate is used. The theoretical bitrate is printed in a comment in the generated sau_spi_extended_cfg_t structure. |
| Callback | Name must be a valid C symbol | sau_spi_callback | A user callback function that is called from the sau spi interrupts when a transfer is completed or an error has occurred. |
| Transmit End Interrupt Priority | MCU Specific Options | | Select the transmit end interrupt priority. |

Clock Configuration

SAU uses system clock (ICLK).

Pin Configuration

This module uses SCKmn, SOMn, and SImn pins to communicate with on board devices.

Note

At high bit rates, it might be necessary to configure the pins with `IOPORT_CFG_DRIVE_HIGH`.

Usage Notes

Enabling Single Channel By User With The SAU SPI

- Single Channel is configurable and disabled by default in the driver code. Enable single channel to reduce code size if only channel 00 or 20 is to be configured for SAU SPI
 - Channel 00 is supported by SAU0
 - Channel 20 is supported by SAU1

Limitations

- When creating multiple stacks related to the same unit in SAU, selecting the same CK may result in unexpected deviation in baud rate. Related SAU modules: SAU-SPI, SAU-IIC and SAU-UART.
- When multiple channels on the same SAU unit need to be used, and one is configured as I2C, then critical section property needs to be enabled.

Transfer Complete Event

The transfer complete event is triggered when all of the data has been transferred. In slave mode if the SS pin is de-asserted then no transfer complete event is generated until the SS pin is asserted and the remaining data is transferred.

Performance

At high bit rates, interrupts may not be able to service transfers fast enough. In master mode this means there will be a delay between each data frame. In slave mode this could result in RX Overflow errors.

Slave Select Pin

- In master mode the slave select pin must be driven in software.
- In slave mode the hardware handles the slave select pin and will only transfer data when the SS pin is low.

Single Channel Use Case

If only SAU channel 00 is to be used for I2C or SPI or UART, enable single channel can reduce the code size.

Examples

Basic Example

This is a basic example of minimal use of the SAU_SPI in an application.

```
static volatile bool g_transfer_complete = false;
static void r_sau_spi_callback (spi_callback_args_t * p_args)
{
    if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
        g_transfer_complete = true;
    }
}

void sau_spi_basic_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
    /* Configure Slave Select Line 1 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
    /* Configure Slave Select Line 2 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
    fsp_err_t err = FSP_SUCCESS;
    /* Initialize the SPI module. */
    err = R_SAU_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Assert Slave Select Line 1 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);
    /* Start a write/read transfer */
    g_transfer_complete = false;
    err = R_SAU_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
    assert(FSP_SUCCESS == err);
    /* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
    while (false == g_transfer_complete)
    {
        ;
    }
    /* De-assert Slave Select Line 1 */
```

```
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);  
/* Wait for minimum time required between transfers. */  
R_BSP_SoftwareDelay(NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);  
/* Assert Slave Select Line 2 */  
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_LOW);  
/* Start a write/read transfer */  
g_transfer_complete = false;  
err = R_SAU_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,  
SPI_BIT_WIDTH_8_BITS);  
assert(FSP_SUCCESS == err);  
/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */  
while (false == g_transfer_complete)  
{  
    ;  
}  
/* De-assert Slave Select Line 2 */  
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);  
}
```

Function Documentation

◆ **R_SAU_SPI_Open()**

```
fsp_err_t R_SAU_SPI_Open ( spi_ctrl_t * p_api_ctrl, spi_cfg_t const *const p_cfg )
```

Initialize a channel for SPI communication mode. Implements `spi_api_t::open`.

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enables the clock for the SAU channel.
- Initializes the associated registers with default value and the user-configurable options.
- Provides the channel handle for use with other API functions.

Parameters

| | |
|------------|---------------------------------------|
| p_api_ctrl | Pointer to the control structure. |
| p_cfg | Pointer to a configuration structure. |

Return values

| | |
|--------------------------------|--|
| FSP_SUCCESS | Channel initialized successfully. |
| FSP_ERR_ASSERTION | An input parameter is invalid or NULL. |
| FSP_ERR_ALREADY_OPEN | The instance has already been opened. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | The channel number is invalid. |

◆ **R_SAU_SPI_Read()**

```
fsp_err_t R_SAU_SPI_Read ( spi_ctrl_t *const p_api_ctrl, void * p_dest, uint32_t const length,
spi_bit_width_t const bit_width )
```

Receive data from an SPI device. Implements `spi_api_t::read`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission by writing data to the TXD register.
- Receive data from receive buffer full interrupt occurs and copy data to the buffer of destination.
- Complete data reception via receive buffer full interrupt and transmitting dummy data.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

| | | |
|------|-------------------------|--|
| | <code>p_api_ctrl</code> | Pointer to the control structure. |
| | <code>p_dest</code> | Pointer to the destination buffer. |
| [in] | <code>length</code> | The number of bytes to transfer. |
| [in] | <code>bit_width</code> | Invalid for SAU_SPI (Set to SPI_BIT_WIDTH_8_BITS). |

Return values

| | |
|---------------------|--|
| FSP_SUCCESS | Read operation successfully completed. |
| FSP_ERR_ASSERTION | One of the following invalid parameters passed: <ul style="list-style-type: none"> • Pointer <code>p_api_ctrl</code> is NULL • Bit width is not 8 bits • Length is equal to 0 • Pointer to destination is NULL |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |
| FSP_ERR_UNSUPPORTED | The given <code>bit_width</code> is not supported. |
| FSP_ERR_IN_USE | A transfer is already in progress. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::reconfigure`

◆ R_SAU_SPI_Write()

```
fsp_err_t R_SAU_SPI_Write ( spi_ctrl_t *const p_api_ctrl, void const * p_src, uint32_t const length,
spi_bit_width_t const bit_width )
```

Transmit data to a SPI device. Implements `spi_api_t::write`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable interrupts.
- Start data transmission with data via transmit buffer empty interrupt.
- Copy data from source buffer to the SPI data register for transmission.
- Complete data transmission via transmit buffer empty interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

| | | |
|------|-------------------------|--|
| | <code>p_api_ctrl</code> | Pointer to the control structure. |
| | <code>p_src</code> | Pointer to the source buffer. |
| [in] | <code>length</code> | The number of bytes to transfer. |
| [in] | <code>bit_width</code> | Invalid for SAU_SPI (Set to <code>SPI_BIT_WIDTH_8_BITS</code>). |

Return values

| | |
|----------------------------------|--|
| <code>FSP_SUCCESS</code> | Write operation successfully completed. |
| <code>FSP_ERR_ASSERTION</code> | One of the following invalid parameters passed: <ul style="list-style-type: none"> • Pointer <code>p_api_ctrl</code> is NULL • Pointer to source is NULL • Length is equal to 0 • Bit width is not equal to 8 bits |
| <code>FSP_ERR_NOT_OPEN</code> | The channel has not been opened. Open the channel first. |
| <code>FSP_ERR_UNSUPPORTED</code> | The given <code>bit_width</code> is not supported. |
| <code>FSP_ERR_IN_USE</code> | A transfer is already in progress. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::reconfigure`

◆ R_SAU_SPI_WriteRead()

```
fsp_err_t R_SAU_SPI_WriteRead ( spi_ctrl_t *const p_api_ctrl, void const * p_src, void * p_dest,
uint32_t const length, spi_bit_width_t const bit_width )
```

Simultaneously transmit data to SPI device while receiving data from SPI device (full duplex). Implements `spi_api_t::writeRead`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission using transmit buffer empty interrupt (or by writing to the TDR register).
- Copy data from source buffer to the SPI data register for transmission.
- Receive data from receive buffer full interrupt and copy data to the destination buffer.
- Complete data transmission and reception via transmit end interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

| | | |
|------|-------------------------|--|
| | <code>p_api_ctrl</code> | Pointer to the control structure. |
| | <code>p_src</code> | Pointer to the source buffer. |
| | <code>p_dest</code> | Pointer to the destination buffer. |
| [in] | <code>length</code> | The number of bytes to transfer. |
| [in] | <code>bit_width</code> | Invalid for SAU_SPI (Set to <code>SPI_BIT_WIDTH_8_BITS</code>). |

Return values

| | |
|----------------------------------|--|
| <code>FSP_SUCCESS</code> | Write operation successfully completed. |
| <code>FSP_ERR_ASSERTION</code> | One of the following invalid parameters passed: <ul style="list-style-type: none"> • Pointer <code>p_api_ctrl</code> is NULL • Pointer to source is NULL • Pointer to destination is NULL • Length is equal to 0 • Bit width is not equal to 8 bits |
| <code>FSP_ERR_NOT_OPEN</code> | The channel has not been opened. Open the channel first. |
| <code>FSP_ERR_UNSUPPORTED</code> | The given <code>bit_width</code> is not supported. |
| <code>FSP_ERR_IN_USE</code> | A transfer is already in progress. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reconfigure](#)

◆ R_SAU_SPI_CallbackSet()

```
fsp_err_t R_SAU_SPI_CallbackSet ( spi_ctrl_t *const p_api_ctrl, void(*)(spi_callback_args_t *)
p_callback, void const *const p_context, spi_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [spi_api_t::callbackSet](#)

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |

◆ R_SAU_SPI_Close()

```
fsp_err_t R_SAU_SPI_Close ( spi_ctrl_t *const p_api_ctrl)
```

Disable the SAU channel and set the instance as not open. Implements [spi_api_t::close](#).

Parameters

| | |
|------------|--------------------------------|
| p_api_ctrl | Pointer to an opened instance. |
|------------|--------------------------------|

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |

◆ R_SAU_SPI_CalculateBitrate()

```
fsp_err_t R_SAU_SPI_CalculateBitrate ( uint32_t bitrate, sau_spi_div_setting_t * sclk_div, uint8_t
sau_unit, uint8_t channel )
```

Calculate the register settings required to achieve the desired bitrate.

Parameters

| | | |
|------|----------|---|
| [in] | bitrate | bitrate [bps]. For example, 250,000; 500,00; 16,000,000 (max), etc. |
| | sclk_div | Pointer to sau_spi_div_setting_t used to configure baudrate settings. |
| | sau_unit | Sau unit. |
| | channel | Sau channel. |

Return values

| | |
|-------------------|--------------------------------|
| FSP_SUCCESS | Baud rate is set successfully. |
| FSP_ERR_ASSERTION | Baud rate is not achievable. |

Note

The application must pause for 1 bit time after the BRR register is loaded before transmitting/receiving to allow time for the clock to settle.

```

Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the [SPI Interface](#).

Overview

Features

- Standard SPI Modes
 - Master or Slave Mode
 - Clock Polarity (CPOL)
 - CPOL=0 SCLK is low when idle
 - CPOL=1 SCLK is high when idle
 - Clock Phase (CPHA)
 - CPHA=0 Select data sampling on leading edge, data change on trailing edge
 - CPHA=1 Select data change on leading edge, data sampling on trailing edge
 - MSB/LSB first
- Configurable bit rate
- DTC Support
- Callback Events
 - Transfer Complete
 - RX Overflow Error (The SCI shift register is copied to the data register before previous data was read)

Configuration

Build Time Configurations for r_sci_b_spi

The following build time configurations are defined in fsp_cfg/r_sci_b_spi_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| DTC Support | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | If support for transferring data using the DTC will be compiled in. |

Configurations for Connectivity > SPI (r_sci_b_spi)

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r_sci_b_spi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---------------------------------|--|--|--|
| Name | Name must be a valid C symbol | g_sci_spi0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Select the SCI channel. |
| Operating Mode | <ul style="list-style-type: none"> Master Slave | Master | Select the SPI operating mode. |
| Clock Phase | <ul style="list-style-type: none"> Data sampling on odd edge, data variation on even edge Data sampling on even edge, data variation on odd edge | Data sampling on odd edge, data variation on even edge | Select the clock edge to sample data. |
| Clock Polarity | <ul style="list-style-type: none"> Low when idle High when idle | Low when idle | Select clock level when idle. |
| Mode Fault Error | <ul style="list-style-type: none"> Enable Disable | Disable | Detect master/slave mode conflicts. |
| Bit Order | <ul style="list-style-type: none"> MSB First LSB First | MSB First | Select the data bit order. |
| Clock Source | <ul style="list-style-type: none"> PCLK SCISPICK | PCLK | Select whether the peripheral clock (PCLK) or SCISPICK is used for generating the SCK frequency. |
| Callback | Name must be a valid C symbol | sci_b_spi_callback | A user callback function that is called from the sci_b_spi interrupts when a transfer is completed or an error has occurred. |
| Receive Interrupt Priority | MCU Specific Options | | Select the receive interrupt priority. |
| Transmit Interrupt Priority | MCU Specific Options | | Select the transmit interrupt priority. |
| Transmit End Interrupt Priority | MCU Specific Options | | Select the transmit end interrupt priority. |
| Error Interrupt Priority | MCU Specific Options | | Select the error |

interrupt priority.

Enter the desired bitrate.

If the requested bitrate cannot be achieved, the settings with the largest possible value that is less than or equal to the requested bitrate is used. The theoretical bitrate is printed in a comment in the generated [sci_spi_extended_cfg_t](#) structure.

Bitrate Value must be an integer greater than 0 8000000

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

| MCU Group | Peripheral Clock |
|-----------|------------------|
| RA6T2 | PCLKA |
| RA8D1 | PCLKA |
| RA8M1 | PCLKA |
| RA8T1 | PCLKA |

Pin Configuration

This module uses SCIn_MOSI, SCIn_MISO, SCIn_SPCK, and SCIn_SS pins to communicate with on board devices.

Note

At high bit rates, it might be necessary to configure the pins with `IOPORT_CFG_DRIVE_HIGH`.

Usage Notes

Transfer Complete Event

The transfer complete event is triggered when all of the data has been transferred. In slave mode if the SS pin is de-asserted then no transfer complete event is generated until the SS pin is asserted and the remaining data is transferred.

Performance

At high bit rates, interrupts may not be able to service transfers fast enough. In master mode this means there will be a delay between each data frame. In slave mode this could result in RX Overflow errors.

In order to improve performance at high bit rates, it is recommended that the instance be configured

to service transfers using the DTC.

Transmit From RXI Interrupt

After every byte, the SCI SPI peripheral generates a transmit buffer empty interrupt and a receive buffer full interrupt. Whenever possible, the SCI SPI module handles both interrupts in the receive buffer full interrupt. This improves performance when the DTC is not being used.

Slave Select Pin

- In master mode the slave select pin must be driven in software.
- In slave mode the hardware handles the slave select pin and will only transfer data when the SS pin is low.

Examples

Basic Example

This is a basic example of minimal use of the SCI_B_SPI module in an application.

```
static volatile bool g_transfer_complete = false;
static void r_sci_b_spi_callback (spi_callback_args_t * p_args)
{
    if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
        g_transfer_complete = true;
    }
}
void sci_b_spi_basic_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
    /* Configure Slave Select Line 1 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
    /* Configure Slave Select Line 2 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
    fsp_err_t err = FSP_SUCCESS;
    /* Initialize the SPI module. */
    err = R_SCI_B_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
}
```

```
/* Assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);
/* Start a write/read transfer */
g_transfer_complete = false;
err = R_SCI_B_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
assert(FSP_SUCCESS == err);
/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
{
    ;
}
/* De-assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
/* Wait for minimum time required between transfers. */
R_BSP_SoftwareDelay(SSL_NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);
/* Assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_LOW);
/* Start a write/read transfer */
g_transfer_complete = false;
err = R_SCI_B_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
assert(FSP_SUCCESS == err);
/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
{
    ;
}
/* De-assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
}
```

Data Structures

struct [sci_b_spi_div_setting_t](#)

Data Structure Documentation

◆ sci_b_spi_div_setting_t

```
struct sci_b_spi_div_setting_t
```

Settings for adjusting the SPI CLK.

Function Documentation

◆ R_SCI_B_SPI_Open()

```
fsp_err_t R_SCI_B_SPI_Open ( spi_ctrl_t* p_api_ctrl, spi_cfg_t const *const p_cfg )
```

Initialize a channel for SPI communication mode. Implements [spi_api_t::open](#).

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enables the clock for the SCI channel.
- Initializes the associated registers with default value and the user-configurable options.
- Provides the channel handle for use with other API functions.

Parameters

| | |
|------------|---------------------------------------|
| p_api_ctrl | Pointer to the control structure. |
| p_cfg | Pointer to a configuration structure. |

Return values

| | |
|--------------------------------|--|
| FSP_SUCCESS | Channel initialized successfully. |
| FSP_ERR_ASSERTION | An input parameter is invalid or NULL. |
| FSP_ERR_ALREADY_OPEN | The instance has already been opened. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | The channel number is invalid. |

◆ **R_SCI_B_SPI_Read()**

```
fsp_err_t R_SCI_B_SPI_Read ( spi_ctrl_t *const p_api_ctrl, void * p_dest, uint32_t const length,
spi_bit_width_t const bit_width )
```

Receive data from an SPI device. Implements `spi_api_t::read`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission by writing data to the TXD register.
- Receive data from receive buffer full interrupt occurs and copy data to the buffer of destination.
- Complete data reception via receive buffer full interrupt and transmitting dummy data.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

| | | |
|------|-------------------------|--|
| | <code>p_api_ctrl</code> | Pointer to the control structure. |
| | <code>p_dest</code> | Pointer to the destination buffer. |
| [in] | <code>length</code> | The number of bytes to transfer. |
| [in] | <code>bit_width</code> | Invalid for SCI_B_SPI (Set to SPI_BIT_WIDTH_8_BITS). |

Return values

| | |
|----------------------------------|--|
| <code>FSP_SUCCESS</code> | Read operation successfully completed. |
| <code>FSP_ERR_ASSERTION</code> | One of the following invalid parameters passed: <ul style="list-style-type: none"> • Pointer <code>p_api_ctrl</code> is NULL • Bit width is not 8 bits • Length is equal to 0 • Pointer to destination is NULL |
| <code>FSP_ERR_NOT_OPEN</code> | The channel has not been opened. Open the channel first. |
| <code>FSP_ERR_UNSUPPORTED</code> | The given <code>bit_width</code> is not supported. |
| <code>FSP_ERR_IN_USE</code> | A transfer is already in progress. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::reconfigure`

◆ R_SCI_B_SPI_Write()

```
fsp_err_t R_SCI_B_SPI_Write ( spi_ctrl_t *const p_api_ctrl, void const * p_src, uint32_t const length,
spi_bit_width_t const bit_width )
```

Transmit data to a SPI device. Implements `spi_api_t::write`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable interrupts.
- Start data transmission with data via transmit buffer empty interrupt.
- Copy data from source buffer to the SPI data register for transmission.
- Complete data transmission via transmit buffer empty interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

| | | |
|------|-------------------------|--|
| | <code>p_api_ctrl</code> | Pointer to the control structure. |
| | <code>p_src</code> | Pointer to the source buffer. |
| [in] | <code>length</code> | The number of bytes to transfer. |
| [in] | <code>bit_width</code> | Invalid for SCI_B_SPI (Set to SPI_BIT_WIDTH_8_BITS). |

Return values

| | |
|---------------------|--|
| FSP_SUCCESS | Write operation successfully completed. |
| FSP_ERR_ASSERTION | One of the following invalid parameters passed: <ul style="list-style-type: none"> • Pointer <code>p_api_ctrl</code> is NULL • Pointer to source is NULL • Length is equal to 0 • Bit width is not equal to 8 bits |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |
| FSP_ERR_UNSUPPORTED | The given <code>bit_width</code> is not supported. |
| FSP_ERR_IN_USE | A transfer is already in progress. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::reconfigure`

◆ R_SCI_B_SPI_WriteRead()

```
fsp_err_t R_SCI_B_SPI_WriteRead ( spi_ctrl_t *const p_api_ctrl, void const * p_src, void * p_dest,
uint32_t const length, spi_bit_width_t const bit_width )
```

Simultaneously transmit data to SPI device while receiving data from SPI device (full duplex). Implements `spi_api_t::writeRead`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission using transmit buffer empty interrupt (or by writing to the TDR register).
- Copy data from source buffer to the SPI data register for transmission.
- Receive data from receive buffer full interrupt and copy data to the destination buffer.
- Complete data transmission and reception via transmit end interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

| | | |
|------|-------------------------|--|
| | <code>p_api_ctrl</code> | Pointer to the control structure. |
| | <code>p_src</code> | Pointer to the source buffer. |
| | <code>p_dest</code> | Pointer to the destination buffer. |
| [in] | <code>length</code> | The number of bytes to transfer. |
| [in] | <code>bit_width</code> | Invalid for SCI_B_SPI (Set to SPI_BIT_WIDTH_8_BITS). |

Return values

| | |
|---------------------|--|
| FSP_SUCCESS | Write operation successfully completed. |
| FSP_ERR_ASSERTION | One of the following invalid parameters passed: <ul style="list-style-type: none"> • Pointer <code>p_api_ctrl</code> is NULL • Pointer to source is NULL • Pointer to destination is NULL • Length is equal to 0 • Bit width is not equal to 8 bits |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |
| FSP_ERR_UNSUPPORTED | The given <code>bit_width</code> is not supported. |
| FSP_ERR_IN_USE | A transfer is already in progress. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reconfigure](#)

◆ R_SCI_B_SPI_CallbackSet()

```
fsp_err_t R_SCI_B_SPI_CallbackSet ( spi_ctrl_t *const p_api_ctrl, void(*) (spi_callback_args_t *)
p_callback, void const *const p_context, spi_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [spi_api_t::callbackSet](#)

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

◆ R_SCI_B_SPI_Close()

```
fsp_err_t R_SCI_B_SPI_Close ( spi_ctrl_t *const p_api_ctrl)
```

Disable the SCI channel and set the instance as not open. Implements [spi_api_t::close](#).

Parameters

| | |
|------------|--------------------------------|
| p_api_ctrl | Pointer to an opened instance. |
|------------|--------------------------------|

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |

◆ **R_SCI_B_SPI_CalculateBitrate()**

```
fsp_err_t R_SCI_B_SPI_CalculateBitrate ( uint32_t bitrate, sci_b_spi_clock_source_t clock_source,
sci_b_spi_div_setting_t* sclk_div )
```

Calculate the register settings required to achieve the desired bitrate.

Parameters

| | | |
|------|--------------|---|
| [in] | bitrate | bitrate [bps]. For example, 250,000; 500,00; 2,500,000 (max), etc. |
| | clock_source | clock source (PCLKA or SCISPICLK) used for bit rate calculation. |
| | sclk_div | Pointer to sci_b_spi_div_setting_t used to configure baudrate settings. |

Return values

| | |
|-------------------|--------------------------------|
| FSP_SUCCESS | Baud rate is set successfully. |
| FSP_ERR_ASSERTION | Baud rate is not achievable. |

Note

The application must pause for 1 bit time after the BRR register is loaded before transmitting/receiving to allow time for the clock to settle.

Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the [SPI Interface](#).

Overview

Features

- Standard SPI Modes
 - Master or Slave Mode
 - Clock Polarity (CPOL)
 - CPOL=0 SCLK is low when idle
 - CPOL=1 SCLK is high when idle
 - Clock Phase (CPHA)
 - CPHA=0 Select data sampling on leading edge, data change on trailing edge
 - CPHA=1 Select data change on leading edge, data sampling on trailing edge
 - MSB/LSB first
- Configurable bit rate
- DTC Support
- Callback Events
 - Transfer Complete
 - RX Overflow Error (The SCI shift register is copied to the data register before previous data was read)

Configuration

Build Time Configurations for r_sci_spi

The following build time configurations are defined in fsp_cfg/r_sci_spi_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| DTC Support | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | If support for transferring data using the DTC will be compiled in. |

Configurations for Connectivity > SPI (r_sci_spi)

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r_sci_spi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---------------------------------|--|--|--|
| Name | Name must be a valid C symbol | g_spi0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Select the SCI channel. |
| Operating Mode | <ul style="list-style-type: none"> • Master • Slave | Master | Select the SPI operating mode. |
| Clock Phase | <ul style="list-style-type: none"> • Data sampling on odd edge, data variation on even edge • Data sampling on even edge, data variation on odd edge | Data sampling on odd edge, data variation on even edge | Select the clock edge to sample data. |
| Clock Polarity | <ul style="list-style-type: none"> • Low when idle • High when idle | Low when idle | Select clock level when idle. |
| Mode Fault Error | <ul style="list-style-type: none"> • Enable • Disable | Disable | Detect master/slave mode conflicts. |
| Bit Order | <ul style="list-style-type: none"> • MSB First • LSB First | MSB First | Select the data bit order. |
| Callback | Name must be a valid C symbol | sci_spi_callback | A user callback function that is called from the sci spi interrupts when a transfer is completed or an error has occurred. |
| Receive Interrupt Priority | MCU Specific Options | | Select the receive interrupt priority. |
| Transmit Interrupt Priority | MCU Specific Options | | Select the transmit interrupt priority. |
| Transmit End Interrupt Priority | MCU Specific Options | | Select the transmit end interrupt priority. |
| Error Interrupt Priority | MCU Specific Options | | Select the error interrupt priority. |
| Bitrate | Value must be an integer greater than 0 | 8000000 | Enter the desired bitrate. If the requested bitrate cannot be achieved, the settings with the |

largest possible value that is less than or equal to the requested bitrate is used. The theoretical bitrate is printed in a comment in the generated [sci_spi_extended_cfg_t](#) structure.

| | | | |
|--------------------|---|----------|---|
| Bitrate Modulation | <ul style="list-style-type: none"> • Disabled • Enabled | Disabled | Enabling bitrate modulation reduces the percent error of the actual bitrate with respect to the requested baud rate. It does this by modulating the number of cycles per clock output pulse, so the clock is no longer a square wave. |
|--------------------|---|----------|---|

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

| MCU Group | Peripheral Clock |
|-----------|------------------|
| RA2A1 | PCLKB |
| RA2A2 | PCLKB |
| RA2E1 | PCLKB |
| RA2E2 | PCLKB |
| RA2E3 | PCLKB |
| RA2L1 | PCLKB |
| RA4E1 | PCLKA |
| RA4E2 | PCLKA |
| RA4M1 | PCLKA |
| RA4M2 | PCLKA |
| RA4M3 | PCLKA |
| RA4T1 | PCLKA |
| RA4W1 | PCLKA |
| RA6E1 | PCLKA |
| RA6E2 | PCLKA |
| RA6M1 | PCLKA |

| | |
|-------|-------|
| RA6M2 | PCLKA |
| RA6M3 | PCLKA |
| RA6M4 | PCLKA |
| RA6M5 | PCLKA |
| RA6T1 | PCLKA |
| RA6T3 | PCLKA |

Pin Configuration

This module uses SCIn_MOSI, SCIn_MISO, SCIn_SPCK, and SCIn_SS pins to communicate with on board devices.

Note

At high bit rates, it might be necessary to configure the pins with `IOPORT_CFG_DRIVE_HIGH`.

Usage Notes

Transfer Complete Event

The transfer complete event is triggered when all of the data has been transferred. In slave mode if the SS pin is de-asserted then no transfer complete event is generated until the SS pin is asserted and the remaining data is transferred.

Performance

At high bit rates, interrupts may not be able to service transfers fast enough. In master mode this means there will be a delay between each data frame. In slave mode this could result in RX Overflow errors. In order to improve performance at high bit rates, it is recommended that the instance be configured to service transfers using the DTC.

Also note when using DTC for data transfer, SCI SPI can experience overrun error if the application makes heavy use of DMAC and/or another DTC instance. This is because DMAC has a higher priority over DTC in arbitration for the mastership of the DMA bus, and the arbitration between different triggers/transfers in DTC is done based on interrupt/trigger priority. Overrun error can be averted with one of the following options:

1. If SCI SPI uses DTC for data transfer, avoid the use of DMAC or another DTC instance in an application.
2. If DMAC/DTC is a must for other data transfers, avoid the use of DTC with SCI SPI.
3. Use the RSPI instead of SCI SPI. The RSPI hardware can handle overrun conditions.

Transmit From RXI Interrupt

After every byte, the SCI SPI peripheral generates a transmit buffer empty interrupt and a receive buffer full interrupt. Whenever possible, the SCI_SPI module handles both interrupts in the receive buffer full interrupt. This improves performance when the DTC is not being used.

Slave Select Pin

- In master mode the slave select pin must be driven in software.
- In slave mode the hardware handles the slave select pin and will only transfer data when

the SS pin is low.

Bit Rate Modulation

Depending on the peripheral clock frequency, the desired bit rate may not be achievable. With bit rate modulation, the device can remove a configurable number of input clock pulses to the internal bit rate counter in order to create the desired bit rate. This has the effect of changing the period of individual bits in order to achieve the desired average bit rate. For more information see section 34.9 Bit Rate Modulation Function in the RA6M3 manual.

Examples

Basic Example

This is a basic example of minimal use of the SCI_SPI in an application.

```
static volatile bool g_transfer_complete = false;
static void r_sci_spi_callback (spi_callback_args_t * p_args)
{
    if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
        g_transfer_complete = true;
    }
}
void sci_spi_basic_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
    /* Configure Slave Select Line 1 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
    /* Configure Slave Select Line 2 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
    fsp_err_t err = FSP_SUCCESS;
    /* Initialize the SPI module. */
    err = R_SCI_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Assert Slave Select Line 1 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);
    /* Start a write/read transfer */
```

```
g_transfer_complete = false;

err = R_SCI_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);

assert(FSP_SUCCESS == err);

/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
{
    ;
}

/* De-assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);

/* Wait for minimum time required between transfers. */
R_BSP_SoftwareDelay(SSL_NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);

/* Assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_LOW);

/* Start a write/read transfer */
g_transfer_complete = false;

err = R_SCI_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);

assert(FSP_SUCCESS == err);

/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
{
    ;
}

/* De-assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
}
```

Data Structures

struct [sci_spi_div_setting_t](#)

Data Structure Documentation

◆ sci_spi_div_setting_t

struct sci_spi_div_setting_t

Settings for adjusting the SPI CLK.

| Data Fields | | |
|-------------|--------|---------------------------|
| uint8_t | brr | |
| uint8_t | cks: 2 | |
| uint8_t | mddr | Set to 0 to disable MDDR. |

Function Documentation

◆ R_SCI_SPI_Open()

```
fsp_err_t R_SCI_SPI_Open ( spi_ctrl_t * p_api_ctrl, spi_cfg_t const *const p_cfg )
```

Initialize a channel for SPI communication mode. Implements `spi_api_t::open`.

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enables the clock for the SCI channel.
- Initializes the associated registers with default value and the user-configurable options.
- Provides the channel handle for use with other API functions.

Parameters

| | |
|------------|---------------------------------------|
| p_api_ctrl | Pointer to the control structure. |
| p_cfg | Pointer to a configuration structure. |

Return values

| | |
|--------------------------------|--|
| FSP_SUCCESS | Channel initialized successfully. |
| FSP_ERR_ASSERTION | An input parameter is invalid or NULL. |
| FSP_ERR_ALREADY_OPEN | The instance has already been opened. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | The channel number is invalid. |

◆ R_SCI_SPI_Read()

```
fsp_err_t R_SCI_SPI_Read ( spi_ctrl_t *const p_api_ctrl, void * p_dest, uint32_t const length,
spi_bit_width_t const bit_width )
```

Receive data from an SPI device. Implements `spi_api_t::read`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission by writing data to the TXD register.
- Receive data from receive buffer full interrupt occurs and copy data to the buffer of destination.
- Complete data reception via receive buffer full interrupt and transmitting dummy data.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

| | | |
|------|-------------------------|--|
| | <code>p_api_ctrl</code> | Pointer to the control structure. |
| | <code>p_dest</code> | Pointer to the destination buffer. |
| [in] | <code>length</code> | The number of bytes to transfer. |
| [in] | <code>bit_width</code> | Invalid for SCI_SPI (Set to <code>SPI_BIT_WIDTH_8_BITS</code>). |

Return values

| | |
|----------------------------------|--|
| <code>FSP_SUCCESS</code> | Read operation successfully completed. |
| <code>FSP_ERR_ASSERTION</code> | One of the following invalid parameters passed: <ul style="list-style-type: none"> • Pointer <code>p_api_ctrl</code> is NULL • Bit width is not 8 bits • Length is equal to 0 • Pointer to destination is NULL |
| <code>FSP_ERR_NOT_OPEN</code> | The channel has not been opened. Open the channel first. |
| <code>FSP_ERR_UNSUPPORTED</code> | The given <code>bit_width</code> is not supported. |
| <code>FSP_ERR_IN_USE</code> | A transfer is already in progress. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::reconfigure`

◆ R_SCI_SPI_Write()

```
fsp_err_t R_SCI_SPI_Write ( spi_ctrl_t *const p_api_ctrl, void const * p_src, uint32_t const length,
spi_bit_width_t const bit_width )
```

Transmit data to a SPI device. Implements `spi_api_t::write`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable interrupts.
- Start data transmission with data via transmit buffer empty interrupt.
- Copy data from source buffer to the SPI data register for transmission.
- Complete data transmission via transmit buffer empty interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

| | | |
|------|-------------------------|--|
| | <code>p_api_ctrl</code> | Pointer to the control structure. |
| | <code>p_src</code> | Pointer to the source buffer. |
| [in] | <code>length</code> | The number of bytes to transfer. |
| [in] | <code>bit_width</code> | Invalid for SCI_SPI (Set to <code>SPI_BIT_WIDTH_8_BITS</code>). |

Return values

| | |
|----------------------------------|--|
| <code>FSP_SUCCESS</code> | Write operation successfully completed. |
| <code>FSP_ERR_ASSERTION</code> | One of the following invalid parameters passed: <ul style="list-style-type: none"> • Pointer <code>p_api_ctrl</code> is NULL • Pointer to source is NULL • Length is equal to 0 • Bit width is not equal to 8 bits |
| <code>FSP_ERR_NOT_OPEN</code> | The channel has not been opened. Open the channel first. |
| <code>FSP_ERR_UNSUPPORTED</code> | The given <code>bit_width</code> is not supported. |
| <code>FSP_ERR_IN_USE</code> | A transfer is already in progress. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::reconfigure`

◆ R_SCI_SPI_WriteRead()

```
fsp_err_t R_SCI_SPI_WriteRead ( spi_ctrl_t *const p_api_ctrl, void const * p_src, void * p_dest,
uint32_t const length, spi_bit_width_t const bit_width )
```

Simultaneously transmit data to SPI device while receiving data from SPI device (full duplex). Implements `spi_api_t::writeRead`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission using transmit buffer empty interrupt (or by writing to the TDR register).
- Copy data from source buffer to the SPI data register for transmission.
- Receive data from receive buffer full interrupt and copy data to the destination buffer.
- Complete data transmission and reception via transmit end interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

| | | |
|------|-------------------------|--|
| | <code>p_api_ctrl</code> | Pointer to the control structure. |
| | <code>p_src</code> | Pointer to the source buffer. |
| | <code>p_dest</code> | Pointer to the destination buffer. |
| [in] | <code>length</code> | The number of bytes to transfer. |
| [in] | <code>bit_width</code> | Invalid for SCI_SPI (Set to <code>SPI_BIT_WIDTH_8_BITS</code>). |

Return values

| | |
|----------------------------------|--|
| <code>FSP_SUCCESS</code> | Write operation successfully completed. |
| <code>FSP_ERR_ASSERTION</code> | One of the following invalid parameters passed: <ul style="list-style-type: none"> • Pointer <code>p_api_ctrl</code> is NULL • Pointer to source is NULL • Pointer to destination is NULL • Length is equal to 0 • Bit width is not equal to 8 bits |
| <code>FSP_ERR_NOT_OPEN</code> | The channel has not been opened. Open the channel first. |
| <code>FSP_ERR_UNSUPPORTED</code> | The given <code>bit_width</code> is not supported. |
| <code>FSP_ERR_IN_USE</code> | A transfer is already in progress. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reconfigure](#)

◆ R_SCI_SPI_CallbackSet()

```
fsp_err_t R_SCI_SPI_CallbackSet ( spi_ctrl_t *const p_api_ctrl, void(*) (spi_callback_args_t *)
p_callback, void const *const p_context, spi_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [spi_api_t::callbackSet](#)

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

◆ R_SCI_SPI_Close()

```
fsp_err_t R_SCI_SPI_Close ( spi_ctrl_t *const p_api_ctrl)
```

Disable the SCI channel and set the instance as not open. Implements [spi_api_t::close](#).

Parameters

| | |
|------------|--------------------------------|
| p_api_ctrl | Pointer to an opened instance. |
|------------|--------------------------------|

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |

◆ R_SCI_SPI_CalculateBitrate()

```
fsp_err_t R_SCI_SPI_CalculateBitrate ( uint32_t bitrate, sci_spi_div_setting_t * sclk_div, bool use_mddr )
```

Calculate the register settings required to achieve the desired bitrate.

Parameters

| | | |
|------|----------|---|
| [in] | bitrate | bitrate [bps]. For example, 250,000; 500,00; 2,500,000 (max), etc. |
| | sclk_div | Pointer to sci_spi_div_setting_t used to configure baudrate settings. |
| [in] | use_mddr | Calculate the divider settings for use with MDDR. |

Return values

| | |
|-------------------|--------------------------------|
| FSP_SUCCESS | Baud rate is set successfully. |
| FSP_ERR_ASSERTION | Baud rate is not achievable. |

Note

The application must pause for 1 bit time after the BRR register is loaded before transmitting/receiving to allow time for the clock to settle.

Detailed Description

Driver for the SPI peripheral on RA MCUs. This module implements the [SPI Interface](#).

Overview

Features

- Standard SPI Modes
 - Master or Slave Mode
 - 3-Wire (clock synchronous) or 4-Wire (SPI) Mode
 - Clock Polarity (CPOL)
 - CPOL=0 SCLK is low when idle
 - CPOL=1 SCLK is high when idle
 - Clock Phase (CPHA)
 - CPHA=0 Data Sampled on the even edge of SCLK (Master Mode Only)
 - CPHA=1 Data Sampled on the odd edge of SCLK
 - MSB/LSB first
 - 8-16 bit, 20-bit, 24-bit, and 32-bit data frames
 - Hardware endian swap in 16-bit and 32-bit modes
 - SSL level keep (burst transfer) supported if available
- Configurable bitrate
- Supports Full Duplex or Transmit Only Mode
- DTC Support
- DMAC Support
- Callback Events
 - Transfer Complete
 - RX Overflow Error (The SPI shift register is copied to the data register before previous data was read)
 - TX Underrun Error (No data to load into shift register for transmitting)
 - Parity Error (When parity is enabled and a parity error is detected)

Configuration

Build Time Configurations for r_spi

The following build time configurations are defined in fsp_cfg/r_spi_cfg.h:

| Configuration | Options | Default | Description |
|---|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Enable Support for using a transfer API | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | If enabled, transfer instances will be included in the build for |

both transmission and reception.

Enable Transmitting from RXI Interrupt

- Enabled
- Disabled

Disabled

If enabled, all operations will be handled from the RX (receive) interrupt. This setting only provides a performance boost when neither DTC nor DMAC is used. In addition, Transmit Only mode is not supported when this configuration is enabled.

Configurations for Connectivity > SPI (r_spi)

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r_spi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|--|--|--|---|
| Name | Name must be a valid C symbol | g_spi0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Select the SPI channel. |
| Receive Interrupt Priority | MCU Specific Options | | Select the interrupt priority for all SPI interrupts. |
| Transmit Buffer Empty Interrupt Priority | MCU Specific Options | | Select the interrupt priority for all SPI interrupts. |
| Transfer Complete Interrupt Priority | MCU Specific Options | | Select the interrupt priority for all SPI interrupts. |
| Error Interrupt Priority | MCU Specific Options | | Select the interrupt priority for all SPI interrupts. |
| Operating Mode | <ul style="list-style-type: none"> • Master • Slave | Master | Select the SPI operating mode. |
| Clock Phase | <ul style="list-style-type: none"> • Data sampling on odd edge, data variation on even edge • Data sampling on even edge, data variation on odd edge | Data sampling on odd edge, data variation on even edge | Select the clock edge to sample data. |

| | | | |
|----------------------------|---|--------------------------------|--|
| Clock Polarity | <ul style="list-style-type: none"> • Low when idle • High when idle | Low when idle | Select clock level when idle. |
| Mode Fault Error | <ul style="list-style-type: none"> • Enable • Disable | Disable | Detect master/slave mode conflicts. |
| Bit Order | <ul style="list-style-type: none"> • MSB First • LSB First | MSB First | Select the data bit order. |
| Callback | Name must be a valid C symbol | spi_callback | A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR). |
| SPI Mode | <ul style="list-style-type: none"> • SPI Operation • Clock Synchronous Operation | Clock Synchronous Operation | Select the clock sync mode. |
| Full or Transmit Only Mode | <ul style="list-style-type: none"> • Full Duplex • Transmit Only | Full Duplex | Select Full Duplex or Transmit Only Mode. |
| Slave Select Polarity | <ul style="list-style-type: none"> • Active Low • Active High | Active Low | Select the slave select active level. |
| Select SSL(Slave Select) | <ul style="list-style-type: none"> • SSL0 • SSL1 • SSL2 • SSL3 | SSL0 | Select which slave to use. |
| MOSI Idle State | <ul style="list-style-type: none"> • MOSI Idle Value Fixing Disable • MOSI Idle Value Fixing Low • MOSI Idle Value Fixing High | MOSI Idle Value Fixing Disable | Select the MOSI idle level if MOSI idle is enabled. |
| Parity Mode | <ul style="list-style-type: none"> • Disabled • Odd • Even | Disabled | Select the parity mode if parity is enabled. |
| Byte Swapping | <ul style="list-style-type: none"> • Disable • Enable | Disable | Select the byte swap mode for 16/32-Bit Data Frames. |
| Bitrate | Value must be an integer greater than 0 | 16000000 | Enter the desired bitrate, change the bitrate to a value supported by MCU. If the requested bitrate cannot be achieved, the settings with the largest possible value that is less than or equal to the requested |

bitrate is used. The theoretical bitrate is printed in a comment in the generated [spi_extended_cfg_t](#) structure.

| | | | |
|--------------------|---|---------|---|
| Clock Delay | <ul style="list-style-type: none"> • 1 Clock • 2 Clocks • 3 Clocks • 4 Clocks • 5 Clocks • 6 Clocks • 7 Clocks • 8 Clocks | 1 Clock | Configure the number of SPI clock cycles before each data frame. |
| SSL Negation Delay | <ul style="list-style-type: none"> • 1 Clock • 2 Clocks • 3 Clocks • 4 Clocks • 5 Clocks • 6 Clocks • 7 Clocks • 8 Clocks | 1 Clock | Configure the number of SPI clock cycles after each data frame. |
| Next Access Delay | <ul style="list-style-type: none"> • 1 Clock • 2 Clocks • 3 Clocks • 4 Clocks • 5 Clocks • 6 Clocks • 7 Clocks • 8 Clocks | 1 Clock | Configure the number of SPI clock cycles between each data frame. |

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

| MCU Group | Peripheral Clock |
|-----------|------------------|
| RA2A1 | PCLKB |
| RA2A2 | PCLKB |
| RA2E1 | PCLKB |
| RA2E2 | PCLKB |
| RA2E3 | PCLKB |
| RA2L1 | PCLKB |
| RA4E1 | PCLKA |
| RA4E2 | PCLKA |
| RA4M1 | PCLKA |

| | |
|-------|-------|
| RA4M2 | PCLKA |
| RA4M3 | PCLKA |
| RA4T1 | PCLKA |
| RA4W1 | PCLKA |
| RA6E1 | PCLKA |
| RA6E2 | PCLKA |
| RA6M1 | PCLKA |
| RA6M2 | PCLKA |
| RA6M3 | PCLKA |
| RA6M4 | PCLKA |
| RA6M5 | PCLKA |
| RA6T1 | PCLKA |
| RA6T3 | PCLKA |

Pin Configuration

This module uses MOSI, MISO, RSPCK, and SSL pins to communicate with on board devices.

Note

At high bitrates, it might be necessary to configure the pins with `IOPORT_CFG_DRIVE_HIGH`.

Usage Notes

Performance

At high bitrates, interrupts may not be able to service transfers fast enough. In master mode this means there will be a delay between each data frame. In slave mode this could result in TX Underrun and RX Overflow errors.

In order to improve performance at high bitrates, it is recommended that the instance be configured to service transfers using the DTC or DMAC.

Another way to improve performance is to transfer the data in 16/32 bit wide data frames when possible. A typical use-case where this is possible is when reading/writing to a block device.

Transmit From RXI Interrupt

After every data frame the SPI peripheral generates a transmit buffer empty interrupt and a receive buffer full interrupt. It is possible to configure the driver to handle transmit buffer empty interrupts in the receive buffer full isr. This only improves performance when neither the DTC nor DMAC is being used.

Note

*Configuring the module to use an RX DTC/DMAC instance without also providing a TX DTC/DMAC instance results in an invalid configuration when RXI transmit is enabled.
Transmit Only mode is not supported when Transmit from RXI is enabled.*

Clock Auto-Stopping

In master mode, if the Receive Buffer Full Interrupts are not handled fast enough, instead of generating a RX Overflow error, the last clock cycle will be stretched until the receive buffer is read.

Parity Mode

When parity mode is configured, the LSB of each data frame is used as a parity bit. When odd parity is selected, the LSB is set such that there are an odd number of ones in the data frame. When even parity is selected, the LSB is set such that there are an even number of ones in the data frame.

Limitations

Developers should be aware of the following limitations when using the SPI:

- In master mode, the driver will only configure 4-Wire mode if the device supports SSL Level Keeping (SSLKP bit in SPCMD0) and will return FSP_ERR_UNSUPPORTED if configured for 4-Wire mode on devices without SSL Level Keeping. Without SSL Level Keeping, the SSL pin is toggled after every data frame. In most cases this is not desirable behavior so it is recommended that the SSL pin be driven in software if SSL Level Keeping is not present on the device.
- In order to use CPHA=0 setting in slave mode, the master must toggle the SSL pin after every data frame (Even if the device supports SSL Level Keeping). Because of this hardware limitation, the module will return FSP_ERR_UNSUPPORTED when it is configured to use CPHA=0 setting in slave mode.
- The module does not support communicating with multiple slaves using different SSL pins. In order to achieve this, the module must either be closed and re-opened to change the SSL pin or drive SSL in software. It is recommended that SSL be driven in software when controlling multiple slave devices.
- The SPI peripheral has a minimum 3 SPI CLK delay between each data frame.
- The behavior for Byte Swap operation is not guaranteed for data frames other than 8-bit, 16-bit and 32bit.

Examples

Basic Example

This is a basic example of minimal use of the SPI in an application.

```
static volatile bool g_transfer_complete = false;
void spi_basic_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
    fsp_err_t err = FSP_SUCCESS;
    /* Initialize the SPI module. */
    err = R_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
    /* Handle any errors. This function should be defined by the user. */
```

```
    assert(FSP_SUCCESS == err);
    /* Start a write/read transfer */
    err = R_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
    assert(FSP_SUCCESS == err);
    /* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
    while (false == g_transfer_complete)
    {
        ;
    }
}
static void r_spi_callback (spi_callback_args_t * p_args)
{
    if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
        g_transfer_complete = true;
    }
}
```

Driving Software Slave Select Line

This is an example of communicating with multiple slave devices by asserting SSL in software.

```
void spi_software_ssl_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
    /* Configure Slave Select Line 1 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
    /* Configure Slave Select Line 2 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
    fsp_err_t err = FSP_SUCCESS;
    /* Initialize the SPI module. */
    err = R_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
    /* Handle any errors. This function should be defined by the user. */
```

```
    assert(FSP_SUCCESS == err);
/* Assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);
/* Start a write/read transfer */
g_transfer_complete = false;
err                  = R_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer,
TRANSFER_SIZE, SPI_BIT_WIDTH_8_BITS);
    assert(FSP_SUCCESS == err);
/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
    {
        ;
    }
/* De-assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
/* Wait for minimum time required between transfers. */
R_BSP_SoftwareDelay(SSL_NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);
/* Assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_LOW);
/* Start a write/read transfer */
g_transfer_complete = false;
err                  = R_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer,
TRANSFER_SIZE, SPI_BIT_WIDTH_8_BITS);
    assert(FSP_SUCCESS == err);
/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
    {
        ;
    }
/* De-assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
}
```

Configuring the SPI Clock Divider Registers

This example demonstrates how to set the SPI clock divisors at runtime.

```
void spi_bitrate_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    g_spi_cfg.p_extend = &g_spi_extended_cfg;

    /* Configure SPI Clock divider to achieve largest bitrate less than or equal to the
    desired bitrate. */

    err = R_SPI_CalculateBitrate(BITRATE, &(g_spi_extended_cfg.spck_div));
    assert(FSP_SUCCESS == err);

    /* Initialize the SPI module. */

    err = R_SPI_Open(&g_spi_ctrl, &g_spi_cfg);

    /* Handle any errors. This function should be defined by the user. */

    assert(FSP_SUCCESS == err);
}
```

Data Structure Documentation

◆ **rspck_div_setting_t**

| | | |
|-----------------------------|---------|-------------------------|
| struct rspck_div_setting_t | | |
| SPI Clock Divider settings. | | |
| Data Fields | | |
| uint8_t | spbr | SPBR register setting. |
| uint8_t | brdv: 2 | BRDV setting in SPCMD0. |

◆ **spi_extended_cfg_t**

| | | |
|--------------------------------------|--------------------|--|
| struct spi_extended_cfg_t | | |
| Extended SPI interface configuration | | |
| Data Fields | | |
| spi_ssl_mode_t | spi_clksyn | Select spi or clock syn mode operation. |
| spi_communication_t | spi_comm | Select full-duplex or transmit-only communication. |
| spi_ssl_polarity_t | ssl_polarity | Select SSLn signal polarity. |
| spi_ssl_select_t | ssl_select | Select which slave to use: 0-SSL0, 1-SSL1, 2-SSL2, 3-SSL3. |
| spi_mosi_idle_value_fixing_t | mosi_idle | Select MOSI idle fixed value and selection. |
| spi_parity_t | parity | Select parity and enable/disable parity. |
| spi_byte_swap_t | byte_swap | Select byte swap mode. |
| rspck_div_setting_t | spck_div | Register values for configuring the SPI Clock Divider. |
| spi_delay_count_t | spck_delay | SPI Clock Delay Register Setting. |
| spi_delay_count_t | ssl_negation_delay | SPI Slave Select Negation Delay Register Setting. |
| spi_delay_count_t | next_access_delay | SPI Next-Access Delay Register Setting. |

◆ **spi_instance_ctrl_t**

| | |
|---|--|
| struct spi_instance_ctrl_t | |
| Channel control block. DO NOT INITIALIZE. Initialization occurs when spi_api_t::open is called. | |
| Data Fields | |
| uint32_t | open |
| | Indicates whether the open() API has been successfully called. |

| | |
|--------------------------------|---|
| <code>spi_cfg_t const *</code> | <code>p_cfg</code> |
| | Pointer to instance configuration. |
| <code>R_SPI0_Type *</code> | <code>p_regs</code> |
| | Base register for this channel. |
| <code>void const *</code> | <code>p_tx_data</code> |
| | Buffer to transmit. |
| <code>void *</code> | <code>p_rx_data</code> |
| | Buffer to receive. |
| <code>uint32_t</code> | <code>tx_count</code> |
| | Number of Data Frames to transfer (8-bit, 16-bit, 32-bit) |
| <code>uint32_t</code> | <code>rx_count</code> |
| | Number of Data Frames to transfer (8-bit, 16-bit, 32-bit) |
| <code>uint32_t</code> | <code>count</code> |
| | Number of Data Frames to transfer (8-bit, 16-bit, 32-bit) |
| <code>spi_bit_width_t</code> | <code>bit_width</code> |
| | Bits per Data frame (8-bit, 16-bit, 32-bit) |

Enumeration Type Documentation

◆ spi_ssl_mode_t

| | |
|------------------------|---|
| enum spi_ssl_mode_t | |
| 3-Wire or 4-Wire mode. | |
| Enumerator | |
| SPI_SSL_MODE_SPI | SPI operation (4-wire method) |
| SPI_SSL_MODE_CLK_SYN | Clock Synchronous operation (3-wire method) |

◆ spi_communication_t

| | |
|--|---|
| enum spi_communication_t | |
| Transmit Only (Half Duplex), or Full Duplex. | |
| Enumerator | |
| SPI_COMMUNICATION_FULL_DUPLEX | Full-Duplex synchronous serial communication. |
| SPI_COMMUNICATION_TRANSMIT_ONLY | Transit only serial communication. |

◆ spi_ssl_polarity_t

| | |
|-------------------------|-----------------------------------|
| enum spi_ssl_polarity_t | |
| Slave Select Polarity. | |
| Enumerator | |
| SPI_SSPL_LOW | SSPL signal polarity active low. |
| SPI_SSPL_HIGH | SSPL signal polarity active high. |

◆ spi_ssl_select_t

| enum spi_ssl_select_t | |
|-----------------------|--------------|
| The Slave Select Line | |
| Enumerator | |
| SPI_SSL_SELECT_SSL0 | Select SSL0. |
| SPI_SSL_SELECT_SSL1 | Select SSL1. |
| SPI_SSL_SELECT_SSL2 | Select SSL2. |
| SPI_SSL_SELECT_SSL3 | Select SSL3. |

◆ spi_mosi_idle_value_fixing_t

| enum spi_mosi_idle_value_fixing_t | |
|------------------------------------|---|
| MOSI Idle Behavior. | |
| Enumerator | |
| SPI_MOSI_IDLE_VALUE_FIXING_DISABLE | MOSI output value=value set in MOIFV bit. |
| SPI_MOSI_IDLE_VALUE_FIXING_LOW | MOSIn level low during MOSI idling. |
| SPI_MOSI_IDLE_VALUE_FIXING_HIGH | MOSIn level high during MOSI idling. |

◆ spi_parity_t

| enum spi_parity_t | |
|-------------------------|---------------------|
| Parity Mode | |
| Enumerator | |
| SPI_PARITY_MODE_DISABLE | Disable parity. |
| SPI_PARITY_MODE_ODD | Select even parity. |
| SPI_PARITY_MODE_EVEN | Select odd parity. |

◆ spi_byte_swap_t

| enum spi_byte_swap_t | |
|-------------------------------|--|
| Byte Swapping Enable/Disable. | |
| Enumerator | |
| SPI_BYTE_SWAP_DISABLE | Disable Byte swapping for 16/32-Bit transfers. |
| SPI_BYTE_SWAP_ENABLE | Enable Byte swapping for 16/32-Bit transfers. |

◆ spi_delay_count_t

| enum spi_delay_count_t | |
|-------------------------------------|-----------------------------------|
| Delay count for SPI delay settings. | |
| Enumerator | |
| SPI_DELAY_COUNT_1 | Set RSPCK delay count to 1 RSPCK. |
| SPI_DELAY_COUNT_2 | Set RSPCK delay count to 2 RSPCK. |
| SPI_DELAY_COUNT_3 | Set RSPCK delay count to 3 RSPCK. |
| SPI_DELAY_COUNT_4 | Set RSPCK delay count to 4 RSPCK. |
| SPI_DELAY_COUNT_5 | Set RSPCK delay count to 5 RSPCK. |
| SPI_DELAY_COUNT_6 | Set RSPCK delay count to 6 RSPCK. |
| SPI_DELAY_COUNT_7 | Set RSPCK delay count to 7 RSPCK. |
| SPI_DELAY_COUNT_8 | Set RSPCK delay count to 8 RSPCK. |

Function Documentation

◆ **R_SPI_Open()**

```
fsp_err_t R_SPI_Open ( spi_ctrl_t* p_api_ctrl, spi_cfg_t const *const p_cfg )
```

This function initializes a channel for SPI communication mode. Implements [spi_api_t::open](#).

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Configures the peripheral registers according to the configuration.
- Initialize the control structure for use in other [SPI Interface](#) functions.

Return values

| | |
|--------------------------------|--|
| FSP_SUCCESS | Channel initialized successfully. |
| FSP_ERR_ALREADY_OPEN | Instance was already initialized. |
| FSP_ERR_ASSERTION | An invalid argument was given in the configuration structure. |
| FSP_ERR_UNSUPPORTED | A requested setting is not possible on this device with the current build configuration. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | The channel number is invalid. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls: [transfer_api_t::open](#)

Note

This function is reentrant.

◆ **R_SPI_Read()**

```
fsp_err_t R_SPI_Read ( spi_ctrl_t*const p_api_ctrl, void* p_dest, uint32_t const length, spi_bit_width_t const bit_width )
```

This function receives data from a SPI device. Implements [spi_api_t::read](#).

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI read operation.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Read operation successfully completed. |
| FSP_ERR_ASSERTION | NULL pointer to control or destination parameters or transfer length is zero. |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open channel first. |
| FSP_ERR_IN_USE | A transfer is already in progress. |

◆ **R_SPI_Write()**

```
fsp_err_t R_SPI_Write ( spi_ctrl_t *const p_api_ctrl, void const * p_src, uint32_t const length,
spi_bit_width_t const bit_width )
```

This function transmits data to a SPI device using the TX Only Communications Operation Mode. Implements `spi_api_t::write`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI write operation.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Write operation successfully completed. |
| FSP_ERR_ASSERTION | NULL pointer to control or source parameters or transfer length is zero. |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |
| FSP_ERR_IN_USE | A transfer is already in progress. |

◆ **R_SPI_WriteRead()**

```
fsp_err_t R_SPI_WriteRead ( spi_ctrl_t *const p_api_ctrl, void const * p_src, void * p_dest, uint32_t
const length, spi_bit_width_t const bit_width )
```

This function simultaneously transmits and receive data. Implements `spi_api_t::writeRead`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI writeRead operation.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Write operation successfully completed. |
| FSP_ERR_ASSERTION | NULL pointer to control, source or destination parameters or transfer length is zero. |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |
| FSP_ERR_IN_USE | A transfer is already in progress. |

◆ **R_SPI_CallbackSet()**

```
fsp_err_t R_SPI_CallbackSet ( spi_ctrl_t *const p_api_ctrl, void(*) (spi_callback_args_t *) p_callback,
void const *const p_context, spi_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [spi_api_t::callbackSet](#)

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

◆ **R_SPI_Close()**

```
fsp_err_t R_SPI_Close ( spi_ctrl_t *const p_api_ctrl)
```

This function manages the closing of a channel by the following task. Implements [spi_api_t::close](#).

Disables SPI operations by disabling the SPI bus.

- Disables the SPI peripheral.
- Disables all the associated interrupts.
- Update control structure so it will not work with [SPI Interface](#) functions.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | A required pointer argument is NULL. |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |

◆ R_SPI_CalculateBitrate()

```
fsp_err_t R_SPI_CalculateBitrate ( uint32_t bitrate, rspck_div_setting_t * spck_div )
```

Calculates the SPBR register value and the BRDV bits for a desired bitrate. If the desired bitrate is faster than the maximum bitrate, than the bitrate is set to the maximum bitrate. If the desired bitrate is slower than the minimum bitrate, than an error is returned.

Parameters

| | | |
|-------|----------|---|
| [in] | bitrate | Desired bitrate |
| [out] | spck_div | Memory location to store bitrate register settings. |

Return values

| | |
|---------------------|--|
| FSP_SUCCESS | Valid spbr and brdv values were calculated |
| FSP_ERR_UNSUPPORTED | Bitrate is not achievable |

5.2.6.21 SPI (r_spi_b)

```
fsp_err_t R_SPI_B_WriteRead (spi_ctrl_t *const p_api_ctrl, void const *p_src, void *p_dest, uint32_t const length, spi_bit_width_t const bit_width)
```

```
fsp_err_t R_SPI_B_CallbackSet (spi_ctrl_t *const p_api_ctrl, void(*p_callback)(spi_callback_args_t *), void const *const p_context, spi_callback_args_t *const p_callback_memory)
```

```
fsp_err_t R_SPI_B_Close (spi_ctrl_t *const p_api_ctrl)
```

```
fsp_err_t R_SPI_B_CalculateBitrate (uint32_t bitrate, spi_b_clock_source_t clock_source, rspck_div_setting_t *spck_div)
```

Detailed Description

Driver for the SPI peripheral on RA MCUs. This module implements the [SPI Interface](#).

Overview

Features

- Standard SPI Modes
 - Master or Slave Mode
 - 3-Wire (clock synchronous) or 4-Wire (SPI) Mode
 - Clock Polarity (CPOL)
 - CPOL=0 SCLK is low when idle
 - CPOL=1 SCLK is high when idle
 - Clock Phase (CPHA)
 - CPHA=0 Data Sampled on the even edge of SCLK (Master Mode Only)
 - CPHA=1 Data Sampled on the odd edge of SCLK
 - MSB/LSB first
 - 8- to 32-Bit data frames
 - Hardware endian swap in 16-Bit and 32-Bit mode
 - SSL level keep (burst transfer) supported
- Configurable bitrate
- Supports Full Duplex or Transmit Only Mode
- DTC Support
- Callback Events
 - Transfer Complete
 - RX Overflow Error (The SPI shift register is copied to the data register before previous data was read)
 - TX Underrun Error (No data to load into shift register for transmitting)
 - Parity Error (When parity is enabled and a parity error is detected)

Configuration

Build Time Configurations for r_spi_b

The following build time configurations are defined in fsp_cfg/r_spi_b_cfg.h:

| Configuration | Options | Default | Description |
|--|--|---------------|--|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Enable Support for using DTC | <ul style="list-style-type: none"> • Enabled • Disabled | Enabled | If enabled, DTC instances will be included in the build for both transmission and reception. |
| Enable Transmitting from RXI Interrupt | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | If enabled, all operations will be handled from the RX (receive) interrupt. This setting only provides a performance boost |

when DTC is not used. In addition, Transmit Only mode is not supported when this configuration is enabled.

Configurations for Connectivity > SPI (r_spi_b)

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r_spi_b). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|--|--|--|---|
| Name | Name must be a valid C symbol | g_spi0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Select the SPI channel. |
| Receive Interrupt Priority | MCU Specific Options | | Select the interrupt priority for all SPI interrupts. |
| Transmit Buffer Empty Interrupt Priority | MCU Specific Options | | Select the interrupt priority for all SPI interrupts. |
| Transfer Complete Interrupt Priority | MCU Specific Options | | Select the interrupt priority for all SPI interrupts. |
| Error Interrupt Priority | MCU Specific Options | | Select the interrupt priority for all SPI interrupts. |
| Operating Mode | <ul style="list-style-type: none"> Master Slave | Master | Select the SPI operating mode. |
| Clock Phase | <ul style="list-style-type: none"> Data sampling on odd edge, data variation on even edge Data sampling on even edge, data variation on odd edge | Data sampling on odd edge, data variation on even edge | Select the clock edge to sample data. |
| Clock Polarity | <ul style="list-style-type: none"> Low when idle High when idle | Low when idle | Select clock level when idle. |
| Mode Fault Error | <ul style="list-style-type: none"> Enable Disable | Disable | Detect master/slave mode conflicts. |
| Bit Order | <ul style="list-style-type: none"> MSB First LSB First | MSB First | Select the data bit order. |
| Callback | Name must be a valid | spi_callback | A user callback |

| | C symbol | | function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR). |
|---------------------------|---|--------------------------------|--|
| SPI Mode | <ul style="list-style-type: none"> • SPI Operation • Clock Synchronous Operation | Clock Synchronous Operation | Select the clock sync mode. |
| Communication Mode Select | <ul style="list-style-type: none"> • Full Duplex • Transmit Only | Full Duplex | Select Full Duplex or Transmit Only Mode. |
| Slave Select Polarity | <ul style="list-style-type: none"> • Active Low • Active High | Active Low | Select the slave select active level. |
| Select SSL(Slave Select) | <ul style="list-style-type: none"> • SSL0 • SSL1 • SSL2 • SSL3 | SSL0 | Select which slave to use. |
| MOSI Idle State | <ul style="list-style-type: none"> • MOSI Idle Value Fixing Disable • MOSI Idle Value Fixing Low • MOSI Idle Value Fixing High | MOSI Idle Value Fixing Disable | Select the MOSI idle level if MOSI idle is enabled. |
| Parity Mode | <ul style="list-style-type: none"> • Disabled • Odd • Even | Disabled | Select the parity mode if parity is enabled. |
| Byte Swapping | <ul style="list-style-type: none"> • Disable • Enable | Disable | Select the byte swap mode for 16/32-Bit Data Frames. |
| Clock Source | MCU Specific Options | | Select the clock source for communication. |
| Bitrate | Value must be an integer greater than 0 | 16000000 | Enter the desired bitrate, change the bitrate to a value supported by MCU. If the requested bitrate cannot be achieved, the settings with the largest possible value that is less than or equal to the requested bitrate is used. The theoretical bitrate is printed in a comment in the generated spi_extended_cfg_t structure. |

| | | | |
|--------------------|---|---------|---|
| Clock Delay | <ul style="list-style-type: none"> • 1 Clock • 2 Clocks • 3 Clocks • 4 Clocks • 5 Clocks • 6 Clocks • 7 Clocks • 8 Clocks | 1 Clock | Configure the number of SPI clock cycles before each data frame. |
| SSL Negation Delay | <ul style="list-style-type: none"> • 1 Clock • 2 Clocks • 3 Clocks • 4 Clocks • 5 Clocks • 6 Clocks • 7 Clocks • 8 Clocks | 1 Clock | Configure the number of SPI clock cycles after each data frame. |
| Next Access Delay | <ul style="list-style-type: none"> • 1 Clock • 2 Clocks • 3 Clocks • 4 Clocks • 5 Clocks • 6 Clocks • 7 Clocks • 8 Clocks | 1 Clock | Configure the number of SPI clock cycles between each data frame. |

Clock Configuration

The SPI peripheral uses the SCISPICK for communication and PCLKB for internal operations. Both can be configured via the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

Pin Configuration

This module uses MOSI, MISO, RSPCK, and SSL pins to communicate with on board devices.

Note

At high bitrates it may be necessary to configure the pins with IOPORT_CFG_DRIVE_HIGH to maintain signal integrity.

Usage Notes

Performance

At high bitrates, interrupts may not be able to service transfers fast enough. In master mode this means there will be a delay between each data frame. In slave mode this could result in TX Underrun and RX Overflow errors.

In order to improve performance at high bitrates, it is recommended that the instance be configured to service transfers using the DTC.

Another way to improve performance is to transfer the data in 16/32 bit wide data frames when possible. A typical use-case where this is possible is when reading/writing to a block device.

Transmit From RXI Interrupt

After every data frame the SPI peripheral generates a transmit buffer empty interrupt and a receive buffer full interrupt. It is possible to configure the driver to handle transmit buffer empty interrupts in the receive buffer full ISR. This only improves performance when the DTC is not being used.

Note

Configuring the module to use RX DTC instance without also providing a TX DTC instance results in an invalid configuration when RXI transmit is enabled.

Transmit Only mode is not supported when Transmit from RXI is enabled.

Clock Auto-Stopping

In master mode, if the Receive Buffer Full Interrupts are not handled fast enough, instead of generating a RX Overflow error, the last clock cycle will be stretched until the receive buffer is read.

Parity Mode

When parity mode is configured, the LSB of each data frame is used as a parity bit. When odd parity is selected, the LSB is set such that there are an odd number of ones in the data frame. When even parity is selected, the LSB is set such that there are an even number of ones in the data frame.

Limitations

Developers should be aware of the following limitations when using the SPI:

- In master mode, the driver will only configure 4-Wire mode if the device supports SSL Level Keeping (SSLKP bit in SPCMD0) and will return FSP_ERR_UNSUPPORTED if configured for 4-Wire mode on devices without SSL Level Keeping. Without SSL Level Keeping, the SSL pin is toggled after every data frame. In most cases this is not desirable behavior so it is recommended that the SSL pin be driven in software if SSL Level Keeping is not present on the device.
- The module does not support communicating with multiple slaves using different SSL pins. In order to achieve this, the module must either be closed and re-opened to change the SSL pin or drive SSL in software. It is recommended that SSL be driven in software when controlling multiple slave devices.
- The SPI peripheral has a minimum 3 SPI CLK delay between each data frame.
- The behavior for Byte Swap operation is not guaranteed for data frames other than 8-bit, 16-bit and 32bit.

Examples

Basic Example

This is a basic example of minimal use of the SPI in an application.

```
static volatile bool g_transfer_complete = false;
void spi_basic_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
```

```
fsp_err_t err = FSP_SUCCESS;

/* Initialize the SPI module. */
err = R_SPI_B_Open(&g_spi_ctrl, &g_spi_cfg);

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

/* Start a write/read transfer */
err = R_SPI_B_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);

assert(FSP_SUCCESS == err);

/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
{
    ;
}

static void r_spi_callback (spi_callback_args_t * p_args)
{
    if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
        g_transfer_complete = true;
    }
}
```

Driving Software Slave Select Line

This is an example of communicating with multiple slave devices by asserting SSL in software.

```
void spi_software_ssl_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];

    /* Configure Slave Select Line 1 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);

    /* Configure Slave Select Line 2 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
}
```

```
fsp_err_t err = FSP_SUCCESS;

/* Initialize the SPI module. */
err = R_SPI_B_Open(&g_spi_ctrl, &g_spi_cfg);

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

/* Assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);

/* Start a write/read transfer */
g_transfer_complete = false;
err = R_SPI_B_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer,
TRANSFER_SIZE, SPI_BIT_WIDTH_8_BITS);
assert(FSP_SUCCESS == err);

/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
{
    ;
}

/* De-assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);

/* Wait for minimum time required between transfers. */
R_BSP_SoftwareDelay(SSL_NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);

/* Assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_LOW);

/* Start a write/read transfer */
g_transfer_complete = false;
err = R_SPI_B_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer,
TRANSFER_SIZE, SPI_BIT_WIDTH_8_BITS);
assert(FSP_SUCCESS == err);

/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
{
    ;
}

/* De-assert Slave Select Line 2 */
```

```
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);  
}
```

Configuring the SPI Clock Divider Registers

This example demonstrates how to set the SPI clock divisors at runtime.

```
void spi_bitrate_example (void)  
{  
    fsp_err_t err = FSP_SUCCESS;  
    g_spi_cfg.p_extend = &g_spi_extended_cfg;  
    /* Configure SPI Clock divider to achieve largest bitrate less than or equal to the  
desired bitrate. */  
    err = R_SPI_B_CalculateBitrate(BITRATE, SPI_B_CLOCK_SOURCE_SCISPICKL,  
&(g_spi_extended_cfg.spck_div));  
    assert(FSP_SUCCESS == err);  
    /* Initialize the SPI module. */  
    err = R_SPI_B_Open(&g_spi_ctrl, &g_spi_cfg);  
    /* Handle any errors. This function should be defined by the user. */  
    assert(FSP_SUCCESS == err);  
}
```

Enumeration Type Documentation

◆ `spi_b_ssl_mode_t`

| | |
|-------------------------------------|---|
| enum <code>spi_b_ssl_mode_t</code> | |
| 3-Wire or 4-Wire mode. | |
| Enumerator | |
| <code>SPI_B_SSL_MODE_SPI</code> | SPI operation (4-wire method) |
| <code>SPI_B_SSL_MODE_CLK_SYN</code> | Clock Synchronous operation (3-wire method) |

◆ `spi_b_communication_t`

| | |
|--|---|
| enum <code>spi_b_communication_t</code> | |
| Transmit Only (Half Duplex), or Full Duplex. | |
| Enumerator | |
| <code>SPI_B_COMMUNICATION_FULL_DUPLEX</code> | Full-Duplex synchronous serial communication. |
| <code>SPI_B_COMMUNICATION_TRANSMIT_ONLY</code> | Transit only serial communication. |

◆ `spi_b_ssl_polarity_t`

| | |
|--|-----------------------------------|
| enum <code>spi_b_ssl_polarity_t</code> | |
| Slave Select Polarity. | |
| Enumerator | |
| <code>SPI_B_SSLP_LOW</code> | SSLP signal polarity active low. |
| <code>SPI_B_SSLP_HIGH</code> | SSLP signal polarity active high. |

◆ spi_b_ssl_select_t

| enum spi_b_ssl_select_t | |
|-------------------------|--------------|
| The Slave Select Line | |
| Enumerator | |
| SPI_B_SSL_SELECT_SSL0 | Select SSL0. |
| SPI_B_SSL_SELECT_SSL1 | Select SSL1. |
| SPI_B_SSL_SELECT_SSL2 | Select SSL2. |
| SPI_B_SSL_SELECT_SSL3 | Select SSL3. |

◆ spi_b_mosi_idle_value_fixing_t

| enum spi_b_mosi_idle_value_fixing_t | |
|--------------------------------------|---|
| MOSI Idle Behavior. | |
| Enumerator | |
| SPI_B_MOSI_IDLE_VALUE_FIXING_DISABLE | MOSI output value=value set in MOIFV bit. |
| SPI_B_MOSI_IDLE_VALUE_FIXING_LOW | MOSIn level low during MOSI idling. |
| SPI_B_MOSI_IDLE_VALUE_FIXING_HIGH | MOSIn level high during MOSI idling. |

◆ spi_b_parity_t

| enum spi_b_parity_t | |
|---------------------------|---------------------|
| Parity Mode | |
| Enumerator | |
| SPI_B_PARITY_MODE_DISABLE | Disable parity. |
| SPI_B_PARITY_MODE_ODD | Select even parity. |
| SPI_B_PARITY_MODE_EVEN | Select odd parity. |

◆ spi_b_byte_swap_t

| | |
|-------------------------------|--|
| enum spi_b_byte_swap_t | |
| Byte Swapping Enable/Disable. | |
| Enumerator | |
| SPI_B_BYTE_SWAP_DISABLE | Disable Byte swapping for 16/32-Bit transfers. |
| SPI_B_BYTE_SWAP_ENABLE | Enable Byte swapping for 16/32-Bit transfers. |

◆ spi_b_delay_count_t

| | |
|-------------------------------------|-----------------------------------|
| enum spi_b_delay_count_t | |
| Delay count for SPI delay settings. | |
| Enumerator | |
| SPI_B_DELAY_COUNT_1 | Set RSPCK delay count to 1 RSPCK. |
| SPI_B_DELAY_COUNT_2 | Set RSPCK delay count to 2 RSPCK. |
| SPI_B_DELAY_COUNT_3 | Set RSPCK delay count to 3 RSPCK. |
| SPI_B_DELAY_COUNT_4 | Set RSPCK delay count to 4 RSPCK. |
| SPI_B_DELAY_COUNT_5 | Set RSPCK delay count to 5 RSPCK. |
| SPI_B_DELAY_COUNT_6 | Set RSPCK delay count to 6 RSPCK. |
| SPI_B_DELAY_COUNT_7 | Set RSPCK delay count to 7 RSPCK. |
| SPI_B_DELAY_COUNT_8 | Set RSPCK delay count to 8 RSPCK. |

◆ spi_b_clock_source_t

| | |
|---------------------------------|--|
| enum spi_b_clock_source_t | |
| SPI communication clock source. | |

Function Documentation

◆ **R_SPI_B_Open()**

```
fsp_err_t R_SPI_B_Open ( spi_ctrl_t* p_api_ctrl, spi_cfg_t const *const p_cfg )
```

This function initializes a channel for SPI communication mode. Implements [spi_api_t::open](#).

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Configures the peripheral registers according to the configuration.
- Initialize the control structure for use in other [SPI Interface](#) functions.

Return values

| | |
|--------------------------------|--|
| FSP_SUCCESS | Channel initialized successfully. |
| FSP_ERR_ALREADY_OPEN | Instance was already initialized. |
| FSP_ERR_ASSERTION | An invalid argument was given in the configuration structure. |
| FSP_ERR_UNSUPPORTED | A requested setting is not possible on this device with the current build configuration. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | The channel number is invalid. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls: [transfer_api_t::open](#)

Note

This function is reentrant.

◆ **R_SPI_B_Read()**

```
fsp_err_t R_SPI_B_Read ( spi_ctrl_t*const p_api_ctrl, void* p_dest, uint32_t const length, spi_bit_width_t const bit_width )
```

This function receives data from a SPI device. Implements [spi_api_t::read](#).

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI read operation.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Read operation successfully completed. |
| FSP_ERR_ASSERTION | NULL pointer to control or destination parameters or transfer length is zero. |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open channel first. |
| FSP_ERR_IN_USE | A transfer is already in progress. |

◆ **R_SPI_B_Write()**

```
fsp_err_t R_SPI_B_Write ( spi_ctrl_t*const p_api_ctrl, void const * p_src, uint32_t const length,
spi_bit_width_t const bit_width )
```

This function transmits data to a SPI device using the TX Only Communications Operation Mode. Implements `spi_api_t::write`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI write operation.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Write operation successfully completed. |
| FSP_ERR_ASSERTION | NULL pointer to control or source parameters or transfer length is zero. |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |
| FSP_ERR_IN_USE | A transfer is already in progress. |

◆ **R_SPI_B_WriteRead()**

```
fsp_err_t R_SPI_B_WriteRead ( spi_ctrl_t*const p_api_ctrl, void const * p_src, void * p_dest,
uint32_t const length, spi_bit_width_t const bit_width )
```

This function simultaneously transmits and receive data. Implements `spi_api_t::writeRead`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI writeRead operation.

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Write operation successfully completed. |
| FSP_ERR_ASSERTION | NULL pointer to control, source or destination parameters or transfer length is zero. |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |
| FSP_ERR_IN_USE | A transfer is already in progress. |

◆ **R_SPI_B_CallbackSet()**

```
fsp_err_t R_SPI_B_CallbackSet ( spi_ctrl_t *const p_api_ctrl, void(*) (spi_callback_args_t *)
p_callback, void const *const p_context, spi_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [spi_api_t::callbackSet](#)

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

◆ **R_SPI_B_Close()**

```
fsp_err_t R_SPI_B_Close ( spi_ctrl_t *const p_api_ctrl)
```

This function manages the closing of a channel by the following task. Implements [spi_api_t::close](#).

Disables SPI operations by disabling the SPI bus.

- Disables the SPI peripheral.
- Disables all the associated interrupts.
- Update control structure so it will not work with [SPI Interface](#) functions.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | A required pointer argument is NULL. |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |

◆ R_SPI_B_CalculateBitrate()

```
fsp_err_t R_SPI_B_CalculateBitrate ( uint32_t bitrate, spi_b_clock_source_t clock_source,
rspck_div_setting_t* spck_div )
```

Calculates the SPBR register value and the BRDV bits for a desired bitrate. If the desired bitrate is faster than the maximum bitrate, than the bitrate is set to the maximum bitrate. If the desired bitrate is slower than the minimum bitrate, than an error is returned.

Parameters

| | | |
|-------|--------------|---|
| [in] | bitrate | Desired bitrate |
| [in] | clock_source | SPI communication clock source to be used |
| [out] | spck_div | Memory location to store bitrate register settings. |

Return values

| | |
|---------------------|--|
| FSP_SUCCESS | Valid spbr and brdv values were calculated |
| FSP_ERR_UNSUPPORTED | Bitrate is not achievable |

```

Detailed Description

UART driver for the SAU peripheral on RA MCUs. This module implements the [UART Interface](#).

Overview

Features

The SAU UART module supports the following features:

- Full-duplex UART communication
- Interrupt-driven data transmission and reception
- Invoking the user-callback function with an event code (RX/TX complete, TX data empty, RX char, error, etc)
- Baud-rate change at run-time
- Integration with the DTC transfer module
- Abort in-progress read/write operations

Configuration

Build Time Configurations for r_sau_uart

The following build time configurations are defined in fsp_cfg/r_sau_uart_cfg.h:

| Configuration | Options | Default | Description |
|---------------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Critical Section Guarding | <ul style="list-style-type: none"> • Enabled • Disabled | Disabled | Enable critical section guarding around peripheral configuration updates. This should be enabled if the R_SAU_I2C module is being used simultaneously with this module. |
| DTC Support | <ul style="list-style-type: none"> • Enable | Disable | Enable DTC support for |

- Disable

the SAU_UART module.

Configurations for Connectivity > UART (r_sau_uart)

This module can be added to the Stacks tab via New Stack > Connectivity > UART (r_sau_uart).

| Configuration | Options | Default | Description |
|-----------------|---|-----------|---|
| General | | | |
| Name | Name must be a valid C symbol | g_uart0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Select the UART channel. |
| Data Bits | <ul style="list-style-type: none"> • 7 bits • 8 bits • 9 bits | 8 bits | Select the number of bits per word. |
| Parity | <ul style="list-style-type: none"> • None • Zero • Odd • Even | None | Select the parity mode. |
| Stop Bits | <ul style="list-style-type: none"> • 1 bit • 2 bits | 1 bit | Select the number of stop bits. In receive, 2 bit is not available. |
| Bit Order | <ul style="list-style-type: none"> • LSB First • MSB First | LSB First | Select of data transfer sequence. |
| Baud | | | |
| Baud Rate | Value must be an integer greater than 0 | 115200 | <p>Enter the desired baud rate.</p> <p>If the requested baud rate cannot be achieved, the settings with the smallest percent error are used. The theoretical calculated baud rate and percent error are printed in a comment in the generated baud_setting_t structure.</p> |
| Extra | | | |
| Operation Clock | <ul style="list-style-type: none"> • CK0 • CK1 | CK0 | <p>Select the operating clock.</p> <p>Note: when creating multiple stacks related to the same unit in SAU, selecting the</p> |

| | | | |
|---------------------------------|--|----------------------|--|
| | | | same CK may result in unexpected deviation in baud rate. |
| Transfer Mode | <ul style="list-style-type: none"> • Single transfer mode • Continuous transfer mode | Single transfer mode | Select the transfer mode. |
| Tx Signal Level | <ul style="list-style-type: none"> • Standard • Inverted | Standard | Select the level of transmitted signal. |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | NULL | A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR). |
| Transmit End Interrupt Priority | MCU Specific Options | | Select the receive interrupt priority. |
| Receive End Interrupt Priority | MCU Specific Options | | Select the receive interrupt priority. |
| Error Interrupt Priority | MCU Specific Options | | Select the receive interrupt priority. |

Clock Configuration

The SAU clock is based on the peripheral module clock which is the system clock (ICLK).

Pin Configuration

Usage Notes

9-bit data transfers

- `p_src`: the address for the send data buffer. `p_src` in `R_SAU_UART_Write` must be aligned on a 16-bit boundary. (the data order in buffer: the lower 8-bits of the first number, the highest 1-bit of the first number, the lower 8-bits of the second number, the highest 1-bit of the second number, etc)
- `byte`: the size of send data buffer.

Limitations

- When creating multiple stacks related to the same unit in SAU, selecting the same CK may result in unexpected deviation in baud rate. Related SAU modules: SAU-SPI, SAU-IIC and SAU-UART.
- Reception is still enabled after `uart_api_t::communicationAbort` API is called. Any characters received after abort and before the next call to read will arrive via the callback function with event `UART_EVENT_RX_CHAR`.
- If 9-bit data length is specified at `R_SAU_UART_Open` call, `p_src` in `R_SAU_UART_Write` must

be aligned on a 16-bit boundary.

- When multiple channels on the same SAU unit need to be used, and one is configured as UART, then critical section property needs to be enabled.

DTC Limitations

- DTC support is available for reception, but labeled as [Not recommended]. This is because the UART bytes are received asynchronously. Bytes can be received between calls to `R_SAU_UART_Read()`. The logic required to combine bytes received through `R_SAU_UART_Read()` (UART_EVENT_RX_COMPLETE) and bytes received between calls (UART_EVENT_RX_CHAR) is complex. Reception length may also be unknown, and the driver will not issue an interrupt unless the entire DTC buffer is filled.
- Transfer size must be less than or equal to 64K bytes if DTC interface is used for transfer. `uart_api_t::infoGet` API can be used to get the max transfer size allowed.
- When using 9-bit reception with DTC, clear the upper 7 bits of data before processing the read data. The upper 7 bits contain status flags that are part of the register used to read data in 9-bit mode.

Examples

SAU UART Example

```
uint8_t g_dest[TRANSFER_LENGTH];
uint8_t g_src[TRANSFER_LENGTH];
uint8_t g_out_of_band_received[TRANSFER_LENGTH];
uint32_t g_transfer_complete = 0;
uint32_t g_receive_complete = 0;
uint32_t g_out_of_band_index = 0;
void r_sau_uart_basic_example (void)
{
    /* Initialize p_src to known data */
    for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
        g_src[i] = (uint8_t) ('A' + (i % 26));
    }

    /* Open the transfer instance with initial configuration. */
    fsp_err_t err = R_SAU_UART_Open(&g_uart0_ctrl, &g_uart0_cfg);
    assert(FSP_SUCCESS == err);

    err = R_SAU_UART_Read(&g_uart0_ctrl, g_dest, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);

    err = R_SAU_UART_Write(&g_uart0_ctrl, g_src, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
}
```

```
while (!g_transfer_complete)
{
}

while (!g_receive_complete)
{
}
}

void example_callback (uart_callback_args_t * p_args)
{
/* Handle the UART event */
switch (p_args->event)
{
/* Received a character */
case UART_EVENT_RX_CHAR:
{
/* Only put the next character in the receive buffer if there is space for it */
if (sizeof(g_out_of_band_received) > g_out_of_band_index)
{
/* Write either the next one or two bytes depending on the receive data size */
if (UART_DATA_BITS_8 >= g_uart0_cfg.data_bits)
{
g_out_of_band_received[g_out_of_band_index++] = (uint8_t)
p_args->data;
}
else
{
uint16_t * p_dest = (uint16_t *)
&g_out_of_band_received[g_out_of_band_index];
*p_dest = (uint16_t) p_args->data;
g_out_of_band_index += 2;
}
}
}
break;
}
```

```
/* Receive complete */
case UART_EVENT_RX_COMPLETE:
    {
        g_receive_complete = 1;
    }
break;
/* Transmit complete */
case UART_EVENT_TX_COMPLETE:
    {
        g_transfer_complete = 1;
    }
break;
default:
    {
    }
}
}
```

SAU UART Baud Set Example

```
#define SAU_UART_BAUDRATE_19200 (19200)
#define SAU_UART_BAUDRATE_ERROR_PERCENT_5 (5000)
void r_sau_uart_baud_example (void)
{
    sau_uart_baudrate_setting_t baud_setting;
    uint32_t baud_rate = SAU_UART_BAUDRATE_19200;
    fsp_err_t err = R_SAU_UART_BaudCalculate(baud_rate, &baud_setting);
    assert(FSP_SUCCESS == err);
    err = R_SAU_UART_BaudSet(&g_uart0_ctrl, (void *) &baud_setting);
    assert(FSP_SUCCESS == err);
}
```

Function Documentation

◆ R_SAU_UART_Open()

```
fsp_err_t R_SAU_UART_Open ( uart_ctrl_t *const p_api_ctrl, uart_cfg_t const *const p_cfg )
```

Configures the UART driver based on the input configurations. If reception is enabled at compile time, reception is enabled at the end of this function. Implements [uart_api_t::open](#)

Return values

| | |
|--------------------------------|--|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Pointer to UART control block or configuration structure is NULL. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | The requested channel does not exist on this MCU. |
| FSP_ERR_INVALID_ARGUMENT | Flow control is enabled but flow control pin is not defined or selected channel does not support "Hardware CTS and Hardware RTS" flow control. |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::open](#)

◆ R_SAU_UART_Close()

```
fsp_err_t R_SAU_UART_Close ( uart_ctrl_t *const p_api_ctrl)
```

Aborts any in progress transfers. Disables interrupts, receiver, and transmitter. Closes lower level transfer drivers if used. Removes power. Implements [uart_api_t::close](#)

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

◆ **R_SAU_UART_Read()**

```
fsp_err_t R_SAU_UART_Read ( uart_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const bytes )
```

Receives user specified number of bytes into destination buffer pointer. Implements [uart_api_t::read](#)

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Data reception successfully ends. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used |
| FSP_ERR_INVALID_ARGUMENT | Destination address or data size is not valid for 9-bit mode. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_IN_USE | A previous read operation is still in progress. |
| FSP_ERR_UNSUPPORTED | current operation mode is transmission only. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reset](#)

Note

If 9-bit data length is specified at R_SAU_UART_Open call, p_dest must be aligned 16-bit boundary.

◆ **R_SAU_UART_Write()**

```
fsp_err_t R_SAU_UART_Write ( uart_ctrl_t *const p_api_ctrl, uint8_t const *const p_src, uint32_t const bytes )
```

Transmits user specified number of bytes from the source buffer pointer. Implements [uart_api_t::write](#)

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Data transmission finished successfully. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used |
| FSP_ERR_INVALID_ARGUMENT | Source address or data size is not valid for 9-bit mode. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_IN_USE | A UART transmission is in progress |
| FSP_ERR_UNSUPPORTED | SAU_UART_CFG_TX_ENABLE is set to 0 |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reset](#)

Note

If 9-bit data length is specified at R_SAU_UART_Open call, p_src must be aligned on a 16-bit boundary.

◆ **R_SAU_UART_BaudSet()**

```
fsp_err_t R_SAU_UART_BaudSet ( uart_ctrl_t *const p_api_ctrl, void const *const p_baud_setting )
```

Updates the baud rate using the clock selected in Open. p_baud_setting is a pointer to a sau_uart_baudrate_setting_t structure. Implements [uart_api_t::baudSet](#)

Warning

This terminates any in-progress transmission.

Return values

| | |
|--------------------------|---------------------------------------|
| FSP_SUCCESS | Baud rate was successfully changed. |
| FSP_ERR_ASSERTION | Pointer p_ctrl is NULL |
| FSP_ERR_INVALID_ARGUMENT | p_api_ctrl is empty. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

◆ **R_SAU_UART_CallbackSet()**

```
fsp_err_t R_SAU_UART_CallbackSet ( uart_ctrl_t *const p_api_ctrl, void(*) (uart_callback_args_t *)
p_callback, void const *const p_context, uart_callback_args_t *const p_callback_memory )
```

Updates the user callback for callback structure. Implements `uart_api_t::callbackSet`

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | Pointer p_ctrl is NULL or p_callback_memory is not NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |

◆ **R_SAU_UART_InfoGet()**

```
fsp_err_t R_SAU_UART_InfoGet ( uart_ctrl_t *const p_api_ctrl, uart_info_t *const p_info )
```

Provides the driver information, including the maximum number of bytes that can be received or transmitted at a time. Implements `uart_api_t::infoGet`

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Information stored in provided p_info. |
| FSP_ERR_INVALID_ARGUMENT | Pointer to UART control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

◆ **R_SAU_UART_Abort()**

```
fsp_err_t R_SAU_UART_Abort ( uart_ctrl_t *const p_api_ctrl, uart_dir_t communication_to_abort )
```

Provides API to abort ongoing transfer. Transmission is aborted after the current character is transmitted. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements [uart_api_t::communicationAbort](#)

Return values

| | |
|---------------------|---|
| FSP_SUCCESS | UART transaction aborted successfully. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_UNSUPPORTED | The requested Abort direction is unsupported. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::disable](#)

◆ **R_SAU_UART_ReadStop()**

```
fsp_err_t R_SAU_UART_ReadStop ( uart_ctrl_t *const p_api_ctrl, uint32_t * remaining_bytes )
```

Provides API to abort ongoing read. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements [uart_api_t::readStop](#)

Return values

| | |
|---------------------|---|
| FSP_SUCCESS | UART transaction aborted successfully. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_UNSUPPORTED | The requested Abort direction is unsupported. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::disable](#)

◆ **R_SAU_UART_BaudCalculate()**

```
fsp_err_t R_SAU_UART_BaudCalculate ( uint32_t baudrate, sau_uart_baudrate_setting_t *const
p_baud_setting )
```

Calculates baud rate register settings. Evaluates and determines the best possible settings set to the baud rate related registers.

Parameters

| | | |
|-------|----------------|--|
| [in] | baudrate | Baud rate [bps]. For example, 19200, 57600, 115200, etc. |
| [out] | p_baud_setting | Baud setting information stored here if successful |

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Baud rate is set successfully |
| FSP_ERR_ASSERTION | Null pointer |
| FSP_ERR_INVALID_ARGUMENT | Baud rate is not in input range max error, or requested max error in baud rate is larger than 15%. |

```

Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the [UART Interface](#).

Overview

Features

The SCI UART module supports the following features:

- Full-duplex UART communication
- Interrupt-driven data transmission and reception
- Invoking the user-callback function with an event code (RX/TX complete, TX data empty, RX char, error, etc)
- Baud-rate change at run-time
- Bit rate modulation and noise cancellation
- CTS/RTS hardware flow control (with an associated pin)
- RS-485 Half Duplex driver support with external RS-485 transceiver
- Integration with the DTC transfer module
- Abort in-progress read/write operations
- FIFO support on supported channels

Configuration

Build Time Configurations for r_sci_b_uart

The following build time configurations are defined in fsp_cfg/r_sci_b_uart_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| FIFO Support | <ul style="list-style-type: none"> • Enable • Disable | Disable | Enable FIFO support for the SCI_UART module. |
| DTC Support | <ul style="list-style-type: none"> • Enable • Disable | Disable | Enable DTC support for the SCI_UART module. |

| | | | |
|----------------------|---|---------|---|
| Flow Control Support | <ul style="list-style-type: none"> • Enable • Disable | Disable | Enable RS232 and RS-485 flow control support using a user provided pin. |
|----------------------|---|---------|---|

Configurations for Connectivity > UART (r_sci_b_uart)

This module can be added to the Stacks tab via New Stack > Connectivity > UART (r_sci_b_uart). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|----------------------|---|----------|--|
| General | | | |
| Name | Name must be a valid C symbol | g_uart0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Select the SCI channel. |
| Data Bits | <ul style="list-style-type: none"> • 8bits • 7bits • 9bits | 8bits | Select the number of bits per word. |
| Parity | <ul style="list-style-type: none"> • None • Odd • Even | None | Select the parity mode. |
| Stop Bits | <ul style="list-style-type: none"> • 1bit • 2bits | 1bit | Select the number of stop bits. |
| Baud | | | |
| Baud Rate | Value must be an integer greater than 0 | 115200 | Enter the desired baud rate. If the requested baud rate cannot be achieved, the settings with the smallest percent error are used. The theoretical calculated baud rate and percent error are printed in a comment in the generated sci_b_baud_setting_t structure. |
| Baud Rate Modulation | <ul style="list-style-type: none"> • Disabled • Enabled | Disabled | Enabling baud rate modulation reduces the percent error of the actual baud rate with respect to the requested baud rate. It does this by modulating the number |

of cycles per clock, so some bits are slightly longer than others.

Maximum percent error allowed during baud calculation. This is used by the algorithm to determine whether or not to consider using less accurate alternative register settings.

NOTE: The baud calculation does not show an error in the tool if this percent error was not achieved. The calculated percent error is recorded in a comment in the generated [sci_b_baud_setting_t](#) structure.

Max Error (%)

Must be a valid non-negative integer with a maximum configurable value of 100

5

Flow Control

CTS/RTS Selection

MCU Specific Options

Select either CTS or RTS function on the CTSn_RTSn pin of SCI channel n or select CTS function on CTSn pin and RTS function on CTSn_RTSn pin of SCI channel n (Available on selected MCUs and channels).

Software RTS Port

Refer to the RA Configuration tool for available options.

Disabled

Specify the flow control pin port for the MCU.

Software RTS Pin

Refer to the RA Configuration tool for available options.

Disabled

Specify the flow control pin for the MCU.

Extra

Extra > RS-485

DE Pin

- Disable
- Enable

Disable

Enable or disable the DE pin for use in RS-485 half-duplex mode.

DE Pin Polarity

- Active Low
- Active High

Active High

Select the polarity of the DE pin.

| | | | |
|----------------------------|--|----------------|---|
| DE Pin Assertion Time | Must be a valid integer greater than 0 and less than or equal to 31. | 1 | Configure the time between assertion of the DE pin and the start of a write transfer. The time is specified in multiples of the SCI base clock period. |
| DE Pin Negation Time | Must be a valid integer greater than 0 and less than or equal to 31. | 1 | Configure the time between the end of a write transfer and the negation of the DE pin. The time is specified in multiples of the SCI base clock period. |
| Clock Source | <ul style="list-style-type: none"> • Internal Clock • Internal Clock With Output on SCK • External Clock 8x baud rate • External Clock 16x baud rate | Internal Clock | Selection of the clock source to be used in the baud-rate clock generator. When internal clock is used the baud rate can be output on the SCK pin. |
| Start bit detection | <ul style="list-style-type: none"> • Falling Edge • Low Level | Falling Edge | Start bit detected as falling edge or low level. |
| Noise Filter | <ul style="list-style-type: none"> • Enable • Disable | Disable | Enable the digital noise filter on RXDn pin. The digital noise filter block in SCI consists of two-stage flipflop circuits. |
| Receive FIFO Trigger Level | Refer to the RA Configuration tool for available options. | Max | Unused if the channel has no FIFO or if DTC is used for reception. Set to One to get a callback immediately when each byte is received. Set to Max to get a callback when FIFO is full or after 15 bit times with no data (fewer interrupts). |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | NULL | A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR). |

| | | |
|--|----------------------|---|
| Receive Interrupt Priority | MCU Specific Options | Select the receive interrupt priority. |
| Transmit Data Empty Interrupt Priority | MCU Specific Options | Select the transmit interrupt priority. |
| Transmit End Interrupt Priority | MCU Specific Options | Select the transmit end interrupt priority. |
| Error Interrupt Priority | MCU Specific Options | Select the error interrupt priority. |

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

| MCU Group | Peripheral Clock |
|-----------|------------------|
| RA6T2 | SCISPICK |
| RA8D1 | SCICLK |
| RA8M1 | SCICLK |
| RA8T1 | SCICLK |

The clock source for the baud-rate clock generator can be selected from the internal clock, the external clock times 8 or the external clock times 16. The external clock is supplied to the SCK pin.

Pin Configuration

This module uses TXD and RXD to communicate to external devices. CTS or RTS can be controlled by the hardware. CTS or RTS or both (CTS and RTS) can be controlled by the hardware. When the internal clock is the source for the baud-rate generator the SCK pin can be used to output a clock with the same frequency as the bit rate.

Usage Notes

- When configured for Hardware CTS and Software RTS the configured flow control pin will be used for RTS. The pin will be set high inside of the receive ISR while data is being read. It will be set low when all data is read.
- When configured for Hardware CTS and Hardware RTS the CSTn_RTSn pin will be used for RTS function and the CTSn pin will be used for CTS function on channel n.
- The driver will follow correct hardware flow control function when CTSn_RTSn pin is connected to CTSn pin when "Hardware CTS and Hardware RTS" flow control is selected. The data will still be transferred when CTSn_RTSn and CTSn are disconnected as the CTSn pin is internally pulled low on the hardware when CTSn pin is configured as a peripheral pin for SCI module. Do not configure CTSn pin if the hardware flow control is not desired.

Limitations

- Reception is still enabled after `uart_api_t::communicationAbort` API is called. Any characters received after abort and before the next call to read will arrive via the callback function with event `UART_EVENT_RX_CHAR`.

DTC Limitations

- DTC support is available for reception, but labeled as [Not recommended]. This is because the UART bytes are received asynchronously. Bytes can be received between calls to [R_SCI_B_UART_Read\(\)](#). The logic required to combine bytes received through [R_SCI_B_UART_Read\(\)](#) (UART_EVENT_RX_COMPLETE) and bytes received between calls (UART_EVENT_RX_CHAR) is complex. Reception length may also be unknown, and the driver will not issue an interrupt unless the entire DTC buffer is filled.
- Transfer size must be less than or equal to 64K bytes if DTC interface is used for transfer. [uart_api_t::infoGet](#) API can be used to get the max transfer size allowed.
- When using 9-bit reception with DTC, clear the upper 7 bits of data before processing the read data. The upper 7 bits contain status flags that are part of the register used to read data in 9-bit mode.

Examples

SCI UART Example

```
uint8_t g_dest[TRANSFER_LENGTH];
uint8_t g_src[TRANSFER_LENGTH];
uint8_t g_out_of_band_received[TRANSFER_LENGTH];
uint32_t g_transfer_complete = 0;
uint32_t g_receive_complete = 0;
uint32_t g_out_of_band_index = 0;
void r_sci_b_uart_basic_example (void)
{
    /* Initialize p_src to known data */
    for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
        g_src[i] = (uint8_t) ('A' + (i % 26));
    }

    /* Open the transfer instance with initial configuration. */
    fsp_err_t err = R_SCI_B_UART_Open(&g_uart0_ctrl, &g_uart0_cfg);
    assert(FSP_SUCCESS == err);

    err = R_SCI_B_UART_Read(&g_uart0_ctrl, g_dest, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);

    err = R_SCI_B_UART_Write(&g_uart0_ctrl, g_src, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);

    while (!g_transfer_complete)
    {
    }
}
```

```
while (!g_receive_complete)
{
}
}

void example_callback (uart_callback_args_t * p_args)
{
/* Handle the UART event */
switch (p_args->event)
{
/* Received a character */
case UART_EVENT_RX_CHAR:
{
/* Only put the next character in the receive buffer if there is space for it */
if (sizeof(g_out_of_band_received) > g_out_of_band_index)
{
/* Write either the next one or two bytes depending on the receive data size */
if (UART_DATA_BITS_8 >= g_uart0_cfg.data_bits)
{
g_out_of_band_received[g_out_of_band_index++] = (uint8_t)
p_args->data;
}
else
{
uint16_t * p_dest = (uint16_t *)
&g_out_of_band_received[g_out_of_band_index];
*p_dest = (uint16_t) p_args->data;
g_out_of_band_index += 2;
}
}
break;
}
/* Receive complete */
case UART_EVENT_RX_COMPLETE:
{
```

```

        g_receive_complete = 1;
    break;
    }
    /* Transmit complete */
    case UART_EVENT_TX_COMPLETE:
        {
            g_transfer_complete = 1;
        break;
        }
    default:
        {
        }
    }
}

```

SCI UART Baud Set Example

```

#define SCI_B_UART_BAUDRATE_19200 (19200)
#define SCI_B_UART_BAUDRATE_ERROR_PERCENT_5 (5000)
void r_sci_b_uart_baud_example (void)
{
    sci_b_baud_setting_t baud_setting;
    uint32_t          baud_rate          = SCI_B_UART_BAUDRATE_19200;
    bool              enable_bitrate_modulation = false;
    uint32_t          error_rate_x_1000   =
SCI_B_UART_BAUDRATE_ERROR_PERCENT_5;
    fsp_err_t err = R_SCI_B_UART_BaudCalculate(baud_rate, enable_bitrate_modulation,
error_rate_x_1000, &baud_setting);
    assert(FSP_SUCCESS == err);
    err = R_SCI_B_UART_BaudSet(&g_uart0_ctrl, (void *) &baud_setting);
    assert(FSP_SUCCESS == err);
}

```

| SCI_B_UART_RX_FIFO_TRIGGER_10 | Callback when FIFO having 10 bytes. |
| SCI_B_UART_RX_FIFO_TRIGGER_11 | Callback when FIFO having 11 bytes. |
| SCI_B_UART_RX_FIFO_TRIGGER_12 | Callback when FIFO having 12 bytes. |
| SCI_B_UART_RX_FIFO_TRIGGER_13 | Callback when FIFO having 13 bytes. |
| SCI_B_UART_RX_FIFO_TRIGGER_14 | Callback when FIFO having 14 bytes. |
| SCI_B_UART_RX_FIFO_TRIGGER_MAX | Callback when FIFO is full or after 15 bit times with no data (fewer interrupts) |

◆ sci_b_uart_start_bit_detect_t

| | |
|--|--|
| enum sci_b_uart_start_bit_detect_t | |
| Asynchronous Start Bit Edge Detection configuration. | |
| Enumerator | |
| SCI_B_UART_START_BIT_LOW_LEVEL | Detect low level on RXDn pin as start bit. |
| SCI_B_UART_START_BIT_FALLING_EDGE | Detect falling level on RXDn pin as start bit. |

◆ sci_b_uart_noise_cancellation_t

| | |
|--|-----------------------------|
| enum sci_b_uart_noise_cancellation_t | |
| Noise cancellation configuration. | |
| Enumerator | |
| SCI_B_UART_NOISE_CANCELLATION_DISABLE | Disable noise cancellation. |
| SCI_B_UART_NOISE_CANCELLATION_ENABLE | Enable noise cancellation. |

◆ sci_b_uart_rs485_enable_t

| | |
|--|------------------|
| enum sci_b_uart_rs485_enable_t | |
| RS-485 Enable/Disable. | |
| Enumerator | |
| SCI_B_UART_RS485_DISABLE | RS-485 disabled. |
| SCI_B_UART_RS485_ENABLE | RS-485 enabled. |

◆ sci_b_uart_rs485_de_polarity_t

| | |
|---|---|
| enum sci_b_uart_rs485_de_polarity_t | |
| The polarity of the RS-485 DE signal. | |
| Enumerator | |
| SCI_B_UART_RS485_DE_POLARITY_HIGH | The DE signal is high when a write transfer is in progress. |
| SCI_B_UART_RS485_DE_POLARITY_LOW | The DE signal is low when a write transfer is in progress. |

Function Documentation

◆ R_SCI_B_UART_Open()

`fsp_err_t R_SCI_B_UART_Open (uart_ctrl_t *const p_api_ctrl, uart_cfg_t const *const p_cfg)`

Configures the UART driver based on the input configurations. If reception is enabled at compile time, reception is enabled at the end of this function. Implements `uart_api_t::open`

Return values

| | |
|--------------------------------|--|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Pointer to UART control block or configuration structure is NULL. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | The requested channel does not exist on this MCU. |
| FSP_ERR_INVALID_ARGUMENT | Flow control is enabled but flow control pin is not defined. |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened or channel is being used by another instance. Call <code>close()</code> then <code>open()</code> to reconfigure. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::open`

◆ R_SCI_B_UART_Close()

`fsp_err_t R_SCI_B_UART_Close (uart_ctrl_t *const p_api_ctrl)`

Aborts any in progress transfers. Disables interrupts, receiver, and transmitter. Closes lower level transfer drivers if used. Removes power. Implements `uart_api_t::close`

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

◆ **R_SCI_B_UART_Read()**

```
fsp_err_t R_SCI_B_UART_Read ( uart_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const bytes )
```

Receives user specified number of bytes into destination buffer pointer. Implements [uart_api_t::read](#)

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Data reception successfully ends. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used |
| FSP_ERR_INVALID_ARGUMENT | Destination address or data size is not valid for 9-bit mode. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_IN_USE | A previous read operation is still in progress. |
| FSP_ERR_UNSUPPORTED | SCI_B_UART_CFG_RX_ENABLE is set to 0 |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reset](#)

Note

If 9-bit data length is specified at R_SCI_B_UART_Open call, p_dest must be aligned 16-bit boundary.

◆ **R_SCI_B_UART_Write()**

```
fsp_err_t R_SCI_B_UART_Write ( uart_ctrl_t *const p_api_ctrl, uint8_t const *const p_src, uint32_t const bytes )
```

Transmits user specified number of bytes from the source buffer pointer. Implements [uart_api_t::write](#)

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Data transmission finished successfully. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used |
| FSP_ERR_INVALID_ARGUMENT | Source address or data size is not valid for 9-bit mode. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_IN_USE | A UART transmission is in progress |
| FSP_ERR_UNSUPPORTED | SCI_B_UART_CFG_TX_ENABLE is set to 0 |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reset](#)

Note

If 9-bit data length is specified at R_SCI_B_UART_Open call, p_src must be aligned on a 16-bit boundary.

◆ **R_SCI_B_UART_CallbackSet()**

```
fsp_err_t R_SCI_B_UART_CallbackSet ( uart_ctrl_t *const p_api_ctrl, void(*) (uart_callback_args_t *) p_callback, void const *const p_context, uart_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [uart_api_t::callbackSet](#)

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

◆ **R_SCI_B_UART_BaudSet()**

```
fsp_err_t R_SCI_B_UART_BaudSet ( uart_ctrl_t *const p_api_ctrl, void const *const p_baud_setting )
```

Updates the baud rate using the clock selected in Open. p_baud_setting is a pointer to a sci_b_baud_setting_t structure. Implements uart_api_t::baudSet

Warning

This terminates any in-progress transmission.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Baud rate was successfully changed. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL or the UART is not configured to use the internal clock. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

◆ **R_SCI_B_UART_InfoGet()**

```
fsp_err_t R_SCI_B_UART_InfoGet ( uart_ctrl_t *const p_api_ctrl, uart_info_t *const p_info )
```

Provides the driver information, including the maximum number of bytes that can be received or transmitted at a time. Implements uart_api_t::infoGet

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Information stored in provided p_info. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

◆ **R_SCI_B_UART_Abort()**

```
fsp_err_t R_SCI_B_UART_Abort ( uart_ctrl_t *const p_api_ctrl, uart_dir_t communication_to_abort )
```

Provides API to abort ongoing transfer. Transmission is aborted after the current character is transmitted. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements [uart_api_t::communicationAbort](#)

Return values

| | |
|---------------------|---|
| FSP_SUCCESS | UART transaction aborted successfully. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_UNSUPPORTED | The requested Abort direction is unsupported. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::disable](#)

◆ **R_SCI_B_UART_ReadStop()**

```
fsp_err_t R_SCI_B_UART_ReadStop ( uart_ctrl_t *const p_api_ctrl, uint32_t * remaining_bytes )
```

Provides API to abort ongoing read. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements [uart_api_t::readStop](#)

Return values

| | |
|---------------------|---|
| FSP_SUCCESS | UART transaction aborted successfully. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_UNSUPPORTED | The requested Abort direction is unsupported. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::disable](#)

◆ R_SCI_B_UART_BaudCalculate()

```
fsp_err_t R_SCI_B_UART_BaudCalculate ( uint32_t baudrate, bool bitrate_modulation, uint32_t
baud_rate_error_x_1000, sci_b_baud_setting_t *const p_baud_setting )
```

Calculates baud rate register settings. Evaluates and determines the best possible settings set to the baud rate related registers.

Parameters

| | | |
|-------|------------------------|---|
| [in] | baudrate | Baud rate [bps]. For example, 19200, 57600, 115200, etc. |
| [in] | bitrate_modulation | Enable bitrate modulation |
| [in] | baud_rate_error_x_1000 | Max baud rate error. At most <baud_rate_percent_error> x 1000 required for module to function. Absolute max baud_rate_error is 15000 (15%). |
| [out] | p_baud_setting | Baud setting information stored here if successful |

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Baud rate is set successfully |
| FSP_ERR_ASSERTION | Null pointer |
| FSP_ERR_INVALID_ARGUMENT | Baud rate is '0', error in calculated baud rate is larger than requested max error, or requested max error in baud rate is larger than 15%. |

Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the [UART Interface](#).

Overview

Features

The SCI UART module supports the following features:

- Full-duplex UART communication
- Interrupt-driven data transmission and reception
- Invoking the user-callback function with an event code (RX/TX complete, TX data empty, RX char, error, etc)
- Baud-rate change at run-time
- Bit rate modulation and noise cancellation
- CTS/RTS hardware flow control (with an associated pin)
- RS-485 Half Duplex driver support with external RS-485 transceiver
- Integration with the DTC transfer module
- Abort in-progress read/write operations
- FIFO support on supported channels

Configuration

Build Time Configurations for r_sci_uart

The following build time configurations are defined in fsp_cfg/r_sci_uart_cfg.h:

| | | | |
|--|--|--|--|
| | | | |
|--|--|--|--|

| Configuration | Options | Default | Description |
|----------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> Default (BSP) Enabled Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| FIFO Support | <ul style="list-style-type: none"> Enable Disable | Disable | Enable FIFO support for the SCI_UART module. |
| DTC Support | <ul style="list-style-type: none"> Enable Disable | Disable | Enable DTC support for the SCI_UART module. |
| Flow Control Support | <ul style="list-style-type: none"> Enable Disable | Disable | Enable RS232 and RS-485 flow control support using a user provided pin. |
| RS-485 Support | <ul style="list-style-type: none"> Enable Disable | Disable | Enable support for controlling the RS-485 DE pin. |

Configurations for Connectivity > UART (r_sci_uart)

This module can be added to the Stacks tab via New Stack > Connectivity > UART (r_sci_uart). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---------------|---|---------|---|
| General | | | |
| Name | Name must be a valid C symbol | g_uart0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Select the SCI channel. |
| Data Bits | <ul style="list-style-type: none"> 8bits 7bits 9bits | 8bits | Select the number of bits per word. |
| Parity | <ul style="list-style-type: none"> None Odd Even | None | Select the parity mode. |
| Stop Bits | <ul style="list-style-type: none"> 1bit 2bits | 1bit | Select the number of stop bits. |
| Baud | | | |
| Baud Rate | Value must be an integer greater than 0 | 115200 | Enter the desired baud rate. If the requested baud rate cannot be achieved, the settings with the smallest percent error are used. The theoretical |

| | | | |
|----------------------|---|----------|--|
| Baud Rate Modulation | <ul style="list-style-type: none"> • Disabled • Enabled | Disabled | <p>calculated baud rate and percent error are printed in a comment in the generated baud_setting_t structure.</p> <p>Enabling baud rate modulation reduces the percent error of the actual baud rate with respect to the requested baud rate. It does this by modulating the number of cycles per clock, so some bits are slightly longer than others.</p> |
| Max Error (%) | Must be a valid non-negative integer with a maximum configurable value of 100 | 5 | <p>Maximum percent error allowed during baud calculation. This is used by the algorithm to determine whether or not to consider using less accurate alternative register settings.</p> <p>NOTE: The baud calculation does not show an error in the tool if this percent error was not achieved. The calculated percent error is recorded in a comment in the generated baud_setting_t structure.</p> |
| Flow Control | | | |
| CTS/RTS Selection | MCU Specific Options | | Select either CTS or RTS function on the CTSn_RTSn pin of SCI channel n or select CTS function on CTSn pin and RTS function on CTSn_RTSn pin of SCI channel n (Available on selected MCUs and channels). |
| Software RTS Port | Refer to the RA Configuration tool for available options. | Disabled | Specify the flow control pin port for the MCU. |

| | | | |
|----------------------------|--|----------------|---|
| Software RTS Pin | Refer to the RA Configuration tool for available options. | Disabled | Specify the flow control pin for the MCU. |
| Extra | | | |
| Extra > RS-485 | | | |
| DE Pin | <ul style="list-style-type: none"> • Disable • Enable | Disable | Enable or disable the DE pin for use in RS-485 half-duplex mode. |
| DE Pin Polarity | <ul style="list-style-type: none"> • Active Low • Active High | Active High | Select the polarity of the DE pin. |
| DE Port Number | Refer to the RA Configuration tool for available options. | Disabled | GPIO output port number to use for generating the DE signal. |
| DE Pin Number | Refer to the RA Configuration tool for available options. | Disabled | GPIO output pin number to use for generating the DE signal. |
| Clock Source | <ul style="list-style-type: none"> • Internal Clock • Internal Clock With Output on SCK • External Clock 8x baud rate • External Clock 16x baud rate | Internal Clock | Selection of the clock source to be used in the baud-rate clock generator. When internal clock is used the baud rate can be output on the SCK pin. |
| Start bit detection | <ul style="list-style-type: none"> • Falling Edge • Low Level | Falling Edge | Start bit detected as falling edge or low level. |
| Noise Filter | <ul style="list-style-type: none"> • Enable • Disable | Disable | Enable the digital noise filter on RXDn pin. The digital noise filter block in SCI consists of two-stage flipflop circuits. |
| Receive FIFO Trigger Level | Refer to the RA Configuration tool for available options. | Max | Unused if the channel has no FIFO or if DTC is used for reception. Set to One to get a callback immediately when each byte is received. Set to Max to get a callback when FIFO is full or after 15 bit times with no data (fewer interrupts). |

Interrupts

| | | | |
|--|-------------------------------|------|--|
| Callback | Name must be a valid C symbol | NULL | A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR). |
| Receive Interrupt Priority | MCU Specific Options | | Select the receive interrupt priority. |
| Transmit Data Empty Interrupt Priority | MCU Specific Options | | Select the transmit interrupt priority. |
| Transmit End Interrupt Priority | MCU Specific Options | | Select the transmit end interrupt priority. |
| Error Interrupt Priority | MCU Specific Options | | Select the error interrupt priority. |

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

| MCU Group | Peripheral Clock |
|-----------|------------------|
| RA2A1 | PCLKB |
| RA2A2 | PCLKB |
| RA2E1 | PCLKB |
| RA2E2 | PCLKB |
| RA2E3 | PCLKB |
| RA2L1 | PCLKB |
| RA4E1 | PCLKA |
| RA4E2 | PCLKA |
| RA4M1 | PCLKA |
| RA4M2 | PCLKA |
| RA4M3 | PCLKA |
| RA4T1 | PCLKA |
| RA4W1 | PCLKA |
| RA6E1 | PCLKA |
| RA6E2 | PCLKA |
| RA6M1 | PCLKA |
| RA6M2 | PCLKA |
| RA6M3 | PCLKA |

| | |
|-------|-------|
| RA6M4 | PCLKA |
| RA6M5 | PCLKA |
| RA6T1 | PCLKA |
| RA6T3 | PCLKA |

The clock source for the baud-rate clock generator can be selected from the internal clock, the external clock times 8 or the external clock times 16. The external clock is supplied to the SCK pin.

Pin Configuration

This module uses TXD and RXD to communicate to external devices. CTS or RTS or both (CTS and RTS) can be controlled by the hardware. Some MCUs support hardware flow control for both CTS and RTS on some channels. Some MCUs and channels support hardware flow control for either CTS or RTS but not both. If both are desired a GPIO pin can be used for RTS. When the internal clock is the source for the baud-rate generator the SCK pin can be used to output a clock with the same frequency as the bit rate.

Usage Notes

- When configured for Hardware CTS and Software RTS the configured flow control pin will be used for RTS. The pin will be set high inside of the receive ISR while data is being read. It will be set low when all data is read.
- When configured for Hardware CTS and Hardware RTS the CSTn_RTSn pin will be used for RTS function and the CTSn pin will be used for CTS function on channel n.
- The driver will follow correct hardware flow control function when CTSn_RTSn pin is connected to CTSn pin when "Hardware CTS and Hardware RTS" flow control is selected. The data will still be transferred when CTSn_RTSn and CTSn are disconnected as the CTSn pin is internally pulled low on the hardware when CTSn pin is configured as a peripheral pin for SCI module. Do not configure CTSn pin if the hardware flow control is not desired.

Limitations

- Reception is still enabled after [uart_api_t::communicationAbort](#) API is called. Any characters received after abort and before the next call to read will arrive via the callback function with event `UART_EVENT_RX_CHAR`.

DTC Limitations

- DTC support is available for reception, but labeled as [Not recommended]. This is because the UART bytes are received asynchronously. Bytes can be received between calls to [R_SCI_UART_Read\(\)](#). The logic required to combine bytes received through [R_SCI_UART_Read\(\)](#) (`UART_EVENT_RX_COMPLETE`) and bytes received between calls (`UART_EVENT_RX_CHAR`) is complex. Reception length may also be unknown, and the driver will not issue an interrupt unless the entire DTC buffer is filled.
- Transfer size must be less than or equal to 64K bytes if DTC interface is used for transfer. [uart_api_t::infoGet](#) API can be used to get the max transfer size allowed.
- When using 9-bit reception with DTC, clear the upper 7 bits of data before processing the read data. The upper 7 bits contain status flags that are part of the register used to read data in 9-bit mode.

Examples

SCI UART Example

```
uint8_t g_dest[TRANSFER_LENGTH];
uint8_t g_src[TRANSFER_LENGTH];
uint8_t g_out_of_band_received[TRANSFER_LENGTH];
uint32_t g_transfer_complete = 0;
uint32_t g_receive_complete = 0;
uint32_t g_out_of_band_index = 0;
void r_sci_uart_basic_example (void)
{
    /* Initialize p_src to known data */
    for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
        g_src[i] = (uint8_t) ('A' + (i % 26));
    }

    /* Open the transfer instance with initial configuration. */
    fsp_err_t err = R_SCI_UART_Open(&g_uart0_ctrl, &g_uart0_cfg);
    assert(FSP_SUCCESS == err);
    err = R_SCI_UART_Read(&g_uart0_ctrl, g_dest, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
    err = R_SCI_UART_Write(&g_uart0_ctrl, g_src, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);

    while (!g_transfer_complete)
    {
    }

    while (!g_receive_complete)
    {
    }
}

void example_callback (uart_callback_args_t * p_args)
{
    /* Handle the UART event */
    switch (p_args->event)
    {
        /* Received a character */
    }
}
```

```
case UART_EVENT_RX_CHAR:
    {
        /* Only put the next character in the receive buffer if there is space for it */
        if (sizeof(g_out_of_band_received) > g_out_of_band_index)
            {
                /* Write either the next one or two bytes depending on the receive data size */
                if (UART_DATA_BITS_8 >= g_uart0_cfg.data_bits)
                    {
                        g_out_of_band_received[g_out_of_band_index++] = (uint8_t)
p_args->data;
                    }
                else
                    {
                        uint16_t * p_dest = (uint16_t *)
&g_out_of_band_received[g_out_of_band_index];
                        *p_dest          = (uint16_t) p_args->data;
                        g_out_of_band_index += 2;
                    }
            }
        break;
    }
/* Receive complete */
case UART_EVENT_RX_COMPLETE:
    {
        g_receive_complete = 1;
    }
    break;
/* Transmit complete */
case UART_EVENT_TX_COMPLETE:
    {
        g_transfer_complete = 1;
    }
    break;
default:
```

```
{  
    }  
}
```

SCI UART Baud Set Example

```
#define SCI_UART_BAUDRATE_19200 (19200)  
#define SCI_UART_BAUDRATE_ERROR_PERCENT_5 (5000)  
void r_sci_uart_baud_example (void)  
{  
    baud_setting_t baud_setting;  
    uint32_t baud_rate = SCI_UART_BAUDRATE_19200;  
    bool enable_bitrate_modulation = false;  
    uint32_t error_rate_x_1000 = SCI_UART_BAUDRATE_ERROR_PERCENT_5;  
    fsp_err_t err = R_SCI_UART_BaudCalculate(baud_rate, enable_bitrate_modulation,  
error_rate_x_1000, &baud_setting);  
    assert(FSP_SUCCESS == err);  
    err = R_SCI_UART_BaudSet(&g_uart0_ctrl, (void *) &baud_setting);  
    assert(FSP_SUCCESS == err);  
}
```

UART on SCI device Configuration

Data Fields

| | | |
|-------------------------------|-------|---|
| sci_clk_src_t | clock | The source clock for the baud-rate generator. If internal optionally output baud rate on SCK. |
| | | |

| | | |
|---|------------------|--|
| sci_uart_start_bit_t | rx_edge_start | Start reception on falling edge. |
| sci_uart_noise_cancellation_t | noise_cancel | Noise cancellation setting. |
| baud_setting_t * | p_baud_setting | Register settings for a desired baud rate. |
| sci_uart_rx_fifo_trigger_t | rx_fifo_trigger | Receive FIFO trigger level, unused if channel has no FIFO or if DTC is used. |
| bsp_io_port_pin_t | flow_control_pin | UART Driver Enable pin. |
| sci_uart_flow_control_t | flow_control | CTS/RTS function of the SSn pin. |
| sci_uart_rs485_setting_t | rs485_setting | RS-485 settings. |

Enumeration Type Documentation

◆ sci_clk_src_t

| | |
|---|---|
| enum sci_clk_src_t | |
| Enumeration for SCI clock source | |
| Enumerator | |
| SCI_UART_CLOCK_INT | Use internal clock for baud generation. |
| SCI_UART_CLOCK_INT_WITH_BAUDRATE_OUTPUT | Use internal clock for baud generation and output on SCK. |
| SCI_UART_CLOCK_EXT8X | Use external clock 8x baud rate. |
| SCI_UART_CLOCK_EXT16X | Use external clock 16x baud rate. |

◆ sci_uart_flow_control_t

| enum sci_uart_flow_control_t | |
|---------------------------------------|---|
| UART flow control mode definition | |
| Enumerator | |
| SCI_UART_FLOW_CONTROL_RTS | Use SCI pin for RTS. |
| SCI_UART_FLOW_CONTROL_CTS | Use SCI pin for CTS. |
| SCI_UART_FLOW_CONTROL_CTSRTS | Use SCI pin for CTS, external pin for RTS. |
| SCI_UART_FLOW_CONTROL_HARDWARE_CTSRTS | Use CTS _n _RTS _n pin for RTS and CTS _n pin for CTS. Available only for some channels on selected MCUs. See hardware manual for channel specific options. |

◆ sci_uart_rx_fifo_trigger_t

| enum sci_uart_rx_fifo_trigger_t | |
|-------------------------------------|--|
| Receive FIFO trigger configuration. | |
| Enumerator | |
| SCI_UART_RX_FIFO_TRIGGER_1 | Callback after each byte is received without buffering. |
| SCI_UART_RX_FIFO_TRIGGER_2 | Callback when FIFO having 2 bytes. |
| SCI_UART_RX_FIFO_TRIGGER_3 | Callback when FIFO having 3 bytes. |
| SCI_UART_RX_FIFO_TRIGGER_4 | Callback when FIFO having 4 bytes. |
| SCI_UART_RX_FIFO_TRIGGER_5 | Callback when FIFO having 5 bytes. |
| SCI_UART_RX_FIFO_TRIGGER_6 | Callback when FIFO having 6 bytes. |
| SCI_UART_RX_FIFO_TRIGGER_7 | Callback when FIFO having 7 bytes. |
| SCI_UART_RX_FIFO_TRIGGER_8 | Callback when FIFO having 8 bytes. |
| SCI_UART_RX_FIFO_TRIGGER_9 | Callback when FIFO having 9 bytes. |
| SCI_UART_RX_FIFO_TRIGGER_10 | Callback when FIFO having 10 bytes. |
| SCI_UART_RX_FIFO_TRIGGER_11 | Callback when FIFO having 11 bytes. |
| SCI_UART_RX_FIFO_TRIGGER_12 | Callback when FIFO having 12 bytes. |
| SCI_UART_RX_FIFO_TRIGGER_13 | Callback when FIFO having 13 bytes. |
| SCI_UART_RX_FIFO_TRIGGER_14 | Callback when FIFO having 14 bytes. |
| SCI_UART_RX_FIFO_TRIGGER_MAX | Callback when FIFO is full or after 15 bit times with no data (fewer interrupts) |

◆ **sci_uart_start_bit_t**

| | |
|--|--|
| enum sci_uart_start_bit_t | |
| Asynchronous Start Bit Edge Detection configuration. | |
| Enumerator | |
| SCI_UART_START_BIT_LOW_LEVEL | Detect low level on RXDn pin as start bit. |
| SCI_UART_START_BIT_FALLING_EDGE | Detect falling level on RXDn pin as start bit. |

◆ **sci_uart_noise_cancellation_t**

| | |
|--|-----------------------------|
| enum sci_uart_noise_cancellation_t | |
| Noise cancellation configuration. | |
| Enumerator | |
| SCI_UART_NOISE_CANCELLATION_DISABLE | Disable noise cancellation. |
| SCI_UART_NOISE_CANCELLATION_ENABLE | Enable noise cancellation. |

◆ **sci_uart_rs485_enable_t**

| | |
|--|------------------|
| enum sci_uart_rs485_enable_t | |
| RS-485 Enable/Disable. | |
| Enumerator | |
| SCI_UART_RS485_DISABLE | RS-485 disabled. |
| SCI_UART_RS485_ENABLE | RS-485 enabled. |

◆ **sci_uart_rs485_de_polarity_t**

| | |
|---|---|
| enum sci_uart_rs485_de_polarity_t | |
| The polarity of the RS-485 DE signal. | |
| Enumerator | |
| SCI_UART_RS485_DE_POLARITY_HIGH | The DE signal is high when a write transfer is in progress. |
| SCI_UART_RS485_DE_POLARITY_LOW | The DE signal is low when a write transfer is in progress. |

Function Documentation

◆ R_SCI_UART_Open()

`fsp_err_t R_SCI_UART_Open (uart_ctrl_t *const p_api_ctrl, uart_cfg_t const *const p_cfg)`

Configures the UART driver based on the input configurations. If reception is enabled at compile time, reception is enabled at the end of this function. Implements `uart_api_t::open`

Return values

| | |
|--------------------------------|--|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Pointer to UART control block or configuration structure is NULL. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | The requested channel does not exist on this MCU. |
| FSP_ERR_INVALID_ARGUMENT | Flow control is enabled but flow control pin is not defined or selected channel does not support "Hardware CTS and Hardware RTS" flow control. |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened or channel is being used by another instance. Call <code>close()</code> then <code>open()</code> to reconfigure. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::open`

◆ R_SCI_UART_Close()

`fsp_err_t R_SCI_UART_Close (uart_ctrl_t *const p_api_ctrl)`

Aborts any in progress transfers. Disables interrupts, receiver, and transmitter. Closes lower level transfer drivers if used. Removes power. Implements `uart_api_t::close`

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

◆ **R_SCI_UART_Read()**

```
fsp_err_t R_SCI_UART_Read ( uart_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const bytes )
```

Receives user specified number of bytes into destination buffer pointer. Implements [uart_api_t::read](#)

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Data reception successfully ends. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used |
| FSP_ERR_INVALID_ARGUMENT | Destination address or data size is not valid for 9-bit mode. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_IN_USE | A previous read operation is still in progress. |
| FSP_ERR_UNSUPPORTED | SCI_UART_CFG_RX_ENABLE is set to 0 |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reset](#)

Note

If 9-bit data length is specified at R_SCI_UART_Open call, p_dest must be aligned 16-bit boundary.

◆ **R_SCI_UART_Write()**

```
fsp_err_t R_SCI_UART_Write ( uart_ctrl_t *const p_api_ctrl, uint8_t const *const p_src, uint32_t const bytes )
```

Transmits user specified number of bytes from the source buffer pointer. Implements [uart_api_t::write](#)

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Data transmission finished successfully. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used |
| FSP_ERR_INVALID_ARGUMENT | Source address or data size is not valid for 9-bit mode. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_IN_USE | A UART transmission is in progress |
| FSP_ERR_UNSUPPORTED | SCI_UART_CFG_TX_ENABLE is set to 0 |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reset](#)

Note

If 9-bit data length is specified at R_SCI_UART_Open call, p_src must be aligned on a 16-bit boundary.

◆ **R_SCI_UART_CallbackSet()**

```
fsp_err_t R_SCI_UART_CallbackSet ( uart_ctrl_t *const p_api_ctrl, void(*) (uart_callback_args_t *) p_callback, void const *const p_context, uart_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [uart_api_t::callbackSet](#)

Return values

| | |
|----------------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

◆ **R_SCI_UART_BaudSet()**

```
fsp_err_t R_SCI_UART_BaudSet ( uart_ctrl_t *const p_api_ctrl, void const *const p_baud_setting )
```

Updates the baud rate using the clock selected in Open. p_baud_setting is a pointer to a `baud_setting_t` structure. Implements `uart_api_t::baudSet`

Warning

This terminates any in-progress transmission.

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Baud rate was successfully changed. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL or the UART is not configured to use the internal clock. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

◆ **R_SCI_UART_InfoGet()**

```
fsp_err_t R_SCI_UART_InfoGet ( uart_ctrl_t *const p_api_ctrl, uart_info_t *const p_info )
```

Provides the driver information, including the maximum number of bytes that can be received or transmitted at a time. Implements `uart_api_t::infoGet`

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Information stored in provided p_info. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

◆ **R_SCI_UART_Abort()**

```
fsp_err_t R_SCI_UART_Abort ( uart_ctrl_t *const p_api_ctrl, uart_dir_t communication_to_abort )
```

Provides API to abort ongoing transfer. Transmission is aborted after the current character is transmitted. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements `uart_api_t::communicationAbort`

Return values

| | |
|---------------------|---|
| FSP_SUCCESS | UART transaction aborted successfully. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_UNSUPPORTED | The requested Abort direction is unsupported. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::disable`

◆ **R_SCI_UART_ReadStop()**

```
fsp_err_t R_SCI_UART_ReadStop ( uart_ctrl_t *const p_api_ctrl, uint32_t * remaining_bytes )
```

Provides API to abort ongoing read. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements `uart_api_t::readStop`

Return values

| | |
|---------------------|---|
| FSP_SUCCESS | UART transaction aborted successfully. |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_UNSUPPORTED | The requested Abort direction is unsupported. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::disable`

◆ R_SCI_UART_BaudCalculate()

```
fsp_err_t R_SCI_UART_BaudCalculate ( uint32_t baudrate, bool bitrate_modulation, uint32_t
baud_rate_error_x_1000, baud_setting_t *const p_baud_setting )
```

Calculates baud rate register settings. Evaluates and determines the best possible settings set to the baud rate related registers.

Parameters

| | | |
|-------|------------------------|---|
| [in] | baudrate | Baud rate [bps]. For example, 19200, 57600, 115200, etc. |
| [in] | bitrate_modulation | Enable bitrate modulation |
| [in] | baud_rate_error_x_1000 | Max baud rate error. At most <baud_rate_percent_error> x 1000 required for module to function. Absolute max baud_rate_error is 15000 (15%). |
| [out] | p_baud_setting | Baud setting information stored here if successful |

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Baud rate is set successfully |
| FSP_ERR_ASSERTION | Null pointer |
| FSP_ERR_INVALID_ARGUMENT | Baud rate is '0', error in calculated baud rate is larger than requested max error, or requested max error in baud rate is larger than 15%. |

Detailed Description

Driver for the UARTA peripheral on RA MCUs. This module implements the [UART Interface](#).

Overview

Features

The UARTA module supports the following features:

- Full-duplex UART communication
- Interrupt-driven data transmission and reception
- Baud-rate change at run-time
- Integration with the DTC transfer module
- Abort in-progress read/write operations
- MSB or LSB first transfer selectable
- Inversion control of communication logic level provided

Configuration

Build Time Configurations for r_uarta

The following build time configurations are defined in fsp_cfg/r_uarta_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

| | | | |
|-------------|---|---------|--|
| DTC Support | <ul style="list-style-type: none"> • Enable • Disable | Disable | Enable DTC support for the UARTA module. |
|-------------|---|---------|--|

Configurations for Connectivity > UART (r_uarta)

This module can be added to the Stacks tab via New Stack > Connectivity > UART (r_uarta).

| Configuration | Options | Default | Description |
|----------------|---|----------------|--|
| General | | | |
| Name | Name must be a valid C symbol | g_uart0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Select the UARTA channel. |
| Data Bits | <ul style="list-style-type: none"> • 8bits • 7bits • 5bits | 8bits | Select the number of bits per word. |
| Parity | <ul style="list-style-type: none"> • None • Zero • Odd • Even | None | Select the parity mode. |
| Stop Bits | <ul style="list-style-type: none"> • 1bit • 2bits | 1bit | Select the number of stop bits. Note: For the receive data, only the first 1 bit of the stop bits is checked regardless of the stop bit length. |
| Baud | | | |
| Baud Rate | Value must be an integer greater than 0 | 115200 | Enter the desired baud rate. If the requested baud rate cannot be achieved, the settings with the smallest percent error are used. The theoretical calculated baud rate and percent error are printed in a comment in the generated baud_setting_t structure. |
| Extra | | | |
| Transfer Order | <ul style="list-style-type: none"> • LSB first • MSB first | LSB first | Selection of the transmission/reception order. |
| Transfer level | <ul style="list-style-type: none"> • Positive logic | Positive logic | Selection of the |

| | | | |
|------------------------------|-------------------------------|----------|--|
| | • Negative logic | | transmission/reception level. |
| Interrupts | | | |
| Receive Error Interrupt Mode | • Disabled • Enabled | Disabled | Selection receive interrupt mode . Disabled: The UARTA0_ERRI interrupt is generated when a reception error occurs. Enabled: The UARTA0_RXI interrupt is generated when a reception error occurs. |
| Callback | Name must be a valid C symbol | NULL | A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR). |
| Receive Interrupt Priority | MCU Specific Options | | Select the receive interrupt priority. |
| Transmit Interrupt Priority | MCU Specific Options | | Select the transmit interrupt priority. |
| Error Interrupt Priority | MCU Specific Options | | Select the error interrupt priority. |

Clock Configuration

The baud-rate clock generator can be selected from the clock source MOSC, HOCO, MOCO, SOSC/LOCO.

Pin Configuration

This module uses TXDA and RXDA pin to communicate to external devices.

Usage Notes

Limitations

- Reception is still enabled after [uart_api_t::communicationAbort](#) API is called. Any characters received after abort and before the next call to read will arrive via the callback function with event `UART_EVENT_RX_CHAR`.
- The UARTA module does not have CTS or RTS signals.

DTC Limitations

- DTC support is available for reception, but labeled as [Not recommended]. This is because the UART bytes are received asynchronously. Bytes can be received between calls to [R_UARTA_Read\(\)](#). The logic required to combine bytes received through [R_UARTA_Read\(\)](#)

(UART_EVENT_RX_COMPLETE) and bytes received between calls (UART_EVENT_RX_CHAR) is complex. Reception length may also be unknown, and the driver will not issue an interrupt unless the entire DTC buffer is filled.

- Transfer size must be less than or equal to 64K bytes if DTC interface is used for transfer. [uart_api_t::infoGet](#) API can be used to get the max transfer size allowed.

Examples

UARTA Example

```
uint8_t g_dest[TRANSFER_LENGTH];
uint8_t g_src[TRANSFER_LENGTH];
uint8_t g_out_of_band_received[TRANSFER_LENGTH];
uint32_t g_transfer_complete = 0;
uint32_t g_receive_complete = 0;
uint32_t g_out_of_band_index = 0;
void r_uarta_basic_example (void)
{
    /* Initialize p_src to known data */
    for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
        g_src[i] = (uint8_t) ('A' + (i % 26));
    }

    /* Open the transfer instance with initial configuration. */
    fsp_err_t err = R_UARTA_Open(&g_uart0_ctrl, &g_uart0_cfg);
    assert(FSP_SUCCESS == err);

    err = R_UARTA_Read(&g_uart0_ctrl, g_dest, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);

    err = R_UARTA_Write(&g_uart0_ctrl, g_src, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);

    while (!g_transfer_complete)
    {
    }

    while (!g_receive_complete)
    {
    }
}

void example_callback (uart_callback_args_t * p_args)
```

```
{
/* Handle the UART event */
switch (p_args->event)
{
/* Received a character */
case UART_EVENT_RX_CHAR:
{
/* Only put the next character in the receive buffer if there is space for it */
if (sizeof(g_out_of_band_received) > g_out_of_band_index)
{
/* Write either the next one or two bytes depending on the receive data size */
if (UART_DATA_BITS_8 >= g_uart0_cfg.data_bits)
{
g_out_of_band_received[g_out_of_band_index++] = (uint8_t)
p_args->data;
}
else
{
uint16_t * p_dest = (uint16_t *)
&g_out_of_band_received[g_out_of_band_index];
*p_dest = (uint16_t) p_args->data;
g_out_of_band_index += 2;
}
}
break;
}

/* Receive complete */
case UART_EVENT_RX_COMPLETE:
{
g_receive_complete = 1;
break;
}

/* Transmit complete */
case UART_EVENT_TX_COMPLETE:
```

```
    {
        g_transfer_complete = 1;
    }
    break;
}
default:
    {
    }
}
}
```

UARTA Baud Set Example

```
#define UARTA_BAUDRATE_19200 (19200)
#define UARTA_BAUDRATE_ERROR_PERCENT_4740 (4740)
void r_uarta_baud_example (void)
{
    uarta_baud_setting_t baud_setting;
    uint32_t          baud_rate          = UARTA_BAUDRATE_19200;
    uint32_t          error_rate_x_1000 = UARTA_BAUDRATE_ERROR_PERCENT_4740;
    uarta_clock_source_t clock_source     = UARTA_CLOCK_SOURCE_HOCO;
    fsp_err_t err = R_UARTA_BaudCalculate(baud_rate, error_rate_x_1000, clock_source,
&baud_setting);
    assert(FSP_SUCCESS == err);
    err = R_UARTA_BaudSet(&g_uart0_ctrl, (void *) &baud_setting);
    assert(FSP_SUCCESS == err);
}
```

◆ **R_UARTA_Open()**

```
fsp_err_t R_UARTA_Open ( uart_ctrl_t *const p_api_ctrl, uart_cfg_t const *const p_cfg )
```

Configures the UARTA driver based on the input configurations. If transmission/reception is enabled at compile time, transmission/reception is enabled at the end of this function. Implements [uart_api_t::open](#)

Return values

| | |
|--------------------------------|--|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Pointer to UARTA control block or configuration structure is NULL. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | The requested channel does not exist on this MCU. |
| FSP_ERR_INVALID_ARGUMENT | Invalid clock select (f_UTA0) and baudrate configuration. |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::open](#)

◆ **R_UARTA_Close()**

```
fsp_err_t R_UARTA_Close ( uart_ctrl_t *const p_api_ctrl)
```

Aborts any in progress transfers. Disables interrupts, receiver, and transmitter. Closes lower level transfer drivers if used. Removes power. Implements [uart_api_t::close](#)

Return values

| | |
|-------------------|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | Pointer to UARTA control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

◆ **R_UARTA_Read()**

```
fsp_err_t R_UARTA_Read ( uart_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const bytes )
```

Receives user specified number of bytes into destination buffer pointer. Implements [uart_api_t::read](#)

Return values

| | |
|---------------------|--|
| FSP_SUCCESS | Data reception successfully ends. |
| FSP_ERR_ASSERTION | Pointer to UARTA control block is NULL. Number of transfers outside the max or min boundary when transfer instance used |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_IN_USE | A previous read operation is still in progress. |
| FSP_ERR_UNSUPPORTED | UARTA_CFG_RX_ENABLE is set to 0 |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reset](#)

◆ **R_UARTA_Write()**

```
fsp_err_t R_UARTA_Write ( uart_ctrl_t *const p_api_ctrl, uint8_t const *const p_src, uint32_t const bytes )
```

Transmits user specified number of bytes from the source buffer pointer. Implements [uart_api_t::write](#)

Return values

| | |
|---------------------|--|
| FSP_SUCCESS | Data transmission finished successfully. |
| FSP_ERR_ASSERTION | Pointer to UARTA control block is NULL. Number of transfers outside the max or min boundary when transfer instance used |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_IN_USE | A UARTA transmission is in progress |
| FSP_ERR_UNSUPPORTED | UART_CFG_TX_ENABLE is set to 0 |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reset](#)

◆ **R_UARTA_CallbackSet()**

```
fsp_err_t R_UARTA_CallbackSet ( uart_ctrl_t *const p_api_ctrl, void (*)(uart_callback_args_t *)
p_callback, void const *const p_context, uart_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `uart_api_t::callbackSet`

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |

◆ **R_UARTA_BaudSet()**

```
fsp_err_t R_UARTA_BaudSet ( uart_ctrl_t *const p_api_ctrl, void const *const p_baud_setting )
```

Updates the baud rate using the clock selected in Open. `p_baud_setting` is a pointer to a `uarta_baud_setting_t` structure. Implements `uart_api_t::baudSet`

Warning

This terminates any in-progress transmission.

Return values

| | |
|--------------------------|---|
| FSP_SUCCESS | Baud rate was successfully changed. |
| FSP_ERR_ASSERTION | Pointer to UARTA control block is NULL or the UART is not configured to use the internal clock. |
| FSP_ERR_INVALID_ARGUMENT | Invalid clock select (f_UTA0) and baudrate configuration. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

◆ **R_UARTA_InfoGet()**

```
fsp_err_t R_UARTA_InfoGet ( uart_ctrl_t *const p_api_ctrl, uart_info_t *const p_info )
```

Provides the driver information, including the maximum number of bytes that can be received or transmitted at a time. Implements `uart_api_t::infoGet`

Return values

| | |
|-------------------|--|
| FSP_SUCCESS | Information stored in provided <code>p_info</code> . |
| FSP_ERR_ASSERTION | Pointer to UART control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

◆ **R_UARTA_Abort()**

```
fsp_err_t R_UARTA_Abort ( uart_ctrl_t *const p_api_ctrl, uart_dir_t communication_to_abort )
```

Provides API to abort ongoing transfer. Transmission is aborted after the current character is transmitted. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements [uart_api_t::communicationAbort](#)

Return values

| | |
|---------------------|---|
| FSP_SUCCESS | UARTA transaction aborted successfully. |
| FSP_ERR_ASSERTION | Pointer to UARTA control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_UNSUPPORTED | The requested Abort direction is unsupported. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls: [transfer_api_t::disable](#)

◆ **R_UARTA_ReadStop()**

```
fsp_err_t R_UARTA_ReadStop ( uart_ctrl_t *const p_api_ctrl, uint32_t * p_remaining_bytes )
```

Provides API to abort ongoing read. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements [uart_api_t::readStop](#)

Return values

| | |
|---------------------|---|
| FSP_SUCCESS | UARTA transaction aborted successfully. |
| FSP_ERR_ASSERTION | Pointer to UARTA control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_UNSUPPORTED | The requested Abort direction is unsupported. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls: [transfer_api_t::disable](#)

◆ R_UARTA_BaudCalculate()

```
fsp_err_t R_UARTA_BaudCalculate ( uint32_t baudrate, uint32_t baud_rate_percent_error_x1000,
uarta_clock_source_t clock_source, uarta_baud_setting_t *const p_baud_setting )
```

Calculates baud rate register settings. Evaluates and determines the best possible settings set to the baud rate related registers.

Parameters

| | | |
|-------|-------------------------------|--|
| [in] | baudrate | Baud rate [bps]. For example, 19200, 57600, 115200, etc. |
| [in] | baud_rate_percent_error_x1000 | Max baud rate error. At most baud_rate_percent_error x 1000 required for module to function. Absolute max baud_rate_error is 4740 (4.74%). |
| [in] | clock_source | Clock Source. Required for module to generate baudrate. The clock sources can be select include UARTA_CLOCK_SOURCE_MOSC, UARTA_CLOCK_SOURCE_HOCO, UARTA_CLOCK_SOURCE_MOCO, UARTA_CLOCK_SOURCE_SOSC_LOCO. |
| [out] | p_baud_setting | Baud setting information stored here if successful |

Return values

| | |
|--------------------------|--|
| FSP_SUCCESS | Baud rate is set successfully |
| FSP_ERR_ASSERTION | Null pointer |
| FSP_ERR_INVALID_ARGUMENT | Argument is out of available range, baud rate is '0'. |
| FSP_ERR_INVALID_RATE | Baud rate error is outside the range or the baud rate could not be set given the current clock source. |

5.2.6.26 UART Communication Device (rm_comms_uart)

Modules » [Connectivity](#)

Functions

`fsp_err_t RM_COMMS_UART_Open (rm_comms_ctrl_t *const p_api_ctrl, rm_comms_cfg_t const *const p_cfg)`

Opens and configures the UART Comms module. Implements `rm_comms_api_t::open`. [More...](#)

`fsp_err_t RM_COMMS_UART_Close (rm_comms_ctrl_t *const p_api_ctrl)`

Disables specified UART Comms module. Implements `rm_comms_api_t::close`. [More...](#)

`fsp_err_t RM_COMMS_UART_CallbackSet (rm_comms_ctrl_t *const p_api_ctrl, void(*p_callback)(rm_comms_callback_args_t *), void const *const p_context)`

Updates the UART Comms callback. Implements `rm_comms_api_t::callbackSet`. [More...](#)

`fsp_err_t RM_COMMS_UART_Read (rm_comms_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const bytes)`

Performs a read from the UART device. Implements `rm_comms_api_t::read`. [More...](#)

`fsp_err_t RM_COMMS_UART_Write (rm_comms_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t const bytes)`

Performs a write to the UART device. Implements `rm_comms_api_t::write`. [More...](#)

`fsp_err_t RM_COMMS_UART_WriteRead (rm_comms_ctrl_t *const p_api_ctrl, rm_comms_write_read_params_t const write_read_params)`

Performs a write to, then a read from the UART device. Implements `rm_comms_api_t::writeRead`. [More...](#)

Detailed Description

Middleware to implement a generic communications interface over UART. This module implements the [Communicatons Middleware Interface](#).

Overview

The `RM_COMMS_UART` module implements COMMS API for UART interface.

Features

The implementation of the UART communications interface has the following key features:

- Non-blocking API for bare metal
- Non-blocking and blocking API for RTOS

Configuration

Build Time Configurations for rm_comms_uart

The following build time configurations are defined in fsp_cfg/rm_comms_uart_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|---------------|---|
| Parameter Checking | <ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

Configurations for Connectivity > UART Communication Device (rm_comms_uart)

This module can be added to the Stacks tab via New Stack > Connectivity > UART Communication Device (rm_comms_uart).

| Configuration | Options | Default | Description |
|-------------------|---|---------------|--|
| RTOS | | | |
| Write Mutex | <ul style="list-style-type: none"> • Do Not Use • Use | Use | Lock device for writing in using RTOS. |
| Read Mutex | <ul style="list-style-type: none"> • Do Not Use • Use | Use | Lock device for reading in using RTOS. |
| Mutex Timeout | Value must be a non-negative integer | 0xFFFFFFFF | Timeout for recursive mutex operation in using RTOS. |
| Write Semaphore | <ul style="list-style-type: none"> • Do Not Use • Use | Use | Block writing in using RTOS. |
| Read Semaphore | <ul style="list-style-type: none"> • Do Not Use • Use | Use | Block reading in using RTOS. |
| Semaphore Timeout | Value must be a non-negative integer | 0xFFFFFFFF | Timeout for semaphore operation in using RTOS. |
| Name | Manual Entry | g_comms_uart0 | Module name. |
| Callback | Name must be a valid C symbol | NULL | A user callback function can be provided. |

Usage Notes

Limitations

- RM_COMMS_API are not reentrant in non blocking mode
- When in blocking mode, [RM_COMMS_UART_Write\(\)](#) and [RM_COMMS_UART_Read\(\)](#) cannot be called in callback.

- RM_COMMS_UART_WriteRead API is not implemented

Examples

Basic Example

This is a basic example of minimal use of UART communications implementation in an application.

```
void rm_comms_uart_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    err = RM_COMMS_UART_Open(&g_comms_uart_ctrl, &g_comms_uart_cfg);
    if (FSP_SUCCESS != err)
    {
        /* Handle any errors. */
    }

    while (true)
    {
        /* Send data. */
        g_err_flag = 0;
        g_tx_flag = 0;
        err = RM_COMMS_UART_Write(&g_comms_uart_ctrl, g_tx_buf, TX_BUF_LEN);
        if (FSP_SUCCESS != err)
        {
            /* Handle any errors. */
        }
        while ((0 == g_tx_flag) && (0 == g_err_flag))
        {
            /* Wait callback */
        }
        /* Receive data. */
        g_err_flag = 0;
        g_rx_flag = 0;
        err = RM_COMMS_UART_Read(&g_comms_uart_ctrl, g_rx_buf, RX_BUF_LEN);
        if (FSP_SUCCESS != err)
        {
            /* Handle any errors.*/
        }
    }
}
```

```

    }
while ((0 == g_rx_flag) && (0 == g_err_flag))
    {
    /* Wait callback */
    }
}
static void rm_comms_uart_callback (rm_comms_callback_args_t * p_args)
{
    if (p_args->event == RM_COMMS_EVENT_TX_OPERATION_COMPLETE)
    {
        g_tx_flag = 1;
    }
    else if (p_args->event == RM_COMMS_EVENT_RX_OPERATION_COMPLETE)
    {
        g_rx_flag = 1;
    }
    else
    {
        g_err_flag = 1;
    }
}

```

Data Structures

struct [rm_comms_uart_instance_ctrl_t](#)

Data Structure Documentation

◆ rm_comms_uart_instance_ctrl_t

struct [rm_comms_uart_instance_ctrl_t](#)

Communications middleware control structure.

Data Fields

| | |
|----------|----------------------|
| uint32_t | open |
| | Open flag. |
| | |

| | |
|---|---|
| <code>rm_comms_cfg_t const *</code> | <code>p_cfg</code> |
| | Middleware configuration. |
| <code>rm_comms_uart_extended_cfg_t const *</code> | <code>p_extend</code> |
| | Pointer to extended configuration structure. |
| <code>void(*</code> | <code>p_callback</code>)(<code>rm_comms_callback_args_t *p_args</code>) |
| | Pointer to callback that is called when a <code>uart_event_t</code> occurs. |
| <code>void const *</code> | <code>p_context</code> |
| | Pointer to context passed into callback function. |

Function Documentation

◆ RM_COMMS_UART_Open()

```
fsp_err_t RM_COMMS_UART_Open ( rm_comms_ctrl_t *const p_api_ctrl, rm_comms_cfg_t const *const p_cfg )
```

Opens and configures the UART Comms module. Implements `rm_comms_api_t::open`.

Return values

| | |
|-----------------------------------|--|
| <code>FSP_SUCCESS</code> | UART Comms module successfully configured. |
| <code>FSP_ERR_ASSERTION</code> | Null pointer, or one or more configuration options is invalid. |
| <code>FSP_ERR_ALREADY_OPEN</code> | Module is already open. This module can only be opened once. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ **RM_COMMS_UART_Close()**

```
fsp_err_t RM_COMMS_UART_Close ( rm_comms_ctrl_t *const p_api_ctrl)
```

Disables specified UART Comms module. Implements `rm_comms_api_t::close`.

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ **RM_COMMS_UART_CallbackSet()**

```
fsp_err_t RM_COMMS_UART_CallbackSet ( rm_comms_ctrl_t *const p_api_ctrl,
void(*) (rm_comms_callback_args_t *) p_callback, void const *const p_context )
```

Updates the UART Comms callback. Implements `rm_comms_api_t::callbackSet`.

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Successfully set. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

◆ **RM_COMMS_UART_Read()**

```
fsp_err_t RM_COMMS_UART_Read ( rm_comms_ctrl_t *const p_api_ctrl, uint8_t *const p_dest,
uint32_t const bytes )
```

Performs a read from the UART device. Implements `rm_comms_api_t::read`.

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ **RM_COMMS_UART_Write()**

```
fsp_err_t RM_COMMS_UART_Write ( rm_comms_ctrl_t *const p_api_ctrl, uint8_t *const p_src,
uint32_t const bytes )
```

Performs a write to the UART device. Implements `rm_comms_api_t::write`.

Return values

| | |
|-------------------|-------------------------------------|
| FSP_SUCCESS | Successfully writing data . |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ **RM_COMMS_UART_WriteRead()**

```
fsp_err_t RM_COMMS_UART_WriteRead ( rm_comms_ctrl_t *const p_api_ctrl,
rm_comms_write_read_params_t const write_read_params )
```

Performs a write to, then a read from the UART device. Implements `rm_comms_api_t::writeRead`.

Return values

| | |
|---------------------|----------------|
| FSP_ERR_UNSUPPORTED | Not supported. |
|---------------------|----------------|

5.2.6.27 USB (r_usb_basic)

Modules » [Connectivity](#)

Functions

```
fsp_err_t R_USB_EventGet (usb_ctrl_t *const p_api_ctrl, usb_status_t *event)
```

Obtains completed USB related events. (OS-less Only) [More...](#)

```
fsp_err_t R_USB_Callback (usb_callback_t *p_callback)
```

Register a callback function to be called upon completion of a USB related event. (RTOS only) [More...](#)

```
fsp_err_t R_USB_Open (usb_ctrl_t *const p_api_ctrl, usb_cfg_t const *const
p_cfg)
```

Applies power to the USB module specified in the argument (p_ctrl).

[More...](#)

`fsp_err_t` [R_USB_Close](#) (`usb_ctrl_t *const p_api_ctrl`)

Terminates power to the USB module specified in argument (`p_ctrl`). USB0 module stops when `USB_IP0` is specified to the member (module), USB1 module stops when `USB_IP1` is specified to the member (module). [More...](#)

`fsp_err_t` [R_USB_Read](#) (`usb_ctrl_t *const p_api_ctrl`, `uint8_t *p_buf`, `uint32_t size`, `uint8_t destination`)

Bulk/Interrupt data transfer. [More...](#)

`fsp_err_t` [R_USB_Write](#) (`usb_ctrl_t *const p_api_ctrl`, `uint8_t const *const p_buf`, `uint32_t size`, `uint8_t destination`)

Bulk/Interrupt data transfer. [More...](#)

`fsp_err_t` [R_USB_Stop](#) (`usb_ctrl_t *const p_api_ctrl`, `usb_transfer_t direction`, `uint8_t destination`)

Requests a data read/write transfer be terminated when a data read/write transfer is being performed. [More...](#)

`fsp_err_t` [R_USB_Suspend](#) (`usb_ctrl_t *const p_api_ctrl`)

Sends a SUSPEND signal from the USB module assigned to the member (module) of the `usb_ctrl_t` structure. [More...](#)

`fsp_err_t` [R_USB_Resume](#) (`usb_ctrl_t *const p_api_ctrl`)

Sends a RESUME signal from the USB module assigned to the member (module) of the `usb_ctrl_t` structure. [More...](#)

`fsp_err_t` [R_USB_VbusSet](#) (`usb_ctrl_t *const p_api_ctrl`, `uint16_t state`)

Specifies starting or stopping the VBUS supply. [More...](#)

`fsp_err_t` [R_USB_InfoGet](#) (`usb_ctrl_t *const p_api_ctrl`, `usb_info_t *p_info`, `uint8_t destination`)

Obtains completed USB-related events. [More...](#)

`fsp_err_t` [R_USB_PipeRead](#) (`usb_ctrl_t *const p_api_ctrl`, `uint8_t *p_buf`, `uint32_t size`, `uint8_t pipe_number`)

Requests a data read (Bulk/Interrupt transfer) via the pipe specified in the argument. [More...](#)

`fsp_err_t R_USB_PipeWrite (usb_ctrl_t *const p_api_ctrl, uint8_t *p_buf, uint32_t size, uint8_t pipe_number)`

Requests a data write (Bulk/Interrupt transfer). [More...](#)

`fsp_err_t R_USB_PipeStop (usb_ctrl_t *const p_api_ctrl, uint8_t pipe_number)`

Terminates a data read/write operation. [More...](#)

`fsp_err_t R_USB_UsedPipesGet (usb_ctrl_t *const p_api_ctrl, uint16_t *p_pipe, uint8_t destination)`

Gets the selected pipe number (number of the pipe that has completed initialization) via bit map information. [More...](#)

`fsp_err_t R_USB_PipeInfoGet (usb_ctrl_t *const p_api_ctrl, usb_pipe_t *p_info, uint8_t pipe_number)`

Gets the following pipe information regarding the pipe specified in the argument (p_ctrl) member (pipe): endpoint number, transfer type, transfer direction and maximum packet size. [More...](#)

`fsp_err_t R_USB_PullUp (usb_ctrl_t *const p_api_ctrl, uint8_t state)`

This API enables or disables pull-up of D+/D- line. [More...](#)

`fsp_err_t R_USB_HostControlTransfer (usb_ctrl_t *const p_api_ctrl, usb_setup_t *p_setup, uint8_t *p_buf, uint8_t device_address)`

Performs settings and transmission processing when transmitting a setup packet. [More...](#)

`fsp_err_t R_USB_PericontrolDataGet (usb_ctrl_t *const p_api_ctrl, uint8_t *p_buf, uint32_t size)`

Receives data sent by control transfer. [More...](#)

`fsp_err_t R_USB_PericontrolDataSet (usb_ctrl_t *const p_api_ctrl, uint8_t *p_buf, uint32_t size)`

Performs transfer processing for control transfer. [More...](#)

`fsp_err_t R_USB_PericontrolStatusSet (usb_ctrl_t *const p_api_ctrl,`

[usb_setup_status_t](#) status)

Set the response to the setup packet. [More...](#)

[fsp_err_t](#) [R_USB_RemoteWakeup](#) ([usb_ctrl_t](#) *const p_api_ctrl)

Sends a remote wake-up signal to the connected Host. [More...](#)

[fsp_err_t](#) [R_USB_DriverActivate](#) ([usb_ctrl_t](#) *const p_api_ctrl)

Activate USB Driver for USB Peripheral BareMetal. [More...](#)

[fsp_err_t](#) [R_USB_CallbackMemorySet](#) ([usb_ctrl_t](#) *const p_api_ctrl,
[usb_callback_args_t](#) *p_callback_memory)

Set callback memory to USB Driver for USB Peripheral BareMetal.
[More...](#)

[fsp_err_t](#) [R_USB_ModuleNumberGet](#) ([usb_ctrl_t](#) *const p_api_ctrl, [uint8_t](#)
*module_number)

This API gets the module number. [More...](#)

[fsp_err_t](#) [R_USB_ClassTypeGet](#) ([usb_ctrl_t](#) *const p_api_ctrl, [usb_class_t](#)
*class_type)

This API gets the class type. [More...](#)

[fsp_err_t](#) [R_USB_DeviceAddressGet](#) ([usb_ctrl_t](#) *const p_api_ctrl, [uint8_t](#)
*device_address)

This API gets the device address. [More...](#)

[fsp_err_t](#) [R_USB_PipeNumberGet](#) ([usb_ctrl_t](#) *const p_api_ctrl, [uint8_t](#)
*pipe_number)

This API gets the pipe number. [More...](#)

[fsp_err_t](#) [R_USB_DeviceStateGet](#) ([usb_ctrl_t](#) *const p_api_ctrl, [uint16_t](#) *state)

This API gets the state of the device. [More...](#)

[fsp_err_t](#) [R_USB_DataSizeGet](#) ([usb_ctrl_t](#) *const p_api_ctrl, [uint32_t](#) *data_size)

This API gets the read data size. [More...](#)

`fsp_err_t R_USB_SetupGet (usb_ctrl_t *const p_api_ctrl, usb_setup_t *setup)`

This API gets the setup information. [More...](#)

`fsp_err_t R_USB_OtgCallbackSet (usb_ctrl_t *const p_api_ctrl, usb_otg_callback_t *p_callback)`

Set callback function to be called when the OTG role swap was completed on Azure RTOS. [More...](#)

`fsp_err_t R_USB_OtgSRP (usb_ctrl_t *const p_api_ctrl)`

Start the SRP processing for OTG on Azure RTOS. [More...](#)

Detailed Description

Driver for the USB peripheral on RA MCUs. This module implements the [USB Interface](#).

Overview

The USB module operates in combination with the device class drivers provided by Renesas to form a complete USB stack.

Features

The USB module has the following key features:

- USB Host mode
 - Enumerates Low/Full/High-speed devices (see note below)
 - Automatic transfer error determination and retry
- USB Peripheral mode
 - Supports USB1.1/2.0/3.0 hosts
- Automatic processing of device connect/disconnect, suspend/resume, and USB bus reset
- Up to 10 pipes
 - Control transfers supported on pipe 0
 - Data transfer on pipes 1 to 9 (Bulk or Interrupt)
- Functions with or without an RTOS

Note

Supported speeds are dependent on the MCU.

Configuration

Build Time Configurations for r_usb_basic

The following build time configurations are defined in fsp_cfg/r_usb_basic_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|-----------------|---------------|----------------------|
| Parameter Checking | • Default (BSP) | Default (BSP) | If selected code for |

| | | | | |
|---|----------------------|---|---------|--|

| USBHS D0FIFO Interrupt Priority | MCU Specific Options | | Select the interrupt priority used by the USBHS D0FIFO ISR. |
| USBHS D1FIFO Interrupt Priority | MCU Specific Options | | Select the interrupt priority used by the USBHS D1FIFO ISR. |
| USB RTOS Callback | Enter the address of the function. | NULL | If an FreeRTOS is used, set the callback function here. |
| USB Callback Context | Enter the address of the context. | NULL | Set the callback context here. |

Clock Configuration

The USB module uses PLL as the clock source. The PLL frequency can be set in the **Clocks** tab of the configuration editor or by using the CGC Interface at run-time.

Note

When using HOCO as the PLL source on Cortex M33 parts the FLL function must be enabled for correct USB operation. Refer to the MCU Family -> Clocks group of the BSP properties in the RA configuration tool to adjust FLL settings.

Pin Configuration

In peripheral mode the USB_VBUS and/or USBHS_VBUS pins are used to detect the USB connection status (connected or disconnected) and should be connected to the USB VBUS signal.

Note

USB_VBUS and USBHS_VBUS are 5V-tolerant pins.

In host mode the USBHS_VBUSEN, USBHS_OVRCURA and USBHS_OVRCURB pins should be connected to the relevant pins of an external power supply IC, if available. These pins will be used to manage the USB VBUS supply.

DMA Configuration

When using DMA with USB the following properties must be configured for each DMAC module:

| Config Name | Select Name | Description |
|-------------------|--------------------|--|
| Transfer Size | 2 Bytes 4 Bytes | In FS mode, select "2 Bytes" In HS mode, select "4 Bytes" |
| Activation source | USBFS FIFO 0 | USB FS Reception |

USBFS FIFO 1
 USBHS FIFO 0
 USBHS FIFO 1

USB FS Transmission
 USB HS Reception
 USB HS Transmission

Descriptor definition

In Peripheral mode, the `usb_descriptor_t` structure stores descriptor information including the device and configuration descriptors. The values set in this structure are sent to the USB host as part of enumeration.

```
typedef struct usb_descriptor
{
    uint8_t *p_device;    /* Pointer to device descriptor */
    uint8_t *p_config_f; /* Pointer to full-speed configuration descriptor */
    uint8_t *p_config_h; /* Pointer to high-speed configuration descriptor (HS only)
*/
    uint8_t *p_qualifier; /* Pointer to device qualifier descriptor (HS only) */
    uint8_t **pp_string; /* Pointer to string descriptor table */
    uint8_t num_string;  /* Number of strings in table */
} usb_descriptor_t;
```

Note

Even in high-speed mode the full-speed configuration must be made available:

```
/* Example USB FS descriptor struct */
usb_descriptor_t g_usb_descriptor =
{
    smp_device,
    smp_config_f,
    NULL,
    NULL,
    smp_str_table,
    3,
};

/* Example USB HS descriptor struct */
usb_descriptor_t g_usb_descriptor =
{
    smp_device,
```

```
smp_config_f,  
smp_config_h,  
smp_qualifier,  
smp_str_table,  
3,  
};
```

String Descriptor

This USB driver requires string descriptors to be registered in the string descriptor table. Use the following format to define the elements:

```
/* String descriptor 0 is reserved for language ID information */  
uint8_t str_descriptor_0[]  
{  
    0x04,      /* Length */  
    0x03,      /* Descriptor type */  
    0x09, 0x04 /* Language ID */  
};  
uint8_t str_descriptor_manufacturer[] =  
{  
    0x10,      /* Length */  
    0x03,      /* Descriptor type */  
    'R', 0x00,  
    'E', 0x00,  
    'N', 0x00,  
    'E', 0x00,  
    'S', 0x00,  
    'A', 0x00,  
    'S', 0x00  
};  
uint8_t str_descriptor_product[] =  
{  
    0x12,      /* Length */  
    0x03,      /* Descriptor type */
```

```
'C', 0x00,
'D', 0x00,
'C', 0x00,
'_', 0x00,
'D', 0x00,
'E', 0x00,
'M', 0x00,
'O', 0x00
};
/* String descriptor table */
uint8_t * smp_str_table[] =
{
    str_descriptor_0,          /* Index: 0 */
    str_descriptor_manufacturer, /* Index: 1 */
    str_descriptor_product,    /* Index: 2 */
};
```

Note

Set the string index values in the device/configuration descriptors (*iManufacturer*, *iConfiguration* etc.) to the index of the desired string in the string descriptor table. For example, in the table below, the manufacturer is described in *str_descriptor_manufacturer* and the value of *iManufacturer* in the device descriptor is **1**.

Other Descriptors

Refer to the Universal Serial Bus Revision 2.0 specification (<http://www.usb.org/developers/docs/>) for details on how to construct the device, configuration and qualifier descriptors.

Usage Notes

Program Structure

USB applications (whether using an RTOS or not) should be written as an event-handling loop. Either a callback function (RTOS only) or *R_USB_EventGet* should be used to provide event data to the application loop where a switch statement handles the event.

Note

1. The *USB_STATUS_CONFIGURED* event should be confirmed before calling *R_USB_Read* or *R_USB_Write*.
2. When attaching to USB Host, Suspend event is notified to the application program in USB peripheral mode. Notification of this event to the application program does not affect the operation.

Limitations

Developers should be aware of the following limitations when using the USB driver:

- The current USB driver does not support hub.
- In USB host mode, the module does not support suspend during data transfers. Execute suspend only after confirming that all transfers are complete.
- Multiconfigurations are not supported.
- This driver does not support CPU transfers using the D0FIFO/D1FIFO register.
- Only one device-class driver may be used at a time.
- The USB Hi-Speed module only supports Hi-Speed operation.
- In USB host mode, this USB driver does not support the composite device.
- The user can not specify DMA transfer to USB IP0 and IP1 modules at the same time when using USB multi-port feature. USB multi-port function: Simultaneous operation feature of USB Host and Peripheral.

Compliance Test

Please set as follows to the following items in RA configuration (r_usb_basic) when doing the compliance test.

1.USB Compliance Test mode Set "Enabled" in this item.

The screenshot shows the configuration window for 'g_basic0 USB (r_usb_basic)'. The 'Settings' tab is active. A table lists properties and their values. The 'USB Compliance Test mode' property is highlighted with a red box and has the value 'Enabled'.

| Property | Value |
|-----------------------------------|---------------|
| DMA Source Address | FS Address |
| DMA Destination Address | FS Address |
| USB Compliance Test mode | Enabled |
| USB TPL table name | usb_tpl_table |
| Module g_basic0 USB (r_usb_basic) | |
| Name | basic0 |

Figure 192: Compliance Test Setting

2.USB TPL table name. Set the start address of TPL(Target Peripheral List) defined in the application program.

The screenshot shows the configuration window for 'g_basic0 USB (r_usb_basic)'. The 'Settings' tab is active. A table lists properties and their values. The 'USB TPL table name' property is highlighted with a red box and has the value 'usb_tpl_table'.

| Property | Value |
|-----------------------------------|---------------|
| DMA Source Address | FS Address |
| DMA Destination Address | FS Address |
| USB Compliance Test mode | Enabled |
| USB TPL table name | usb_tpl_table |
| Module g_basic0 USB (r_usb_basic) | |
| Name | basic0 |

Figure 193: TPL Start Address Setting

Please refer to the following about how to define for TPL.
The following example is when two devices are set in TPL.

```
const uint16_t usb_tpl_table[] =
{
    2,          /* Number of tpl */
    0,          /* Reserved */
    0x0123, 0x4567, /* Vendor ID, Product ID (1st device) */
};
```

```
0x89ab, 0xcdef /* Vendor ID, Product ID (2nd device) */
};
```

3.USB Compliance Callback Set the start address of the callback function defined in the application program.

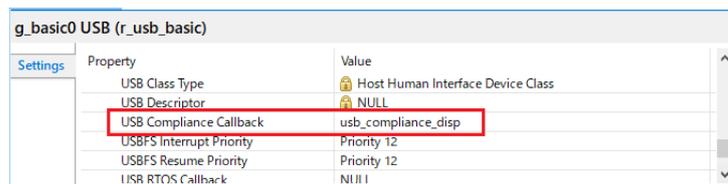

Figure 194: Compliance Callback Setting

The user needs to create this callback function by referring to the following.

```
void usb_compliance_disp (void * param)
{
    usb_compliance_t    *disp_data;
    uint8_t              print_data[32];
    disp_data = (usb_compliance_t*)param;
    switch(disp_data->status)
    {
        case USB_COMPLIANCETEST_ATTACH:          /* Device Attach Detection */
            display("\nATTACH \n");
            break;
        case USB_COMPLIANCETEST_DETACH:         /* Device Detach Detection */
            display("\nDETACH \n");
            break;
        case USB_COMPLIANCETEST_TPL:           /* TPL device connect */
            display("\nTPL PID:%04x VID:%04x \n",disp_data->pid, disp_data->vid);
            break;
        case USB_COMPLIANCETEST_NOTTPL:        /* Not TPL device connect */
            display("\nNOTTPL PID:%04x VID:%04x \n",disp_data->pid, disp_data->vid);
            break;
        case USB_COMPLIANCETEST_HUB:          /* USB Hub connect */
            display("\nHub \n");
    }
}
```

```

break;

case USB_COMPLIANCE_TEST_OVRC:                /* over current */
break;

case USB_COMPLIANCE_TEST_NORES:              /* Response Time out for Control Read
Transfer */
    display("\nNOTRESP \n");
break;

case USB_COMPLIANCE_TEST_SETUP_ERR:          /* Setup Transaction Error */
break;

default:
break;
}
} /* End of function usb_compliance_disp() */

```

Please replace the display function described in the example with the display function created by the customer.

Callback function for USB Peripheral

The user can get completed USB event using callback function in USB Peripheral for BareMetal.

- Please specify user callback function in the following item.

| | |
|------------------------|------------------|
| USBHS D1FIFO Interrupt | Not Supported |
| USBHS D1FIFO Interrupt | Not Supported |
| USB RTOS Callback | usb_apl_callback |
| USB Callback Context | NULL |

Figure 195: User Callback Function Setting

- Please call the *R_USB_DriverActivate* function using one of the following methods.
 - Infinite loop in user application program
 - Timer Interrupt (Add *r_gpt* module in user system)
- Please specify the area to store USB events to USB driver using *R_USB_CallbackMemorySet* function after calling *R_USB_Open* function.

```
usb_callback_args_t g_apl_usb_event_callback;
```

- Please allocate a buffer area such as a ring buffer to store USB event information in user application program.

```

#define BUFSIZE 10
usb_callback_args_t g_apl_usb_event_buffer[BUFSIZE];

```

- The USB driver calls the callback function when the USB event completes. USB event information is stored in the area indicated by the callback function argument. Copy the callback function argument to the ring buffer area or other area secured above.

```
g_apl_usb_event_buffer[g_apl_buffer_wp] = g_apl_usb_event_callback;  
g_apl_buffer_wp++;  
g_apl_buffer_wp %= BUFSIZE;
```

TrustZone

1. The USB driver for FreeRTOS cannot be allocated in Secure region.
2. Please place the descriptor file in Secure region when using Non-Secure Callable.
3. The user callback function should be specified using the *R_USB_Callback* function after calling the *R_USB_Open* function when using Non-Secure Callable.
4. For Non-Secure region, please do USB clock setting when creating Secure project.
5. Please do USB pin setting when creating USB driver project.

Support Composite Device

This driver for FreeRTOS supports the following composite device when this driver for FreeRTOS works in USB Host mode.

1. PCDC + PMSC

How to Configuration

- Add HMSC and HCDC stack as follow.

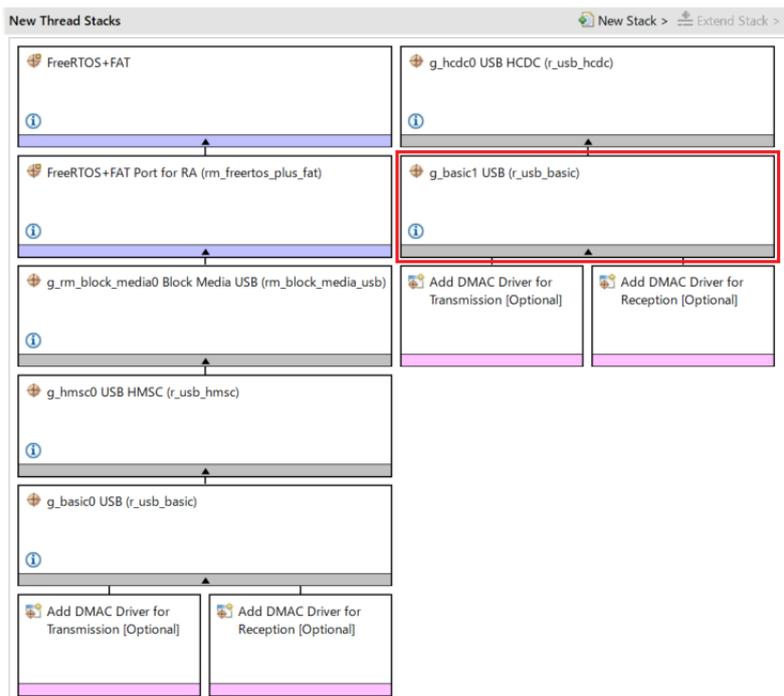

Figure 196: Add HMSC and HCDC Stack

- Delete the "g_basic1" instance manually since this instance is not used in composite device. (Refer to the red frame in the above figure.)

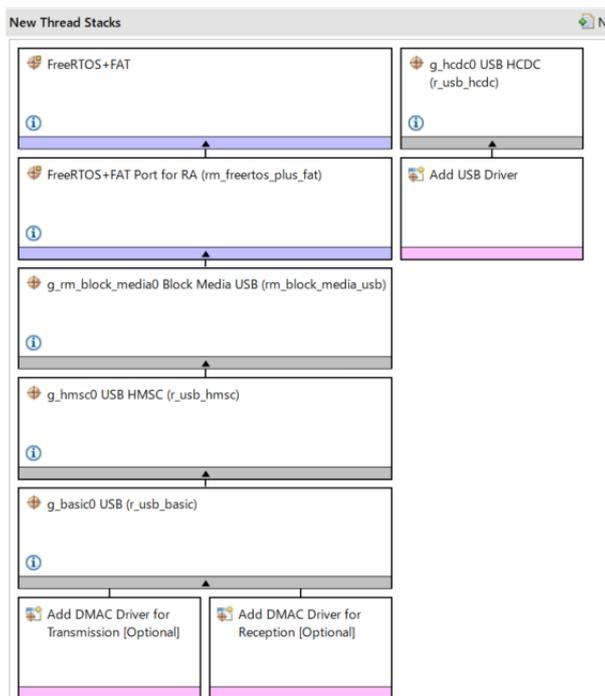

Figure 197: Delete g_basic1 instance

UCLK setting

Enable UCLK in "Clocks" tab on e² studio when using the following MCU.

1. RA6M4

Examples

USB Basic Example

This is a basic example of minimal use of the USB in an application.

```
void usb_basic_example (void)
{
    usb_event_info_t event_info;
    usb_status_t      event;

    g_usb_on_usb.open(&g_basic0_ctrl, &g_basic0_cfg);
    /* Loop back between PC(TerminalSoft) and USB MCU */
    while (1)
    {
        g_usb_on_usb.eventGet(&event_info, &event);
        switch (event)
        {
            case USB_STATUS_CONFIGURED:
            case USB_STATUS_WRITE_COMPLETE:
                g_usb_on_usb.read(&g_basic0_ctrl, g_buf, DATA_LEN, USB_CLASS_PCDC);
                break;
            case USB_STATUS_READ_COMPLETE:
                g_usb_on_usb.write(&g_basic0_ctrl, g_buf, event_info.data_size,
                USB_CLASS_PCDC);
                break;
            case USB_STATUS_REQUEST: /* Receive Class Request */
                if (USB_PCDC_SET_LINE_CODING == (event_info.setup.request_type & USB_BREQUEST))
                {
                    g_usb_on_usb.periControlDataGet(&g_basic0_ctrl, (uint8_t *)
                    &g_line_coding, LINE_CODING_LENGTH);
                }
                else if (USB_PCDC_GET_LINE_CODING == (event_info.setup.request_type & USB_BREQUEST))
                {
                    g_usb_on_usb.periControlDataSet(&g_basic0_ctrl, (uint8_t *)
```

```
&g_line_coding, LINE_CODING_LENGTH);
    }
else
    {
        g_usb_on_usb.periControlStatusSet(&g_basic0_ctrl,
USB_SETUP_STATUS_ACK);
    }
break;
case USB_STATUS_SUSPEND:
case USB_STATUS_DETACH:
break;
default:
break;
    }
}
} /* End of function usb_main() */
```

Typedefs

```
typedef usb_event_info_t  usb_instance_ctrl_t
```

Typedef Documentation

◆ usb_instance_ctrl_t

```
typedef usb_event_info_t  usb_instance_ctrl_t
```

USB private control block. DO NOT MODIFY. Initialization occurs when R_USB_Open is called.

Function Documentation

◆ R_USB_EventGet()

```
fsp_err_t R_USB_EventGet ( usb_ctrl_t*const p_api_ctrl, usb_status_t* event )
```

Obtains completed USB related events. (OS-less Only)

In USB host mode, the device address value of the USB device that completed an event is specified in the usb_ctrl_t structure member (address) specified by the event's argument. In USB peripheral mode, USB_NULL is specified in member (address). If this function is called in the RTOS execution environment, a failure is returned.

Return values

| | |
|--------------------|--|
| FSP_SUCCESS | Event Get Success. |
| FSP_ERR_USB_FAILED | If called in the RTOS environment, an error is returned. |

Note

*Do not use the same variable as the first argument of R_USB_Open for the first argument.
Do not call this API in the interrupt function.*

◆ **R_USB_Callback()**

```
fsp_err_t R_USB_Callback ( usb_callback_t* p_callback)
```

Register a callback function to be called upon completion of a USB related event. (RTOS only)

This function registers a callback function to be called when a USB-related event has completed. If this function is called in the OS-less execution environment, a failure is returned.

Return values

| | |
|-------------------|--------------------------|
| FSP_SUCCESS | Successfully completed. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |

Note

Do not call this API in the interrupt function.

◆ **R_USB_Open()**

```
fsp_err_t R_USB_Open ( usb_ctrl_t*const p_api_ctrl, usb_cfg_t const*const p_cfg )
```

Applies power to the USB module specified in the argument (p_ctrl).

Return values

| | |
|-----------------------|---|
| FSP_SUCCESS | Success in open. |
| FSP_ERR_USB_BUSY | Specified USB module now in use. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_Close()**

```
fsp_err_t R_USB_Close ( usb_ctrl_t *const p_api_ctrl)
```

Terminates power to the USB module specified in argument (p_ctrl). USB0 module stops when USB_IP0 is specified to the member (module), USB1 module stops when USB_IP1 is specified to the member (module).

Return values

| | |
|-----------------------|---|
| FSP_SUCCESS | Success. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_USB_NOT_OPEN | USB module is not open. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_Read()**

```
fsp_err_t R_USB_Read ( usb_ctrl_t *const p_api_ctrl, uint8_t * p_buf, uint32_t size, uint8_t destination )
```

Bulk/Interrupt data transfer.

Requests USB data read (bulk/interrupt transfer). The read data is stored in the area specified by argument (p_buf). After data read is completed, confirm the operation by checking the return value (USB_STATUS_READ_COMPLETE) of the R_USB_GetEvent function. The received data size is set in member (size) of the usb_ctrl_t structure. To figure out the size of the data when a read is complete, check the return value (USB_STATUS_READ_COMPLETE) of the R_USB_GetEvent function, and then refer to the member (size) of the usb_ctrl_t structure.

Return values

| | |
|-----------------------|--|
| FSP_SUCCESS | Successfully completed (Data read request completed). |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_USB_BUSY | Data receive request already in process for USB device with same device address. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

Note

1. Do not call this API in the following function.
 - (1). Interrupt function.
 - (2). Callback function (for RTOS).
2. Allocate the following the storage area when using DMA transfer and specify the start address of the allocated storage area to the 2nd argument(p_buf).
 - (1). When using High-speed and enabling continuous transfer mode, allocate the storage area with a size that is a multiple of 2048.
 - (2). When using High-speed and disabling continuous transfer mode, allocate the storage area with a size that is a multiple of 512.
 - (3). When using Full-speed, allocate the storage area with a size that is a multiple of 64.
3. Specify the following address to the 2nd argument (p_buf) when using DMA transfer.
 - (1). When using High-speed module, specify start address of the buffer area aligned on 4-byte boundary.
 - (2). When using Full-speed module, specify start address of the buffer area aligned on 2-byte boundary.

◆ **R_USB_Write()**

```
fsp_err_t R_USB_Write ( usb_ctrl_t *const p_api_ctrl, uint8_t const *const p_buf, uint32_t size,
uint8_t destination )
```

Bulk/Interrupt data transfer.

Requests USB data write (bulk/interrupt transfer). Stores write data in area specified by argument (p_buf). Set the device class type in usb_ctrl_t structure member (type). Confirm after data write is completed by checking the return value (USB_STATUS_WRITE_COMPLETE) of the R_USB_GetEvent function. For sending a zero-length packet, please refer the following Note.

Return values

| | |
|-----------------------|--|
| FSP_SUCCESS | Successfully completed. (Data write request completed) |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_USB_BUSY | Data write request already in process for USB device with same device address. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

Note

1. The user needs to send the zero-length packet(ZLP) since this USB driver does not send the ZLP automatically. When sending a ZLP, the user sets USB_NULL in the third argument (size) of R_USB_Write function as follow.

e.g)

```
R_USB_Write (&g_basic0_ctrl, &g_buf, USB_NULL);
```

2. Specify the following address to the 2nd argument (p_buf) when using DMA transfer.

(1). When using High-speed module, specify start address of the buffer area aligned on 4-byte boundary.

(2). When using Full-speed module, specify start address of the buffer area aligned on 2-byte boundary.

3. Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_Stop()**

```
fsp_err_t R_USB_Stop ( usb_ctrl_t *const p_api_ctrl, usb_transfer_t direction, uint8_t destination )
```

Requests a data read/write transfer be terminated when a data read/write transfer is being performed.

To stop a data read, set USB_TRANSFER_READ as the argument (type); to stop a data write, specify USB_WRITE as the argument (type).

Return values

| | |
|-----------------------|---|
| FSP_SUCCESS | Successfully completed. (stop completed) |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_BUSY | Stop processing is called multiple times. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_Suspend()**

```
fsp_err_t R_USB_Suspend ( usb_ctrl_t *const p_api_ctrl)
```

Sends a SUSPEND signal from the USB module assigned to the member (module) of the usb_ctrl_t structure.

After the suspend request is completed, confirm the operation with the return value (USB_STATUS_SUSPEND) of the R_USB_EventGet function.

Return values

| | |
|-----------------------|---|
| FSP_SUCCESS | Successfully completed. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_USB_BUSY | During a suspend request to the specified USB module, or when the USB module is already in the suspended state. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_Resume()**

```
fsp_err_t R_USB_Resume ( usb_ctrl_t *const p_api_ctrl)
```

Sends a RESUME signal from the USB module assigned to the member (module) of the usb_ctrl_t structure.

After the resume request is completed, confirm the operation with the return value (USB_STATUS_RESUME) of the R_USB_EventGet function

Return values

| | |
|-------------------------|--|
| FSP_SUCCESS | Successfully completed. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_USB_BUSY | Resume already requested for same device address. (USB host mode only) |
| FSP_ERR_USB_NOT_SUSPEND | USB device is not in the SUSPEND state. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_VbusSet()**

```
fsp_err_t R_USB_VbusSet ( usb_ctrl_t *const p_api_ctrl, uint16_t state )
```

Specifies starting or stopping the VBUS supply.

Return values

| | |
|-----------------------|---|
| FSP_SUCCESS | Successful completion. (VBUS supply start/stop completed) |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ R_USB_InfoGet()

```
fsp_err_t R_USB_InfoGet ( usb_ctrl_t *const p_api_ctrl, usb_info_t * p_info, uint8_t destination )
```

Obtains completed USB-related events.

Return values

| | |
|-----------------------|---|
| FSP_SUCCESS | Successful completion. (VBUS supply start/stop completed) |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

◆ R_USB_PipeRead()

```
fsp_err_t R_USB_PipeRead ( usb_ctrl_t *const p_api_ctrl, uint8_t * p_buf, uint32_t size, uint8_t pipe_number )
```

Requests a data read (Bulk/Interrupt transfer) via the pipe specified in the argument.

The read data is stored in the area specified in the argument (p_buf). After the data read is completed, confirm the operation with the R_USB_GetEvent function return value(USB_STATUS_READ_COMPLETE). To figure out the size of the data when a read is complete, check the return value (USB_STATUS_READ_COMPLETE) of the R_USB_GetEvent function, and then refer to the member (size) of the usb_ctrl_t structure.

Return values

| | |
|-----------------------|--|
| FSP_SUCCESS | Successfully completed. |
| FSP_ERR_USB_BUSY | Specified pipe now handling data receive/send request. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

Note

1. Do not call this API in the following function.
 - (1). Interrupt function.
 - (2). Callback function (for RTOS).
2. Allocate the following the storage area when using DMA transfer and specify the start address of the allocated storage area to the 2nd argument(p_buf).
 - (1). When using High-speed and enabling continuous transfer mode, allocate the storage area with a size that is a multiple of 2048.
 - (2). When using High-speed and disabling continuous transfer mode, allocate the storage area with a size that is a multiple of 512.
 - (3). When using Full-speed, allocate the storage area with a size that is a multiple of 64.
3. Specify the following address to the 2nd argument (p_buf) when using DMA transfer.
 - (1). When using High-speed module, specify start address of the buffer area aligned on 4-byte boundary.
 - (2). When using Full-speed module, specify start address of the buffer area aligned on 2-byte boundary.

◆ **R_USB_PipeWrite()**

```
fsp_err_t R_USB_PipeWrite ( usb_ctrl_t *const p_api_ctrl, uint8_t * p_buf, uint32_t size, uint8_t pipe_number )
```

Requests a data write (Bulk/Interrupt transfer).

The write data is stored in the area specified in the argument (p_buf). After data write is completed, confirm the operation with the return value (USB_STATUS_WRITE_COMPLETE) of the EventGet function. For sending a zero-length packet, please refer the following Note.

Return values

| | |
|-----------------------|--|
| FSP_SUCCESS | Successfully completed. |
| FSP_ERR_USB_BUSY | Specified pipe now handling data receive/send request. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

Note

1. The user needs to send the zero-length packet(ZLP) since this USB driver does not send the ZLP automatically. When sending a ZLP, the user sets `USB_NULL` in the third argument (size) of `R_USB_PipeWrite` function as follow.

e.g)

```
R_USB_PipeWrite (&g_basic0_ctrl, &g_buf, USB_NULL, pipe_number);
```

2. Specify the following address to the 2nd argument (p_buf) when using DMA transfer.

(1). When using High-speed module, specify start address of the buffer area aligned on 4-byte boundary.

(2). When using Full-speed module, specify start address of the buffer area aligned on 2-byte boundary.

3. Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_PipeStop()**

```
fsp_err_t R_USB_PipeStop ( usb_ctrl_t *const p_api_ctrl, uint8_t pipe_number )
```

Terminates a data read/write operation.

Return values

| | |
|-----------------------|---|
| FSP_SUCCESS | Successfully completed. (Stop request completed) |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_UsedPipesGet()**

```
fsp_err_t R_USB_UsedPipesGet ( usb_ctrl_t *const p_api_ctrl, uint16_t * p_pipe, uint8_t destination )
```

Gets the selected pipe number (number of the pipe that has completed initialization) via bit map information.

The bit map information is stored in the area specified in argument (p_pipe). Based on the information (module member and address member) assigned to the usb_ctrl_t structure, obtains the PIPE information of that USB device.

Return values

| | |
|-----------------------|---|
| FSP_SUCCESS | Successfully completed. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

◆ **R_USB_PipeInfoGet()**

```
fsp_err_t R_USB_PipeInfoGet ( usb_ctrl_t *const p_api_ctrl, usb_pipe_t * p_info, uint8_t pipe_number )
```

Gets the following pipe information regarding the pipe specified in the argument (p_ctrl) member (pipe): endpoint number, transfer type, transfer direction and maximum packet size.

The obtained pipe information is stored in the area specified in the argument (p_info).

Return values

| | |
|-----------------------|---|
| FSP_SUCCESS | Successfully completed. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

◆ **R_USB_PullUp()**

```
fsp_err_t R_USB_PullUp ( usb_ctrl_t *const p_api_ctrl, uint8_t state )
```

This API enables or disables pull-up of D+/D- line.

Return values

| | |
|-----------------------|---|
| FSP_SUCCESS | Successful completion. (Pull-up enable/disable setting completed) |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

Note

Do not call this API in the following function.

- (1). Interrupt function.
- (2). Callback function (for RTOS).

◆ **R_USB_HostControlTransfer()**

```
fsp_err_t R_USB_HostControlTransfer ( usb_ctrl_t *const p_api_ctrl, usb_setup_t * p_setup, uint8_t * p_buf, uint8_t device_address )
```

Performs settings and transmission processing when transmitting a setup packet.

Return values

| | |
|-----------------------|--|
| FSP_SUCCESS | Successful completion. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |
| FSP_ERR_USB_BUSY | Specified pipe now handling data receive/send request. |

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_PeriControlDataGet()**

```
fsp_err_t R_USB_PeriControlDataGet ( usb_ctrl_t *const p_api_ctrl, uint8_t * p_buf, uint32_t size )
```

Receives data sent by control transfer.

Return values

| | |
|-----------------------|--|
| FSP_SUCCESS | Successful completion. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_BUSY | Specified pipe now handling data receive/send request. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_PeriControlDataSet()**

```
fsp_err_t R_USB_PeriControlDataSet ( usb_ctrl_t *const p_api_ctrl, uint8_t * p_buf, uint32_t size )
```

Performs transfer processing for control transfer.

Return values

| | |
|-----------------------|--|
| FSP_SUCCESS | Successful completion. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_BUSY | Specified pipe now handling data receive/send request. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_PeriControlStatusSet()**

```
fsp_err_t R_USB_PeriControlStatusSet ( usb_ctrl_t *const p_api_ctrl, usb_setup_status_t status )
```

Set the response to the setup packet.

Return values

| | |
|-----------------------|---|
| FSP_SUCCESS | Successful completion. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_RemoteWakeup()**

```
fsp_err_t R_USB_RemoteWakeup ( usb_ctrl_t *const p_api_ctrl)
```

Sends a remote wake-up signal to the connected Host.

Return values

| | |
|-------------------------|---|
| FSP_SUCCESS | Successful completion. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_NOT_SUSPEND | Device is not suspended. |
| FSP_ERR_USB_BUSY | The device is in resume operation. |

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_DriverActivate()**

```
fsp_err_t R_USB_DriverActivate ( usb_ctrl_t *const p_api_ctrl)
```

Activate USB Driver for USB Peripheral BareMetal.

Return values

| | |
|--------------------|---|
| FSP_SUCCESS | Successful completion. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |

Note

Call this API in the in the infinite loop of the application program or a timer interrupt.

◆ **R_USB_CallbackMemorySet()**

```
fsp_err_t R_USB_CallbackMemorySet ( usb_ctrl_t *const p_api_ctrl, usb_callback_args_t *
p_callback_memory )
```

Set callback memory to USB Driver for USB Peripheral BareMetal.

Return values

| | |
|--------------------|---|
| FSP_SUCCESS | Successful completion. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |

Note

Call this API after calling R_USB_Open function.

◆ **R_USB_ModuleNumberGet()**

```
fsp_err_t R_USB_ModuleNumberGet ( usb_ctrl_t *const p_api_ctrl, uint8_t * module_number )
```

This API gets the module number.

Return values

| | |
|-------------|------------------------|
| FSP_SUCCESS | Successful completion. |
|-------------|------------------------|

◆ **R_USB_ClassTypeGet()**

```
fsp_err_t R_USB_ClassTypeGet ( usb_ctrl_t *const p_api_ctrl, usb_class_t * class_type )
```

This API gets the class type.

Return values

| | |
|-------------|------------------------|
| FSP_SUCCESS | Successful completion. |
|-------------|------------------------|

Note

In Bare-Metal, In the Bare-Metal version, please specify the variable specified by the 1st argument of the R_USB_EventGet function to the 1st argument of this API.

In the FreeRTOS, please specify one of the following to the 1st argument of this API.

1. The 1st argument of the callback function specified in Conguration.
2. The start address of the area where the structure area of the 1st argument was copied.

◆ **R_USB_DeviceAddressGet()**

```
fsp_err_t R_USB_DeviceAddressGet ( usb_ctrl_t*const p_api_ctrl, uint8_t* device_address )
```

This API gets the device address.

Return values

| | |
|-------------|------------------------|
| FSP_SUCCESS | Successful completion. |
|-------------|------------------------|

Note

In Bare-Metal, In the Bare-Metal version, please specify the variable specified by the 1st argument of the R_USB_EventGet function to the 1st argument of this API.

In the FreeRTOS, please specify one of the following to the 1st argument of this API.

1. The 1st argument of the callback function specified in Conguration.
2. The start address of the area where the structure area of the 1st argument was copied.

◆ **R_USB_PipeNumberGet()**

```
fsp_err_t R_USB_PipeNumberGet ( usb_ctrl_t*const p_api_ctrl, uint8_t* pipe_number )
```

This API gets the pipe number.

Return values

| | |
|-------------|------------------------|
| FSP_SUCCESS | Successful completion. |
|-------------|------------------------|

Note

In Bare-Metal, In the Bare-Metal version, please specify the variable specified by the 1st argument of the R_USB_EventGet function to the 1st argument of this API.

In the FreeRTOS, please specify one of the following to the 1st argument of this API.

1. The 1st argument of the callback function specified in Conguration.
2. The start address of the area where the structure area of the 1st argument was copied.

◆ **R_USB_DeviceStateGet()**

```
fsp_err_t R_USB_DeviceStateGet ( usb_ctrl_t*const p_api_ctrl, uint16_t* state )
```

This API gets the state of the device.

Return values

| | |
|-------------|------------------------|
| FSP_SUCCESS | Successful completion. |
|-------------|------------------------|

Note

In Bare-Metal, In the Bare-Metal version, please specify the variable specified by the 1st argument of the R_USB_EventGet function to the 1st argument of this API.

In the FreeRTOS, please specify one of the following to the 1st argument of this API.

1. The 1st argument of the callback function specified in Conguration.
2. The start address of the area where the structure area of the 1st argument was copied.

◆ **R_USB_DataSizeGet()**

```
fsp_err_t R_USB_DataSizeGet ( usb_ctrl_t*const p_api_ctrl, uint32_t* data_size )
```

This API gets the read data size.

Return values

| | |
|-------------|------------------------|
| FSP_SUCCESS | Successful completion. |
|-------------|------------------------|

Note

In Bare-Metal, In the Bare-Metal version, please specify the variable specified by the 1st argument of the R_USB_EventGet function to the 1st argument of this API.

In the FreeRTOS, please specify one of the following to the 1st argument of this API.

1. The 1st argument of the callback function specified in Conguration.
2. The start address of the area where the structure area of the 1st argument was copied.

◆ **R_USB_SetupGet()**

```
fsp_err_t R_USB_SetupGet ( usb_ctrl_t*const p_api_ctrl, usb_setup_t* setup )
```

This API gets the setup information.

Return values

| | |
|-------------|------------------------|
| FSP_SUCCESS | Successful completion. |
|-------------|------------------------|

Note

In Bare-Metal, In the Bare-Metal version, please specify the variable specified by the 1st argument of the R_USB_EventGet function to the 1st argument of this API.

In the FreeRTOS, please specify one of the following to the 1st argument of this API.

1. The 1st argument of the callback function specified in Conguration.
2. The start address of the area where the structure area of the 1st argument was copied.

◆ **R_USB_OtgCallbackSet()**

```
fsp_err_t R_USB_OtgCallbackSet ( usb_ctrl_t*const p_api_ctrl, usb_otg_callback_t* p_callback )
```

Set callback function to be called when the OTG role swap was completed on Azure RTOS.

Return values

| | |
|--------------------|---|
| FSP_SUCCESS | Successful completion. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |

◆ R_USB_OtgSRP()

`fsp_err_t R_USB_OtgSRP (usb_ctrl_t *const p_api_ctrl)`

Start the SRP processing for OTG on Azure RTOS.

Return values

| | |
|--------------------|---|
| FSP_SUCCESS | Successful completion. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |

Note

Do not support the VBUS Pulsing since OTG 2.0 does not support the VBUS Pulsing..

5.2.6.28 USB Composite (r_usb_composite)

Modules » [Connectivity](#)

Functions

Refer to [USB \(r_usb_basic\)](#) for the common API (r_usb_basic) to be called from the application.

Overview

USB composite device works as a USB Peripheral by combining two peripheral device classes and r_usb_basic module.

This USB driver supports the following composite devices:

1. PCDC + PMSC
2. PCDC + PHID
3. PHID + PMSC
4. PCDC + PCDC
5. PHID + PHID
6. PCDC + PVND

How to Configuration

The following shows FSP configuration procedure for USB composite device.

- Select [New Stack]->[USB]->[USB Composite]

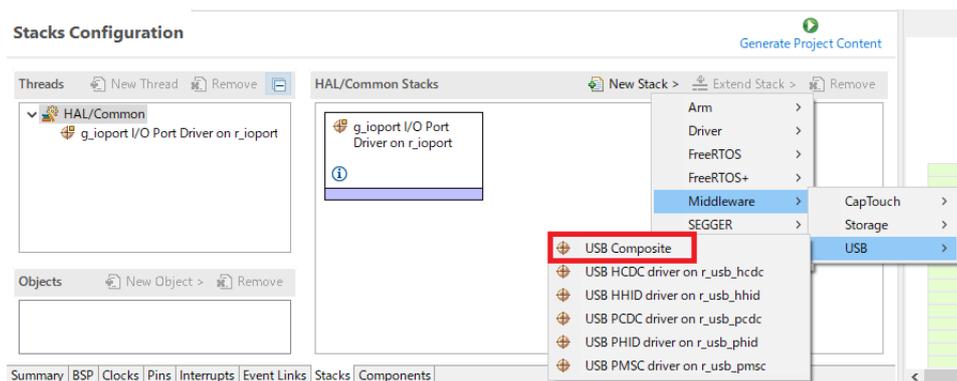

Figure 198: Select USB Composite

- The following is displayed when selecting [USB Composite].

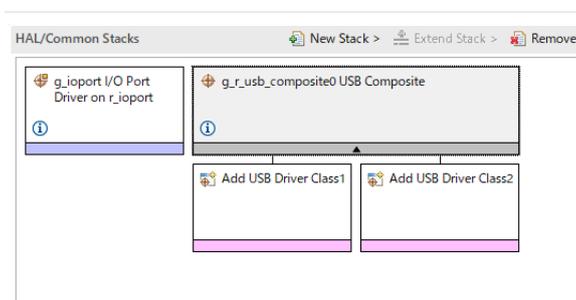

Figure 199: USB Composite Stack

- Select the supported 2 device classes as follows.

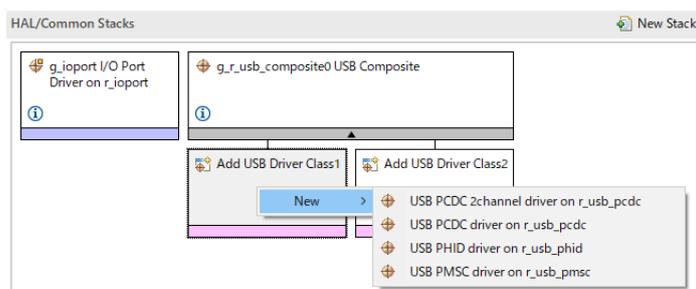

Figure 200: Select Device Classes

Note

- Be sure to select "USB PCDC driver on r_usb_pcdc" and "USB PCDC 2channel driver on r_usb_pcdc" when configuring for "PCDC + PCDC".
- Be sure to select "USB PHID driver on r_usb_phid" and "USB PHID 2channel driver on r_usb_phid" when configuring for "PHID + PHID".

- Select the supported 2 device classes as follows. The following is displayed when selecting

2 device classes.

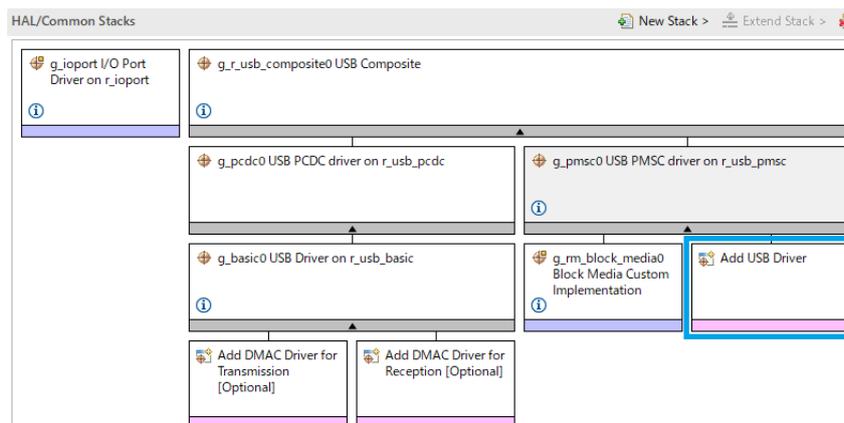

Figure 201: Delete USB Basic Instance

Note

1. Delete the "g_basic1" instance manually since this instance is not used in composite device. (Refer to the blue frame in the above figure.)
2. The error is output when selecting the following device classes.
 - a. PMSC + PMSC

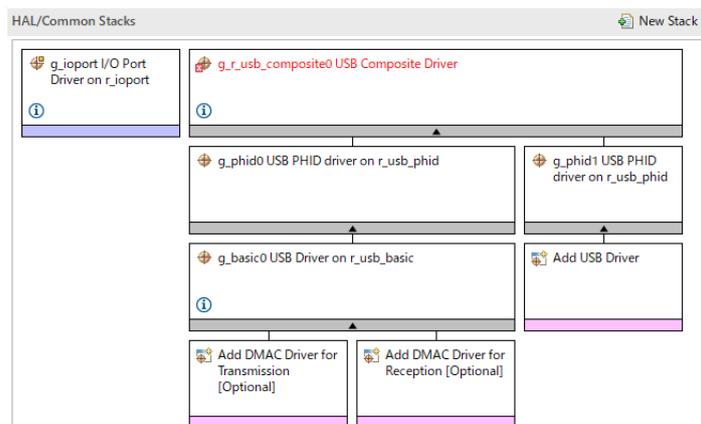

Figure 202: Device Class Selection Error

Limitations

- The following composite device is not supported when using RA2A1(MCU).
 - PMSC + PCDC
 - PCDC + PCDC
- If you use PMSC, make sure to use usb_basic module with PMSC.

There is a risk that the information on the PMSC storage media cannot be registered normally in the "USB Callback Context".

Notes

Please determine by the member "pipe" in "usb_event_info" structure when getting PCDC channel number which the write event is completed in PCDC + PCDC.
Don't refer to the member "type" in "usb_event_info" structure.

Descriptor

Templates for composite device descriptors can be found in ra/fsp/src/r_usb_composite folder. Also, please be sure to use your vendor ID.

1. r_usb_pcdc_pmsc_descriptor.c.template (for PCDC + PMSC)
2. r_usb_pcdc_phid_descriptor.c.template (for PCDC + PHID)
3. r_usb_phid_pmsc_descriptor.c.template (for PHID + PMSC)
4. r_usb_pcdc_pcdc_descriptor.c.template (for PCDC + PCDC)
5. r_usb_phid_phid_descriptor.c.template (for PHID + PHID)
6. r_usb_pcdc_pvnd_descriptor.c.template (for PCDC + PVND)

Examples

USB COMPOSITE Example

- PCDC + PHID

```
void main_task (void)

5.2.6.29 USB HCDC (r_usb_hcdc)

Modules » Connectivity

Functions

`fsp_err_t` [R_USB_HCDC_ControlDataRead](#) (`usb_ctrl_t *const p_api_ctrl`, `uint8_t *p_buf`, `uint32_t size`, `uint8_t device_address`)

Read Control Data.(CDC Interrupt IN data) [More...](#)

`fsp_err_t` [R_USB_HCDC_SpecificDeviceRegister](#) (`usb_ctrl_t *const p_api_ctrl`, `uint16_t vendor_id`, `uint16_t product_id`)

Register the specified vendor class device in the device table. [More...](#)

`fsp_err_t` [R_USB_HCDC_DeviceInfoGet](#) (`usb_ctrl_t *const p_api_ctrl`, `usb_hcdc_device_info_t *p_info`, `uint8_t device_address`)

Get the VID, PID and subclass code of the connected device. [More...](#)

Detailed Description

This module provides a USB Host Communications Device Class (HCDC) driver. It implements the [USB HCDC Interface](#).

Functions

Refer to [USB \(r_usb_basic\)](#) for the common API (`r_usb_basic`) to be called from the application.

Detailed Description

Overview

The `r_usb_hcdc` module, when used in combination with the `r_usb_basic` module, operates as a USB Host Communications Device Class (HCDC) driver. The HCDC conforms to the PSTN device subclass abstract control model of the USB Communications Device Class (CDC) specification and enables communication with a CDC peripheral device.

Features

The `r_usb_hcdc` module has the following key features:

- Checks for connected devices
- Implementation of communication line settings
- Acquisition of the communication line state
- Data transfer to and from a CDC peripheral device

Configuration

Build Time Configurations for r_usb_hcdc

The following build time configurations are defined in fsp_cfg/r_usb_hcdc_cfg.h:

| Configuration | Options | Default | Description |
|-----------------------------------|---|----------------------------|--|
| Target Peripheral Device Class ID | <ul style="list-style-type: none"> • CDC class supported device • Vendor class device | CDC class supported device | Specify the device class ID of the CDC device to be connected. |
| Bulk Input Transfer Pipe | <ul style="list-style-type: none"> • USB PIPE1 • USB PIPE2 • USB PIPE3 • USB PIPE4 • USB PIPE5 | USB PIPE4 | Select the USB pipe to use for bulk input transfers. |
| Bulk Output Transfer Pipe | <ul style="list-style-type: none"> • USB PIPE1 • USB PIPE2 • USB PIPE3 • USB PIPE4 • USB PIPE5 | USB PIPE5 | Select the USB pipe to use for bulk output transfers. |
| Interrupt In Pipe | <ul style="list-style-type: none"> • USB PIPE6 • USB PIPE7 • USB PIPE8 • USB PIPE9 | USB PIPE6 | Select the USB pipe to use for interrupts. |

Configurations for Connectivity > USB HCDC (r_usb_hcdc)

This module can be added to the Stacks tab via New Stack > Connectivity > USB HCDC (r_usb_hcdc).

| Configuration | Options | Default | Description |
|---------------|-------------------------------|---------|--------------|
| Name | Name must be a valid C symbol | g_hcdc0 | Module name. |

Note

Refer to the [USB \(r_usb_basic\)](#) module for hardware configuration options.

Clock Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Pin Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Usage Notes

Communications Device Class (CDC), PSTN and ACM

This software conforms to the Abstract Control Model (ACM) subclass of the Communications Device Class specification as defined in the "USB Communications Class Subclass Specification for PSTN Devices", Revision 1.2. The Abstract Control Model subclass is a technology that bridges the gap between USB devices and earlier modems (employing RS-232C connections) enabling use of application programs designed for older modems.

Basic Functions

The main functions of HCDC are the following:

- Verify connected devices
- Make communication line settings
- Acquire the communication line state
- Transfer data to and from the CDC peripheral device

Abstract Control Model Class Requests - Host to Device

This driver supports the following class requests:

| Request | Code | Description |
|-------------------------|------|---|
| SendEncapsulatedCommand | 0x00 | Transmits an AT command as defined by the protocol used by the device (normally 0 for USB). |
| GetEncapsulatedResponse | 0x01 | Requests a response to a command transmitted by SendEncapsulatedCommand. |
| SetCommFeature | 0x02 | Enables or disables features such as device-specific 2-byte code and country setting. |
| GetCommFeature | 0x03 | Acquires the enabled/disabled state of features such as device-specific 2-byte code and country setting. |
| ClearCommFeature | 0x04 | Restores the default enabled/disabled settings of features such as device-specific 2-byte code and country setting. |
| SetLineCoding | 0x20 | Makes communication line settings (communication speed, data length, parity bit, and stop bit length). |
| GetLineCoding | 0x21 | Acquires the communication line setting state. |
| SetControllLineState | 0x22 | Makes communication line |

control signal (RTS, DTR) settings.

SendBreak 0x23 Transmits a break signal.

Note

For more information about Abstract Control Model requests, refer to Table 11 "Requests - Abstract Control Model" in the "USB Communications Class Subclass Specification for PSTN Devices", Revision 1.2.

The expected data format for each command is shown below followed by dependent structures.

| bmRequestType | bRequest | wValue | wIndex | wLength | Data |
|---------------|----------------------------------|---|--------|-------------|---|
| 0x21 | SEND_ENCAPSULATED_COMMAND (0x00) | 0x0000 | 0x0000 | Data length | usb_hcdc_encapsulated_t |
| 0x21 | GET_ENCAPSULATED_RESPONSE (0x01) | 0x0000 | 0x0000 | Data length | usb_hcdc_encapsulated_t |
| 0x21 | SET_COMM_FEATURE (0x02) | usb_hcdc_feature_selector_t | 0x0000 | Data length | usb_hcdc_comfeature_t |
| 0x21 | GET_COMM_FEATURE (0x03) | usb_hcdc_feature_selector_t | 0x0000 | Data length | usb_hcdc_comfeature_t |
| 0x21 | CLEAR_COMM_FEATURE (0x04) | usb_hcdc_feature_selector_t | 0x0000 | Data length | None |
| 0x21 | SET_LINE_CODING (0x20) | 0x0000 | 0x0000 | 0x0000 | usb_hcdc_linecoding_t |
| 0xA1 | GET_LINE_CODING (0x21) | 0x0000 | 0x0000 | 0x0007 | usb_hcdc_linecoding_t |
| 0x21 | SET_CONTROL_LINE_STATE (0x22) | usb_hcdc_control_line_state_t | 0x0000 | 0x0000 | None |
| 0x21 | SEND_BREAK (0x23) | usb_hcdc_break_duration_t | 0x0000 | 0x0000 | None |

ACM Notifications from Device to Host

The following class notifications are supported:

| Notification | Code | Description |
|--------------------|------|---------------------------------------|
| RESPONSE_AVAILABLE | 0x01 | Response to GET_ENCAPSULATED_RESPONSE |
| SERIAL_STATE | 0x20 | Notification of serial line state |

The data types returned are as follows:

| bmRequestType | bRequest | wValue | wIndex | wLength | Data |
|---------------|---------------------------|--------|--------|---------|---|
| 0xA1 | RESPONSE_AVAILABLE (0x01) | 0x0000 | 0x0000 | 0x0000 | None |
| 0xA1 | SERIAL_STATE (0x20) | 0x0000 | 0x0000 | 0x0002 | usb_hcdc_serial_state_t |

Note

The host is notified with `SERIAL_STATE` whenever a change in the UART port state is detected.

Limitations

This driver is subject to the following limitations:

- Suspend is not supported when a data transfer is in progress. Confirm that data transfer has completed before executing suspend.
- Use of compound USB devices with CDC class support is not supported.
- This module must be incorporated into a project using `r_usb_basic` and does not provide any public APIs.
- This driver does not support Low-speed.
- This driver does not support simultaneous operation with the other device class.
- CDC-ECM requires a TCP/IP driver for USB driver on the upper layer.
- The user needs to support the porting layer for TCP/IP when using CDC-ECM.
- CDC-ECM works on FreeRTOS.
- CDC-ECM was evaluated using the following USB to Ethernet adapter.
 - UGREEN USB to Ethernet Adapter RJ45 (Manufacture: Ugreen Group Limited, Item modle number: 50922)

Examples**USB HCDC Loopback Example**

The main functions of the HCDC loopback example are as follows:

1. Virtual UART control settings are configured by transmitting the class request `SET_LINE_CODING` to the CDC device.
2. Sends receive (Bulk In transfer) requests to a CDC peripheral device and receives data.
3. Loops received data back to the peripheral by means of Bulk Out transfers.

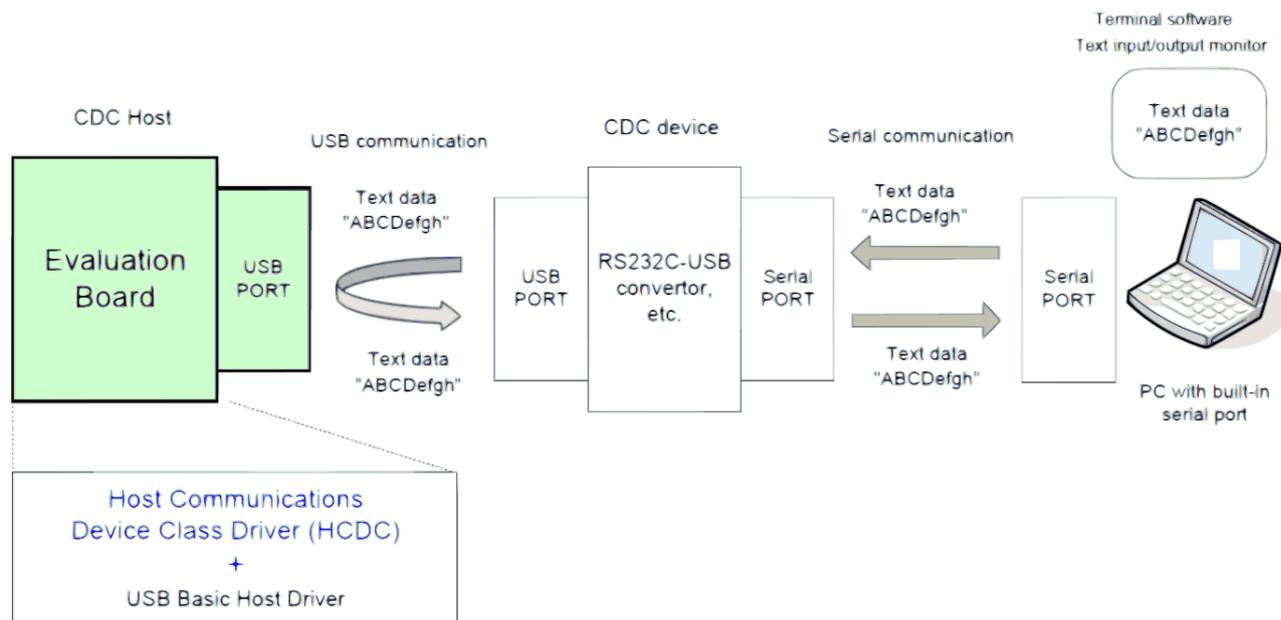

Figure 203: Data Transfer (Loopback)

The main loop performs loopback processing in which data received from a CDC peripheral device is transmitted unaltered back to the peripheral.

Function Documentation

◆ R_USB_HCDC_ControlDataRead()

```
fsp_err_t R_USB_HCDC_ControlDataRead ( usb_ctrl_t*const p_api_ctrl, uint8_t* p_buf, uint32_t size, uint8_t device_address )
```

Read Control Data.(CDC Interrupt IN data)

Return values

| | |
|-----------------------|--|
| FSP_SUCCESS | Successfully completed (Data read request completed). |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_USB_BUSY | Data receive request already in process for USB device with same device address. |
| FSP_ERR_ASSERTION | Parameter is NULL error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

Note

1. Do not call this API in the following function.
 - (1). Interrupt function.
 - (2). Callback function (for RTOS).

◆ R_USB_HCDC_SpecificDeviceRegister()

```
fsp_err_t R_USB_HCDC_SpecificDeviceRegister ( usb_ctrl_t*const p_api_ctrl, uint16_t vendor_id, uint16_t product_id )
```

Register the specified vendor class device in the device table.

Return values

| | |
|-----------------------|---|
| FSP_SUCCESS | Successfully completed. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter Null pointer error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

Note

- (1). Interrupt function.
- (2). Callback function (for RTOS).

◆ R_USB_HCDC_DeviceInfoGet()

```
fsp_err_t R_USB_HCDC_DeviceInfoGet ( usb_ctrl_t *const p_api_ctrl, usb_hcdc_device_info_t *
p_info, uint8_t device_address )
```

Get the VID, PID and subclass code of the connected device.

Return values

| | |
|-----------------------|---|
| FSP_SUCCESS | Successfully completed. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter Null pointer error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

Note

- (1). Interrupt function.
(2). Callback function (for RTOS).

5.2.6.30 USB HHID (r_usb_hhid)

Modules » [Connectivity](#)

Functions

```
fsp_err_t R_USB_HHID_TypeGet (usb_ctrl_t *const p_api_ctrl, uint8_t *p_type,
uint8_t device_address)
```

Get HID protocol.(USB Mouse/USB Keyboard/Other Type.) [More...](#)

```
fsp_err_t R_USB_HHID_MaxPacketSizeGet (usb_ctrl_t *const p_api_ctrl,
uint16_t *p_size, uint8_t direction, uint8_t device_address)
```

Obtains max packet size for the connected HID device. The max packet size is set to the area. Set the direction (USB_HID_IN/USB_HID_OUT). [More...](#)

Detailed Description

This module provides a USB Host Human Interface Device Class Driver (HHID). It implements the [USB HHID Interface](#).

Overview

The r_usb_hhid module combines with the r_usb_basic module to provide a USB Host Human Interface Device Class (HHID) driver. The HHID driver conforms to the USB Human Interface Device

class specifications and implements communication with a HID device.

Features

The r_usb_hhid module has the following key features:

- Data communication with a connected HID device (USB mouse, keyboard etc.)
- Issuing of HID class requests to a connected HID device
- Supports Interrupt OUT transfer

Configuration

Build Time Configurations for r_usb_hhid

The following build time configurations are defined in fsp_cfg/r_usb_hhid_cfg.h:

| Configuration | Options | Default | Description |
|--------------------|--|-----------|--|
| Interrupt In Pipe | <ul style="list-style-type: none"> • USB PIPE6 • USB PIPE7 • USB PIPE8 • USB PIPE9 | USB PIPE6 | Select the pipe number to use for input interrupt events. |
| Interrupt Out Pipe | <ul style="list-style-type: none"> • USB PIPE6 • USB PIPE7 • USB PIPE8 • USB PIPE9 | USB PIPE9 | Select the pipe number to use for output interrupt events. |

Configurations for Connectivity > USB HHID (r_usb_hhid)

This module can be added to the Stacks tab via New Stack > Connectivity > USB HHID (r_usb_hhid). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---------------|-------------------------------|---------|--------------|
| Name | Name must be a valid C symbol | g_hhid0 | Module name. |

Clock Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Pin Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Usage Notes

Note

This driver is not guaranteed to provide USB HID operation in all scenarios. The developer must verify correct operation when connected to the targeted USB peripherals.

Class Requests

The class requests supported by this driver are shown below:

| Request | Code | Description |
|---------------------------|------|---|
| USB_GET_REPORT | 0x01 | Receives a report from the HID device. |
| USB_SET_REPORT | 0x09 | Sends a report to the HID device. |
| USB_GET_IDLE | 0x02 | Receives a duration (time) from the HID device. |
| USB_SET_IDLE | 0x0A | Sends a duration (time) to the HID device. |
| USB_GET_PROTOCOL | 0x03 | Reads a protocol from the HID device. |
| USB_SET_PROTOCOL | 0x0B | Sends a protocol to the HID device. |
| USB_GET_REPORT_DESCRIPTOR | 0x06 | Requests a report descriptor. |
| USB_GET_HID_DESCRIPTOR | 0x06 | Requests a HID descriptor. |

Data Format

The boot protocol data format of data received from the keyboard or mouse through interrupt-IN transfers is shown below:

| offset | Keyboard (8 Bytes) | Mouse (3 Bytes) |
|--------------|--------------------|---|
| 0 (Top Byte) | Modifier keys | b0 : Button 1 b1 : Button 2 b2 : Button 3 b3-b7 : Reserved |
| +1 | Reserved | X displacement |
| +2 | Keycode 1 | Y displacement |
| +3 | Keycode 2 | - |
| +4 | Keycode 3 | - |
| +5 | Keycode 4 | - |
| +6 | Keycode 5 | - |
| +7 | Keycode 6 | - |

Limitations

- The HID driver does not analyze the report descriptor. This driver determines the report format from the interface protocol.
- This driver does not support DMA transfers.
- This driver does not support High-speed.
- The transfer rates of Full-speed and Low-speed are the same when the max packet sizes of Full-speed and Low-speed are the same.

- This driver does not support simultaneous operation with the other device class.

Examples

USB HHID Example

The main functions of the application are as follows:

1. Performs enumeration and initialization of HID devices.
2. Transfers data to and from a connected HID device (mouse or keyboard). Data received from the device is read and discarded.
3. When an RTOS is used, the USB driver calls the callback (`usb_apl_callback`) in order to pass events to the main loop through a queue.

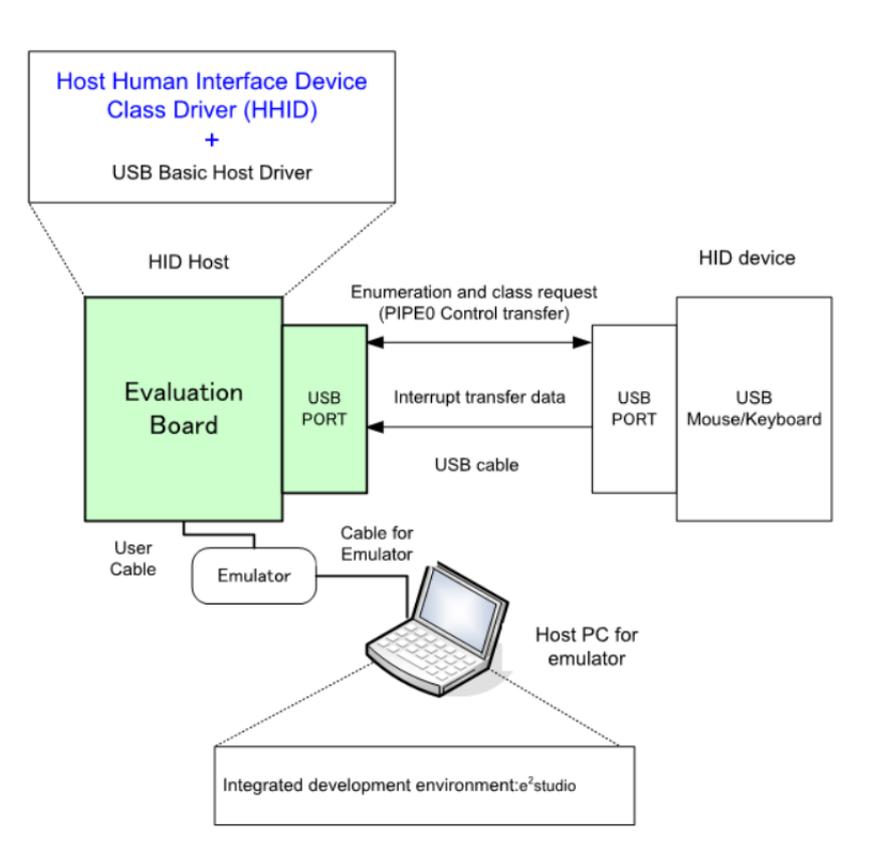

Figure 204: Example Operating Environment

Application Processing (for RTOS)

The main loop performs processing to receive data from the HID device as part of the main routine. An overview of the processing performed by the loop is shown below.

1. When a USB-related event has completed, the USB driver calls the callback function (`usb_apl_callback`). In the callback function (`usb_apl_callback`), the application task (APL) is notified of the USB completion event using the real-time OS functionality.
2. In APL, information regarding the USB completion event was notified from the callback function is retrieved using the real-time OS functionality.
3. If the USB completion event (the event member of the `usb_ctrl_t` structure) retrieved in step

2. If the return value of R_USB_GetEvent is USB_STATUS_CONFIGURED, APL sends the class request (SET_PROTOCOL) to the HID device.
4. If the USB completion event (the event member of the usb_ctrl_t structure) retrieved in step 2 above is USB_STATUS_REQUEST_COMPLETE, APL performs a data reception request to receive data transmitted from the HID device by calling the R_USB_Read function.
5. The above processing is repeated.

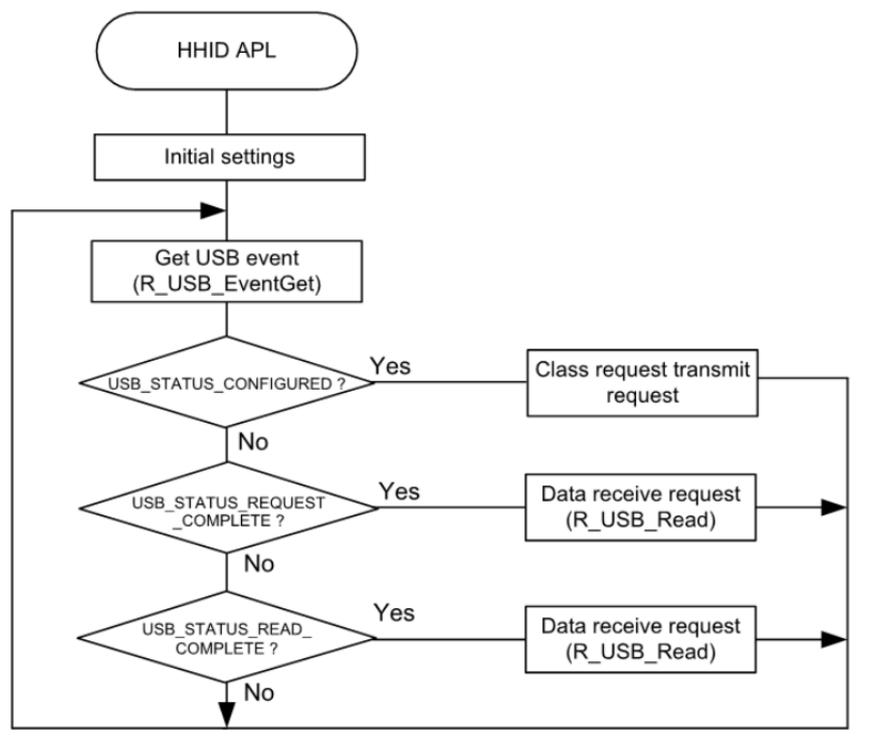

Figure 205: Main Loop (Normal mode)

Application Processing (for Non-OS)

The main loop performs processing to receive data from the HID device as part of the main routine. An overview of the processing of the main loop is presented below.

1. When the R_USB_GetEvent function is called after an HID device attaches to the USB host and enumeration completes, USB_STATUS_CONFIGURED is set as the return value. When the APL confirms USB_STATUS_CONFIGURED, it calls the R_USB_Write function to request transmission of data to the HID device.
2. When the R_USB_GetEvent function is called after sending of class request SET_PROTOCOL to the HID device has completed, USB_STATUS_REQUEST_COMPLETE is set as the return value. When the APL confirms USB_STATUS_REQUEST_COMPLETE, it calls the R_USB_Read function to make a data receive request for data sent by the HID device.
3. When the R_USB_GetEvent function is called after reception of data from the HID device has completed, USB_STATUS_READ_COMPLETE is set as the return value. When the APL confirms USB_STATUS_READ_COMPLETE, it calls the R_USB_Read function to make a data receive request for data sent by the HID device.
4. The processing in step 3, above, is repeated.

Detailed Description

This module provides a USB Host Mass Storage Class (HMSC) driver. It implements the [USB HMSC Interface](#).

Overview

The `r_usb_hmse` module, when used in combination with the `r_usb_basic` module, operates as a USB Host Mass Storage Class (HMSC) driver. It is built on the USB Mass Storage Class Bulk-Only Transport (BOT) protocol. It is possible to communicate with BOT-compatible USB storage devices by combining this module with a file system and storage device driver.

Note

This module should be used in combination with the FreeRTOS+FAT File System.

Features

The `r_usb_hmse` module has the following key features:

- Checking of connected USB storage devices to determine whether or not operation is supported
- Storage command communication using the BOT protocol
- Support for SFF-8070i (ATAPI) USB mass storage subclass
- Sharing of a single pipe for IN/OUT directions or multiple devices
- Supports up to 4 connected USB storage devices

Known Issues

- Users can not use TrustZone features that use Non-secure Callable.

Class Requests

The class requests supported by this driver are shown below.

| Request | Description |
|------------------|--|
| GetMaxLun | Gets the maximum number of units that are supported. |
| MassStorageReset | Cancel a protocol error. |

Storage Commands

This driver supports the following storage commands:

- TEST_UNIT_READY
- MODE_SELECT10
- MODE_SENSE10

- PREVENT_ALLOW
- READ_FORMAT_CAPACITY
- READ10
- WRITE10

Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Clock Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Pin Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Usage Notes

Warning

Due to the wide variety of USB mass storage device implementations, this driver is not guaranteed to work with all devices. When implementing the driver it is important to verify correct operation with the mass storage devices that the end user is expected to use.

Multi Port

This driver supports simultaneous operation with Peripheral Communication Device Class(PCDC). If the user are using MCU that supports 2 USB modules, such as RA6M3, the user can run HMSC on one USB module and PCDC on the other. This driver does not support simultaneous operation using device classes other than PCDC.

For Bare Metal

1. To use FreeRTOS+FAT without FreeRTOS, copy FreeRTOSConfigMinimal.h to one of your project's include paths and rename it FreeRTOSConfig.h.
2. In RA configurator, enter the appropriate values in the Main stack size and Heap size fields. The figure below is an example of the RA6M3-EK board.

| | |
|------------------------------|--------------------------|
| ▼ RA Common | |
| Main stack size (bytes) | 0x800 |
| Heap size (bytes) | 0x800 |
| MCU Vcc (mV) | 3300 |
| Parameter checking | Disabled |
| Assert Failures | Return FSP_ERR_ASSERTION |
| Error Log | No Error Log |
| Soft Reset | Disabled |
| Main Oscillator Populated | Populated |
| PFS Protect | Enabled |
| C Runtime Initialization | Enabled |
| Main Oscillator Clock Source | Crystal or Resonator |
| Subclock Populated | Populated |
| Subclock Drive (Drive capac) | Standard/Normal mode |
| Subclock Stabilization Time | 1000 |

Figure 207: BSP Setting

1. In the Bare Metal version, specify "NULL" in the Callback item.

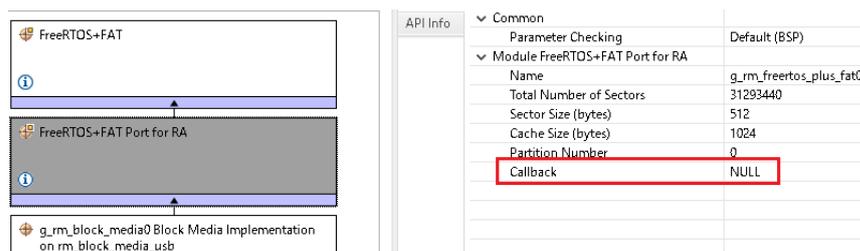

Figure 208: For Bare Metal Setting

Limitations

1. Some MSC devices may be unable to connect because they are not recognized as storage devices.
2. MSC devices that return values of 1 or higher in response to the GetMaxLun command (mass storage class command) are not supported.
3. A maximum of 4 USB storage devices can be connected.
4. Only USB storage devices with a sector size of 512 bytes can be connected.
5. A device that does not respond to the READ_CAPACITY command operates as a device with a sector size of 512 bytes.
6. The continuous transfer mode cannot be used when using DMA.
7. This module must be incorporated into a project using r_usb_basic and does not provide any public APIs.
8. This driver does not support Low-speed.

Examples

USB HMSC Example

Example Operating Environment

The following shows an example operating environment for the HMSC.

Refer to the associated instruction manuals for details on setting up the evaluation board and using the emulator, etc.

- device is mounted and the file is written to the MSC device.
- If the USB completion event (the event member of the `usb_ctrl_t` structure) retrieved in step 2 above is `USB_STS_DETACH`, the application initializes the variables for state management.

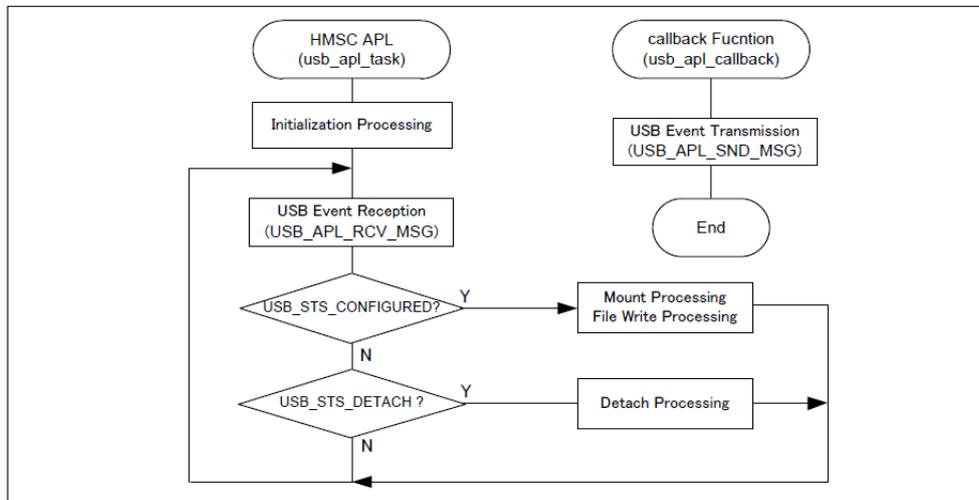

Figure 210: usb_apl_task

file_read_task

Of the application tasks `usb_apl_task` and `file_read_task`, `file_read_task` is processed while `usb_apl_task` is in the wait state. This task performs file read processing on the file that was written to the MSC device.

Example Code

```

#define RM_FREERTOS_PLUS_FAT_EXAMPLE_FILE_NAME "TEST_FILE.txt"

Function Documentation

◆ R_USB_HMSC_StorageCommand()

`fsp_err_t R_USB_HMSC_StorageCommand (usb_ctrl_t*const p_api_ctrl, uint8_t* buf, uint8_t command, uint8_t destination)`

Processing for MassStorage(ATAPI) command.

Return values

| | |
|-----------------------|---|
| FSP_SUCCESS | Success. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter Null pointer error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

◆ **R_USB_HMSC_DriveNumberGet()**

```
fsp_err_t R_USB_HMSC_DriveNumberGet ( usb_ctrl_t *const p_api_ctrl, uint8_t * p_drive, uint8_t destination )
```

Get number of Storage drive.

Return values

| | |
|-----------------------|---|
| FSP_SUCCESS | Success. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter Null pointer error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

◆ **R_USB_HMSC_StorageReadSector()**

```
fsp_err_t R_USB_HMSC_StorageReadSector ( uint16_t drive_number, uint8_t *const buff, uint32_t sector_number, uint16_t sector_count )
```

Read sector information.

Return values

| | |
|-----------------------|---|
| FSP_SUCCESS | Success. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter Null pointer error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

Note

The address specified in the argument buff must be 4-byte aligned.

◆ **R_USB_HMSC_StorageWriteSector()**

```
fsp_err_t R_USB_HMSC_StorageWriteSector ( uint16_t drive_number, uint8_t const *const buff,
uint32_t sector_number, uint16_t sector_count )
```

Write sector information.

Return values

| | |
|-----------------------|---|
| FSP_SUCCESS | Success. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |
| FSP_ERR_ASSERTION | Parameter Null pointer error. |
| FSP_ERR_USB_PARAMETER | Parameter error. |

Note

The address specified in the argument *buff* must be 4-byte aligned.

◆ **R_USB_HMSC_SemaphoreGet()**

```
fsp_err_t R_USB_HMSC_SemaphoreGet ( void )
```

Get a semaphore. (RTOS only)

If this function is called in the OS less execution environment, a failure is returned.

Return values

| | |
|--------------------|---|
| FSP_SUCCESS | Success. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |

◆ **R_USB_HMSC_SemaphoreRelease()**

```
fsp_err_t R_USB_HMSC_SemaphoreRelease ( void )
```

Release a semaphore. (RTOS only)

If this function is called in the OS less execution environment, a failure is returned.

Return values

| | |
|--------------------|---|
| FSP_SUCCESS | Success. |
| FSP_ERR_USB_FAILED | The function could not be completed successfully. |

Modules » Connectivity

Functions

Refer to [USB \(r_usb_basic\)](#) for the common API (r_usb_basic) to be called from the application.

Overview

USB Host Vendor class works by combining r_usb_basic module.

How to Configuration

The following shows FSP configuration procedure for USB Host Vendor class.

- Select [New Stack]->[Middleware]->[USB]->[USB Host Vendor class driver on r_usb_hvnd].

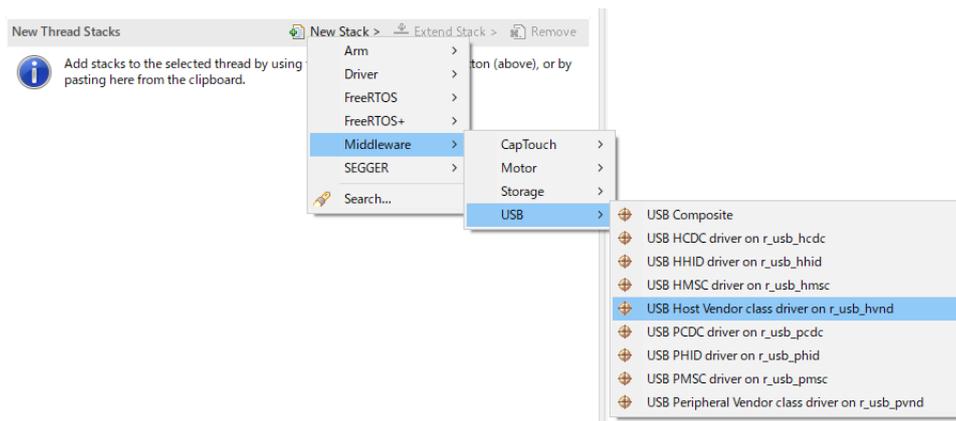

Figure 211: Select USB Host Vendor Class

- The following is displayed when selecting [USB Host Vendor class driver on r_usb_hvnd]. The user does not specify USB pipe number in Vendor class.

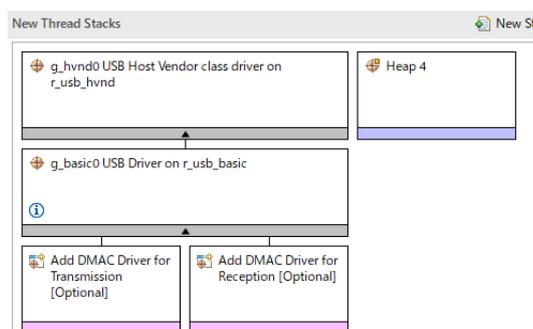

Figure 212: USB Host Vendor Class Stack

API

Use the following APIs in Host Vendor class application program.

- For Data Transfer
Use the following APIs for data transfer for Bulk transfer or Interrupt transfer.

1. R_USB_PipeRead()
2. R_USB_PipeWrite()
3. R_USB_PipeStop()

- For Control Transfer
Use the following API for the class request processing.

1. R_USB_HostControlTransfer()

- For USB Pipe Information
The USB driver allocates USB PIPE by analyzing the descriptor of USB device in Vendor class. Use the following APIs to get the allocated USB pipe information.

1. R_USB_UsedPipesGet()
2. R_USB_PipeInfoGet()

USB PIPE Allocation

The USB driver allocates USB PIPE by analyzing the descriptor of USB device in Vendor class. The USB PIPE related to the Endpoint Descriptor are allocated in order from USB PIPE1 according to the description order of the Endpoint Descriptor.

Examples

This application program processes the following after the enumeration completes with USB device.

1. Getting USB Pipe Information
2. Vendor Class Request Processing
3. Loopback processing of bulk transfer and interrupt transfer.

```

5.2.6.33 USB PCDC (r_usb_pcdc)

Modules » [Connectivity](#)

This module provides a USB Peripheral Communications Device Class Driver (PCDC). It implements the [USB PCDC Interface](#).

Functions

Refer to [USB \(r_usb_basic\)](#) for the common API (r_usb_basic) to be called from the application.

Detailed Description

Overview

The r_usb_pcdc module combines with the r_usb_basic module to provide a USB Peripheral Communications Device Class (PCDC) driver. The PCDC driver conforms to Abstract Control Model of the USB Communications Device Class (CDC) specification and enables communication with a CDC host device.

Features

The r_usb_pcdc module has the following key features:

- Data transfer to and from a USB host
- Response to CDC class requests
- Supports CDC notifications

Configuration

Build Time Configurations for r_usb_pcdc

The following build time configurations are defined in fsp_cfg/r_usb_pcdc_cfg.h:

| Configuration | Options | Default | Description |
|-------------------|---|-----------|---|
| Bulk In Pipe | <ul style="list-style-type: none"> • USB PIPE1 • USB PIPE2 • USB PIPE3 • USB PIPE4 • USB PIPE5 | USB PIPE4 | Select the USB pipe to use for bulk input transfers. |
| Bulk Out Pipe | <ul style="list-style-type: none"> • USB PIPE1 • USB PIPE2 • USB PIPE3 • USB PIPE4 • USB PIPE5 | USB PIPE5 | Select the USB pipe to use for bulk output transfers. |
| Interrupt In Pipe | <ul style="list-style-type: none"> • USB PIPE6 • USB PIPE7 • USB PIPE8 • USB PIPE9 | USB PIPE6 | Select the USB pipe to use for interrupts. |

Configurations for Connectivity > USB PCDC (r_usb_pcdc)

This module can be added to the Stacks tab via New Stack > Connectivity > USB PCDC (r_usb_pcdc).

| Configuration | Options | Default | Description |
|---------------|-------------------------------|---------|--------------|
| Name | Name must be a valid C symbol | g_pcdc0 | Module name. |

Note

Refer to the [USB \(r_usb_basic\)](#) module for hardware configuration options.

Clock Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Pin Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Usage Notes

Abstract Control Model Overview

The Abstract Control Model subclass of CDC is a technology that bridges the gap between USB devices and earlier modems (employing RS-232C connections), enabling use of application programs designed for older modems.

Class Requests (Host to Peripheral)

This driver notifies the application when receiving the following class requests:

| Request | Code | Description |
|---------------------|------|--|
| SetLineCoding | 0x20 | Sets communication line settings (bitrate, data length, parity, and stop bit length) |
| GetLineCoding | 0x21 | Acquires the communication line setting state |
| SetControlLineState | 0x22 | Set communication line control signals (RTS, DTR) |

Note

For details concerning the Abstract Control Model requests, refer to Table 11 "Requests - Abstract Control Model" in the "USB Communications Class Subclass Specification for PSTN Devices", Revision 1.2.

Data Format of Class Requests

The data format of supported class requests is described below:

| bmRequestType | bRequest | wValue | wIndex | wLength | Data |
|---------------|-------------------------------|--|--------|---------|---------------------------------------|
| 0x21 | SET_LINE_CODING (0x20) | 0x0000 | 0x0000 | 0x0007 | usb_pcdc_linecoding_t |
| 0xA1 | GET_LINE_CODING (0x21) | 0x0000 | 0x0000 | 0x0007 | usb_pcdc_linecoding_t |
| 0x21 | SET_CONTROL_LINE_STATE (0x22) | usb_pcdc_ctrlinestates_t | 0x0000 | 0x0000 | None |

Class Notifications (Peripheral to Host)

The following class notifications are supported:

| Notification | Code | Description |
|--------------|------|-----------------------------------|
| SERIAL_STATE | 0x20 | Notification of serial line state |

The data types returned are as follows:

| bmRequestType | bRequest | wValue | wIndex | wLength | Data |
|---------------|----------|--------|--------|---------|------|
|---------------|----------|--------|--------|---------|------|

| | | | | | |
|------|------------------------|--------|--------|--------|---|
| 0xA1 | SERIAL_STATE (0x20) | 0x0000 | 0x0000 | 0x0002 | usb_serial_state_bitmap_t |
|------|------------------------|--------|--------|--------|---|

Note

The host is notified with SERIAL_STATE whenever a change in the UART port state is detected. This driver will automatically detect overrun, parity and framing errors. A state notification is performed when a transition from normal to error state is detected.

Virtual COM-port Usage

When connected to a PC the CDC device can be used as a virtual COM port. After enumeration, the CDC class requests GetLineCoding and SetControlLineState are executed by the target, and the CDC device is registered in Windows Device Manager as a virtual COM device.

Registering the CDC device as a virtual COM-port in Windows Device Manager enables data communication with the CDC device via a terminal app such as PuTTY. When changing settings of the serial port in the terminal application, the UART setting is propagated to the firmware via the class request SetLineCoding.

Data input (or file transmission) from the terminal app window is transmitted to the board using endpoint 2 (EP2); data from the board side is transmitted to the PC using EP1.

When the last packet of data received is the maximum packet size, and the terminal determines that there is continuous data, the received data may not be displayed in the terminal. If the received data is smaller than the maximum packet size, the data received up to that point is displayed in the terminal.

Multi Port

This driver supports simultaneous operation with Host Mass Storage Class(HMSC). If the user are using MCU that supports 2 USB modules, such as RA6M3, the user can run PCDC on one USB module and HMSC on the other. This driver does not support simultaneous operation using device classes other than HMSC.

Limitations

- This module must be incorporated into a project using r_usb_basic and does not provide any public APIs.
- This driver does not support Low-speed.

Examples**USB PCDC Loopback Example**

The main functions of the PCDC loopback example are as follows:

1. Receives virtual UART configuration data from the host terminal
2. Loops all other received data back to the host terminal

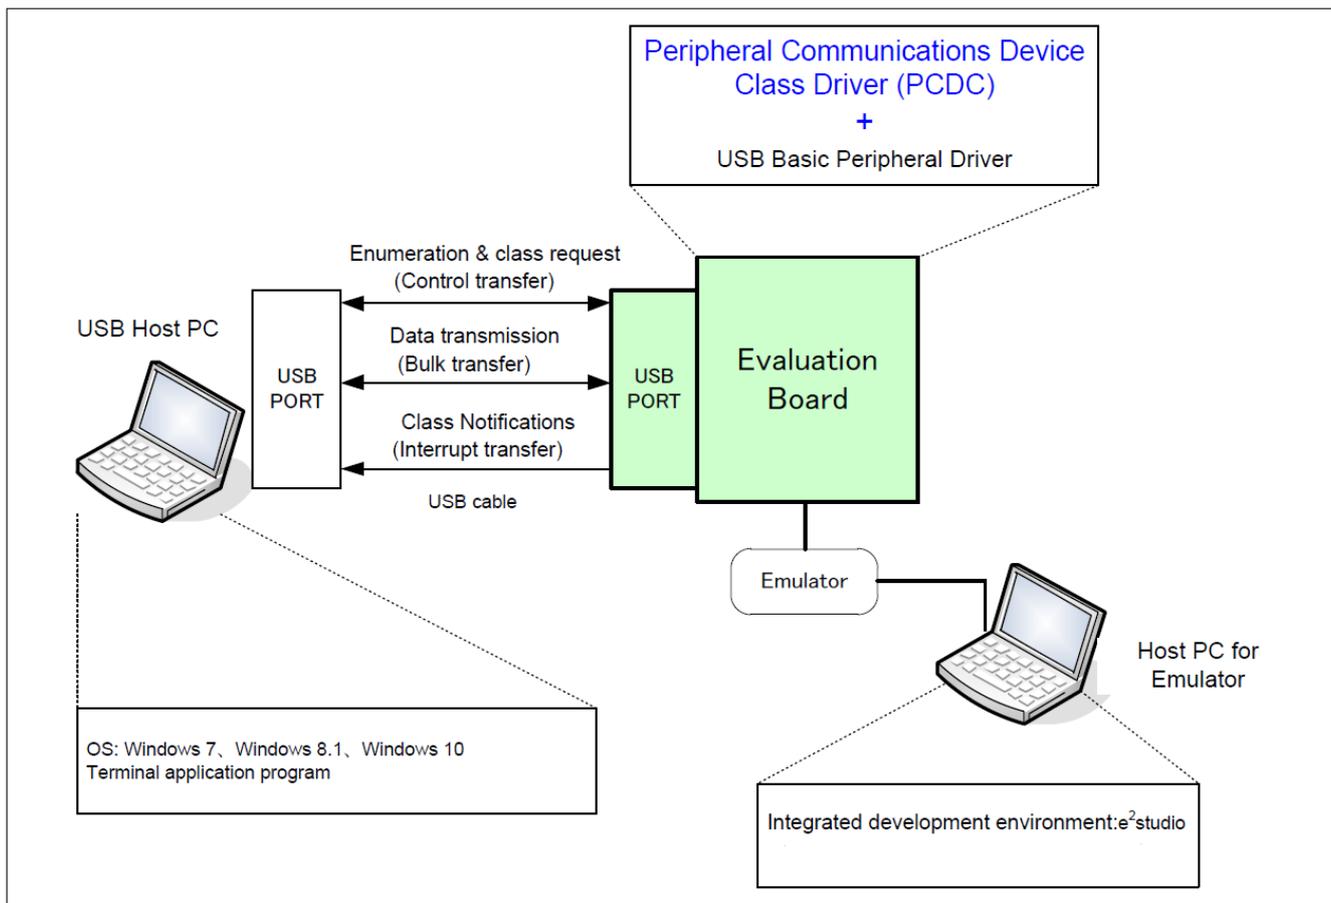

Figure 213: Example Operating Environment
